The `OpFRem` and `OpFMod` instructions use cheap approximations of remainder, and the error can be large due to the discontinuity in `trunc()` and `floor()`. This can produce mathematically unexpected results in some cases, such as `FMod(x,x)` computing x rather than 0, and can also cause the result to have a different sign than the infinitely precise result.

Table 85. Precision of GLSL.std.450 Instructions

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
fma()	Inherited from <code>OpFMul</code> followed by <code>OpFAdd</code> .	
exp(x), exp2(x)	$3 + 2 \times x $ ULP.	$1 + 2 \times x $ ULP.
log(), log2()	3 ULP outside the range $[0.5, 2.0]$. Absolute error $< 2^{-21}$ inside the range $[0.5, 2.0]$.	3 ULP outside the range $[0.5, 2.0]$. Absolute error $< 2^{-7}$ inside the range $[0.5, 2.0]$.

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
<code>pow(x, y)</code>	Inherited from <code>exp2(y × log2(x))</code> .	
<code>sqrt()</code>	Inherited from <code>1.0 / inversesqrt()</code> .	
<code>inversesqrt()</code>	2 ULP.	
<code>radians(x)</code>	Inherited from $x \times \frac{\pi}{180}$.	
<code>degrees(x)</code>	Inherited from $x \times \frac{180}{\pi}$.	
<code>sin()</code>	Absolute error $\leq 2^{-11}$ inside the range $[-\pi, \pi]$.	Absolute error $\leq 2^{-7}$ inside the range $[-\pi, \pi]$.
<code>cos()</code>	Absolute error $\leq 2^{-11}$ inside the range $[-\pi, \pi]$.	Absolute error $\leq 2^{-7}$ inside the range $[-\pi, \pi]$.
<code>tan()</code>	Inherited from $\frac{\sin()}{\cos()}$.	
<code>asin(x)</code>	Inherited from <code>atan2(x, sqrt(1.0 - x × x))</code> .	
<code>acos(x)</code>	Inherited from <code>atan2(sqrt(1.0 - x × x), x)</code> .	
<code>atan(), atan2()</code>	4096 ULP	5 ULP.
<code>sinh(x)</code>	Inherited from $(\exp(x) - \exp(-x)) \times 0.5$.	
<code>cosh(x)</code>	Inherited from $(\exp(x) + \exp(-x)) \times 0.5$.	
<code>tanh()</code>	Inherited from $\frac{\sinh()}{\cosh()}$.	
<code>asinh(x)</code>	Inherited from <code>log(x + sqrt(x × x + 1.0))</code> .	
<code>acosh(x)</code>	Inherited from <code>log(x + sqrt(x × x - 1.0))</code> .	
<code>atanh(x)</code>	Inherited from $\log(\frac{1.0 + x}{1.0 - x}) \times 0.5$.	
<code>frexp()</code>	Correctly rounded.	
<code>ldexp()</code>	Correctly rounded.	
<code>length(x)</code>	Inherited from <code>sqrt(dot(x, x))</code> .	
<code>distance(x, y)</code>	Inherited from <code>length(x - y)</code> .	
<code>cross()</code>	Inherited from <code>OpFSub(OpFMul, OpFMul)</code> .	

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
<code>normalize(x)</code>	Inherited from $\frac{x}{length(x)}$.	
<code>faceforward(N, I, NRef)</code>	Inherited from $dot(NRef, I) < 0.0 ? N : -N$.	
<code>reflect(x, y)</code>	Inherited from $x - 2.0 \times dot(y, x) \times y$.	
<code>refract(I, N, eta)</code>	Inherited from $k < 0.0 ? 0.0 : eta \times I - (eta \times dot(N, I) + sqrt(k)) \times N$, where $k = 1 - eta \times eta \times (1.0 - dot(N, I) \times dot(N, I))$.	
<code>round</code>	Correctly rounded.	
<code>roundEven</code>	Correctly rounded.	
<code>trunc</code>	Correctly rounded.	
<code>fabs</code>	Correctly rounded.	
<code>fsign</code>	Correctly rounded.	
<code>floor</code>	Correctly rounded.	
<code>ceil</code>	Correctly rounded.	
<code>fract</code>	Correctly rounded.	
<code>modf</code>	Correctly rounded.	
<code>fmin</code>	Correctly rounded.	
<code>fmax</code>	Correctly rounded.	
<code>fclamp</code>	Correctly rounded.	
<code>fmix(x, y, a)</code>	Inherited from $x \times (1.0 - a) + y \times a$.	
<code>step</code>	Correctly rounded.	
<code>smoothStep(edge0, edge1, x)</code>	Inherited from $t \times t \times (3.0 - 2.0 \times t)$, where $t = clamp(\frac{x - edge0}{edge1 - edge0}, 0.0, 1.0)$.	
<code>nmin</code>	Correctly rounded.	
<code>nmax</code>	Correctly rounded.	
<code>nclamp</code>	Correctly rounded.	

GLSL.std.450 extended instructions specifically defined in terms of the above instructions inherit the above errors. GLSL.std.450 extended instructions not listed above and not defined in terms of the above have undefined precision.

For the `OpSRem` and `OpSMod` instructions, if either operand is negative the result is undefined.

Note

While the `OpSRem` and `OpSMod` instructions are supported by the Vulkan environment, they require non-negative values and thus do not enable additional functionality beyond what `OpUMod` provides.

`OpCooperativeMatrixMulAddNV` performs its operations in an implementation-dependent order and internal precision.

Signedness of SPIR-V Image Accesses

SPIR-V associates a signedness with all integer image accesses. This is required in certain parts of the SPIR-V and the Vulkan image access pipeline to ensure defined results. The signedness is determined from a combination of the access instruction's `Image Operands` and the underlying image's `Sampled Type` as follows:

1. If the instruction's `Image Operands` contains the `SignExtend` operand then the access is signed.
2. If the instruction's `Image Operands` contains the `ZeroExtend` operand then the access is unsigned.
3. Otherwise, the image accesses signedness matches that of the `Sampled Type` of the `OpTypeImage` being accessed.

Image Format and Type Matching

When specifying the `Image Format` of an `OpTypeImage`, the converted bit width and type, as shown in the table below, **must** match the `Sampled Type`. The signedness **must** match the `signedness of any access` to the image.

Note

Formatted accesses are always converted from a shader readable type to the resource's format or vice versa via `Format Conversion` for reads and `Texel Output Format Conversion` for writes. As such, the bit width and format below do not necessarily match 1:1 with what might be expected for some formats.

For a given `Image Format`, the `Sampled Type` **must** be the type described in the `Type` column of the below table, with its `Literal Width` set to that in the `Bit Width` column. Every access that is made to the image **must** have a signedness equal to that in the `Signedness` column (where applicable).

Appendix B: Memory Model

Agent

Operation is a general term for any task that is executed on the system.

Note

An operation is by definition something that is executed. Thus if an instruction is skipped due to control flow, it does not constitute an operation.

Each operation is executed by a particular *agent*. Possible agents include each shader invocation, each host thread, and each fixed-function stage of the pipeline.

Memory Location

A *memory location* identifies unique storage for 8 bits of data. Memory operations access a *set of memory locations* consisting of one or more memory locations at a time, e.g. an operation accessing a 32-bit integer in memory would read/write a set of four memory locations. Memory operations that access whole aggregates **may** access any padding bytes between elements or members, but no padding bytes at the end of the aggregate. Two sets of memory locations *overlap* if the intersection of their sets of memory locations is non-empty. A memory operation **must** not affect memory at a memory location not within its set of memory locations.

Memory locations for buffers and images are explicitly allocated in [VkDeviceMemory](#) objects, and are implicitly allocated for SPIR-V variables in each shader invocation.

Variables with [Workgroup](#) storage class that point to a block-decorated type share a set of memory locations.

Allocation

The values stored in newly allocated memory locations are determined by a SPIR-V variable's initializer, if present, or else are undefined. At the time an allocation is created there have been no [memory operations](#) to any of its memory locations. The initialization is not considered to be a memory operation.

Note

For tessellation control shader output variables, a consequence of initialization not being considered a memory operation is that some implementations may need to insert a barrier between the initialization of the output variables and any reads of those variables.

Memory Operation

For an operation A and memory location M:

- A *reads* M if and only if the data stored in M is an input to A.
- A *writes* M if and only if the data output from A is stored to M.
- A *accesses* M if and only if it either reads or writes (or both) M.

Note

A write whose value is the same as what was already in those memory locations is still considered to be a write and has all the same effects.

Reference

A *reference* is an object that a particular agent **can** use to access a set of memory locations. On the host, a reference is a host virtual address. On the device, a reference is:

- The descriptor that a variable is bound to, for variables in Image, Uniform, or StorageBuffer storage classes. If the variable is an array (or array of arrays, etc.) then each element of the array **may** be a unique reference.
- The address range for a buffer in **PhysicalStorageBuffer** storage class, where the base of the address range is queried with **vkGetBufferDeviceAddress** and the length of the range is the size of the buffer.
- A single common reference for all variables with **Workgroup** storage class that point to a block-decorated type.
- The variable itself for non-block-decorated type variables in **Workgroup** storage class.
- The variable itself for variables in other storage classes.

Two memory accesses through distinct references **may** require availability and visibility operations as defined [below](#).

Program-Order

A *dynamic instance* of an instruction is defined in SPIR-V (<https://www.khronos.org/registry/spir-v/specs/unified1/SPIRV.html#DynamicInstance>) as a way of referring to a particular execution of a static instruction. Program-order is an ordering on dynamic instances of instructions executed by a single shader invocation:

- (Basic block): If instructions A and B are in the same basic block, and A is listed in the module before B, then the n'th dynamic instance of A is program-ordered before the n'th dynamic instance of B.
- (Branch): The dynamic instance of a branch or switch instruction is program-ordered before the dynamic instance of the OpLabel instruction to which it transfers control.
- (Call entry): The dynamic instance of an **OpFunctionCall** instruction is program-ordered before the dynamic instances of the **OpFunctionParameter** instructions and the body of the called function.
- (Call exit): The dynamic instance of the instruction following an **OpFunctionCall** instruction is program-ordered after the dynamic instance of the return instruction executed by the called

function.

- (Transitive Closure): If dynamic instance A of any instruction is program-ordered before dynamic instance B of any instruction and B is program-ordered before dynamic instance C of any instruction then A is program-ordered before C.
- (Complete definition): No other dynamic instances are program-ordered.

For instructions executed on the host, the source language defines the program-order relation (e.g. as “sequenced-before”).

Shader Call Related

Shader-call-related is an equivalence relation on invocations defined as the symmetric and transitive closure of:

- A is shader-call-related to B if A is created by an [invocation repack](#) instruction executed by B.

Shader Call Order

Shader-call-order is a partial order on dynamic instances of instructions executed by invocations that are shader-call-related:

- (Program order): If dynamic instance A is program-ordered before B, then A is shader-call-ordered before B.
- (Shader call entry): If A is a dynamic instance of an [invocation repack](#) instruction and B is a dynamic instance executed by an invocation that is created by A, then A is shader-call-ordered before B.
- (Shader call exit): If A is a dynamic instance of an [invocation repack](#) instruction, B is the next dynamic instance executed by the same invocation, and C is a dynamic instance executed by an invocation that is created by A, then C is shader-call-ordered before B.
- (Transitive closure): If A is shader-call-ordered-before B and B is shader-call-ordered-before C, then A is shader-call-ordered-before C.
- (Complete definition): No other dynamic instances are shader-call-ordered.

Scope

Atomic and barrier instructions include scopes which identify sets of shader invocations that **must** obey the requested ordering and atomicity rules of the operation, as defined below.

The various scopes are described in detail in [the Shaders chapter](#).

Atomic Operation

An *atomic operation* on the device is any SPIR-V operation whose name begins with **OpAtomic**. An atomic operation on the host is any operation performed with an std::atomic typed object.

Each atomic operation has a memory [scope](#) and a [semantics](#). Informally, the scope determines which other agents it is atomic with respect to, and the [semantics](#) constrains its ordering against other memory accesses. Device atomic operations have explicit scopes and semantics. Each host atomic operation implicitly uses the [CrossDevice](#) scope, and uses a memory semantics equivalent to a C++ std::memory_order value of relaxed, acquire, release, acq_rel, or seq_cst.

Two atomic operations A and B are *potentially-mutually-ordered* if and only if all of the following are true:

- They access the same set of memory locations.
- They use the same reference.
- A is in the instance of B's memory scope.
- B is in the instance of A's memory scope.
- A and B are not the same operation (irreflexive).

Two atomic operations A and B are *mutually-ordered* if and only if they are potentially-mutually-ordered and any of the following are true:

- A and B are both device operations.
- A and B are both host operations.
- A is a device operation, B is a host operation, and the implementation supports concurrent host- and device-atomics.

Note

If two atomic operations are not mutually-ordered, and if their sets of memory locations overlap, then each **must** be synchronized against the other as if they were non-atomic operations.

Scoped Modification Order

For a given atomic write A, all atomic writes that are mutually-ordered with A occur in an order known as A's *scoped modification order*. A's scoped modification order relates no other operations.

Note

Invocations outside the instance of A's memory scope **may** observe the values at A's set of memory locations becoming visible to it in an order that disagrees with the scoped modification order.

Note

It is valid to have non-atomic operations or atomics in a different scope instance to the same set of memory locations, as long as they are synchronized against each other as if they were non-atomic (if they are not, it is treated as a [data race](#)). That means this definition of A's scoped modification order could include atomic operations that occur much later, after intervening non-atomics. That is a bit non-intuitive, but it helps to keep this definition simple and non-circular.

Memory Semantics

Non-atomic memory operations, by default, **may** be observed by one agent in a different order than they were written by another agent.

Atomics and some synchronization operations include *memory semantics*, which are flags that constrain the order in which other memory accesses (including non-atomic memory accesses and [availability and visibility operations](#)) performed by the same agent **can** be observed by other agents, or **can** observe accesses by other agents.

Device instructions that include semantics are [OpAtomic*](#), [OpControlBarrier](#), [OpMemoryBarrier](#), and [OpMemoryNamedBarrier](#). Host instructions that include semantics are some std::atomic methods and memory fences.

SPIR-V supports the following memory semantics:

- Relaxed: No constraints on order of other memory accesses.
- Acquire: A memory read with this semantic performs an *acquire operation*. A memory barrier with this semantic is an *acquire barrier*.
- Release: A memory write with this semantic performs a *release operation*. A memory barrier with this semantic is a *release barrier*.
- AcquireRelease: A memory read-modify-write operation with this semantic performs both an acquire operation and a release operation, and inherits the limitations on ordering from both of those operations. A memory barrier with this semantic is both a release and acquire barrier.

Note

SPIR-V does not support “consume” semantics on the device.

The memory semantics operand also includes *storage class semantics* which indicate which storage classes are constrained by the synchronization. SPIR-V storage class semantics include:

- UniformMemory
- WorkgroupMemory
- ImageMemory
- OutputMemory

Each SPIR-V memory operation accesses a single storage class. Semantics in synchronization operations can include a combination of storage classes.

The UniformMemory storage class semantic applies to accesses to memory in the PhysicalStorageBuffer, [ShaderRecordBufferKHR](#), Uniform and StorageBuffer storage classes. The WorkgroupMemory storage class semantic applies to accesses to memory in the Workgroup storage class. The ImageMemory storage class semantic applies to accesses to memory in the Image storage class. The OutputMemory storage class semantic applies to accesses to memory in the Output storage class.

Note

Informally, these constraints limit how memory operations can be reordered, and these limits apply not only to the order of accesses as performed in the agent that executes the instruction, but also to the order the effects of writes become visible to all other agents within the same instance of the instruction's memory scope.

Note

Release and acquire operations in different threads **can** act as synchronization operations, to guarantee that writes that happened before the release are visible after the acquire. (This is not a formal definition, just an Informative forward reference.)

Note

The OutputMemory storage class semantic is only useful in tessellation control shaders, which is the only execution model where output variables are shared between invocations.

The memory semantics operand **can** also include availability and visibility flags, which apply availability and visibility operations as described in [availability](#) and [visibility](#). The availability/visibility flags are:

- MakeAvailable: Semantics **must** be Release or AcquireRelease. Performs an availability operation before the release operation or barrier.
- MakeVisible: Semantics **must** be Acquire or AcquireRelease. Performs a visibility operation after the acquire operation or barrier.

The specifics of these operations are defined in [Availability and Visibility Semantics](#).

Host atomic operations **may** support a different list of memory semantics and synchronization operations, depending on the host architecture and source language.

Release Sequence

After an atomic operation A performs a release operation on a set of memory locations M, the *release sequence headed by A* is the longest continuous subsequence of A's scoped modification order that consists of:

- the atomic operation A as its first element
- atomic read-modify-write operations on M by any agent

Note

The atomics in the last bullet **must** be mutually-ordered with A by virtue of being in A's scoped modification order.

Note

This intentionally omits “atomic writes to M performed by the same agent that performed A”, which is present in the corresponding C++ definition.

Synchronizes-With

Synchronizes-with is a relation between operations, where each operation is either an atomic operation or a memory barrier (aka fence on the host).

If A and B are atomic operations, then A synchronizes-with B if and only if all of the following are true:

- A performs a release operation
- B performs an acquire operation
- A and B are mutually-ordered
- B reads a value written by A or by an operation in the release sequence headed by A

`OpControlBarrier`, `OpMemoryBarrier`, and `OpMemoryNamedBarrier` are *memory barrier* instructions in SPIR-V.

If A is a release barrier and B is an atomic operation that performs an acquire operation, then A synchronizes-with B if and only if all of the following are true:

- there exists an atomic write X (with any memory semantics)
- A is program-ordered before X
- X and B are mutually-ordered
- B reads a value written by X or by an operation in the release sequence headed by X
 - If X is relaxed, it is still considered to head a hypothetical release sequence for this rule
- A and B are in the instance of each other’s memory scopes
- X’s storage class is in A’s semantics.

If A is an atomic operation that performs a release operation and B is an acquire barrier, then A synchronizes-with B if and only if all of the following are true:

- there exists an atomic read X (with any memory semantics)
- X is program-ordered before B
- X and A are mutually-ordered
- X reads a value written by A or by an operation in the release sequence headed by A
- A and B are in the instance of each other’s memory scopes
- X’s storage class is in B’s semantics.

If A is a release barrier and B is an acquire barrier, then A synchronizes-with B if all of the following are true:

- there exists an atomic write X (with any memory semantics)
- A is program-ordered before X
- there exists an atomic read Y (with any memory semantics)
- Y is program-ordered before B
- X and Y are mutually-ordered
- Y reads the value written by X or by an operation in the release sequence headed by X
 - If X is relaxed, it is still considered to head a hypothetical release sequence for this rule
- A and B are in the instance of each other's memory scopes
- X's and Y's storage class is in A's and B's semantics.
 - NOTE: X and Y must have the same storage class, because they are mutually ordered.

If A is a release barrier, B is an acquire barrier, and C is a control barrier (where A **can** equal C, and B **can** equal C), then A synchronizes-with B if all of the following are true:

- A is program-ordered before (or equals) C
- C is program-ordered before (or equals) B
- A and B are in the instance of each other's memory scopes
- A and B are in the instance of C's execution scope

Note

This is similar to the barrier-barrier synchronization above, but with a control barrier filling the role of the relaxed atomics.

Let F be an ordering of fragment shader invocations, such that invocation F_1 is ordered before invocation F_2 if and only if F_1 and F_2 overlap as described in [Fragment Shader Interlock](#) and F_1 executes the interlocked code before F_2 .

If A is an `OpEndInvocationInterlockEXT` instruction and B is an `OpBeginInvocationInterlockEXT` instruction, then A synchronizes-with B if the agent that executes A is ordered before the agent that executes B in F. A and B are both considered to have [FragmentInterlock](#) memory scope and semantics of UniformMemory and ImageMemory, and A is considered to have Release semantics and B is considered to have Acquire semantics.

Note

`OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT` do not perform implicit availability or visibility operations. Usually, shaders using fragment shader interlock will declare the relevant resources as [coherent](#) to get implicit [per-instruction availability and visibility operations](#).

If A is a release barrier and B is an acquire barrier, then A synchronizes-with B if all of the following are true:

- A is shader-call-ordered-before B

- A and B are in the instance of each other's memory scopes

No other release and acquire barriers synchronize-with each other.

System-Synchronizes-With

System-synchronizes-with is a relation between arbitrary operations on the device or host. Certain operations system-synchronize-with each other, which informally means the first operation occurs before the second and that the synchronization is performed without using application-visible memory accesses.

If there is an [execution dependency](#) between two operations A and B, then the operation in the first synchronization scope system-synchronizes-with the operation in the second synchronization scope.

Note

This covers all Vulkan synchronization primitives, including device operations executing before a synchronization primitive is signaled, wait operations happening before subsequent device operations, signal operations happening before host operations that wait on them, and host operations happening before [vkQueueSubmit](#). The list is spread throughout the synchronization chapter, and is not repeated here.

System-synchronizes-with implicitly includes all storage class semantics and has [CrossDevice](#) scope.

If A system-synchronizes-with B, we also say A is *system-synchronized-before* B and B is *system-synchronized-after* A.

Private vs. Non-Private

By default, non-atomic memory operations are treated as *private*, meaning such a memory operation is not intended to be used for communication with other agents. Memory operations with the NonPrivatePointer/NonPrivateTexel bit set are treated as *non-private*, and are intended to be used for communication with other agents.

More precisely, for private memory operations to be [Location-Ordered](#) between distinct agents requires using system-synchronizes-with rather than shader-based synchronization. Non-private memory operations still obey program-order.

Atomic operations are always considered non-private.

Inter-Thread-Happens-Before

Let SC be a non-empty set of storage class semantics. Then (using template syntax) operation A *inter-thread-happens-before*<SC> operation B if and only if any of the following is true:

- A system-synchronizes-with B

- A synchronizes-with B, and both A and B have all of SC in their semantics
- A is an operation on memory in a storage class in SC or that has all of SC in its semantics, B is a release barrier or release atomic with all of SC in its semantics, and A is program-ordered before B
- A is an acquire barrier or acquire atomic with all of SC in its semantics, B is an operation on memory in a storage class in SC or that has all of SC in its semantics, and A is program-ordered before B
- A and B are both host operations and A inter-thread-happens-before B as defined in the host language specification
- A inter-thread-happens-before_{<SC>} some X and X inter-thread-happens-before_{<SC>} B

Happens-Before

Operation A *happens-before* operation B if and only if any of the following is true:

- A is program-ordered before B
- A inter-thread-happens-before_{<SC>} B for some set of storage classes SC

Happens-after is defined similarly.

Note

Unlike C++, happens-before is not always sufficient for a write to be visible to a read. Additional [availability and visibility](#) operations **may** be required for writes to be [visible-to](#) other memory accesses.

Note

Happens-before is not transitive, but each of program-order and inter-thread-happens-before_{<SC>} are transitive. These can be thought of as covering the “single-threaded” case and the “multi-threaded” case, and it is not necessary (and not valid) to form chains between the two.

Availability and Visibility

Availability and *visibility* are states of a write operation, which (informally) track how far the write has permeated the system, i.e. which agents and references are able to observe the write. Availability state is per *memory domain*. Visibility state is per (agent,reference) pair. Availability and visibility states are per-memory location for each write.

Memory domains are named according to the agents whose memory accesses use the domain. Domains used by shader invocations are organized hierarchically into multiple smaller memory domains which correspond to the different [scopes](#). Each memory domain is considered the *dual* of a scope, and vice versa. The memory domains defined in Vulkan include:

- *host* - accessible by host agents
- *device* - accessible by all device agents for a particular device

- *shader* - accessible by shader agents for a particular device, corresponding to the [Device](#) scope
- *queue family instance* - accessible by shader agents in a single queue family, corresponding to the [QueueFamily](#) scope.
- *fragment interlock instance* - accessible by fragment shader agents that [overlap](#), corresponding to the [FragmentInterlock](#) scope.
- *shader call instance* - accessible by shader agents that are [shader-call-related](#), corresponding to the [ShaderCallKHR](#) scope.
- *workgroup instance* - accessible by shader agents in the same workgroup, corresponding to the [Workgroup](#) scope.
- *subgroup instance* - accessible by shader agents in the same subgroup, corresponding to the [Subgroup](#) scope.

The memory domains are nested in the order listed above, except for shader call instance domain, with memory domains later in the list nested in the domains earlier in the list. The shader call instance domain is at an implementation-dependent location in the list, and is nested according to that location. The shader call instance domain is not broader than the queue family instance domain.

Note

Memory domains do not correspond to storage classes or device-local and host-local [VkDeviceMemory](#) allocations, rather they indicate whether a write can be made visible only to agents in the same subgroup, same workgroup, overlapping fragment shader invocation, shader-call-related ray tracing invocation, in any shader invocation, or anywhere on the device, or host. The shader, queue family instance, fragment interlock instance, shader call instance, workgroup instance, and subgroup instance domains are only used for shader-based availability/visibility operations, in other cases writes can be made available from/visible to the shader via the device domain.

Availability operations, *visibility operations*, and *memory domain operations* alter the state of the write operations that happen-before them, and which are included in their *source scope* to be available or visible to their *destination scope*.

- For an availability operation, the source scope is a set of (agent,reference,memory location) tuples, and the destination scope is a set of memory domains.
- For a memory domain operation, the source scope is a memory domain and the destination scope is a memory domain.
- For a visibility operation, the source scope is a set of memory domains and the destination scope is a set of (agent,reference,memory location) tuples.

How the scopes are determined depends on the specific operation. Availability and memory domain operations expand the set of memory domains to which the write is available. Visibility operations expand the set of (agent,reference,memory location) tuples to which the write is visible.

Recall that availability and visibility states are per-memory location, and let W be a write operation to one or more locations performed by agent A via reference R. Let L be one of the locations

written. (W,L) (the write W to L), is initially not available to any memory domain and only visible to (A,R,L). An availability operation AV that happens-after W and that includes (A,R,L) in its source scope makes (W,L) *available* to the memory domains in its destination scope.

A memory domain operation DOM that happens-after AV and for which (W,L) is available in the source scope makes (W,L) available in the destination memory domain.

A visibility operation VIS that happens-after AV (or DOM) and for which (W,L) is available in any domain in the source scope makes (W,L) *visible* to all (agent,reference,L) tuples included in its destination scope.

If write W_2 happens-after W, and their sets of memory locations overlap, then W will not be available/visible to all agents/references for those memory locations that overlap (and future AV/DOM/VIS ops cannot revive W's write to those locations).

Availability, memory domain, and visibility operations are treated like other non-atomic memory accesses for the purpose of [memory semantics](#), meaning they can be ordered by release-acquire sequences or memory barriers.

An *availability chain* is a sequence of availability operations to increasingly broad memory domains, where element N+1 of the chain is performed in the dual scope instance of the destination memory domain of element N and element N happens-before element N+1. An example is an availability operation with destination scope of the workgroup instance domain that happens-before an availability operation to the shader domain performed by an invocation in the same workgroup. An availability chain AVC that happens-after W and that includes (A,R,L) in the source scope makes (W,L) *available* to the memory domains in its final destination scope. An availability chain with a single element is just the availability operation.

Similarly, a *visibility chain* is a sequence of visibility operations from increasingly narrow memory domains, where element N of the chain is performed in the dual scope instance of the source memory domain of element N+1 and element N happens-before element N+1. An example is a visibility operation with source scope of the shader domain that happens-before a visibility operation with source scope of the workgroup instance domain performed by an invocation in the same workgroup. A visibility chain VISC that happens-after AVC (or DOM) and for which (W,L) is available in any domain in the source scope makes (W,L) *visible* to all (agent,reference,L) tuples included in its final destination scope. A visibility chain with a single element is just the visibility operation.

Availability, Visibility, and Domain Operations

The following operations generate availability, visibility, and domain operations. When multiple availability/visibility/domain operations are described, they are system-synchronized-with each other in the order listed.

An operation that performs a [memory dependency](#) generates:

- If the source access mask includes `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from host domain to device domain.
- An availability operation with source scope of all writes in the first [access scope](#) of the

dependency and a destination scope of the device domain.

- A visibility operation with source scope of the device domain and destination scope of the second access scope of the dependency.
- If the destination access mask includes `VK_ACCESS_HOST_READ_BIT` or `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from device domain to host domain.

`vkFlushMappedMemoryRanges` performs an availability operation, with a source scope of (agents,references) = (all host threads, all mapped memory ranges passed to the command), and destination scope of the host domain.

`vkInvalidateMappedMemoryRanges` performs a visibility operation, with a source scope of the host domain and a destination scope of (agents,references) = (all host threads, all mapped memory ranges passed to the command).

`vkQueueSubmit` performs a memory domain operation from host to device, and a visibility operation with source scope of the device domain and destination scope of all agents and references on the device.

Availability and Visibility Semantics

A memory barrier or atomic operation via agent A that includes `MakeAvailable` in its semantics performs an availability operation whose source scope includes agent A and all references in the storage classes in that instruction's storage class semantics, and all memory locations, and whose destination scope is a set of memory domains selected as specified below. The implicit availability operation is program-ordered between the barrier or atomic and all other operations program-ordered before the barrier or atomic.

A memory barrier or atomic operation via agent A that includes `MakeVisible` in its semantics performs a visibility operation whose source scope is a set of memory domains selected as specified below, and whose destination scope includes agent A and all references in the storage classes in that instruction's storage class semantics, and all memory locations. The implicit visibility operation is program-ordered between the barrier or atomic and all other operations program-ordered after the barrier or atomic.

The memory domains are selected based on the memory scope of the instruction as follows:

- `Device` scope uses the shader domain
- `QueueFamily` scope uses the queue family instance domain
- `FragmentInterlock` scope uses the fragment interlock instance domain
- `ShaderCallKHR` scope uses the shader call instance domain
- `Workgroup` scope uses the workgroup instance domain
- `Subgroup` uses the subgroup instance domain
- `Invocation` perform no availability/visibility operations.

When an availability operation performed by an agent A includes a memory domain D in its destination scope, where D corresponds to scope instance S, it also includes the memory domains

that correspond to each smaller scope instance S' that is a subset of S and that includes A . Similarly for visibility operations.

Per-Instruction Availability and Visibility Semantics

A memory write instruction that includes MakePointerAvailable, or an image write instruction that includes MakeTexelAvailable, performs an availability operation whose source scope includes the agent and reference used to perform the write and the memory locations written by the instruction, and whose destination scope is a set of memory domains selected by the Scope operand specified in [Availability and Visibility Semantics](#). The implicit availability operation is program-ordered between the write and all other operations program-ordered after the write.

A memory read instruction that includes MakePointerVisible, or an image read instruction that includes MakeTexelVisible, performs a visibility operation whose source scope is a set of memory domains selected by the Scope operand as specified in [Availability and Visibility Semantics](#), and whose destination scope includes the agent and reference used to perform the read and the memory locations read by the instruction. The implicit visibility operation is program-ordered between read and all other operations program-ordered before the read.

Note

Although reads with per-instruction visibility only perform visibility ops from the shader or fragment interlock instance or shader call instance or workgroup instance or subgroup instance domain, they will also see writes that were made visible via the device domain, i.e. those writes previously performed by non-shader agents and made visible via API commands.

Note

It is expected that all invocations in a subgroup execute on the same processor with the same path to memory, and thus availability and visibility operations with subgroup scope can be expected to be “free”.

Location-Ordered

Let X and Y be memory accesses to overlapping sets of memory locations M , where $X \neq Y$. Let (A_X, R_X) be the agent and reference used for X , and (A_Y, R_Y) be the agent and reference used for Y . For now, let “ \rightarrow ” denote happens-before and “ \rightarrow^{rpo} ” denote the reflexive closure of program-ordered before.

If D_1 and D_2 are different memory domains, then let $\text{DOM}(D_1, D_2)$ be a memory domain operation from D_1 to D_2 . Otherwise, let $\text{DOM}(D, D)$ be a placeholder such that $X \rightarrow \text{DOM}(D, D) \rightarrow Y$ if and only if $X \rightarrow Y$.

X is *location-ordered* before Y for a location L in M if and only if any of the following is true:

- $A_X == A_Y$ and $R_X == R_Y$ and $X \rightarrow Y$
 - NOTE: this case means no availability/visibility ops are required when it is the same (agent,reference).

- X is a read, both X and Y are non-private, and $X \rightarrow Y$
- X is a read, and X (transitively) system-synchronizes with Y
- If $R_X == R_Y$ and A_X and A_Y access a common memory domain D (e.g. are in the same workgroup instance if D is the workgroup instance domain), and both X and Y are non-private:
 - X is a write, Y is a write, $AVC(A_X, R_X, D, L)$ is an availability chain making (X, L) available to domain D, and $X \xrightarrow{\text{rcpo}} AVC(A_X, R_X, D, L) \rightarrow Y$
 - X is a write, Y is a read, $AVC(A_X, R_X, D, L)$ is an availability chain making (X, L) available to domain D, $VISC(A_Y, R_Y, D, L)$ is a visibility chain making writes to L available in domain D visible to Y, and $X \xrightarrow{\text{rcpo}} AVC(A_X, R_X, D, L) \rightarrow VISC(A_Y, R_Y, D, L) \xrightarrow{\text{rcpo}} Y$
 - If [VkPhysicalDeviceVulkanMemoryModelFeatures](#)
`::vulkanMemoryModelAvailabilityVisibilityChains` is `VK_FALSE`, then AVC and VISC **must** each only have a single element in the chain, in each sub-bullet above.
- Let D_X and D_Y each be either the device domain or the host domain, depending on whether A_X and A_Y execute on the device or host:
 - X is a write and Y is a write, and $X \rightarrow AV(A_X, R_X, D_X, L) \rightarrow DOM(D_X, D_Y) \rightarrow Y$
 - X is a write and Y is a read, and $X \rightarrow AV(A_X, R_X, D_X, L) \rightarrow DOM(D_X, D_Y) \rightarrow VIS(A_Y, R_Y, D_Y, L) \rightarrow Y$

Note

The final bullet (synchronization through device/host domain) requires API-level synchronization operations, since the device/host domains are not accessible via shader instructions. And “device domain” is not to be confused with “device scope”, which synchronizes through the “shader domain”.

Data Race

Let X and Y be operations that access overlapping sets of memory locations M, where $X != Y$, and at least one of X and Y is a write, and X and Y are not mutually-ordered atomic operations. If there does not exist a location-ordered relation between X and Y for each location in M, then there is a *data race*.

Applications **must** ensure that no data races occur during the execution of their application.

Note

Data races can only occur due to instructions that are actually executed. For example, an instruction skipped due to control flow must not contribute to a data race.

Visible-To

Let X be a write and Y be a read whose sets of memory locations overlap, and let M be the set of memory locations that overlap. Let M_2 be a non-empty subset of M. Then X is *visible-to* Y for memory locations M_2 if and only if all of the following are true:

- X is location-ordered before Y for each location L in M_2 .
- There does not exist another write Z to any location L in M_2 such that X is location-ordered before Z for location L and Z is location-ordered before Y for location L.

If X is visible-to Y, then Y reads the value written by X for locations M_2 .

Note

It is possible for there to be a write between X and Y that overwrites a subset of the memory locations, but the remaining memory locations (M_2) will still be visible-to Y.

Acyclicity

Reads-from is a relation between operations, where the first operation is a write, the second operation is a read, and the second operation reads the value written by the first operation. *From-reads* is a relation between operations, where the first operation is a read, the second operation is a write, and the first operation reads a value written earlier than the second operation in the second operation's scoped modification order (or the first operation reads from the initial value, and the second operation is any write to the same locations).

Then the implementation **must** guarantee that no cycles exist in the union of the following relations:

- location-ordered
- scoped modification order (over all atomic writes)
- reads-from
- from-reads

Note

This is a “consistency” axiom, which informally guarantees that sequences of operations cannot violate causality.

Scoped Modification Order Coherence

Let A and B be mutually-ordered atomic operations, where A is location-ordered before B. Then the following rules are a consequence of acyclicity:

- If A and B are both reads and A does not read the initial value, then the write that A takes its value from **must** be earlier in its own scoped modification order than (or the same as) the write that B takes its value from (no cycles between location-order, reads-from, and from-reads).
- If A is a read and B is a write and A does not read the initial value, then A **must** take its value from a write earlier than B in B's scoped modification order (no cycles between location-order, scope modification order, and reads-from).
- If A is a write and B is a read, then B **must** take its value from A or a write later than A in A's scoped modification order (no cycles between location-order, scoped modification order, and

from-reads).

- If A and B are both writes, then A **must** be earlier than B in A's scoped modification order (no cycles between location-order and scoped modification order).
- If A is a write and B is a read-modify-write and B reads the value written by A, then B comes immediately after A in A's scoped modification order (no cycles between scoped modification order and from-reads).

Shader I/O

If a shader invocation A in a shader stage other than `Vertex` performs a memory read operation X from an object in storage class `CallableDataKHR`, `IncomingCallableDataKHR`, `RayPayloadKHR`, `HitAttributeKHR`, `IncomingRayPayloadKHR`, or `Input`, then X is system-synchronized-after all writes to the corresponding `CallableDataKHR`, `IncomingCallableDataKHR`, `RayPayloadKHR`, `HitAttributeKHR`, `IncomingRayPayloadKHR`, or `Output` storage variable(s) in the shader invocation(s) that contribute to generating invocation A, and those writes are all visible-to X.

Note

It is not necessary for the upstream shader invocations to have completed execution, they only need to have generated the output that is being read.

Deallocation

A call to `vkFreeMemory` **must** happen-after all memory operations on all memory locations in that `VkDeviceMemory` object.

Note

Normally, device memory operations in a given queue are synchronized with `vkFreeMemory` by having a host thread wait on a fence signalled by that queue, and the wait happens-before the call to `vkFreeMemory` on the host.

The deallocation of SPIR-V variables is managed by the system and happens-after all operations on those variables.

Descriptions (Informative)

This subsection offers more easily understandable consequences of the memory model for app/compiler developers.

Let SC be the storage class(es) specified by a release or acquire operation or barrier.

- An atomic write with release semantics must not be reordered against any read or write to SC that is program-ordered before it (regardless of the storage class the atomic is in).
- An atomic read with acquire semantics must not be reordered against any read or write to SC that is program-ordered after it (regardless of the storage class the atomic is in).
- Any write to SC program-ordered after a release barrier must not be reordered against any read

or write to SC program-ordered before that barrier.

- Any read from SC program-ordered before an acquire barrier must not be reordered against any read or write to SC program-ordered after the barrier.

A control barrier (even if it has no memory semantics) must not be reordered against any memory barriers.

This memory model allows memory accesses with and without availability and visibility operations, as well as atomic operations, all to be performed on the same memory location. This is critical to allow it to reason about memory that is reused in multiple ways, e.g. across the lifetime of different shader invocations or draw calls. While GLSL (and legacy SPIR-V) applies the “coherent” decoration to variables (for historical reasons), this model treats each memory access instruction as having optional implicit availability/visibility operations. GLSL to SPIR-V compilers should map all (non-atomic) operations on a coherent variable to `Make{Pointer, Texel}{Available}{Visible}` flags in this model.

Atomic operations implicitly have availability/visibility operations, and the scope of those operations is taken from the atomic operation’s scope.

Tessellation Output Ordering

For SPIR-V that uses the Vulkan Memory Model, the `OutputMemory` storage class is used to synchronize accesses to tessellation control output variables. For legacy SPIR-V that does not enable the Vulkan Memory Model via `OpMemoryModel`, tessellation outputs can be ordered using a control barrier with no particular memory scope or semantics, as defined below.

Let X and Y be memory operations performed by shader invocations A_X and A_Y . Operation X is *tessellation-output-ordered* before operation Y if and only if all of the following are true:

- There is a dynamic instance of an `OpControlBarrier` instruction C such that X is program-ordered before C in A_X and C is program-ordered before Y in A_Y .
- A_X and A_Y are in the same instance of C ’s execution scope.

If shader invocations A_X and A_Y in the `TessellationControl` execution model execute memory operations X and Y , respectively, on the `Output` storage class, and X is tessellation-output-ordered before Y with a scope of `Workgroup`, then X is location-ordered before Y , and if X is a write and Y is a read then X is visible-to Y .

Cooperative Matrix Memory Access

For each dynamic instance of a cooperative matrix load or store instruction (`OpCooperativeMatrixLoadNV` or `OpCooperativeMatrixStoreNV`), a single implementation-dependent invocation within the instance of the matrix’s scope performs a non-atomic load or store (respectively) to each memory location that is defined to be accessed by the instruction.

Appendix C: Compressed Image Formats

The compressed texture formats used by Vulkan are described in the specifically identified sections of the [Khronos Data Format Specification](#), version 1.3.

Unless otherwise described, the quantities encoded in these compressed formats are treated as normalized, unsigned values.

Those formats listed as sRGB-encoded have in-memory representations of R, G and B components which are nonlinearly-encoded as R', G', and B'; any alpha component is unchanged. As part of filtering, the nonlinear R', G', and B' values are converted to linear R, G, and B components; any alpha component is unchanged. The conversion between linear and nonlinear encoding is performed as described in the “KHR_DF_TRANSFER_SRGB” section of the Khronos Data Format Specification.

Block-Compressed Image Formats

BC1, BC2 and BC3 formats are described in “S3TC Compressed Texture Image Formats” chapter of the [Khronos Data Format Specification](#). BC4 and BC5 are described in the “RGTC Compressed Texture Image Formats” chapter. BC6H and BC7 are described in the “BPTC Compressed Texture Image Formats” chapter.

Table 87. Mapping of Vulkan BC formats to descriptions

VkFormat	Khronos Data Format Specification description
Formats described in the “S3TC Compressed Texture Image Formats” chapter	
VK_FORMAT_BC1_RGB_UNORM_BLOCK	BC1 with no alpha
VK_FORMAT_BC1_RGB_SRGB_BLOCK	BC1 with no alpha, sRGB-encoded
VK_FORMAT_BC1_RGBA_UNORM_BLOCK	BC1 with alpha
VK_FORMAT_BC1_RGBA_SRGB_BLOCK	BC1 with alpha, sRGB-encoded
VK_FORMAT_BC2_UNORM_BLOCK	BC2
VK_FORMAT_BC2_SRGB_BLOCK	BC2, sRGB-encoded
VK_FORMAT_BC3_UNORM_BLOCK	BC3
VK_FORMAT_BC3_SRGB_BLOCK	BC3, sRGB-encoded
Formats described in the “RGTC Compressed Texture Image Formats” chapter	
VK_FORMAT_BC4_UNORM_BLOCK	BC4 unsigned
VK_FORMAT_BC4_SNORM_BLOCK	BC4 signed
VK_FORMAT_BC5_UNORM_BLOCK	BC5 unsigned
VK_FORMAT_BC5_SNORM_BLOCK	BC5 signed
Formats described in the “BPTC Compressed Texture Image Formats” chapter	
VK_FORMAT_BC6H_UFLOAT_BLOCK	BC6H (unsigned version)
VK_FORMAT_BC6H_SFLOAT_BLOCK	BC6H (signed version)
VK_FORMAT_BC7_UNORM_BLOCK	BC7
VK_FORMAT_BC7_SRGB_BLOCK	BC7, sRGB-encoded

ETC Compressed Image Formats

The following formats are described in the “ETC2 Compressed Texture Image Formats” chapter of the [Khronos Data Format Specification](#).

Table 88. Mapping of Vulkan ETC formats to descriptions

VkFormat	Khronos Data Format Specification description
VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK	RGB ETC2

ASTC Compressed Image Formats

ASTC formats are described in the “ASTC Compressed Texture Image Formats” chapter of the [Khronos Data Format Specification](#).

Table 89. Mapping of Vulkan ASTC formats to descriptions

VkFormat	Compressed texel block dimensions	Requested mode
VK_FORMAT_ASTC_4x4_UNORM_BLOCK	4×4	Linear LDR
VK_FORMAT_ASTC_4x4_SRGB_BLOCK	4×4	sRGB
VK_FORMAT_ASTC_5x4_UNORM_BLOCK	5×4	Linear LDR
VK_FORMAT_ASTC_5x4_SRGB_BLOCK	5×4	sRGB
VK_FORMAT_ASTC_5x5_UNORM_BLOCK	5×5	Linear LDR
VK_FORMAT_ASTC_5x5_SRGB_BLOCK	5×5	sRGB
VK_FORMAT_ASTC_6x5_UNORM_BLOCK	6×5	Linear LDR
VK_FORMAT_ASTC_6x5_SRGB_BLOCK	6×5	sRGB
VK_FORMAT_ASTC_6x6_UNORM_BLOCK	6×6	Linear LDR
VK_FORMAT_ASTC_6x6_SRGB_BLOCK	6×6	sRGB
VK_FORMAT_ASTC_8x5_UNORM_BLOCK	8×5	Linear LDR
VK_FORMAT_ASTC_8x5_SRGB_BLOCK	8×5	sRGB
VK_FORMAT_ASTC_8x6_UNORM_BLOCK	8×6	Linear LDR
VK_FORMAT_ASTC_8x6_SRGB_BLOCK	8×6	sRGB
VK_FORMAT_ASTC_8x8_UNORM_BLOCK	8×8	Linear LDR
VK_FORMAT_ASTC_8x8_SRGB_BLOCK	8×8	sRGB
VK_FORMAT_ASTC_10x5_UNORM_BLOCK	10×5	Linear LDR
VK_FORMAT_ASTC_10x5_SRGB_BLOCK	10×5	sRGB
VK_FORMAT_ASTC_10x6_UNORM_BLOCK	10×6	Linear LDR
VK_FORMAT_ASTC_10x6_SRGB_BLOCK	10×6	sRGB
VK_FORMAT_ASTC_10x8_UNORM_BLOCK	10×8	Linear LDR
VK_FORMAT_ASTC_10x8_SRGB_BLOCK	10×8	sRGB
VK_FORMAT_ASTC_10x10_UNORM_BLOCK	10×10	Linear LDR
VK_FORMAT_ASTC_10x10_SRGB_BLOCK	10×10	sRGB
VK_FORMAT_ASTC_12x10_UNORM_BLOCK	12×10	Linear LDR
VK_FORMAT_ASTC_12x10_SRGB_BLOCK	12×10	sRGB
VK_FORMAT_ASTC_12x12_UNORM_BLOCK	12×12	Linear LDR

VkFormat	Compressed texel block dimensions	Requested mode
VK_FORMAT_ASTC_12x12_SRGB_BLOCK	12×12	sRGB
VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK	4×4	HDR
VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK	5×4	HDR
VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK	5×5	HDR
VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK	6×5	HDR
VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK	6×6	HDR
VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK	8×5	HDR
VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK	8×6	HDR
VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK	8×8	HDR
VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK	10×5	HDR
VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK	10×6	HDR
VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK	10×8	HDR
VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK	10×10	HDR
VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK	12×10	HDR
VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK	12×12	HDR

ASTC textures containing HDR block encodings **should** be passed to the API using an ASTC SFLOAT texture format.

Note

An HDR block in a texture passed using a LDR UNORM format will return the appropriate ASTC error color if the implementation supports only the ASTC LDR profile, but may result in either the error color or a decompressed HDR color if the implementation supports HDR decoding.

ASTC decode mode

If the `VK_EXT_astc_decode_mode` extension is enabled, the decode mode is determined as follows:

Table 90. Mapping of Vulkan ASTC decoding format to ASTC decoding modes

VkFormat	Decoding mode
VK_FORMAT_R16G16B16A16_SFLOAT	decode_float16
VK_FORMAT_R8G8B8A8_UNORM	decode_unorm8
VK_FORMAT_E5B9G9R9_UFLOAT_PACK32	decode_rgb9e5

Otherwise, the ASTC decode mode is decode_float16.

Note that an implementation **may** use HDR mode when linear LDR mode is requested unless the decode mode is decode_unorm8.

PVRTC Compressed Image Formats

PVRTC formats are described in the “PVRTC Compressed Texture Image Formats” chapter of the [Khronos Data Format Specification](#).

Table 91. Mapping of Vulkan PVRTC formats to descriptions

VkFormat	Compressed texel block dimensions	sRGB-encoded
VK_FORMAT_PVRTC1_2BPP_UNORM_BLOCK_IMG	8×4	No
VK_FORMAT_PVRTC1_4BPP_UNORM_BLOCK_IMG	4×4	No
VK_FORMAT_PVRTC2_2BPP_UNORM_BLOCK_IMG	8×4	No
VK_FORMAT_PVRTC2_4BPP_UNORM_BLOCK_IMG	4×4	No
VK_FORMAT_PVRTC1_2BPP_SRGB_BLOCK_IMG	8×4	Yes
VK_FORMAT_PVRTC1_4BPP_SRGB_BLOCK_IMG	4×4	Yes
VK_FORMAT_PVRTC2_2BPP_SRGB_BLOCK_IMG	8×4	Yes
VK_FORMAT_PVRTC2_4BPP_SRGB_BLOCK_IMG	4×4	Yes

Appendix D: Core Revisions (Informative)

New minor versions of the Vulkan API are defined periodically by the Khronos Vulkan Working Group. These consist of some amount of additional functionality added to the core API, potentially including both new functionality and functionality [promoted](#) from extensions.

It is possible to build the specification for earlier versions, but to aid readability of the latest versions, this appendix gives an overview of the changes as compared to earlier versions.

Version 1.3

Vulkan Version 1.3 [promoted](#) a number of key extensions into the core API:

- [VK_KHR_copy_commands2](#)
- [VK_KHR_dynamic_rendering](#)
- [VK_KHR_format_feature_flags2](#)
- [VK_KHR_maintenance4](#)
- [VK_KHR_shader_integer_dot_product](#)
- [VK_KHR_shader_non_semantic_info](#)
- [VK_KHR_shader_terminate_invocation](#)
- [VK_KHR_synchronization2](#)
- [VK_KHR_zero_initialize_workgroup_memory](#)
- [VK_EXT_4444_formats](#)
- [VK_EXT_extended_dynamic_state](#)
- [VK_EXT_extended_dynamic_state2](#)
- [VK_EXT_image_robustness](#)
- [VK_EXT_inline_uniform_block](#)
- [VK_EXT_pipeline_creation_cache_control](#)
- [VK_EXT_pipeline_creation_feedback](#)
- [VK_EXT_private_data](#)
- [VK_EXT_shader_demote_to_helper_invocation](#)
- [VK_EXT_subgroup_size_control](#)
- [VK_EXT_texel_buffer_alignment](#)
- [VK_EXT_texture_compression_astc_hdr](#)
- [VK_EXT_tooling_info](#)
- [VK_EXT_ycbcr_2plane_444_formats](#)

All differences in behavior between these extensions and the corresponding Vulkan 1.3 functionality are summarized below.

Differences relative to `VK_EXT_4444_formats`

If the `VK_EXT_4444_formats` extension is not supported, support for all formats defined by it are optional in Vulkan 1.3. There are no members in the `VkPhysicalDeviceVulkan13Features` structure corresponding to the `VkPhysicalDevice4444FormatsFeaturesEXT` structure.

Differences relative to `VK_EXT_extended_dynamic_state`

All dynamic state enumerants and entry points defined by `VK_EXT_extended_dynamic_state` are required in Vulkan 1.3. There are no members in the `VkPhysicalDeviceVulkan13Features` structure corresponding to the `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` structure.

Differences relative to `VK_EXT_extended_dynamic_state2`

The optional dynamic state enumerants and entry points defined by `VK_EXT_extended_dynamic_state2` for patch control points and logic op are not promoted in Vulkan 1.3. There are no members in the `VkPhysicalDeviceVulkan13Features` structure corresponding to the `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT` structure.

Differences relative to `VK_EXT_texel_buffer_alignment`

The more specific alignment requirements defined by `VkPhysicalDeviceTexelBufferAlignmentProperties` are required in Vulkan 1.3. There are no members in the `VkPhysicalDeviceVulkan13Features` structure corresponding to the `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` structure.

Differences relative to `VK_EXT_texture_compression_astc_hdr`

If the `VK_EXT_texture_compression_astc_hdr` extension is not supported, support for all formats defined by it are optional in Vulkan 1.3. The `textureCompressionASTC_HDR` member of `VkPhysicalDeviceVulkan13Features` indicates whether a Vulkan 1.3 implementation supports these formats.

Differences relative to `VK_EXT_ycbcr_2plane_444_formats`

If the `VK_EXT_ycbcr_2plane_444_formats` extension is not supported, support for all formats defined by it are optional in Vulkan 1.3. There are no members in the `VkPhysicalDeviceVulkan13Features` structure corresponding to the `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure.

Additional Vulkan 1.3 Feature Support

In addition to the promoted extensions described above, Vulkan 1.3 added required support for:

- SPIR-V version 1.6
 - SPIR-V 1.6 deprecates (but does not remove) the `WorkgroupSize` decoration.

- The `bufferDeviceAddress` feature which indicates support for accessing memory in shaders as storage buffers via `vkGetBufferDeviceAddress`.
- The `vulkanMemoryModel`, `vulkanMemoryModelDeviceScope`, and `vulkanMemoryModelAvailabilityVisibilityChains` features, which indicate support for the corresponding Vulkan Memory Model capabilities.
- The `maxInlineUniformTotalSize` limit is added to provide the total size of all inline uniform block bindings in a pipeline layout.

Version 1.2

Vulkan Version 1.2 [promoted](#) a number of key extensions into the core API:

- VK_KHR_8bit_storage
- VK_KHR_buffer_device_address
- VK_KHR_create_renderpass2
- VK_KHR_depth_stencil_resolve
- VK_KHR_draw_indirect_count
- VK_KHR_driver_properties
- VK_KHR_image_format_list
- VK_KHR_imageless_framebuffer
- VK_KHR_sampler_mirror_clamp_to_edge
- VK_KHR_separate_depth_stencil_layouts
- VK_KHR_shader_atomic_int64
- VK_KHR_shader_float16_int8
- VK_KHR_shader_float_controls
- VK_KHR_shader_subgroup_extended_types
- VK_KHR_spirv_1_4
- VK_KHR_timeline_semaphore
- VK_KHR_uniform_buffer_standard_layout
- VK_KHR_vulkan_memory_model

- `VK_EXT_descriptor_indexing`
- `VK_EXT_host_query_reset`
- `VK_EXT_sampler_filter_minmax`
- `VK_EXT_scalar_block_layout`
- `VK_EXT_separate_stencil_usage`
- `VK_EXT_shader_viewport_index_layer`

All differences in behavior between these extensions and the corresponding Vulkan 1.2 functionality are summarized below.

Differences relative to `VK_KHR_8bit_storage`

If the `VK_KHR_8bit_storage` extension is not supported, support for the SPIR-V `StorageBuffer8BitAccess` capability in shader modules is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::storageBuffer8BitAccess` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_KHR_draw_indirect_count`

If the `VK_KHR_draw_indirect_count` extension is not supported, support for the entry points `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::drawIndirectCount` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_KHR_sampler_mirror_clamp_to_edge`

If the `VK_KHR_sampler_mirror_clamp_to_edge` extension is not supported, support for the `VkSamplerAddressMode VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_EXT_descriptor_indexing`

If the `VK_EXT_descriptor_indexing` extension is not supported, support for the `descriptorIndexing` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features ::descriptorIndexing` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_EXT_scalar_block_layout`

If the `VK_EXT_scalar_block_layout` extension is not supported, support for the `scalarBlockLayout` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features ::scalarBlockLayout` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_EXT_shader_viewport_index_layer`

If the `VK_EXT_shader_viewport_index_layer` extension is not supported, support for the

`ShaderViewportIndexLayerEXT` SPIR-V capability is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::shaderOutputViewportIndex` and `VkPhysicalDeviceVulkan12Features::shaderOutputLayer` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_KHR_buffer_device_address`

If the `VK_KHR_buffer_device_address` extension is not supported, support for the `bufferDeviceAddress` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::bufferDeviceAddress` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_KHR_shader_atomic_int64`

If the `VK_KHR_shader_atomic_int64` extension is not supported, support for the `shaderBufferInt64Atomics` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::shaderBufferInt64Atomics` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_KHR_shader_float16_int8`

If the `VK_KHR_shader_float16_int8` extension is not supported, support for the `shaderFloat16` and `shaderInt8` features is optional. Support for these features are defined by `VkPhysicalDeviceVulkan12Features::shaderFloat16` and `VkPhysicalDeviceVulkan12Features::shaderInt8` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_KHR_vulkan_memory_model`

If the `VK_KHR_vulkan_memory_model` extension is not supported, support for the `vulkanMemoryModel` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVulkan12Features::vulkanMemoryModel` when queried via `vkGetPhysicalDeviceFeatures2`.

Additional Vulkan 1.2 Feature Support

In addition to the promoted extensions described above, Vulkan 1.2 added support for:

- SPIR-V version 1.4.
- SPIR-V version 1.5.
- The `samplerMirrorClampToEdge` feature which indicates whether the implementation supports the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode.
- The `ShaderNonUniform` capability in SPIR-V version 1.5.
- The `shaderOutputViewportIndex` feature which indicates that the `ShaderViewportIndex` capability can be used.
- The `shaderOutputLayer` feature which indicates that the `ShaderLayer` capability can be used.
- The `subgroupBroadcastDynamicId` feature which allows the “`Id`” operand of `OpGroupNonUniformBroadcast` to be dynamically uniform within a subgroup, and the “`Index`”

operand of `OpGroupNonUniformQuadBroadcast` to be dynamically uniform within a derivative group, in shader modules of version 1.5 or higher.

- The `drawIndirectCount` feature which indicates whether the `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` functions can be used.
- The `descriptorIndexing` feature which indicates the implementation supports the minimum number of descriptor indexing features as defined in the [Feature Requirements](#) section.
- The `samplerFilterMinmax` feature which indicates whether the implementation supports the minimum number of image formats that support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT` feature bit as defined by the `filterMinmaxSingleComponentFormats` property minimum requirements.
- The `framebufferIntegerColorSampleCounts` limit which indicates the color sample counts that are supported for all framebuffer color attachments with integer formats.

Version 1.1

Vulkan Version 1.1 [promoted](#) a number of key extensions into the core API:

- [VK_KHR_16bit_storage](#)
- [VK_KHR_bind_memory2](#)
- [VK_KHR_dedicated_allocation](#)
- [VK_KHR_descriptor_update_template](#)
- [VK_KHR_device_group](#)
- [VK_KHR_device_group_creation](#)
- [VK_KHR_external_fence](#)
- [VK_KHR_external_fence_capabilities](#)
- [VK_KHR_external_memory](#)
- [VK_KHR_external_memory_capabilities](#)
- [VK_KHR_external_semaphore](#)
- [VK_KHR_external_semaphore_capabilities](#)

- `VK_KHR_get_memory_requirements2`
- `VK_KHR_get_physical_device_properties2`
- `VK_KHR_maintenance1`
- `VK_KHR_maintenance2`
- `VK_KHR_maintenance3`
- `VK_KHR_multiview`
- `VK_KHR_relaxed_block_layout`
- `VK_KHR_sampler_ycbcr_conversion`
- `VK_KHR_shader_draw_parameters`
- `VK_KHR_storage_buffer_storage_class`
- `VK_KHR_variable_pointers`

All differences in behavior between these extensions and the corresponding Vulkan 1.1 functionality are summarized below.

Differences relative to `VK_KHR_16bit_storage`

If the `VK_KHR_16bit_storage` extension is not supported, support for the `storageBuffer16BitAccess` feature is optional. Support for this feature is defined by `VkPhysicalDevice16BitStorageFeatures::storageBuffer16BitAccess` or `VkPhysicalDeviceVulkan11Features::storageBuffer16BitAccess` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_KHR_sampler_ycbcr_conversion`

If the `VK_KHR_sampler_ycbcr_conversion` extension is not supported, support for the `samplerYcbcrConversion` feature is optional. Support for this feature is defined by `VkPhysicalDeviceSamplerYcbcrConversionFeatures::samplerYcbcrConversion` or `VkPhysicalDeviceVulkan11Features::samplerYcbcrConversion` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_KHR_shader_draw_parameters`

If the `VK_KHR_shader_draw_parameters` extension is not supported, support for the `SPV_KHR_shader_draw_parameters` SPIR-V extension is optional. Support for this feature is defined by `VkPhysicalDeviceShaderDrawParametersFeatures::shaderDrawParameters` or `VkPhysicalDeviceVulkan11Features::shaderDrawParameters` when queried via `vkGetPhysicalDeviceFeatures2`.

Differences relative to `VK_KHR_variable_pointers`

If the `VK_KHR_variable_pointers` extension is not supported, support for the `variablePointersStorageBuffer` feature is optional. Support for this feature is defined by `VkPhysicalDeviceVariablePointersFeatures::variablePointersStorageBuffer` or

`VkPhysicalDeviceVulkan11Features::variablePointersStorageBuffer` when queried via `vkGetPhysicalDeviceFeatures2`.

Additional Vulkan 1.1 Feature Support

In addition to the promoted extensions described above, Vulkan 1.1 added support for:

- The [group operations](#) and [subgroup scope](#).
- The [protected memory](#) feature.
- A new command to enumerate the instance version: [vkEnumerateInstanceVersion](#).
- The [VkPhysicalDeviceShaderDrawParametersFeatures](#) feature query struct (where the [VK_KHR_shader_draw_parameters](#) extension did not have one).

New Macros

Appendix E: Layers & Extensions (Informative)

Extensions to the Vulkan API **can** be defined by authors, groups of authors, and the Khronos Vulkan Working Group. In order not to compromise the readability of the Vulkan Specification, the core Specification does not incorporate most extensions. The online Registry of extensions is available at URL

<https://www.khronos.org/registry/vulkan/>

and allows generating versions of the Specification incorporating different extensions.

Most of the content previously in this appendix does not specify **use** of specific Vulkan extensions and layers, but rather specifies the processes by which extensions and layers are created. As of version 1.0.21 of the Vulkan Specification, this content has been migrated to the [Vulkan Documentation and Extensions](#) document. Authors creating extensions and layers **must** follow the mandatory procedures in that document.

The remainder of this appendix documents a set of extensions chosen when this document was built. Versions of the Specification published in the Registry include:

- Core API + mandatory extensions required of all Vulkan implementations.
- Core API + all registered and published Khronos (**KHR**) extensions.
- Core API + all registered and published extensions.

Extensions are grouped as Khronos **KHR**, multivendor **EXT**, and then alphabetically by author ID. Within each group, extensions are listed in alphabetical order by their name.

Note

As of the initial Vulkan 1.1 public release, the **KHX** author ID is no longer used. All **KHX** extensions have been promoted to **KHR** status. Previously, this author ID was used to indicate that an extension was experimental, and is being considered for standardization in future **KHR** or core Vulkan API versions. We no longer use this mechanism for exposing experimental functionality.

Some vendors may use an alternate author ID ending in **X** for some of their extensions. The exact meaning of such an author ID is defined by each vendor, and may not be equivalent to **KHX**, but it is likely to indicate a lesser degree of interface stability than a non-**X** extension from the same vendor.

Description

In order to be efficient, rendering techniques such as ray tracing need a quick way to identify which primitives may be intersected by a ray traversing the geometries. Acceleration structures are the most common way to represent the geometry spatially sorted, in order to quickly identify such potential intersections.

This extension adds new functionalities:

- Acceleration structure objects and build commands
- Structures to describe geometry inputs to acceleration structure builds
- Acceleration structure copy commands

New Object Types

- `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR`

If `VK_KHR_format_feature_flags2` is supported:

- Extending `VkFormatFeatureFlagBits2`:
 - `VK_FORMAT_FEATURE_2_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR`

Issues

(1) How does this extension differ from `VK_NV_ray_tracing`?

DISCUSSION:

The following is a summary of the main functional differences between `VK_KHR_acceleration_structure` and `VK_NV_ray_tracing`:

- added acceleration structure serialization / deserialization (`VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`, `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR`, `vkCmdCopyAccelerationStructureToMemoryKHR`, `vkCmdCopyMemoryToAccelerationStructureKHR`)
- document inactive primitives and instances
- added `VkPhysicalDeviceAccelerationStructureFeaturesKHR` structure
- added indirect and batched acceleration structure builds (`vkCmdBuildAccelerationStructuresIndirectKHR`)
- added host acceleration structure commands
- reworked geometry structures so they could be better shared between device, host, and indirect builds
- explicitly made `VkAccelerationStructureKHR` use device addresses
- added acceleration structure compatibility check function (`vkGetDeviceAccelerationStructureCompatibilityKHR`)
- add parameter for requesting memory requirements for host and/or device build
- added format feature for acceleration structure build vertex formats (`VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR`)

(2) Can you give a more detailed comparision of differences and similarities between

VK_NV_ray_tracing and VK_KHR_acceleration_structure?

DISCUSSION:

The following is a more detailed comparision of which commands, structures, and enums are aliased, changed, or removed.

- Aliased functionality—enums, structures, and commands that are considered equivalent:
 - [VkGeometryTypeNV](#) ↔ [VkGeometryTypeKHR](#)
 - [VkAccelerationStructureTypeNV](#) ↔ [VkAccelerationStructureTypeKHR](#)
 - [VkCopyAccelerationStructureModeNV](#) ↔ [VkCopyAccelerationStructureModeKHR](#)
 - [VkGeometryFlagsNV](#) ↔ [VkGeometryFlagsKHR](#)
 - [VkGeometryFlagBitsNV](#) ↔ [VkGeometryFlagBitsKHR](#)
 - [VkGeometryInstanceFlagsNV](#) ↔ [VkGeometryInstanceFlagsKHR](#)
 - [VkGeometryInstanceFlagBitsNV](#) ↔ [VkGeometryInstanceFlagBitsKHR](#)
 - [VkBuildAccelerationStructureFlagsNV](#) ↔ [VkBuildAccelerationStructureFlagsKHR](#)
 - [VkBuildAccelerationStructureFlagBitsNV](#) ↔ [VkBuildAccelerationStructureFlagBitsKHR](#)
 - [VkTransformMatrixNV](#) ↔ [VkTransformMatrixKHR](#) (added to VK_NV_ray_tracing for descriptive purposes)
 - [VkAabbPositionsNV](#) ↔ [VkAabbPositionsKHR](#) (added to VK_NV_ray_tracing for descriptive purposes)
 - [VkAccelerationStructureInstanceNV](#) ↔ [VkAccelerationStructureInstanceKHR](#) (added to VK_NV_ray_tracing for descriptive purposes)
- Changed enums, structures, and commands:
 - renamed [VK_GEOMETRY_INSTANCE_TRIANGLE_CULL_DISABLE_BIT_NV](#) → [VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR](#) in [VkGeometryInstanceFlagBitsKHR](#)
 - [VkGeometryTrianglesNV](#) → [VkAccelerationStructureGeometryTrianglesDataKHR](#) (device or host address instead of buffer+offset)
 - [VkGeometryAABB NV](#) → [VkAccelerationStructureGeometryAabbsDataKHR](#) (device or host address instead of buffer+offset)
 - [VkGeometryDataNV](#) → [VkAccelerationStructureGeometryDataKHR](#) (union of triangle/aabbs/instances)
 - [VkGeometryNV](#) → [VkAccelerationStructureGeometryKHR](#) (changed type of geometry)
 - [VkAccelerationStructureCreateInfoNV](#) → [VkAccelerationStructureCreateInfoKHR](#) (reshuffle geometry layout/information)
 - [VkPhysicalDeviceRayTracingPropertiesNV](#) → [VkPhysicalDeviceAccelerationStructurePropertiesKHR](#) (for acceleration structure properties, renamed `maxTriangleCount` to `maxPrimitiveCount`, added per stage and update after bind limits) and [VkPhysicalDeviceRayTracingPipelinePropertiesKHR](#) (for ray tracing pipeline properties)

- [VkAccelerationStructureMemoryRequirementsInfoNV](#) (deleted - replaced by allocating on top of [VkBuffer](#))
- [VkWriteDescriptorSetAccelerationStructureNV](#) → [VkWriteDescriptorSetAccelerationStructureKHR](#) (different acceleration structure type)
- [vkCreateAccelerationStructureNV](#) → [vkCreateAccelerationStructureKHR](#) (device address, different geometry layout/information)
- [vkGetAccelerationStructureMemoryRequirementsNV](#) (deleted - replaced by allocating on top of [VkBuffer](#))
- [vkCmdBuildAccelerationStructureNV](#) → [vkCmdBuildAccelerationStructuresKHR](#) (params moved to structs, layout differences)
- [vkCmdCopyAccelerationStructureNV](#) → [vkCmdCopyAccelerationStructureKHR](#) (params to struct, extendable)
- [vkGetAccelerationStructureHandleNV](#) → [vkGetAccelerationStructureDeviceAddressKHR](#) (device address instead of handle)
- [VkAccelerationStructureMemoryRequirementsTypeNV](#) → size queries for scratch space moved to [vkGetAccelerationStructureBuildSizesKHR](#)
- [vkDestroyAccelerationStructureNV](#) → [vkDestroyAccelerationStructureKHR](#) (different acceleration structure types)
- [vkCmdWriteAccelerationStructuresPropertiesNV](#) → [vkCmdWriteAccelerationStructuresPropertiesKHR](#) (different acceleration structure types)

- Added enums, structures and commands:

- [VK_GEOMETRY_TYPE_INSTANCES_KHR](#) to [VkGeometryTypeKHR](#) enum
- [VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR](#),
[VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR](#) to [VkCopyAccelerationStructureModeKHR](#) enum
- [VkPhysicalDeviceAccelerationStructureFeaturesKHR](#) structure
- [VkAccelerationStructureBuildTypeKHR](#) enum
- [VkBuildAccelerationStructureModeKHR](#) enum
- [VkDeviceOrHostAddressKHR](#) and [VkDeviceOrHostAddressConstKHR](#) unions
- [VkAccelerationStructureBuildRangeInfoKHR](#) struct
- [VkAccelerationStructureGeometryInstancesDataKHR](#) struct
- [VkAccelerationStructureDeviceAddressInfoKHR](#) struct
- [VkAccelerationStructureVersionInfoKHR](#) struct
- [VkStridedDeviceAddressRegionKHR](#) struct
- [VkCopyAccelerationStructureToMemoryInfoKHR](#) struct
- [VkCopyMemoryToAccelerationStructureInfoKHR](#) struct
- [VkCopyAccelerationStructureInfoKHR](#) struct
- [vkBuildAccelerationStructuresKHR](#) command (host build)

- [vkCopyAccelerationStructureKHR](#) command (host copy)
- [vkCopyAccelerationStructureToMemoryKHR](#) (host serialize)
- [vkCopyMemoryToAccelerationStructureKHR](#) (host deserialize)
- [vkWriteAccelerationStructuresPropertiesKHR](#) (host properties)
- [vkCmdCopyAccelerationStructureToMemoryKHR](#) (device serialize)
- [vkCmdCopyMemoryToAccelerationStructureKHR](#) (device deserialize)
- [vkGetDeviceAccelerationStructureCompatibilityKHR](#) (serialization)

(3) What are the changes between the public provisional (VK_KHR_ray_tracing v8) release and the internal provisional (VK_KHR_ray_tracing v9) release?

- added `geometryFlags` to [VkAccelerationStructureCreateInfoKHR](#) (later reworked to obsolete this)
- added `minAccelerationStructureScratchOffsetAlignment` property to [VkPhysicalDeviceRayTracingPropertiesKHR](#)
- fix naming and return enum from [vkGetDeviceAccelerationStructureCompatibilityKHR](#)
 - renamed [VkAccelerationStructureVersionKHR](#) to [VkAccelerationStructureVersionInfoKHR](#)
 - renamed `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_KHR` to `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR`
 - removed `VK_ERROR_INCOMPATIBLE_VERSION_KHR`
 - added [VkAccelerationStructureCompatibilityKHR](#) enum
 - remove return value from [vkGetDeviceAccelerationStructureCompatibilityKHR](#) and added return enum parameter
- Require Vulkan 1.1
- added creation time capture and replay flags
 - added [VkAccelerationStructureCreateFlagBitsKHR](#) and [VkAccelerationStructureCreateFlagsKHR](#)
 - renamed the `flags` member of [VkAccelerationStructureCreateInfoKHR](#) to `buildFlags` (later removed) and added the `createFlags` member
- change [vkCmdBuildAccelerationStructuresIndirectKHR](#) to use buffer device address for indirect parameter
- make `VK_KHR_deferred_host_operations` an interaction instead of a required extension (later went back on this)
- renamed [VkAccelerationStructureBuildOffsetInfoKHR](#) to [VkAccelerationStructureBuildRangeInfoKHR](#)
 - renamed the `ppOffsetInfos` parameter of [vkCmdBuildAccelerationStructuresKHR](#) to `ppBuildRangeInfos`
- Re-unify geometry description between build and create
 - remove [VkAccelerationStructureCreateGeometryTypeInfoKHR](#) and `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_GEOMETRY_TYPE_INFO_KHR`

- added `VkAccelerationStructureCreateInfoKHR` structure (later removed)
- change type of the `pGeometryInfos` member of `VkAccelerationStructureCreateInfoKHR` from `VkAccelerationStructureCreateGeometryTypeInfoKHR` to `VkAccelerationStructureGeometryKHR` (later removed)
- added `pCreateSizeInfos` member to `VkAccelerationStructureCreateInfoKHR` (later removed)
- Fix `ppGeometries` ambiguity, add `pGeometries`
 - remove `geometryArrayOfPointers` member of `VkAccelerationStructureBuildGeometryInfoKHR`
 - disambiguate two meanings of `ppGeometries` by explicitly adding `pGeometries` to the `VkAccelerationStructureBuildGeometryInfoKHR` structure and require one of them be `NULL`
- added `nullDescriptor` support for acceleration structures
- changed the `update` member of `VkAccelerationStructureBuildGeometryInfoKHR` from a bool to the `mode` `VkBuildAccelerationStructureModeKHR` enum which allows future extensibility in update types
- Clarify deferred host ops for pipeline creation
 - `VkDeferredOperationKHR` is now a top-level parameter for `vkCreateRayTracingPipelinesKHR`, `vkCopyAccelerationStructureKHR`, and `vkCopyMemoryToAccelerationStructureKHR`
 - removed `VkDeferredOperationInfoKHR` structure
 - change deferred host creation/return parameter behavior such that the implementation can modify such parameters until the deferred host operation completes
 - `VK_KHR_deferred_host_operations` is required again
- Change acceleration structure build to always be sized
 - de-alias `VkAccelerationStructureMemoryRequirementsTypeNV` and `VkAccelerationStructureMemoryRequirementsTypeKHR` and remove `VkAccelerationStructureMemoryRequirementsTypeKHR`
 - add `vkGetAccelerationStructureBuildSizesKHR` command and `VkAccelerationStructureBuildSizesInfoKHR` structure and `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR` enum to query sizes for acceleration structures and scratch storage
 - move size queries for scratch space to `vkGetAccelerationStructureBuildSizesKHR`
 - remove `compactedSize`, `buildFlags`, `maxGeometryCount`, `pGeometryInfos`, `pCreateSizeInfos` members of `VkAccelerationStructureCreateInfoKHR` and add the `size` member
 - add `maxVertex` member to `VkAccelerationStructureGeometryTrianglesDataKHR` structure
 - remove `VkAccelerationStructureCreateInfoKHR` structure

(4) What are the changes between the internal provisional (VK_KHR_ray_tracing v9) release and the final (VK_KHR_acceleration_structure v11) release?

- refactor `VK_KHR_ray_tracing` into 3 extensions, enabling implementation flexibility and

decoupling ray query support from ray pipelines:

- `VK_KHR_acceleration_structure` (for acceleration structure operations)
- `VK_KHR_ray_tracing_pipeline` (for ray tracing pipeline and shader stages)
- `VK_KHR_ray_query` (for ray queries in existing shader stages)
- clarify buffer usage flags for ray tracing
 - `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` is left alone in `VK_NV_ray_tracing` (required on `scratch` and `instanceData`)
 - `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` is added as an alias of `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` in `VK_KHR_ray_tracing_pipeline` and is required on shader binding table buffers
 - `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READONLY_BIT_KHR` is added in `VK_KHR_acceleration_structure` for all vertex, index, transform, aabb, and instance buffer data referenced by device build commands
 - `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` is used for `scratchData`
- add max primitive counts (`ppMaxPrimitiveCounts`) to `vkCmdBuildAccelerationStructuresIndirectKHR`
- Allocate acceleration structures from `VkBuffers` and add a mode to constrain the device address
 - de-alias `VkBindAccelerationStructureMemoryInfoNV` and `vkBindAccelerationStructureMemoryNV`, and remove `VkBindAccelerationStructureMemoryInfoKHR`, `VkAccelerationStructureMemoryRequirementsInfoKHR`, and `vkGetAccelerationStructureMemoryRequirementsKHR`
 - acceleration structures now take a `VkBuffer` and offset at creation time for memory placement
 - add a new `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR` buffer usage for such buffers
 - add a new `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` acceleration structure type for layering
- move `VK_GEOMETRY_TYPE_INSTANCES_KHR` to main enum instead of being added via extension
- make build commands more consistent - all now build multiple acceleration structures and are named plurally (`vkCmdBuildAccelerationStructuresIndirectKHR`, `vkCmdBuildAccelerationStructuresKHR`, `vkBuildAccelerationStructuresKHR`)
- add interactions with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` for acceleration structures, including a new feature (`descriptorBindingAccelerationStructureUpdateAfterBind`) and 3 new properties (`maxPerStageDescriptorAccelerationStructures`, `maxPerStageDescriptorUpdateAfterBindAccelerationStructures`, `maxDescriptorSetUpdateAfterBindAccelerationStructures`)
- extension is no longer provisional
- define synchronization requirements for builds, traces, and copies
- define synchronization requirements for AS build inputs and indirect build buffer

(5) What is `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` for?

RESOLVED: It is primarily intended for API layering. In DXR, the acceleration structure is basically just a buffer in a special layout, and you do not know at creation time whether it will be used as a top or bottom level acceleration structure. We thus added a generic acceleration structure type whose type is unknown at creation time, but is specified at build time instead. Applications which are written directly for Vulkan should not use it.

Version History

- Revision 1, 2019-12-05 (Members of the Vulkan Ray Tracing TSG)
 - Internal revisions (forked from `VK_NV_ray_tracing`)
- Revision 2, 2019-12-20 (Daniel Koch, Eric Werness)
 - Add const version of `DeviceOrHostAddress` (!3515)
 - Add VU to clarify that only handles in the current pipeline are valid (!3518)
 - Restore some missing VUs and add in-place update language (#1902, !3522)
 - rename `VkAccelerationStructureInstanceKHR` member from `accelerationStructure` to `accelerationStructureReference` to better match its type (!3523)
 - Allow `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` for pipeline creation if shader group handles cannot be reused (!3523)
 - update documentation for the `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` error code and add missing documentation for new return codes from `VK_KHR_deferred_host_operations` (!3523)
 - list new query types for `VK_KHR_ray_tracing` (!3523)
 - Fix VU statements for `VkAccelerationStructureGeometryKHR` referring to correct union members and update to use more current wording (!3523)
- Revision 3, 2020-01-10 (Daniel Koch, Jon Leech, Christoph Kubisch)
 - Fix 'instance of' and 'that/which contains/defines' markup issues (!3528)
 - factor out `VK_KHR_pipeline_library` as stand-alone extension (!3540)
 - Resolve Vulkan-hpp issues (!3543)
 - add missing require for `VkGeometryInstanceFlagsKHR`
 - de-alias `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_NV` since the KHR structure is no longer equivalent
 - add len to `pDataSize` attribute for `vkWriteAccelerationStructuresPropertiesKHR`
- Revision 4, 2020-01-23 (Daniel Koch, Eric Werness)
 - Improve `vkWriteAccelerationStructuresPropertiesKHR`, add return value and VUs (#1947)
 - Clarify language to allow multiple raygen shaders (#1959)
 - Various editorial feedback (!3556)
 - Add language to help deal with looped self-intersecting fans (#1901)

- Change vkCmdTraceRays{Indirect}KHR args to pointers (!3559)
 - Add scratch address validation language (#1941, !3551)
 - Fix definition and add hierarchy information for shader call scope (#1977, !3571)
- Revision 5, 2020-02-04 (Eric Werness, Jeff Bolz, Daniel Koch)
 - remove vestigial accelerationStructureUUID (!3582)
 - update definition of repack instructions and improve memory model interactions (#1910, #1913, !3584)
 - Fix wrong sType for VkPhysicalDeviceRayTracingFeaturesKHR (#1988)
 - Use provisional SPIR-V capabilities (#1987)
 - require rayTraversalPrimitiveCulling if rayQuery is supported (#1927)
 - Miss shaders do not have object parameters (!3592)
 - Fix missing required types in XML (!3592)
 - clarify matching conditions for update (!3592)
 - add goal that host and device builds be similar (!3592)
 - clarify that `maxPrimitiveCount` limit should apply to triangles and AABBs (!3592)
 - Require alignment for instance arrayOfPointers (!3592)
 - Zero is a valid value for instance flags (!3592)
 - Add some alignment VUs that got lost in refactoring (!3592)
 - Recommend TMin epsilon rather than culling (!3592)
 - Get angle from dot product not cross product (!3592)
 - Clarify that AH can access the payload and attributes (!3592)
 - Match DXR behavior for inactive primitive definition (!3592)
 - Use a more generic term than degenerate for inactive to avoid confusion (!3592)
- Revision 6, 2020-02-20 (Daniel Koch)
 - fix some dangling NV references (#1996)
 - rename VkCmdTraceRaysIndirectCommandKHR to VkTraceRaysIndirectCommandKHR (!3607)
 - update contributor list (!3611)
 - use `uint64_t` instead of `VkAccelerationStructureReferenceKHR` in `VkAccelerationStructureInstanceKHR` (#2004)
- Revision 7, 2020-02-28 (Tobias Hector)
 - remove HitTKHR SPIR-V builtin (spirv/spirv-extensions#7)
- Revision 8, 2020-03-06 (Tobias Hector, Dae Kim, Daniel Koch, Jeff Bolz, Eric Werness)
 - explicitly state that Tmax is updated when new closest intersection is accepted (#2020, !3536)
 - Made references to min and max t values consistent (!3644)

- finish enumerating differences relative to VK_NV_ray_tracing in issues (1) and (2) (#1974,!3642)
- fix formatting in some math equations (!3642)
- Restrict the Hit Kind operand of `OpReportIntersectionKHR` to 7-bits (spirv/spirv-extensions#8,!3646)
- Say ray tracing '**should**' be watertight (#2008,!3631)
- Clarify memory requirements for ray tracing buffers (#2005,!3649)
- Add callable size limits (#1997,!3652)
- Revision 9, 2020-04-15 (Eric Werness, Daniel Koch, Tobias Hector, Joshua Barczak)
 - Add geometry flags to acceleration structure creation (!3672)
 - add build scratch memory alignment (minAccelerationStructureScratchOffsetAlignment) (#2065,!3725)
 - fix naming and return enum from vkGetDeviceAccelerationStructureCompatibilityKHR (#2051,!3726)
 - require SPIR-V 1.4 (#2096,!3777)
 - added creation time capture/replay flags (#2104,!3774)
 - require Vulkan 1.1 (#2133,!3806)
 - use device addresses instead of VkBuffers for ray tracing commands (#2074,!3815)
 - add interactions with Vulkan 1.2 and VK_KHR_vulkan_memory_model (#2133,!3830)
 - make VK_KHR_pipeline_library an interaction instead of required (#2045,#2108,!3830)
 - make VK_KHR_deferred_host_operations an interaction instead of required (#2045,!3830)
 - removed maxCallableSize and added explicit stack size management for ray pipelines (#1997,!3817,!3772,!3844)
 - improved documentation for VkAccelerationStructureVersionInfoKHR (#2135,3835)
 - rename VkAccelerationStructureBuildOffsetInfoKHR to VkAccelerationStructureBuildRangeInfoKHR (#2058,!3754)
 - Re-unify geometry description between build and create (!3754)
 - Fix ppGeometries ambiguity, add pGeometries (#2032,!3811)
 - add interactions with VK_EXT_robustness2 and allow nullDescriptor support for acceleration structures (#1920,!3848)
 - added future extensibility for AS updates (#2114,!3849)
 - Fix VU for dispatchrays and add a limit on the size of the full grid (#2160,!3851)
 - Add shaderGroupHandleAlignment property (#2180,!3875)
 - Clarify deferred host ops for pipeline creation (#2067,!3813)
 - Change acceleration structure build to always be sized (#2131,#2197,#2198,!3854,!3883,!3880)
- Revision 10, 2020-07-03 (Mathieu Robart, Daniel Koch, Eric Werness, Tobias Hector)

- Decomposition of the specification, from VK_KHR_ray_tracing to VK_KHR_acceleration_structure (#1918,!3912)
- clarify buffer usage flags for ray tracing (#2181,!3939)
- add max primitive counts to build indirect command (#2233,!3944)
- Allocate acceleration structures from VkBuffers and add a mode to constrain the device address (#2131,!3936)
- Move VK_GEOMETRY_TYPE_INSTANCES_KHR to main enum (#2243,!3952)
- make build commands more consistent (#2247,!3958)
- add interactions with UPDATE_AFTER_BIND (#2128,!3986)
- correct and expand build command VUs (!4020)
- fix copy command VUs (!4018)
- added various alignment requirements (#2229,!3943)
- fix valid usage for arrays of geometryCount items (#2198,!4010)
- define what is allowed to change on RTAS updates and relevant VUs (#2177,!3961)
- Revision 11, 2020-11-12 (Eric Werness, Josh Barczak, Daniel Koch, Tobias Hector)
 - de-alias NV and KHR acceleration structure types and associated commands (#2271,!4035)
 - specify alignment for host copy commands (#2273,!4037)
 - document `VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR`
 - specify that acceleration structures are non-linear (#2289,!4068)
 - add several missing VUs for strides, vertexFormat, and indexType (#2315,!4069)
 - restore VUs for VkAccelerationStructureBuildGeometryInfoKHR (#2337,!4098)
 - ban multi-instance memory for host operations (#2324,!4102)
 - allow dstAccelerationStructure to be null for vkGetAccelerationStructureBuildSizesKHR (#2330,!4111)
 - more build VU cleanup (#2138,#4130)
 - specify host endianness for AS serialization (#2261,!4136)
 - add invertible transform matrix VU (#1710,!4140)
 - require geometryCount to be 1 for TLAS builds (!4145)
 - improved validity conditions for build addresses (#4142)
 - add single statement SPIR-V VUs, build limit VUs (!4158)
 - document limits for vertex and aabb strides (#2390,!4184)
 - specify that `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` applies to AS copies (#2382,#4173)
 - define sync for AS build inputs and indirect buffer (#2407,!4208)
- Revision 12, 2021-08-06 (Samuel Bourasseau)
 - rename `VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR` to

VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR (keep previous as alias).

- Clarify description and add note.
- Revision 13, 2021-09-30 (Jon Leech)
 - Add interaction with [VK_KHR_format_feature_flags2](#) to [vk.xml](#)

Description

The `VK_KHR_android_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) that refers to an `ANativeWindow`, Android's native surface type. The `ANativeWindow` represents the producer endpoint of any buffer queue, regardless of consumer endpoint. Common consumer endpoints for `ANativeWindows` are the system window compositor, video encoders, and application-specific compositors importing the images through a `SurfaceTexture`.

New Base Types

- `ANativeWindow`

New Commands

- `vkCreateAndroidSurfaceKHR`

New Structures

- `VkAndroidSurfaceCreateInfoKHR`

New Bitmasks

- `VkAndroidSurfaceCreateFlagsKHR`

New Enum Constants

- `VK_KHR_ANDROID_SURFACE_EXTENSION_NAME`
- `VK_KHR_ANDROID_SURFACE_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR`

Issues

- 1) Does Android need a way to query for compatibility between a particular physical device (and queue family?) and a specific Android display?

RESOLVED: No. Currently on Android, any physical device is expected to be able to present to the system compositor, and all queue families must support the necessary image layout transitions and synchronization operations.

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
 - Initial draft.
- Revision 2, 2015-10-26 (Ian Elliott)
 - Renamed from VK_EXT_KHR_android_surface to VK_KHR_android_surface.
- Revision 3, 2015-11-03 (Daniel Rakos)
 - Added allocation callbacks to surface creation function.
- Revision 4, 2015-11-10 (Jesse Hall)
 - Removed VK_ERROR_INVALID_ANDROID_WINDOW_KHR.
- Revision 5, 2015-11-28 (Daniel Rakos)
 - Updated the surface create function to take a pCreateInfo structure.
- Revision 6, 2016-01-14 (James Jones)
 - Moved VK_ERROR_NATIVE_WINDOW_IN_USE_KHR from the VK_KHR_android_surface to the VK_KHR_surface extension.

Description

The [VK_KHR_deferred_host_operations](#) extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands **must** not be deferred unless the deferral is specifically allowed by another extension which depends on [VK_KHR_deferred_host_operations](#).

New Object Types

- [VkDeferredOperationKHR](#)

New Commands

- [vkCreateDeferredOperationKHR](#)
- [vkDeferredOperationJoinKHR](#)
- [vkDestroyDeferredOperationKHR](#)
- [vkGetDeferredOperationMaxConcurrencyKHR](#)
- [vkGetDeferredOperationResultKHR](#)

New Enum Constants

- [VK_KHR_DEFERRED_HOST_OPERATIONS_EXTENSION_NAME](#)
- [VK_KHR_DEFERRED_HOST_OPERATIONS_SPEC_VERSION](#)
- Extending [VkObjectType](#):
 - [VK_OBJECT_TYPE_DEFERRED_OPERATION_KHR](#)
- Extending [VkResult](#):

- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR
- VK_THREAD_DONE_KHR
- VK_THREAD_IDLE_KHR

Code Examples

The following examples will illustrate the concept of deferrable operations using a hypothetical example. The command `vkDoSomethingExpensive` denotes a deferrable command.

The following example illustrates how a vulkan application might request deferral of an expensive operation:

```
// create a deferred operation
VkDeferredOperationKHR hOp;
VkResult result = vkCreateDeferredOperationKHR(device, pCallbacks, &hOp);
assert(result == VK_SUCCESS);

result = vkDoSomethingExpensive(device, hOp, ...);
assert( result == VK_OPERATION_DEFERRED_KHR );

// operation was deferred. Execute it asynchronously
std::async::launch(
    [ hOp ] ( )
{
    vkDeferredOperationJoinKHR(device, hOp);

    result = vkGetDeferredOperationResultKHR(device, hOp);

    // deferred operation is now complete. 'result' indicates success or failure

    vkDestroyDeferredOperationKHR(device, hOp, pCallbacks);
}
);

```

The following example illustrates extracting concurrency from a single deferred operation:

```

// create a deferred operation
VkDeferredOperationKHR hOp;
VkResult result = vkCreateDeferredOperationKHR(device, pCallbacks, &hOp);
assert(result == VK_SUCCESS);

result = vkDoSomethingExpensive(device, hOp, ...);
assert( result == VK_OPERATION_DEFERRED_KHR );

// Query the maximum amount of concurrency and clamp to the desired maximum
uint32_t numLaunches = std::min(vkGetDeferredOperationMaxConcurrencyKHR(device, hOp),
maxThreads);

std::vector<std::future<void>> joins;

for (uint32_t i = 0; i < numLaunches; i++) {
    joins.emplace_back(std::async::launch(
        [ hOp ] () {
            {
                vkDeferredOperationJoinKHR(device, hOp);
                // in a job system, a return of VK_THREAD_IDLE_KHR should queue
another
                // job, but it is not functionally required
            }
        });
}

for (auto &f : joins) {
    f.get();
}

result = vkGetDeferredOperationResultKHR(device, hOp);

// deferred operation is now complete. 'result' indicates success or failure

vkDestroyDeferredOperationKHR(device, hOp, pCallbacks);

```

The following example shows a subroutine which guarantees completion of a deferred operation, in the presence of multiple worker threads, and returns the result of the operation.

```

VkResult FinishDeferredOperation(VkDeferredOperationKHR hOp)
{
    // Attempt to join the operation until the implementation indicates that we should
    // stop

    VkResult result = vkDeferredOperationJoinKHR(device, hOp);
    while( result == VK_THREAD_IDLE_KHR )
    {
        std::this_thread::yield();
        result = vkDeferredOperationJoinKHR(device, hOp);
    }

    switch( result )
    {
        case VK_SUCCESS:
        {
            // deferred operation has finished. Query its result
            result = vkGetDeferredOperationResultKHR(device, hOp);
        }
        break;

        case VK_THREAD_DONE_KHR:
        {
            // deferred operation is being wrapped up by another thread
            // wait for that thread to finish
            do
            {
                std::this_thread::yield();
                result = vkGetDeferredOperationResultKHR(device, hOp);
            } while( result == VK_NOT_READY );
        }
        break;

        default:
            assert(false); // other conditions are illegal.
            break;
    }

    return result;
}

```

Issues

1. Should this extension have a VkPhysicalDevice*FeaturesKHR structure?

RESOLVED: No. This extension does not add any functionality on its own and requires a dependent extension to actually enable functionality and thus there is no value in adding a feature structure. If necessary, any dependent extension could add a feature boolean if it wanted to indicate that it is adding optional deferral support.

Version History

- Revision 1, 2019-12-05 (Josh Barczak, Daniel Koch)
 - Initial draft.
- Revision 2, 2020-03-06 (Daniel Koch, Tobias Hector)
 - Add missing VK_OBJECT_TYPE_DEFERRED_OPERATION_KHR enum
 - fix sample code
 - Clarified deferred operation parameter lifetimes (#2018,!3647)
- Revision 3, 2020-05-15 (Josh Barczak)
 - Clarify behavior of vkGetDeferredOperationMaxConcurrencyKHR, allowing it to return 0 if the operation is complete (#2036,!3850)
- Revision 4, 2020-11-12 (Tobias Hector, Daniel Koch)
 - Remove VkDeferredOperationInfoKHR and change return value semantics when deferred host operations are in use (#2067,3813)
 - clarify return value of vkGetDeferredOperationResultKHR (#2339,!4110)

Description

This extension provides the API to enumerate displays and available modes on a given device.

New Object Types

- [VkDisplayKHR](#)
- [VkDisplayModeKHR](#)

New Commands

- [vkCreateDisplayModeKHR](#)
- [vkCreateDisplayPlaneSurfaceKHR](#)
- [vkGetDisplayModePropertiesKHR](#)
- [vkGetDisplayPlaneCapabilitiesKHR](#)
- [vkGetDisplayPlaneSupportedDisplaysKHR](#)
- [vkGetPhysicalDeviceDisplayPlanePropertiesKHR](#)
- [vkGetPhysicalDeviceDisplayPropertiesKHR](#)

New Structures

- [VkDisplayModeCreateInfoKHR](#)
- [VkDisplayModeParametersKHR](#)
- [VkDisplayModePropertiesKHR](#)
- [VkDisplayPlaneCapabilitiesKHR](#)
- [VkDisplayPlanePropertiesKHR](#)
- [VkDisplayPropertiesKHR](#)
- [VkDisplaySurfaceCreateInfoKHR](#)

New Enums

- [VkDisplayPlaneAlphaFlagBitsKHR](#)

New Bitmasks

- [VkDisplayModeCreateFlagsKHR](#)
- [VkDisplayPlaneAlphaFlagsKHR](#)
- [VkDisplaySurfaceCreateFlagsKHR](#)
- [VkSurfaceTransformFlagsKHR](#)

New Enum Constants

- [VK_KHR_DISPLAY_EXTENSION_NAME](#)
- [VK_KHR_DISPLAY_SPEC_VERSION](#)
- Extending [VkObjectType](#):
 - [VK_OBJECT_TYPE_DISPLAY_KHR](#)
 - [VK_OBJECT_TYPE_DISPLAY_MODE_KHR](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR](#)

Issues

1) Which properties of a mode should be fixed in the mode information vs. settable in some other function when setting the mode? E.g., do we need to double the size of the mode pool to include both stereo and non-stereo modes? YUV and RGB scanout even if they both take RGB input images? BGR vs. RGB input? etc.

PROPOSED RESOLUTION: Many modern displays support at most a handful of resolutions and timings natively. Other “modes” are expected to be supported using scaling hardware on the display engine or GPU. Other properties, such as rotation and mirroring should not require duplicating hardware modes just to express all combinations. Further, these properties may be implemented on a per-display or per-overlay granularity.

To avoid the exponential growth of modes as mutable properties are added, as was the case with [EGLConfig](#)/WGL pixel formats/[GLXFBConfig](#), this specification should separate out hardware properties and configurable state into separate objects. Modes and overlay planes will express capabilities of the hardware, while a separate structure will allow applications to configure scaling, rotation, mirroring, color keys, LUT values, alpha masks, etc. for a given swapchain independent of the mode in use. Constraints on these settings will be established by properties of the immutable objects.

Note the resolution of this issue may affect issue 5 as well.

2) What properties of a display itself are useful?

PROPOSED RESOLUTION: This issue is too broad. It was meant to prompt general discussion, but resolving this issue amounts to completing this specification. All interesting properties should be

included. The issue will remain as a placeholder since removing it would make it hard to parse existing discussion notes that refer to issues by number.

3) How are multiple overlay planes within a display or mode enumerated?

PROPOSED RESOLUTION: They are referred to by an index. Each display will report the number of overlay planes it contains.

4) Should swapchains be created relative to a mode or a display?

PROPOSED RESOLUTION: When using this extension, swapchains are created relative to a mode and a plane. The mode implies the display object the swapchain will present to. If the specified mode is not the display's current mode, the new mode will be applied when the first image is presented to the swapchain, and the default operating system mode, if any, will be restored when the swapchain is destroyed.

5) Should users query generic ranges from displays and construct their own modes explicitly using those constraints rather than querying a fixed set of modes (Most monitors only have one real "mode" these days, even though many support relatively arbitrary scaling, either on the monitor side or in the GPU display engine, making "modes" something of a relic/compatibility construct).

PROPOSED RESOLUTION: Expose both. Display information structures will expose a set of predefined modes, as well as any attributes necessary to construct a customized mode.

6) Is it fine if we return the display and display mode handles in the structure used to query their properties?

PROPOSED RESOLUTION: Yes.

7) Is there a possibility that not all displays of a device work with all of the present queues of a device? If yes, how do we determine which displays work with which present queues?

PROPOSED RESOLUTION: No known hardware has such limitations, but determining such limitations is supported automatically using the existing `VK_KHR_surface` and `VK_KHR_swapchain` query mechanisms.

8) Should all presentation need to be done relative to an overlay plane, or can a display mode + display be used alone to target an output?

PROPOSED RESOLUTION: Require specifying a plane explicitly.

9) Should displays have an associated window system display, such as an `HDC` or `Display*`?

PROPOSED RESOLUTION: No. Displays are independent of any windowing system in use on the system. Further, neither `HDC` nor `Display*` refer to a physical display object.

10) Are displays queried from a physical GPU or from a device instance?

PROPOSED RESOLUTION: Developers prefer to query modes directly from the physical GPU so they can use display information as an input to their device selection algorithms prior to device creation. This avoids the need to create placeholder device instances to enumerate displays.

This preference must be weighed against the extra initialization that must be done by driver vendors prior to device instance creation to support this usage.

11) Should displays and/or modes be dispatchable objects? If functions are to take displays, overlays, or modes as their first parameter, they must be dispatchable objects as defined in Khronos bug 13529. If they are not added to the list of dispatchable objects, functions operating on them must take some higher-level object as their first parameter. There is no performance case against making them dispatchable objects, but they would be the first extension objects to be dispatchable.

PROPOSED RESOLUTION: Do not make displays or modes dispatchable. They will dispatch based on their associated physical device.

12) Should hardware cursor capabilities be exposed?

PROPOSED RESOLUTION: Defer. This could be a separate extension on top of the base WSI specs.

if they are one physical display device to an end user, but may internally be implemented as two side-by-side displays using the same display engine (and sometimes cabling) resources as two physically separate display devices.

RESOLVED: Tiled displays will appear as a single display object in this API.

14) Should the raw EDID data be included in the display information?

RESOLVED: No. A future extension could be added which reports the EDID if necessary. This may be complicated by the outcome of issue 13.

15) Should min and max scaling factor capabilities of overlays be exposed?

RESOLVED: Yes. This is exposed indirectly by allowing applications to query the min/max position and extent of the source and destination regions from which image contents are fetched by the display engine when using a particular mode and overlay pair.

16) Should devices be able to expose planes that can be moved between displays? If so, how?

RESOLVED: Yes. Applications can determine which displays a given plane supports using [vkGetDisplayPlaneSupportedDisplaysKHR](#).

17) Should there be a way to destroy display modes? If so, does it support destroying “built in” modes?

RESOLVED: Not in this extension. A future extension could add this functionality.

18) What should the lifetime of display and built-in display mode objects be?

RESOLVED: The lifetime of the instance. These objects cannot be destroyed. A future extension may be added to expose a way to destroy these objects and/or support display hotplug.

19) Should persistent mode for smart panels be enabled/disabled at swapchain creation time, or on a per-present basis.

RESOLVED: On a per-present basis.

Examples

Note

The example code for the `VK_KHR_display` and `VK_KHR_display_swapchain` extensions was removed from the appendix after revision 1.0.43. The display enumeration example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: <https://github.com/KhronosGroup/Vulkan-Tools/blob/master/cube/cube.c>).

Version History

- Revision 1, 2015-02-24 (James Jones)
 - Initial draft
- Revision 2, 2015-03-12 (Norbert Nopper)
 - Added overlay enumeration for a display.
- Revision 3, 2015-03-17 (Norbert Nopper)
 - Fixed typos and namings as discussed in Bugzilla.
 - Reordered and grouped functions.
 - Added functions to query count of display, mode and overlay.
 - Added native display handle, which may be needed on some platforms to create a native Window.
- Revision 4, 2015-03-18 (Norbert Nopper)
 - Removed primary and virtualPosition members (see comment of James Jones in Bugzilla).
 - Added native overlay handle to information structure.
 - Replaced , with ; in struct.
- Revision 6, 2015-03-18 (Daniel Rakos)
 - Added WSI extension suffix to all items.
 - Made the whole API more “Vulkanish”.
 - Replaced all functions with a single `vkGetDisplayInfoKHR` function to better match the rest of the API.
 - Made the display, display mode, and overlay objects be first class objects, not subclasses of `VkBaseObject` as they do not support the common functions anyways.
 - Renamed *Info structures to *Properties.
 - Removed `overlayIndex` field from `VkOverlayProperties` as there is an implicit index already as a result of moving to a “Vulkanish” API.
 - Displays are not get through device, but through physical GPU to match the rest of the Vulkan API. Also this is something ISVs explicitly requested.

- Added issue (6) and (7).
- Revision 7, 2015-03-25 (James Jones)
 - Added an issues section
 - Added rotation and mirroring flags
- Revision 8, 2015-03-25 (James Jones)
 - Combined the duplicate issues sections introduced in last change.
 - Added proposed resolutions to several issues.
- Revision 9, 2015-04-01 (Daniel Rakos)
 - Rebased extension against Vulkan 0.82.0
- Revision 10, 2015-04-01 (James Jones)
 - Added issues (10) and (11).
 - Added more straw-man issue resolutions, and cleaned up the proposed resolution for issue (4).
 - Updated the rotation and mirroring enums to have proper bitmask semantics.
- Revision 11, 2015-04-15 (James Jones)
 - Added proposed resolution for issues (1) and (2).
 - Added issues (12), (13), (14), and (15)
 - Removed pNativeHandle field from overlay structure.
 - Fixed small compilation errors in example code.
- Revision 12, 2015-07-29 (James Jones)
 - Rewrote the guts of the extension against the latest WSI swapchain specifications and the latest Vulkan API.
 - Address overlay planes by their index rather than an object handle and refer to them as “planes” rather than “overlays” to make it slightly clearer that even a display with no “overlays” still has at least one base “plane” that images can be displayed on.
 - Updated most of the issues.
 - Added an “extension type” section to the specification header.
 - Re-used the VK_EXT_KHR_surface surface transform enumerations rather than redefining them here.
 - Updated the example code to use the new semantics.
- Revision 13, 2015-08-21 (Ian Elliott)
 - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
 - Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.
- Revision 14, 2015-09-01 (James Jones)
 - Restore single-field revision number.

- Revision 15, 2015-09-08 (James Jones)
 - Added alpha flags enum.
 - Added premultiplied alpha support.
- Revision 16, 2015-09-08 (James Jones)
 - Added description section to the spec.
 - Added issues 16 - 18.
- Revision 17, 2015-10-02 (James Jones)
 - Planes are now a property of the entire device rather than individual displays. This allows planes to be moved between multiple displays on devices that support it.
 - Added a function to create a VkSurfaceKHR object describing a display plane and mode to align with the new per-platform surface creation conventions.
 - Removed detailed mode timing data. It was agreed that the mode extents and refresh rate are sufficient for current use cases. Other information could be added back in as an extension if it is needed in the future.
 - Added support for smart/persistent/buffered display devices.
- Revision 18, 2015-10-26 (Ian Elliott)
 - Renamed from VK_EXT_KHR_display to VK_KHR_display.
- Revision 19, 2015-11-02 (James Jones)
 - Updated example code to match revision 17 changes.
- Revision 20, 2015-11-03 (Daniel Rakos)
 - Added allocation callbacks to creation functions.
- Revision 21, 2015-11-10 (Jesse Hall)
 - Added VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR, and use VkDisplayPlaneAlphaFlagBitsKHR for VkDisplayPlanePropertiesKHR::alphaMode instead of VkDisplayPlaneAlphaFlagsKHR, since it only represents one mode.
 - Added reserved flags bitmask to VkDisplayPlanePropertiesKHR.
 - Use VkSurfaceTransformFlagBitsKHR instead of obsolete VkSurfaceTransformKHR.
 - Renamed vkGetDisplayPlaneSupportedDisplaysKHR parameters for clarity.
- Revision 22, 2015-12-18 (James Jones)
 - Added missing “planeIndex” parameter to vkGetDisplayPlaneSupportedDisplaysKHR()
- Revision 23, 2017-03-13 (James Jones)
 - Closed all remaining issues. The specification and implementations have been shipping with the proposed resolutions for some time now.
 - Removed the sample code and noted it has been integrated into the official Vulkan SDK cube demo.

VK_KHR_display_swapchain

- Jesse Hall, Google

Description

This extension provides an API to create a swapchain directly on a device's display without any underlying window system.

New Commands

- `vkCreateSharedSwapchainsKHR`

New Structures

- Extending `VkPresentInfoKHR`:

- [VkDisplayPresentInfoKHR](#)

New Enum Constants

- `VK_KHR_DISPLAY_SWAPCHAIN_EXTENSION_NAME`
- `VK_KHR_DISPLAY_SWAPCHAIN_SPEC_VERSION`
- Extending [VkResult](#):
 - `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`

Issues

1) Should swapchains sharing images each hold a reference to the images, or should it be up to the application to destroy the swapchains and images in an order that avoids the need for reference counting?

RESOLVED: Take a reference. The lifetime of presentable images is already complex enough.

2) Should the `srcRect` and `dstRect` parameters be specified as part of the presentation command, or at swapchain creation time?

RESOLVED: As part of the presentation command. This allows moving and scaling the image on the screen without the need to respecify the mode or create a new swapchain and presentable images.

3) Should `srcRect` and `dstRect` be specified as rects, or separate offset/extent values?

RESOLVED: As rects. Specifying them separately might make it easier for hardware to expose support for one but not the other, but in such cases applications must just take care to obey the reported capabilities and not use non-zero offsets or extents that require scaling, as appropriate.

4) How can applications create multiple swapchains that use the same images?

RESOLVED: By calling [vkCreateSharedSwapchainsKHR](#).

An earlier resolution used [vkCreateSwapchainKHR](#), chaining multiple [VkSwapchainCreateInfoKHR](#) structures through `pNext`. In order to allow each swapchain to also allow other extension structs, a level of indirection was used: `VkSwapchainCreateInfoKHR::pNext` pointed to a different structure, which had both `sType` and `pNext` members for additional extensions, and also had a pointer to the next [VkSwapchainCreateInfoKHR](#) structure. The number of swapchains to be created could only be found by walking this linked list of alternating structures, and the `pSwapchains` out parameter was reinterpreted to be an array of [VkSwapchainKHR](#) handles.

Another option considered was a method to specify a “shared” swapchain when creating a new swapchain, such that groups of swapchains using the same images could be built up one at a time. This was deemed unusable because drivers need to know all of the displays an image will be used on when determining which internal formats and layouts to use for that image.

Examples

Note

The example code for the `VK_KHR_display` and `VK_KHR_display_swapchain` extensions was removed from the appendix after revision 1.0.43. The display swapchain creation example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: <https://github.com/KhronosGroup/Vulkan-Tools/blob/master/cube/cube.c>).

Version History

- Revision 1, 2015-07-29 (James Jones)
 - Initial draft
- Revision 2, 2015-08-21 (Ian Elliott)
 - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
 - Switched from “revision” to “version”, including use of the `VK_MAKE_VERSION` macro in the header file.
- Revision 3, 2015-09-01 (James Jones)
 - Restore single-field revision number.
- Revision 4, 2015-09-08 (James Jones)
 - Allow creating multiple swap chains that share the same images using a single call to `vkCreateSwapchainKHR()`.
- Revision 5, 2015-09-10 (Alon Or-bach)
 - Removed underscores from `SWAP_CHAIN` in two enums.
- Revision 6, 2015-10-02 (James Jones)
 - Added support for smart panels/buffered displays.
- Revision 7, 2015-10-26 (Ian Elliott)
 - Renamed from `VK_EXT_KHR_display_swapchain` to `VK_KHR_display_swapchain`.
- Revision 8, 2015-11-03 (Daniel Rakos)
 - Updated sample code based on the changes to `VK_KHR_swapchain`.
- Revision 9, 2015-11-10 (Jesse Hall)
 - Replaced `VkDisplaySwapchainCreateInfoKHR` with `vkCreateSharedSwapchainsKHR`, changing resolution of issue #4.
- Revision 10, 2017-03-13 (James Jones)
 - Closed all remaining issues. The specification and implementations have been shipping with the proposed resolutions for some time now.
 - Removed the sample code and noted it has been integrated into the official Vulkan SDK cube demo.

Issues

This extension borrows concepts, semantics, and language from [VK_KHR_external_semaphore_win32](#). That extension's issues apply equally to this extension.

- 1) Should D3D12 fence handle types be supported, like they are for semaphores?

RESOLVED: No. Doing so would require extending the fence signal and wait operations to provide values to signal / wait for, like [VkD3D12FenceSubmitInfoKHR](#) does. A D3D12 fence can be signaled by importing it into a [VkSemaphore](#) instead of a [VkFence](#), and applications can check status or wait on the D3D12 fence using non-Vulkan APIs. The convenience of being able to do these operations on [VkFence](#) objects does not justify the extra API complexity.

Description

An application may wish to reference device memory in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension enables an application to export POSIX file descriptor handles from Vulkan memory objects and to import Vulkan memory objects from POSIX file descriptor handles exported from other Vulkan memory objects or from similar resources in other APIs.

New Commands

- [vkGetMemoryFdKHR](#)
- [vkGetMemoryFdPropertiesKHR](#)

New Structures

- [VkMemoryFdPropertiesKHR](#)
- [VkMemoryGetFdInfoKHR](#)
- Extending [VkMemoryAllocateInfo](#):
 - [VkImportMemoryFdInfoKHR](#)

New Enum Constants

- [VK_KHR_EXTERNAL_MEMORY_FD_EXTENSION_NAME](#)
- [VK_KHR_EXTERNAL_MEMORY_FD_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR](#)
 - [VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR](#)

Issues

1) Does the application need to close the file descriptor returned by [vkGetMemoryFdKHR](#)?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the memory. A successful get call transfers ownership of the file descriptor to the application, and a successful import transfers it back to the driver. Destroying the original memory object will not close the file descriptor or remove its reference to the underlying memory resource associated with it.

2) Do drivers ever need to expose multiple file descriptors per memory object?

RESOLVED: No. This would indicate there are actually multiple memory objects, rather than a

single memory object.

3) How should the valid size and memory type for POSIX file descriptor memory handles created outside of Vulkan be specified?

RESOLVED: The valid memory types are queried directly from the external handle. The size will be specified by future extensions that introduce such external memory handle types.

Issues

1) Do applications need to call [CloseHandle\(\)](#) on the values returned from [vkGetMemoryWin32HandleKHR](#) when [handleType](#) is [VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR](#)?

RESOLVED: Yes, unless it is passed back in to another driver instance to import the object. A successful get call transfers ownership of the handle to the application. Destroying the memory object will not destroy the handle or the handle's reference to the underlying memory resource.

2) Should the language regarding KMT/Windows 7 handles be moved to a separate extension so that it can be deprecated over time?

RESOLVED: No. Support for them can be deprecated by drivers if they choose, by no longer

returning them in the supported handle types of the instance level queries.

3) How should the valid size and memory type for windows memory handles created outside of Vulkan be specified?

RESOLVED: The valid memory types are queried directly from the external handle. The size is determined by the associated image or buffer memory requirements for external handle types that require dedicated allocations, and by the size specified when creating the object from which the handle was exported for other external handle types.

Description

An application using external memory may wish to synchronize access to that memory using semaphores. This extension enables an application to export semaphore payload to and import semaphore payload from POSIX file descriptors.

New Commands

- [vkGetSemaphoreFdKHR](#)
- [vkImportSemaphoreFdKHR](#)

New Structures

- [VkImportSemaphoreFdInfoKHR](#)
- [VkSemaphoreGetFdInfoKHR](#)

New Enum Constants

- `VK_KHR_EXTERNAL_SEMAPHORE_FD_EXTENSION_NAME`
- `VK_KHR_EXTERNAL_SEMAPHORE_FD_SPEC_VERSION`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`
 - `VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR`

Issues

1) Does the application need to close the file descriptor returned by [vkGetSemaphoreFdKHR](#)?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the semaphore. A successful get call transfers ownership of the file descriptor to the application, and a successful import transfers it back to the driver. Destroying the original semaphore object will not close the file descriptor or remove its reference to the underlying semaphore resource associated with it.

 - [VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR](#)

Issues

1) Do applications need to call [CloseHandle\(\)](#) on the values returned from [vkGetSemaphoreWin32HandleKHR](#) when [handleType](#) is [VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR](#)?

RESOLVED: Yes, unless it is passed back in to another driver instance to import the object. A successful get call transfers ownership of the handle to the application. Destroying the semaphore object will not destroy the handle or the handle's reference to the underlying semaphore resource.

2) Should the language regarding KMT/Windows 7 handles be moved to a separate extension so that it can be deprecated over time?

RESOLVED: No. Support for them can be deprecated by drivers if they choose, by no longer returning them in the supported handle types of the instance level queries.

3) Should applications be allowed to specify additional object attributes for shared handles?

RESOLVED: Yes. Applications will be allowed to provide similar attributes to those they would to any other handle creation API.

4) How do applications communicate the desired fence values to use with [D3D12_FENCE](#)-based Vulkan semaphores?

RESOLVED: There are a couple of options. The values for the signaled and reset states could be communicated up front when creating the object and remain static for the life of the Vulkan semaphore, or they could be specified using auxiliary structures when submitting semaphore signal and wait operations, similar to what is done with the keyed mutex extensions. The latter is more flexible and consistent with the keyed mutex usage, but the former is a much simpler API.

Since Vulkan tends to favor flexibility and consistency over simplicity, a new structure specifying D3D12 fence acquire and release values is added to the [vkQueueSubmit](#) function.

- Contributors to the VK_NV_shading_rate_image specification
- Contributors to the VK_EXT_fragment_density_map specification

Description

This extension adds the ability to change the rate at which fragments are shaded. Rather than the usual single fragment invocation for each pixel covered by a primitive, multiple pixels can be shaded by a single fragment shader invocation.

Up to three methods are available to the application to change the fragment shading rate:

- [Pipeline Fragment Shading Rate](#), which allows the specification of a rate per-draw.
- [Primitive Fragment Shading Rate](#), which allows the specification of a rate per primitive, specified during shading.
- [Attachment Fragment Shading Rate](#), which allows the specification of a rate per-region of the framebuffer, specified in a specialized image attachment.

Additionally, these rates can all be specified and combined in order to adjust the overall detail in the image at each point.

This functionality can be used to focus shading efforts where higher levels of detail are needed in some parts of a scene compared to others. This can be particularly useful in high resolution rendering, or for XR contexts.

This extension also adds support for the [SPV_KHR_fragment_shading_rate](#) extension which enables setting the [primitive fragment shading rate](#), and allows querying the final shading rate from a fragment shader.

New Commands

Description

This extension provides new entry points to query device display properties and capabilities in a way that can be easily extended by other extensions, without introducing any further entry points. This extension can be considered the `VK_KHR_display` equivalent of the `VK_KHR_get_physical_device_properties2` extension.

New Commands

- [vkGetDisplayModeProperties2KHR](#)
- [vkGetDisplayPlaneCapabilities2KHR](#)
- [vkGetPhysicalDeviceDisplayPlaneProperties2KHR](#)
- [vkGetPhysicalDeviceDisplayProperties2KHR](#)

New Structures

- [VkDisplayModeProperties2KHR](#)
- [VkDisplayPlaneCapabilities2KHR](#)
- [VkDisplayPlaneInfo2KHR](#)
- [VkDisplayPlaneProperties2KHR](#)
- [VkDisplayProperties2KHR](#)

New Enum Constants

- [VK_KHR_GET_DISPLAY_PROPERTIES_2_EXTENSION_NAME](#)
- [VK_KHR_GET_DISPLAY_PROPERTIES_2_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR](#)
 - [VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR](#)

Issues

1) What should this extension be named?

RESOLVED: [VK_KHR_get_display_properties2](#). Other alternatives:

- [VK_KHR_display2](#)
- One extension, combined with [VK_KHR_surface_capabilities2](#).

2) Should extensible input structs be added for these new functions?

RESOLVED:

- [vkGetPhysicalDeviceDisplayProperties2KHR](#): No. The only current input is a [VkPhysicalDevice](#). Other inputs would not make sense.
- [vkGetPhysicalDeviceDisplayPlaneProperties2KHR](#): No. The only current input is a [VkPhysicalDevice](#). Other inputs would not make sense.

- [vkGetDisplayModeProperties2KHR](#): No. The only current inputs are a [VkPhysicalDevice](#) and a [VkDisplayModeKHR](#). Other inputs would not make sense.

3) Should additional display query functions be extended?

RESOLVED:

- [vkGetDisplayPlaneSupportedDisplaysKHR](#): No. Extensions should instead extend [vkGetDisplayPlaneCapabilitiesKHR\(\)](#).

Version History

Description

This extension provides new entry points to query device surface capabilities in a way that can be easily extended by other extensions, without introducing any further entry points. This extension can be considered the `VK_KHR_surface` equivalent of the `VK_KHR_get_physical_device_properties2` extension.

New Commands

- `vkGetPhysicalDeviceSurfaceCapabilities2KHR`
- `vkGetPhysicalDeviceSurfaceFormats2KHR`

New Structures

- `VkPhysicalDeviceSurfaceInfo2KHR`
- `VkSurfaceCapabilities2KHR`
- `VkSurfaceFormat2KHR`

New Enum Constants

- `VK_KHR_GET_SURFACE_CAPABILITIES_2_EXTENSION_NAME`
- `VK_KHR_GET_SURFACE_CAPABILITIES_2_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR`
 - `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`
 - `VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR`

Issues

1) What should this extension be named?

RESOLVED: `VK_KHR_get_surface_capabilities2`. Other alternatives:

- `VK_KHR_surface2`
- One extension, combining a separate display-specific query extension.

2) Should additional WSI query functions be extended?

RESOLVED:

- `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`: Yes. The need for this motivated the extension.
- `vkGetPhysicalDeviceSurfaceSupportKHR`: No. Currently only has boolean output. Extensions should instead extend `vkGetPhysicalDeviceSurfaceCapabilities2KHR`.

- [vkGetPhysicalDeviceSurfaceFormatsKHR](#): Yes.
- [vkGetPhysicalDeviceSurfacePresentModesKHR](#): No. Recent discussion concluded this introduced too much variability for applications to deal with. Extensions should instead extend [vkGetPhysicalDeviceSurfaceCapabilities2KHR](#).
- [vkGetPhysicalDeviceXlibPresentationSupportKHR](#): Not in this extension.
- [vkGetPhysicalDeviceXcbPresentationSupportKHR](#): Not in this extension.
- [vkGetPhysicalDeviceWaylandPresentationSupportKHR](#): Not in this extension.
- [vkGetPhysicalDeviceWin32PresentationSupportKHR](#): Not in this extension.

Version History

- Revision 1, 2017-02-27 (James Jones)
 - Initial draft.

VK_KHR_global_priority

Name String

`VK_KHR_global_priority`

Extension Type

Device extension

Other Extension Metadata

Last Modified Date

2021-10-22

Contributors

- Tobias Hector, AMD
- Contributors to [VK_EXT_global_priority](#)
- Contributors to [VK_EXT_global_priority_query](#)

Description

In Vulkan, users can specify device-scope queue priorities. In some cases it may be useful to extend this concept to a system-wide scope. This device extension allows applications to query the global queue priorities supported by a queue family, and then set a priority when creating queues. The default queue priority is `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`.

Implementations can report which global priority levels are treated differently by the implementation. It is intended primarily for use in system integration along with certain platform-specific priority enforcement rules.

The driver implementation will attempt to skew hardware resource allocation in favour of the higher-priority task. Therefore, higher-priority work may retain similar latency and throughput characteristics even if the system is congested with lower priority work.

The global priority level of a queue shall take precedence over the per-process queue priority (`VkDeviceQueueCreateInfo::pQueuePriorities`).

Abuse of this feature may result in starving the rest of the system from hardware resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (`VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`) if the caller does not have sufficient privileges. In this scenario `VK_ERROR_NOT_PERMITTED_EXT` is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

New Structures

- Extending `VkDeviceQueueCreateInfo`:
 - `VkDeviceQueueGlobalPriorityCreateInfoKHR`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR`
- Extending `VkQueueFamilyProperties2`:
 - `VkQueueFamilyGlobalPriorityPropertiesKHR`

New Enums

- `VkQueueGlobalPriorityKHR`

New Enum Constants

- `VK_KHR_GLOBAL_PRIORITY_EXTENSION_NAME`
- `VK_KHR_GLOBAL_PRIORITY_SPEC_VERSION`
- `VK_MAX_GLOBAL_PRIORITY_SIZE_KHR`
- Extending `VkResult`:

- `VK_ERROR_NOT_PERMITTED_KHR`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GLOBAL_PRIORITY_QUERY_FEATURES_KHR`
 - `VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR`

Issues

1) Can we additionally query whether a caller is permitted to acquire a specific global queue priority in this extension?

RESOLVED: No. Whether a caller has enough privilege goes with the OS, and the Vulkan driver cannot really guarantee that the privilege will not change in between this query and the actual queue creation call.

2) If more than 1 queue using global priority is requested, is there a good way to know which queue is failing the device creation?

RESOLVED: No. There is not a good way at this moment, and it is also not quite actionable for the applications to know that because the information may not be accurate. Queue creation can fail because of runtime constraints like insufficient privilege or lack of resource, and the failure is not necessarily tied to that particular queue configuration requested.

Version History

- Ray Smith, ARM
- Mika Isojarvi, Google
- Jeff Juliano, NVIDIA
- Jeff Bolz, NVIDIA

Description

This device extension extends `vkQueuePresentKHR`, from the `VK_KHR_swapchain` extension, allowing an application to specify a list of rectangular, modified regions of each image to present. This should be used in situations where an application is only changing a small portion of the presentable images within a swapchain, since it enables the presentation engine to avoid wasting time presenting parts of the surface that have not changed.

This extension is leveraged from the `EGL_KHR_swap_buffers_with_damage` extension.

New Structures

- `VkPresentRegionKHR`
- `VkRectLayerKHR`
- Extending `VkPresentInfoKHR`:
 - `VkPresentRegionsKHR`

New Enum Constants

- `VK_KHR_INCREMENTAL_PRESENT_EXTENSION_NAME`
- `VK_KHR_INCREMENTAL_PRESENT_SPEC_VERSION`

- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR`

Issues

1) How should we handle stereoscopic-3D swapchains? We need to add a layer for each rectangle. One approach is to create another struct containing the [VkRect2D](#) plus layer, and have [VkPresentRegionsKHR](#) point to an array of that struct. Another approach is to have two parallel arrays, `pRectangles` and `pLayers`, where `pRectangles[i]` and `pLayers[i]` must be used together. Which approach should we use, and if the array of a new structure, what should that be called?

RESOLVED: Create a new structure, which is a [VkRect2D](#) plus a layer, and will be called [VkRectLayerKHR](#).

2) Where is the origin of the [VkRectLayerKHR](#)?

RESOLVED: The upper left corner of the presentable image(s) of the swapchain, per the definition of framebuffer coordinates.

3) Does the rectangular region, [VkRectLayerKHR](#), specify pixels of the swapchain's image(s), or of the surface?

RESOLVED: Of the image(s). Some presentation engines may scale the pixels of a swapchain's image(s) to the size of the surface. The size of the swapchain's image(s) will be consistent, where the size of the surface may vary over time.

4) What if all of the rectangles for a given swapchain contain a width and/or height of zero?

RESOLVED: The application is indicating that no pixels changed since the last present. The presentation engine may use such a hint and not update any pixels for the swapchain. However, all other semantics of [vkQueuePresentKHR](#) must still be honored, including waiting for semaphores to signal.

5) When the swapchain is created with [VkSwapchainCreateInfoKHR::preTransform](#) set to a value other than `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, should the rectangular region, [VkRectLayerKHR](#), be transformed to align with the `preTransform`?

RESOLVED: No. The rectangular region in [VkRectLayerKHR](#) should not be tranformed. As such, it may not align with the extents of the swapchain's image(s). It is the responsibility of the presentation engine to transform the rectangular region. This matches the behavior of the Android presentation engine, which set the precedent.

Version History

- Revision 1, 2016-11-02 (Ian Elliott)
 - Internal revisions
- Revision 2, 2021-03-18 (Ian Elliott)
 - Clarified alignment of rectangles for presentation engines that support transformed

swapchains.

Description

The `VK_KHR_performance_query` extension adds a mechanism to allow querying of performance counters for use in applications and by profiling tools.

Each queue family **may** expose counters that **can** be enabled on a queue of that family. We extend `VkQueryType` to add a new query type for performance queries, and chain a structure on `VkQueryPoolCreateInfo` to specify the performance queries to enable.

New Commands

- [vkAcquireProfilingLockKHR](#)
- [vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR](#)
- [vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR](#)
- [vkReleaseProfilingLockKHR](#)

New Structures

- [VkAcquireProfilingLockInfoKHR](#)
- [VkPerformanceCounterDescriptionKHR](#)
- [VkPerformanceCounterKHR](#)
- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDevicePerformanceQueryFeaturesKHR](#)
- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDevicePerformanceQueryPropertiesKHR](#)
- Extending [VkQueryPoolCreateInfo](#):
 - [VkQueryPoolPerformanceCreateInfoKHR](#)
- Extending [VkSubmitInfo](#), [VkSubmitInfo2](#):
 - [VkPerformanceQuerySubmitInfoKHR](#)

New Unions

- [VkPerformanceCounterResultKHR](#)

New Enums

- [VkAcquireProfilingLockFlagBitsKHR](#)
- [VkPerformanceCounterDescriptionFlagBitsKHR](#)
- [VkPerformanceCounterScopeKHR](#)
- [VkPerformanceCounterStorageKHR](#)
- [VkPerformanceCounterUnitKHR](#)

New Bitmasks

- [VkAcquireProfilingLockFlagsKHR](#)
- [VkPerformanceCounterDescriptionFlagsKHR](#)

New Enum Constants

- [VK_KHR_PERFORMANCE_QUERY_EXTENSION_NAME](#)
- [VK_KHR_PERFORMANCE_QUERY_SPEC_VERSION](#)
- Extending [VkQueryType](#):
 - [VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR](#)
 - [VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR](#)
 - [VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_FEATURES_KHR](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_PROPERTIES_KHR](#)
 - [VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR](#)

Issues

1) Should this extension include a mechanism to begin a query in command buffer *A* and end the query in command buffer *B*?

RESOLVED No - queries are tied to command buffer creation and thus have to be encapsulated within a single command buffer.

2) Should this extension include a mechanism to begin and end queries globally on the queue, not using the existing command buffer commands?

RESOLVED No - for the same reasoning as the resolution of 1).

3) Should this extension expose counters that require multiple passes?

RESOLVED Yes - users should re-submit a command buffer with the same commands in it multiple times, specifying the pass to count as the query parameter in `VkPerformanceQuerySubmitInfoKHR`.

4) How to handle counters across parallel workloads?

RESOLVED In the spirit of Vulkan, a counter description flag `VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR` denotes that the accuracy of a counter result is affected by parallel workloads.

5) How to handle secondary command buffers?

RESOLVED Secondary command buffers inherit any counter pass index specified in the parent primary command buffer. Note: this is no longer an issue after change from issue 10 resolution

6) What commands does the profiling lock have to be held for?

RESOLVED For any command buffer that is being queried with a performance query pool, the profiling lock **must** be held while that command buffer is in the *recording*, *executable*, or *pending state*.

7) Should we support `vkCmdCopyQueryPoolResults`?

RESOLVED Yes.

8) Should we allow performance queries to interact with multiview?

RESOLVED Yes, but the performance queries must be performed once for each pass per view.

9) Should a `queryCount > 1` be usable for performance queries?

RESOLVED Yes. Some vendors will have costly performance counter query pool creation, and would rather if a certain set of counters were to be used multiple times that a `queryCount > 1` can be used to amortize the instantiation cost.

10) Should we introduce an indirect mechanism to set the counter pass index?

RESOLVED Specify the counter pass index at submit time instead, to avoid requiring re-recording of command buffers when multiple counter passes are needed.

Examples

The following example shows how to find what performance counters a queue family supports, setup a query pool to record these performance counters, how to add the query pool to the command buffer to record information, and how to get the results from the query pool.

```
// A previously created physical device
VkPhysicalDevice physicalDevice;

// One of the queue families our device supports
uint32_t queueFamilyIndex;
```

```

uint32_t counterCount;

// Get the count of counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    physicalDevice,
    queueFamilyIndex,
    &counterCount,
    NULL,
    NULL);

VkPerformanceCounterKHR* counters =
    malloc(sizeof(VkPerformanceCounterKHR) * counterCount);
VkPerformanceCounterDescriptionKHR* counterDescriptions =
    malloc(sizeof(VkPerformanceCounterDescriptionKHR) * counterCount);

// Get the counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    physicalDevice,
    queueFamilyIndex,
    &counterCount,
    counters,
    counterDescriptions);

// Try to enable the first 8 counters
uint32_t enabledCounters[8];

Description

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. This extension adds a mechanism to query properties and statistics about the different executables produced by the pipeline compilation process. This is intended to be used by debugging and performance tools to allow them to provide more detailed information to the user. Certain compile-time shader statistics provided through this extension may be useful to developers for debugging or performance analysis.

New Commands

- [vkGetPipelineExecutableInternalRepresentationsKHR](#)
- [vkGetPipelineExecutablePropertiesKHR](#)
- [vkGetPipelineExecutableStatisticsKHR](#)

New Structures

- [VkPipelineExecutableInfoKHR](#)
- [VkPipelineExecutableInternalRepresentationKHR](#)
- [VkPipelineExecutablePropertiesKHR](#)
- [VkPipelineExecutableStatisticKHR](#)
- [VkPipelineInfoKHR](#)
- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR](#)

New Unions

- [VkPipelineExecutableStatisticValueKHR](#)

New Enums

- [VkPipelineExecutableStatisticFormatKHR](#)

New Enum Constants

- `VK_KHR_PIPELINE_EXECUTABLE_PROPERTIES_EXTENSION_NAME`
- `VK_KHR_PIPELINE_EXECUTABLE_PROPERTIES_SPEC_VERSION`
- Extending `VkPipelineCreateFlagBits`:
 - `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`
 - `VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_EXECUTABLE_PROPERTIES_FEATURES_KHR`
 - `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR`
 - `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR`
 - `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR`
 - `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR`
 - `VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR`

Issues

1) What should we call the pieces of the pipeline which are produced by the compilation process and about which you can query properties and statistics?

RESOLVED: Call them “executables”. The name “binary” was used in early drafts of the extension but it was determined that “pipeline binary” could have a fairly broad meaning (such as a binary serialized form of an entire pipeline) and was too big of a namespace for the very specific needs of this extension.

Description

A pipeline library is a special pipeline that cannot be bound, instead it defines a set of shaders and shader groups which can be linked into other pipelines. This extension defines the infrastructure for pipeline libraries, but does not specify the creation or usage of pipeline libraries. This is left to additional dependent extensions.

Other Extension Metadata

Last Modified Date

2019-05-15

IP Status

No known IP claims.

Contributors

- Keith Packard, Valve
- Ian Elliott, Google
- Tobias Hector, AMD
- Daniel Stone, Collabora

Description

This device extension allows an application that uses the `VK_KHR_swapchain` extension to wait for present operations to complete. An application can use this to monitor and control the pacing of the application by managing the number of outstanding images yet to be presented.

New Commands

- `vkWaitForPresentKHR`

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDevicePresentWaitFeaturesKHR`

New Enum Constants

- `VK_KHR_PRESENT_WAIT_EXTENSION_NAME`
- `VK_KHR_PRESENT_WAIT_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_WAIT_FEATURES_KHR`

Issues

1) When does the wait finish?

RESOLVED. The wait will finish when the present is visible to the user. There is no requirement for any precise timing relationship between the presentation of the image to the user, but implementations **should** signal the wait as close as possible to the presentation of the first pixel in the new image to the user.

2) Should this use fences or other existing synchronization mechanism.

RESOLVED. Because display and rendering are often implemented in separate drivers, this extension will provide a separate synchronization API.

3) Should this extension share present identification with other extensions?

RESOLVED. Yes. A new extension, `VK_KHR_present_id`, should be created to provide a shared structure for presentation identifiers.

4) What happens when presentations complete out of order wrt calls to vkQueuePresent? This could happen if the semaphores for the presentations were ready out of order.

OPTION A: Require that when a PresentId is set that the driver ensure that images are always presented in the order of calls to vkQueuePresent.

OPTION B: Finish both waits when the earliest present completes. This will complete the later present wait earlier than the actual presentation. This should be the easiest to implement as the driver need only track the largest present ID completed. This is also the 'natural' consequence of interpreting the existing vkWaitForPresentKHR specificationn.

OPTION C: Finish both waits when both have completed. This will complete the earlier presentation later than the actual presentation time. This is allowed by the current specification as there is no precise timing requirement for when the presentId value is updated. This requires slightly more complexity in the driver as it will need to track all outstanding presentId values.

Description

Rasterization has been the dominant method to produce interactive graphics, but increasing performance of graphics hardware has made ray tracing a viable option for interactive rendering. Being able to integrate ray tracing with traditional rasterization makes it easier for applications to incrementally add ray traced effects to existing applications or to do hybrid approaches with rasterization for primary visibility and ray tracing for secondary queries.

Ray queries are available to all shader types, including graphics, compute and ray tracing pipelines. Ray queries are not able to launch additional shaders, instead returning traversal results to the calling shader.

This extension adds support for the following SPIR-V extension in Vulkan:

- [SPV_KHR_ray_query](#)

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceRayQueryFeaturesKHR](#)

New Enum Constants

- [VK_KHR_RAY_QUERY_EXTENSION_NAME](#)
- [VK_KHR_RAY_QUERY_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_QUERY_FEATURES_KHR](#)

New SPIR-V Capabilities

- [RayQueryKHR](#)
- [RayTraversalPrimitiveCullingKHR](#)

Sample Code

Example of ray query in a GLSL shader

```

rayQueryEXT rq;

rayQueryInitializeEXT(rq, accStruct, gl_RayFlagsNoneEXT, 0, origin, tMin, direction,
tMax);

while(rayQueryProceedEXT(rq)) {
    if (rayQueryGetIntersectionTypeEXT(rq, false) ==
gl_RayQueryCandidateIntersectionTriangleEXT) {
        //...
        rayQueryConfirmIntersectionEXT(rq);
    }
}

if (rayQueryGetIntersectionTypeEXT(rq, true) ==
gl_RayQueryCommittedIntersectionNoneEXT) {
    //...
}

```

Issues

(1) What are the changes between the public provisional (VK_KHR_ray_tracing v8) release and the final (VK_KHR_acceleration_structure v11 / VK_KHR_ray_query v1) release?

- refactor VK_KHR_ray_tracing into 3 extensions, enabling implementation flexibility and decoupling ray query support from ray pipelines:
 - [VK_KHR_acceleration_structure](#) (for acceleration structure operations)
 - [VK_KHR_ray_tracing_pipeline](#) (for ray tracing pipeline and shader stages)
 - [VK_KHR_ray_query](#) (for ray queries in existing shader stages)
- Update SPIRV capabilities to use [RayQueryKHR](#)
- extension is no longer provisional

Version History

- Revision 1, 2020-11-12 (Mathieu Robart, Daniel Koch, Andrew Garrard)
 - Decomposition of the specification, from VK_KHR_ray_tracing to VK_KHR_ray_query (#1918,!3912)
 - update to use [RayQueryKHR](#) SPIR-V capability
 - add numerical limits for ray parameters (#2235,!3960)
 - relax formula for ray intersection candidate determination (#2322,!4080)
 - restrict traces to TLAS (#2239,!4141)
 - require [HitT](#) to be in ray interval for [OpRayQueryGenerateIntersectionKHR](#) (#2359,!4146)
 - add ray query shader stages for AS read bit (#2407,!4203)

Description

Rasterization has been the dominant method to produce interactive graphics, but increasing performance of graphics hardware has made ray tracing a viable option for interactive rendering. Being able to integrate ray tracing with traditional rasterization makes it easier for applications to incrementally add ray traced effects to existing applications or to do hybrid approaches with rasterization for primary visibility and ray tracing for secondary queries.

To enable ray tracing, this extension adds a few different categories of new functionality:

- A new ray tracing pipeline type with new shader domains: ray generation, intersection, any-hit, closest hit, miss, and callable
- A shader binding indirection table to link shader groups with acceleration structure items
- Ray tracing commands which initiate the ray pipeline traversal and invocation of the various new shader domains depending on which traversal conditions are met

This extension adds support for the following SPIR-V extension in Vulkan:

- [SPV_KHR_ray_tracing](#)

New Commands

- [vkCmdSetRayTracingPipelineStackSizeKHR](#)
- [vkCmdTraceRaysIndirectKHR](#)
- [vkCmdTraceRaysKHR](#)
- [vkCreateRayTracingPipelinesKHR](#)

- `HitKindKHR`
- `IncomingRayFlagsKHR`
- `RayGeometryIndexKHR`
- (modified) `PrimitiveId`

New SPIR-V Capabilities

- `RayTracingKHR`
- `RayTraversalPrimitiveCullingKHR`

Issues

(1) How does this extension differ from `VK_NV_ray_tracing`?

DISCUSSION:

The following is a summary of the main functional differences between `VK_KHR_ray_tracing_pipeline` and `VK_NV_ray_tracing`:

- added support for indirect ray tracing (`vkCmdTraceRaysIndirectKHR`)
- uses SPV_KHR_ray_tracing instead of SPV_NV_ray_tracing
 - refer to KHR SPIR-V enums instead of NV SPIR-V enums (which are functionally equivalent and aliased to the same values).

- added `RayGeometryIndexKHR` built-in
- removed `vkCompileDeferredNV` compilation functionality and replaced with `deferred host operations` interactions for ray tracing
- added `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` structure
- extended `VkPhysicalDeviceRayTracingPipelinePropertiesKHR` structure
 - renamed `maxRecursionDepth` to `maxRayRecursionDepth` and it has a minimum of 1 instead of 31
 - require `shaderGroupHandleSize` to be 32 bytes
 - added `maxRayDispatchInvocationCount`, `shaderGroupHandleAlignment` and `maxRayHitAttributeSize`
- reworked geometry structures so they could be better shared between device, host, and indirect builds
- changed SBT parameters to a structure and added size (`VkStridedDeviceAddressRegionKHR`)
- add parameter for requesting memory requirements for host and/or device build
- added `pipeline library` support for ray tracing
- added `watertightness guarantees`
- added no-null-shader pipeline flags (`VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_*_SHADERS_BIT_KHR`)
- added `memory model interactions` with ray tracing and define how subgroups work and can be repacked

(2) Can you give a more detailed comparision of differences and similarities between `VK_NV_ray_tracing` and `VK_KHR_ray_tracing_pipeline`?

DISCUSSION:

The following is a more detailed comparision of which commands, structures, and enums are aliased, changed, or removed.

- Aliased functionality — enums, structures, and commands that are considered equivalent:
 - `VkRayTracingShaderGroupTypeNV` ↔ `VkRayTracingShaderGroupTypeKHR`
 - `vkGetRayTracingShaderGroupHandlesNV` ↔ `vkGetRayTracingShaderGroupHandlesKHR`
- Changed enums, structures, and commands:
 - `VkRayTracingShaderGroupCreateInfoNV` → `VkRayTracingShaderGroupCreateInfoKHR` (added `pShaderGroupCaptureReplayHandle`)
 - `VkRayTracingPipelineCreateInfoNV` → `VkRayTracingPipelineCreateInfoKHR` (changed type of `pGroups`, added `libraries`, `pLibraryInterface`, and `pDynamicState`)
 - `VkPhysicalDeviceRayTracingPropertiesNV` → `VkPhysicalDeviceRayTracingPropertiesKHR` (renamed `maxTriangleCount` to `maxPrimitiveCount`, added `shaderGroupHandleCaptureReplaySize`)
 - `vkCmdTraceRaysNV` → `vkCmdTraceRaysKHR` (params to struct)
 - `vkCreateRayTracingPipelinesNV` → `vkCreateRayTracingPipelinesKHR` (different struct, changed functionality)

- Added enums, structures and commands:

- `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`
`VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR,`
`VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR,`
`VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR,`
`VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR,`
`VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` to `VkPipelineCreateFlagBits`
- `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` structure
- `VkDeviceOrHostAddressKHR` and `VkDeviceOrHostAddressConstKHR` unions
- `VkPipelineLibraryCreateInfoKHR` struct
- `VkRayTracingPipelineInterfaceCreateInfoKHR` struct
- `VkStridedDeviceAddressRegionKHR` struct
- `vkCmdTraceRaysIndirectKHR` command and `VkTraceRaysIndirectCommandKHR` struct
- `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR` (shader group capture/replay)
- `vkCmdSetRayTracingPipelineStackSizeKHR` and `vkGetRayTracingShaderGroupStackSizeKHR` commands for stack size control

- Functionality removed:

- `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV`
- `vkCompileDeferredNV` command (replaced with `VK_KHR_deferred_host_operations`)

(3) What are the changes between the public provisional (`VK_KHR_ray_tracing` v8) release and the internal provisional (`VK_KHR_ray_tracing` v9) release?

- Require Vulkan 1.1 and SPIR-V 1.4
- Added interactions with Vulkan 1.2 and `VK_KHR_vulkan_memory_model`
- added creation time capture and replay flags
 - added `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR` to `VkPipelineCreateFlagBits`
- replace `VkStridedBufferRegionKHR` with `VkStridedDeviceAddressRegionKHR` and change `vkCmdTraceRaysKHR`, `vkCmdTraceRaysIndirectKHR`, to take these for the shader binding table and use device addresses instead of buffers.
- require the shader binding table buffers to have the `VK_BUFFER_USAGE_RAY_TRACING_BIT_KHR` set
- make `VK_KHR_pipeline_library` an interaction instead of required extension
- rename the `libraries` member of `VkRayTracingPipelineCreateInfoKHR` to `pLibraryInfo` and make it a pointer
- make `VK_KHR_deferred_host_operations` an interaction instead of a required extension (later went back on this)
- added explicit stack size management for ray tracing pipelines
 - removed the `maxCallableSize` member of `VkRayTracingPipelineInterfaceCreateInfoKHR`

- added the `pDynamicState` member to `VkRayTracingPipelineCreateInfoKHR`
- added `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state for ray tracing pipelines
- added `vkGetRayTracingShaderGroupStackSizeKHR` and `vkCmdSetRayTracingPipelineStackSizeKHR` commands
- added `VkShaderGroupShaderKHR` enum
- Added `maxRayDispatchInvocationCount` limit to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`
- Added `shaderGroupHandleAlignment` property to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`
- Added `maxRayHitAttributeSize` property to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`
- Clarify deferred host ops for pipeline creation
 - `VkDeferredOperationKHR` is now a top-level parameter for `vkCreateRayTracingPipelinesKHR`
 - removed `VkDeferredOperationInfoKHR` structure
 - change deferred host creation/return parameter behavior such that the implementation can modify such parameters until the deferred host operation completes
 - `VK_KHR_deferred_host_operations` is required again

(4) What are the changes between the internal provisional (VK_KHR_ray_tracing v9) release and the final (VK_KHR_acceleration_structure v11 / VK_KHR_ray_tracing_pipeline v1) release?

- refactor `VK_KHR_ray_tracing` into 3 extensions, enabling implementation flexibility and decoupling ray query support from ray pipelines:
 - `VK_KHR_acceleration_structure` (for acceleration structure operations)
 - `VK_KHR_ray_tracing_pipeline` (for ray tracing pipeline and shader stages)
 - `VK_KHR_ray_query` (for ray queries in existing shader stages)
- Require `Volatile` for the following builtins in the ray generation, closest hit, miss, intersection, and callable shader stages:
 - `SubgroupSize`, `SubgroupLocalInvocationId`, `SubgroupEqMask`, `SubgroupGeMask`, `SubgroupGtMask`, `SubgroupLeMask`, `SubgroupLtMask`
 - `SMIDNV`, `WarpIDNV`
- clarify buffer usage flags for ray tracing
 - `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` is added as an alias of `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` and is required on shader binding table buffers
 - `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` is used in `VK_KHR_acceleration_structure` for `scratchData`
- rename `maxRecursionDepth` to `maxRayPipelineRecursionDepth` (pipeline creation) and `maxRayRecursionDepth` (limit) to reduce confusion
- Add queryable `maxRayHitAttributeSize` limit and rename members of `VkRayTracingPipelineInterfaceCreateInfoKHR` to `maxPipelineRayPayloadSize` and

`maxPipelineRayHitAttributeSize` for clarity

- Update SPIRV capabilities to use `RayTracingKHR`
- extension is no longer provisional
- define synchronization requirements for indirect trace rays and indirect buffer

(5) This extension adds `gl_InstanceID` for the intersection, any-hit, and closest hit shaders, but in `KHR_vulkan_glsl`, `gl_InstanceID` is replaced with `gl_InstanceIndex`. Which should be used for Vulkan in this extension?

RESOLVED: This extension uses `gl_InstanceID` and maps it to `InstanceId` in SPIR-V. It is acknowledged that this is different than other shader stages in Vulkan. There are two main reasons for the difference here:

- symmetry with `gl_PrimitiveID` which is also available in these shaders
- there is no “baseInstance” relevant for these shaders, and so ID makes it more obvious that this is zero-based.

Sample Code

Example ray generation GLSL shader

```
#version 450 core
#extension GL_EXT_ray_tracing : require
layout(set = 0, binding = 0, rgba8) uniform image2D image;
layout(set = 0, binding = 1) uniform accelerationStructureEXT as;
layout(location = 0) rayPayloadEXT float payload;

void main()
{
    vec4 col = vec4(0, 0, 0, 1);

    vec3 origin = vec3(float(gl_LaunchIDEXT.x)/float(gl_LaunchSizeEXT.x), float(gl_LaunchIDEXT.y)/float(gl_LaunchSizeEXT.y), 1.0);
    vec3 dir = vec3(0.0, 0.0, -1.0);

    traceRayEXT(as, 0, 0xff, 0, 1, 0, origin, 0.0, dir, 1000.0, 0);

    col.y = payload;

    imageStore(image, ivec2(gl_LaunchIDEXT.xy), col);
}
```

Version History

- Revision 1, 2020-11-12 (Mathieu Robart, Daniel Koch, Eric Werness, Tobias Hector)
 - Decomposition of the specification, from `VK_KHR_ray_tracing` to `VK_KHR_ray_tracing_pipeline` (#1918,!3912)

- require certain subgroup and sm_shader_builtin shader builtins to be decorated as volatile in the ray generation, closest hit, miss, intersection, and callable stages (#1924,!3903,!3954)
- clarify buffer usage flags for ray tracing (#2181,!3939)
- rename maxRecursionDepth to maxRayPipelineRecursionDepth and maxRayRecursionDepth (#2203,!3937)
- add queriable maxRayHitAttributeSize and rename members of VkRayTracingPipelineInterfaceCreateInfoKHR (#2102,!3966)
- update to use [RayTracingKHR](#) SPIR-V capability
- add VUs for matching hit group type against geometry type (#2245,!3994)
- require [RayTMaxKHR](#) be volatile in intersection shaders (#2268,!4030)
- add numerical limits for ray parameters (#2235,!3960)
- fix SBT indexing rules for device addresses (#2308,!4079)
- relax formula for ray intersection candidate determination (#2322,!4080)
- add more details on [ShaderRecordBufferKHR](#) variables (#2230,!4083)
- clarify valid bits for [InstanceCustomIndexKHR](#) (GLSL/GLSL#19,!4128)
- allow at most one [IncomingRayPayloadKHR](#), [IncomingCallableDataKHR](#), and [HitAttributeKHR](#) (!4129)
- add minimum for maxShaderGroupStride (#2353,!4131)
- require VK_KHR_pipeline_library extension to be supported (#2348,!4135)
- clarify meaning of 'geometry index' (#2272,!4137)
- restrict traces to TLAS (#2239,!4141)
- add note about maxPipelineRayPayloadSize (#2383,!4172)
- do not require raygen shader in pipeline libraries (!4185)
- define sync for indirect trace rays and indirect buffer (#2407,!4208)

- Daniel Koch, NVIDIA

Description

This extension advertises the SPIR-V [ShaderClockKHR](#) capability for Vulkan, which allows a shader to query a real-time or monotonically incrementing counter at the subgroup level or across the device level. The two valid SPIR-V scopes for [OpReadClockKHR](#) are [Subgroup](#) and [Device](#).

When using GLSL source-based shading languages, the [clockRealtime*EXT\(\)](#) timing functions map to the [OpReadClockKHR](#) instruction with a scope of [Device](#), and the [clock*ARB\(\)](#) timing functions map to the [OpReadClockKHR](#) instruction with a scope of [Subgroup](#).

- This extension requires [SPV_KHR_subgroup_uniform_control_flow](#)
- This extension provides API support for [GL_EXT_subgroupuniform_qualifier](#)

Contributors

- Alan Baker, Google
- Jeff Bolz, NVIDIA

Description

This extension allows the use of the `SPV_KHR_subgroup_uniform_control_flow` SPIR-V extension in shader modules. `SPV_KHR_subgroup_uniform_control_flow` provides stronger guarantees that diverged subgroups will reconverge.

Developers should utilize this extension if they use subgroup operations to reduce the work performed by a uniform subgroup. This extension will guarantee that uniform subgroup will reconverge in the same manner as invocation groups (see “Uniform Control Flow” in the [Kronos SPIR-V Specification](#)).

Description

This extension extends [VK_KHR_swapchain](#) to enable creation of a shared presentable image. This allows the application to use the image while the presentation engine is accessing it, in order to reduce the latency between rendering and presentation.

New Commands

- [vkGetSwapchainStatusKHR](#)

New Structures

- Extending [VkSurfaceCapabilities2KHR](#):
 - [VkSharedPresentSurfaceCapabilitiesKHR](#)

New Enum Constants

- `VK_KHR_SHARED_PRESENTABLE_IMAGE_EXTENSION_NAME`
- `VK_KHR_SHARED_PRESENTABLE_IMAGE_SPEC_VERSION`
- Extending `VkImageLayout`:
 - `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- Extending `VkPresentModeKHR`:
 - `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`
 - `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

Issues

1) Should we allow a Vulkan WSI swapchain to toggle between normal usage and shared presentation usage?

RESOLVED: No. WSI swapchains are typically recreated with new properties instead of having their properties changed. This can also save resources, assuming that fewer images are needed for shared presentation, and assuming that most VR applications do not need to switch between normal and shared usage.

2) Should we have a query for determining how the presentation engine refresh is triggered?

RESOLVED: Yes. This is done via which presentation modes a surface supports.

3) Should the object representing a shared presentable image be an extension of a `VkSwapchainKHR` or a separate object?

RESOLVED: Extension of a swapchain due to overlap in creation properties and to allow common functionality between shared and normal presentable images and swapchains.

4) What should we call the extension and the new structures it creates?

RESOLVED: Shared presentable image / shared present.

5) Should the `minImageCount` and `presentMode` values of the `VkSwapchainCreateInfoKHR` be ignored, or required to be compatible values?

RESOLVED: `minImageCount` must be set to 1, and `presentMode` should be set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

6) What should the layout of the shared presentable image be?

RESOLVED: After acquiring the shared presentable image, the application must transition it to the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout prior to it being used. After this initial transition, any image usage that was requested during swapchain creation **can** be performed on the image

without layout transitions being performed.

7) Do we need a new API for the trigger to refresh new content?

RESOLVED: `vkQueuePresentKHR` to act as API to trigger a refresh, as will allow combination with other compatible extensions to `vkQueuePresentKHR`.

8) How should an application detect a `VK_ERROR_OUT_OF_DATE_KHR` error on a swapchain using the `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` present mode?

RESOLVED: Introduce `vkGetSwapchainStatusKHR` to allow applications to query the status of a swapchain using a shared presentation mode.

9) What should subsequent calls to `vkQueuePresentKHR` for `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` swapchains be defined to do?

RESOLVED: State that implementations may use it as a hint for updated content.

10) Can the ownership of a shared presentable image be transferred to a different queue?

RESOLVED: No. It is not possible to transfer ownership of a shared presentable image obtained from a swapchain created using `VK_SHARING_MODE_EXCLUSIVE` after it has been presented.

11) How should `vkQueueSubmit` behave if a command buffer uses an image from a `VK_ERROR_OUT_OF_DATE_KHR` swapchain?

RESOLVED: `vkQueueSubmit` is expected to return the `VK_ERROR_DEVICE_LOST` error.

12) Can Vulkan provide any guarantee on the order of rendering, to enable beam chasing?

RESOLVED: This could be achieved via use of render passes to ensure strip rendering.

Description

The `VK_KHR_surface` extension is an instance extension. It introduces `VkSurfaceKHR` objects, which abstract native platform surface or window objects for use with Vulkan. It also provides a way to determine whether a queue family in a physical device supports presenting to particular surface.

Separate extensions for each platform provide the mechanisms for creating `VkSurfaceKHR` objects, but once created they may be used in this and other platform-independent extensions, in particular the `VK_KHR_swapchain` extension.

Examples

Note

The example code for the `VK_KHR_surface` and `VK_KHR_swapchain` extensions was removed from the appendix after revision 1.0.29. This WSI example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: <https://github.com/KhronosGroup/Vulkan-Tools/blob/master/cube/cube.c>).

Issues

1) Should this extension include a method to query whether a physical device supports presenting to a specific window or native surface on a given platform?

RESOLVED: Yes. Without this, applications would need to create a device instance to determine whether a particular window can be presented to. Knowing that a device supports presentation to a platform in general is not sufficient, as a single machine might support multiple seats, or instances of the platform that each use different underlying physical devices. Additionally, on some platforms, such as the X Window System, different drivers and devices might be used for different windows depending on which section of the desktop they exist on.

2) Should the `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, `vkGetPhysicalDeviceSurfaceFormatsKHR`, and `vkGetPhysicalDeviceSurfacePresentModesKHR` functions be in this extension and operate on physical devices, rather than being in `VK_KHR_swapchain` (i.e. device extension) and being dependent on `VkDevice`?

RESOLVED: Yes. While it might be useful to depend on `VkDevice` (and therefore on enabled extensions and features) for the queries, Vulkan was released only with the `VkPhysicalDevice` versions. Many cases can be resolved by a Valid Usage statement, and/or by a separate `pNext` chain version of the query struct specific to a given extension or parameters, via extensible versions of the queries: `vkGetPhysicalDeviceSurfacePresentModes2EXT`, `vkGetPhysicalDeviceSurfaceCapabilities2KHR`, and `vkGetPhysicalDeviceSurfaceFormats2KHR`.

3) Should Vulkan support Xlib or XCB as the API for accessing the X Window System platform?

RESOLVED: Both. XCB is a more modern and efficient API, but Xlib usage is deeply ingrained in many applications and likely will remain in use for the foreseeable future. Not all drivers necessarily need to support both, but including both as options in the core specification will probably encourage support, which should in turn ease adoption of the Vulkan API in older codebases. Additionally, the performance improvements possible with XCB likely will not have a measurable impact on the performance of Vulkan presentation and other minimal window system interactions defined here.

4) Should the GBM platform be included in the list of platform enums?

RESOLVED: Deferred, and will be addressed with a platform-specific extension to be written in the future.

Version History

- Revision 1, 2015-05-20 (James Jones)
 - Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
- Revision 2, 2015-05-22 (Ian Elliott)
 - Created initial Description section.
 - Removed query for whether a platform requires the use of a queue for presentation, since it was decided that presentation will always be modeled as being part of the queue.
 - Fixed typos and other minor mistakes.

- Revision 3, 2015-05-26 (Ian Elliott)
 - Improved the Description section.
- Revision 4, 2015-05-27 (James Jones)
 - Fixed compilation errors in example code.
- Revision 5, 2015-06-01 (James Jones)
 - Added issues 1 and 2 and made related spec updates.
- Revision 6, 2015-06-01 (James Jones)
 - Merged the platform type mappings table previously removed from VK_KHR_swapchain with the platform description table in this spec.
 - Added issues 3 and 4 documenting choices made when building the initial list of native platforms supported.
- Revision 7, 2015-06-11 (Ian Elliott)
 - Updated table 1 per input from the KHR TSG.
 - Updated issue 4 (GBM) per discussion with Daniel Stone. He will create a platform-specific extension sometime in the future.
- Revision 8, 2015-06-17 (James Jones)
 - Updated enum-extending values using new convention.
 - Fixed the value of VK_SURFACE_PLATFORM_INFO_TYPE_SUPPORTED_KHR.
- Revision 9, 2015-06-17 (James Jones)
 - Rebased on Vulkan API version 126.
- Revision 10, 2015-06-18 (James Jones)
 - Marked issues 2 and 3 resolved.
- Revision 11, 2015-06-23 (Ian Elliott)
 - Examples now show use of function pointers for extension functions.
 - Eliminated extraneous whitespace.
- Revision 12, 2015-07-07 (Daniel Rakos)
 - Added error section describing when each error is expected to be reported.
 - Replaced the term “queue node index” with “queue family index” in the spec as that is the agreed term to be used in the latest version of the core header and spec.
 - Replaced bool32_t with VkBool32.
- Revision 13, 2015-08-06 (Daniel Rakos)
 - Updated spec against latest core API header version.
- Revision 14, 2015-08-20 (Ian Elliott)
 - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
 - Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the

header file.

- Did miscellaneous cleanup, etc.
- Revision 15, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)
 - Moved the surface transform enums here from VK_WSI_swapchain so they could be reused by VK_WSI_display.
- Revision 16, 2015-09-01 (James Jones)
 - Restore single-field revision number.
- Revision 17, 2015-09-01 (James Jones)
 - Fix example code compilation errors.
- Revision 18, 2015-09-26 (Jesse Hall)
 - Replaced VkSurfaceDescriptionKHR with the VkSurfaceKHR object, which is created via layered extensions. Added VkDestroySurfaceKHR.
- Revision 19, 2015-09-28 (Jesse Hall)
 - Renamed from VK_EXT_KHR_swapchain to VK_EXT_KHR_surface.
- Revision 20, 2015-09-30 (Jeff Vigil)
 - Add error result VK_ERROR_SURFACE_LOST_KHR.
- Revision 21, 2015-10-15 (Daniel Rakos)
 - Updated the resolution of issue #2 and include the surface capability queries in this extension.
 - Renamed SurfaceProperties to SurfaceCapabilities as it better reflects that the values returned are the capabilities of the surface on a particular device.
 - Other minor cleanup and consistency changes.
- Revision 22, 2015-10-26 (Ian Elliott)
 - Renamed from VK_EXT_KHR_surface to VK_KHR_surface.
- Revision 23, 2015-11-03 (Daniel Rakos)
 - Added allocation callbacks to vkDestroySurfaceKHR.
- Revision 24, 2015-11-10 (Jesse Hall)
 - Removed VkSurfaceTransformKHR. Use VkSurfaceTransformFlagBitsKHR instead.
 - Rename VkSurfaceCapabilitiesKHR member maxImageArraySize to maxImageArrayLayers.
- Revision 25, 2016-01-14 (James Jones)
 - Moved VK_ERROR_NATIVE_WINDOW_IN_USE_KHR from the VK_KHR_android_surface to the VK_KHR_surface extension.
- 2016-08-23 (Ian Elliott)
 - Update the example code, to not have so many characters per line, and to split out a new example to show how to obtain function pointers.
- 2016-08-25 (Ian Elliott)

- A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.

Description

This extension extends `VkSurfaceCapabilities2KHR`, providing applications a way to query whether swapchains **can** be created with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set.

Vulkan 1.1 added (optional) support for protect memory and protected resources including buffers (`VK_BUFFER_CREATE_PROTECTED_BIT`), images (`VK_IMAGE_CREATE_PROTECTED_BIT`), and swapchains (`VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR`). However, on implementations which support multiple windowing systems, not all window systems **may** be able to provide a protected display path.

This extension provides a way to query if a protected swapchain created for a surface (and thus a specific windowing system) **can** be displayed on screen. It extends the existing `VkSurfaceCapabilities2KHR` structure with a new `VkSurfaceProtectedCapabilitiesKHR` structure from which the application **can** obtain information about support for protected swapchain creation through `vkGetPhysicalDeviceSurfaceCapabilities2KHR`.

New Structures

- Extending `VkSurfaceCapabilities2KHR`:
 - `VkSurfaceProtectedCapabilitiesKHR`

New Enum Constants

- `VK_KHR_SURFACE_PROTECTED_CAPABILITIES_EXTENSION_NAME`
- `VK_KHR_SURFACE_PROTECTED_CAPABILITIES_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`

Version History

- Revision 1, 2018-12-18 (Sandeep Shinde, Daniel Koch)
 - Internal revisions.

`VK_KHR_swapchain`

Name String

`VK_KHR_swapchain`

Extension Type

Device extension

Registered Extension Number

2

Revision

70

Extension and Version Dependencies

- Requires Vulkan 1.0
- Requires `VK_KHR_surface`

Description

The `VK_KHR_swapchain` extension is the device-level companion to the `VK_KHR_surface` extension. It introduces `VkSwapchainKHR` objects, which provide the ability to present rendering results to a surface.

New Object Types

- `VkSwapchainKHR`

New Commands

- `vkAcquireNextImageKHR`
- `vkCreateSwapchainKHR`

- [vkDestroySwapchainKHR](#)
- [vkGetSwapchainImagesKHR](#)
- [vkQueuePresentKHR](#)

If [Version 1.1](#) is supported:

- [vkAcquireNextImage2KHR](#)
- [vkGetDeviceGroupPresentCapabilitiesKHR](#)
- [vkGetDeviceGroupSurfacePresentModesKHR](#)
- [vkGetPhysicalDevicePresentRectanglesKHR](#)

New Structures

- [VkPresentInfoKHR](#)
- [VkSwapchainCreateInfoKHR](#)

If [Version 1.1](#) is supported:

- [VkAcquireNextImageInfoKHR](#)
- [VkDeviceGroupPresentCapabilitiesKHR](#)
- Extending [VkBindImageMemoryInfo](#):
 - [VkBindImageMemorySwapchainInfoKHR](#)
- Extending [VkImageCreateInfo](#):
 - [VkImageSwapchainCreateInfoKHR](#)
- Extending [VkPresentInfoKHR](#):
 - [VkDeviceGroupPresentInfoKHR](#)
- Extending [VkSwapchainCreateInfoKHR](#):
 - [VkDeviceGroupSwapchainCreateInfoKHR](#)

New Enums

- [VkSwapchainCreateFlagBitsKHR](#)

If [Version 1.1](#) is supported:

- [VkDeviceGroupPresentModeFlagBitsKHR](#)

New Bitmasks

- [VkSwapchainCreateFlagsKHR](#)

If [Version 1.1](#) is supported:

- [VkDeviceGroupPresentModeFlagsKHR](#)

New Enum Constants

- `VK_KHR_SWAPCHAIN_EXTENSION_NAME`
- `VK_KHR_SWAPCHAIN_SPEC_VERSION`
- Extending `VkImageLayout`:
 - `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- Extending `VkObjectType`:
 - `VK_OBJECT_TYPE_SWAPCHAIN_KHR`
- Extending `VkResult`:
 - `VK_ERROR_OUT_OF_DATE_KHR`
 - `VK_SUBOPTIMAL_KHR`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PRESENT_INFO_KHR`
 - `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`

If Version 1.1 is supported:

- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR`
 - `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR`
 - `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`
 - `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`
 - `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
 - `VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR`
- Extending `VkSwapchainCreateFlagBitsKHR`:
 - `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR`
 - `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`

Issues

1) Does this extension allow the application to specify the memory backing of the presentable images?

RESOLVED: No. Unlike standard images, the implementation will allocate the memory backing of the presentable image.

2) What operations are allowed on presentable images?

RESOLVED: This is determined by the image usage flags specified when creating the presentable image's swapchain.

3) Does this extension support MSAA presentable images?

RESOLVED: No. Presentable images are always single-sampled. Multi-sampled rendering must use regular images. To present the rendering results the application must manually resolve the multi-sampled image to a single-sampled presentable image prior to presentation.

4) Does this extension support stereo/multi-view presentable images?

RESOLVED: Yes. The number of views associated with a presentable image is determined by the `imageArrayLayers` specified when creating a swapchain. All presentable images in a given swapchain use the same array size.

5) Are the layers of stereo presentable images half-sized?

RESOLVED: No. The image extents always match those requested by the application.

6) Do the “present” and “acquire next image” commands operate on a queue? If not, do they need to include explicit semaphore objects to interlock them with queue operations?

RESOLVED: The present command operates on a queue. The image ownership operation it represents happens in order with other operations on the queue, so no explicit semaphore object is required to synchronize its actions.

Applications may want to acquire the next image in separate threads from those in which they manage their queue, or in multiple threads. To make such usage easier, the acquire next image command takes a semaphore to signal as a method of explicit synchronization. The application must later queue a wait for this semaphore before queuing execution of any commands using the image.

7) Does `vkAcquireNextImageKHR` block if no images are available?

RESOLVED: The command takes a timeout parameter. Special values for the timeout are 0, which makes the call a non-blocking operation, and `UINT64_MAX`, which blocks indefinitely. Values in between will block for up to the specified time. The call will return when an image becomes available or an error occurs. It may, but is not required to, return before the specified timeout expires if the swapchain becomes out of date.

8) Can multiple presents be queued using one `vkQueuePresentKHR` call?

RESOLVED: Yes. `VkPresentInfoKHR` contains a list of swapchains and corresponding image indices that will be presented. When supported, all presentations queued with a single `vkQueuePresentKHR` call will be applied atomically as one operation. The same swapchain must not appear in the list more than once. Later extensions may provide applications stronger guarantees of atomicity for such present operations, and/or allow them to query whether atomic presentation of a particular group of swapchains is possible.

9) How do the presentation and acquire next image functions notify the application the targeted surface has changed?

RESOLVED: Two new result codes are introduced for this purpose:

- `VK_SUBOPTIMAL_KHR` - Presentation will still succeed, subject to the window resize behavior, but the swapchain is no longer configured optimally for the surface it targets. Applications should

query updated surface information and recreate their swapchain at the next convenient opportunity.

- **VK_ERROR_OUT_OF_DATE_KHR** - Failure. The swapchain is no longer compatible with the surface it targets. The application must query updated surface information and recreate the swapchain before presentation will succeed.

These can be returned by both [vkAcquireNextImageKHR](#) and [vkQueuePresentKHR](#).

10) Does the [vkAcquireNextImageKHR](#) command return a semaphore to the application via an output parameter, or accept a semaphore to signal from the application as an object handle parameter?

RESOLVED: Accept a semaphore to signal as an object handle. This avoids the need to specify whether the application must destroy the semaphore or whether it is owned by the swapchain, and if the latter, what its lifetime is and whether it can be reused for other operations once it is received from [vkAcquireNextImageKHR](#).

11) What types of swapchain queuing behavior should be exposed? Options include swap interval specification, mailbox/most recent vs. FIFO queue management, targeting specific vertical blank intervals or absolute times for a given present operation, and probably others. For some of these, whether they are specified at swapchain creation time or as per-present parameters needs to be decided as well.

RESOLVED: The base swapchain extension will expose 3 possible behaviors (of which, FIFO will always be supported):

- Immediate present: Does not wait for vertical blanking period to update the current image, likely resulting in visible tearing. No internal queue is used. Present requests are applied immediately.
- Mailbox queue: Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application.
- FIFO queue: Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal queue containing **numSwapchainImages** - 1 entries is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty

Not all surfaces will support all of these modes, so the modes supported will be returned using a surface information query. All surfaces must support the FIFO queue mode. Applications must choose one of these modes up front when creating a swapchain. Switching modes can be accomplished by recreating the swapchain.

12) Can **VK_PRESENT_MODE_MAILBOX_KHR** provide non-blocking guarantees for [vkAcquireNextImageKHR](#)? If so, what is the proper criteria?

RESOLVED: Yes. The difficulty is not immediately obvious here. Naively, if at least 3 images are

requested, mailbox mode should always have an image available for the application if the application does not own any images when the call to `vkAcquireNextImageKHR` was made. However, some presentation engines may have more than one “current” image, and would still need to block in some cases. The right requirement appears to be that if the application allocates the surface’s minimum number of images + 1 then it is guaranteed non-blocking behavior when it does not currently own any images.

13) Is there a way to create and initialize a new swapchain for a surface that has generated a `VK_SUBOPTIMAL_KHR` return code while still using the old swapchain?

RESOLVED: Not as part of this specification. This could be useful to allow the application to create an “optimal” replacement swapchain and rebuild all its command buffers using it in a background thread at a low priority while continuing to use the “suboptimal” swapchain in the main thread. It could probably use the same “atomic replace” semantics proposed for recreating direct-to-device swapchains without incurring a mode switch. However, after discussion, it was determined some platforms probably could not support concurrent swapchains for the same surface though, so this will be left out of the base KHR extensions. A future extension could add this for platforms where it is supported.

14) Should there be a special value for `VkSurfaceCapabilitiesKHR::maxImageCount` to indicate there are no practical limits on the number of images in a swapchain?

RESOLVED: Yes. There will often be cases where there is no practical limit to the number of images in a swapchain other than the amount of available resources (i.e., memory) in the system. Trying to derive a hard limit from things like memory size is prone to failure. It is better in such cases to leave it to applications to figure such soft limits out via trial/failure iterations.

15) Should there be a special value for `VkSurfaceCapabilitiesKHR::currentExtent` to indicate the size of the platform surface is undefined?

RESOLVED: Yes. On some platforms (Wayland, for example), the surface size is defined by the images presented to it rather than the other way around.

16) Should there be a special value for `VkSurfaceCapabilitiesKHR::maxImageExtent` to indicate there is no practical limit on the surface size?

RESOLVED: No. It seems unlikely such a system would exist. 0 could be used to indicate the platform places no limits on the extents beyond those imposed by Vulkan for normal images, but this query could just as easily return those same limits, so a special “unlimited” value does not seem useful for this field.

17) How should surface rotation and mirroring be exposed to applications? How do they specify rotation and mirroring transforms applied prior to presentation?

RESOLVED: Applications can query both the supported and current transforms of a surface. Both are specified relative to the device’s “natural” display rotation and direction. The supported transforms indicate which orientations the presentation engine accepts images in. For example, a presentation engine that does not support transforming surfaces as part of presentation, and which is presenting to a surface that is displayed with a 90-degree rotation, would return only one supported transform bit: `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR`. Applications must transform

their rendering by the transform they specify when creating the swapchain in `preTransform` field.

18) Can surfaces ever not support `VK_MIRROR_NONE`? Can they support vertical and horizontal mirroring simultaneously? Relatedly, should `VK_MIRROR_NONE[_BIT]` be zero, or bit one, and should applications be allowed to specify multiple pre and current mirror transform bits, or exactly one?

RESOLVED: Since some platforms may not support presenting with a transform other than the native window's current transform, and prerotation/mirroring are specified relative to the device's natural rotation and direction, rather than relative to the surface's current rotation and direction, it is necessary to express lack of support for no mirroring. To allow this, the `MIRROR_NONE` enum must occupy a bit in the flags. Since `MIRROR_NONE` must be a bit in the bitmask rather than a bitmask with no values set, allowing more than one bit to be set in the bitmask would make it possible to describe undefined transforms such as `VK_MIRROR_NONE_BIT | VK_MIRROR_HORIZONTAL_BIT`, or a transform that includes both "no mirroring" and "horizontal mirroring" simultaneously. Therefore, it is desirable to allow specifying all supported mirroring transforms using only one bit. The question then becomes, should there be a `VK_MIRROR_HORIZONTAL_AND_VERTICAL_BIT` to represent a simultaneous horizontal and vertical mirror transform? However, such a transform is equivalent to a 180 degree rotation, so presentation engines and applications that wish to support or use such a transform can express it through rotation instead. Therefore, 3 exclusive bits are sufficient to express all needed mirroring transforms.

19) Should support for sRGB be required?

RESOLVED: In the advent of UHD and HDR display devices, proper color space information is vital to the display pipeline represented by the swapchain. The app can discover the supported format/color-space pairs and select a pair most suited to its rendering needs. Currently only the sRGB color space is supported, future extensions may provide support for more color spaces. See issues 23 and 24.

20) Is there a mechanism to modify or replace an existing swapchain with one targeting the same surface?

RESOLVED: Yes. This is described above in the text.

21) Should there be a way to set prerotation and mirroring using native APIs when presenting using a Vulkan swapchain?

RESOLVED: Yes. The transforms that can be expressed in this extension are a subset of those possible on native platforms. If a platform exposes a method to specify the transform of presented images for a given surface using native methods and exposes more transforms or other properties for surfaces than Vulkan supports, it might be impossible, difficult, or inconvenient to set some of those properties using Vulkan KHR extensions and some using the native interfaces. To avoid overwriting properties set using native commands when presenting using a Vulkan swapchain, the application can set the pretransform to "inherit", in which case the current native properties will be used, or if none are available, a platform-specific default will be used. Platforms that do not specify a reasonable default or do not provide native mechanisms to specify such transforms should not include the inherit bits in the `supportedTransforms` bitmask they return in `VkSurfaceCapabilitiesKHR`.

22) Should the content of presentable images be clipped by objects obscuring their target surface?

RESOLVED: Applications can choose which behavior they prefer. Allowing the content to be clipped could enable more efficient presentation methods on some platforms, but some applications might rely on the content of presentable images to perform techniques such as partial updates or motion blurs.

23) What is the purpose of specifying a [VkColorSpaceKHR](#) along with [VkFormat](#) when creating a swapchain?

RESOLVED: While Vulkan itself is color space agnostic (e.g. even the meaning of R, G, B and A can be freely defined by the rendering application), the swapchain eventually will have to present the images on a display device with specific color reproduction characteristics. If any color space transformations are necessary before an image can be displayed, the color space of the presented image must be known to the swapchain. A swapchain will only support a restricted set of color format and -space pairs. This set can be discovered via [vkGetPhysicalDeviceSurfaceFormatsKHR](#). As it can be expected that most display devices support the sRGB color space, at least one format/color-space pair has to be exposed, where the color space is [VK_COLOR_SPACE_SRGB_NONLINEAR_KHR](#).

24) How are sRGB formats and the sRGB color space related?

RESOLVED: While Vulkan exposes a number of SRGB texture formats, using such formats does not guarantee working in a specific color space. It merely means that the hardware can directly support applying the non-linear transfer functions defined by the sRGB standard color space when reading from or writing to images of those formats. Still, it is unlikely that a swapchain will expose a [*_SRGB](#) format along with any color space other than [VK_COLOR_SPACE_SRGB_NONLINEAR_KHR](#).

On the other hand, non-[*_SRGB](#) formats will be very likely exposed in pair with a SRGB color space. This means, the hardware will not apply any transfer function when reading from or writing to such images, yet they will still be presented on a device with SRGB display characteristics. In this case the application is responsible for applying the transfer function, for instance by using shader math.

25) How are the lifetimes of surfaces and swapchains targeting them related?

RESOLVED: A surface must outlive any swapchains targeting it. A [VkSurfaceKHR](#) owns the binding of the native window to the Vulkan driver.

26) How can the client control the way the alpha component of swapchain images is treated by the presentation engine during compositing?

RESOLVED: We should add new enum values to allow the client to negotiate with the presentation engine on how to treat image alpha values during the compositing process. Since not all platforms can practically control this through the Vulkan driver, a value of [VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR](#) is provided like for surface transforms.

27) Is [vkCreateSwapchainKHR](#) the right function to return [VK_ERROR_NATIVE_WINDOW_IN_USE_KHR](#), or should the various platform-specific [VkSurfaceKHR](#) factory functions catch this error earlier?

RESOLVED: For most platforms, the [VkSurfaceKHR](#) structure is a simple container holding the data that identifies a native window or other object representing a surface on a particular platform. For the surface factory functions to return this error, they would likely need to register a reference on

the native objects with the native display server somehow, and ensure no other such references exist. Surfaces were not intended to be that heavyweight.

Swapchains are intended to be the objects that directly manipulate native windows and communicate with the native presentation mechanisms. Swapchains will already need to communicate with the native display server to negotiate allocation and/or presentation of presentable images for a native surface. Therefore, it makes more sense for swapchain creation to be the point at which native object exclusivity is enforced. Platforms may choose to enforce further restrictions on the number of `VkSurfaceKHR` objects that may be created for the same native window if such a requirement makes sense on a particular platform, but a global requirement is only sensible at the swapchain level.

Examples

Note

The example code for the `VK_KHR_surface` and `VK_KHR_swapchain` extensions was removed from the appendix after revision 1.0.29. This WSI example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: <https://github.com/KhronosGroup/Vulkan-Tools/blob/master/cube/cube.c>).

Version History

- Revision 1, 2015-05-20 (James Jones)
 - Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
- Revision 2, 2015-05-22 (Ian Elliott)
 - Made many agreed-upon changes from 2015-05-21 KHR TSG meeting. This includes using only a queue for presentation, and having an explicit function to acquire the next image.
 - Fixed typos and other minor mistakes.
- Revision 3, 2015-05-26 (Ian Elliott)
 - Improved the Description section.
 - Added or resolved issues that were found in improving the Description. For example, `pSurfaceDescription` is used consistently, instead of sometimes using `pSurface`.
- Revision 4, 2015-05-27 (James Jones)
 - Fixed some grammatical errors and typos
 - Filled in the description of `imageUseFlags` when creating a swapchain.
 - Added a description of `swapInterval`.
 - Replaced the paragraph describing the order of operations on a queue for image ownership and presentation.
- Revision 5, 2015-05-27 (James Jones)
 - Imported relevant issues from the (abandoned) `vk_wsi_persistent_swapchain_images` extension.

- Added issues 6 and 7, regarding behavior of the acquire next image and present commands with respect to queues.
- Updated spec language and examples to align with proposed resolutions to issues 6 and 7.
- Revision 6, 2015-05-27 (James Jones)
 - Added issue 8, regarding atomic presentation of multiple swapchains
 - Updated spec language and examples to align with proposed resolution to issue 8.
- Revision 7, 2015-05-27 (James Jones)
 - Fixed compilation errors in example code, and made related spec fixes.
- Revision 8, 2015-05-27 (James Jones)
 - Added issue 9, and the related VK_SUBOPTIMAL_KHR result code.
 - Renamed VK_OUT_OF_DATE_KHR to VK_ERROR_OUT_OF_DATE_KHR.
- Revision 9, 2015-05-27 (James Jones)
 - Added inline proposed resolutions (marked with [JRK]) to some XXX questions/issues. These should be moved to the issues section in a subsequent update if the proposals are adopted.
- Revision 10, 2015-05-28 (James Jones)
 - Converted vkAcquireNextImageKHR back to a non-queue operation that uses a VkSemaphore object for explicit synchronization.
 - Added issue 10 to determine whether vkAcquireNextImageKHR generates or returns semaphores, or whether it operates on a semaphore provided by the application.
- Revision 11, 2015-05-28 (James Jones)
 - Marked issues 6, 7, and 8 resolved.
 - Renamed VkSurfaceCapabilityPropertiesKHR to VkSurfacePropertiesKHR to better convey the mutable nature of the information it contains.
- Revision 12, 2015-05-28 (James Jones)
 - Added issue 11 with a proposed resolution, and the related issue 12.
 - Updated various sections of the spec to match the proposed resolution to issue 11.
- Revision 13, 2015-06-01 (James Jones)
 - Moved some structures to VK_EXT_KHR_swap_chain to resolve the specification's issues 1 and 2.
- Revision 14, 2015-06-01 (James Jones)
 - Added code for example 4 demonstrating how an application might make use of the two different present and acquire next image KHR result codes.
 - Added issue 13.
- Revision 15, 2015-06-01 (James Jones)
 - Added issues 14 - 16 and related spec language.
 - Fixed some spelling errors.
 - Added language describing the meaningful return values for vkAcquireNextImageKHR and

`vkQueuePresentKHR`.

- Revision 16, 2015-06-02 (James Jones)
 - Added issues 17 and 18, as well as related spec language.
 - Removed some erroneous text added by mistake in the last update.
- Revision 17, 2015-06-15 (Ian Elliott)
 - Changed special value from "-1" to "0" so that the data types can be unsigned.
- Revision 18, 2015-06-15 (Ian Elliott)
 - Clarified the values of `VkSurfacePropertiesKHR::minImageCount` and the `timeout` parameter of the `vkAcquireNextImageKHR` function.
- Revision 19, 2015-06-17 (James Jones)
 - Misc. cleanup. Removed resolved inline issues and fixed typos.
 - Fixed clarification of `VkSurfacePropertiesKHR::minImageCount` made in version 18.
 - Added a brief "Image Ownership" definition to the list of terms used in the spec.
- Revision 20, 2015-06-17 (James Jones)
 - Updated enum-extending values using new convention.
- Revision 21, 2015-06-17 (James Jones)
 - Added language describing how to use `VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR`.
 - Cleaned up an XXX comment regarding the description of which queues `vkQueuePresentKHR` can be used on.
- Revision 22, 2015-06-17 (James Jones)
 - Rebased on Vulkan API version 126.
- Revision 23, 2015-06-18 (James Jones)
 - Updated language for issue 12 to read as a proposed resolution.
 - Marked issues 11, 12, 13, 16, and 17 resolved.
 - Temporarily added links to the relevant bugs under the remaining unresolved issues.
 - Added issues 19 and 20 as well as proposed resolutions.
- Revision 24, 2015-06-19 (Ian Elliott)
 - Changed special value for `VkSurfacePropertiesKHR::currentExtent` back to "-1" from "0". This value will never need to be unsigned, and "0" is actually a legal value.
- Revision 25, 2015-06-23 (Ian Elliott)
 - Examples now show use of function pointers for extension functions.
 - Eliminated extraneous whitespace.
- Revision 26, 2015-06-25 (Ian Elliott)
 - Resolved Issues 9 & 10 per KHR TSG meeting.
- Revision 27, 2015-06-25 (James Jones)

- Added oldSwapchain member to VkSwapchainCreateInfoKHR.
- Revision 28, 2015-06-25 (James Jones)
 - Added the “inherit” bits to the rotation and mirroring flags and the associated issue 21.
- Revision 29, 2015-06-25 (James Jones)
 - Added the “clipped” flag to VkSwapchainCreateInfoKHR, and the associated issue 22.
 - Specified that presenting an image does not modify it.
- Revision 30, 2015-06-25 (James Jones)
 - Added language to the spec that clarifies the behavior of vkCreateSwapchainKHR() when the oldSwapchain field of VkSwapchainCreateInfoKHR is not NULL.
- Revision 31, 2015-06-26 (Ian Elliott)
 - Example of new VkSwapchainCreateInfoKHR members, “oldSwapchain” and “clipped”.
 - Example of using VkSurfacePropertiesKHR::{min|max}ImageCount to set VkSwapchainCreateInfoKHR::minImageCount.
 - Rename vkGetSurfaceInfoKHR()'s 4th parameter to “pDataSize”, for consistency with other functions.
 - Add macro with C-string name of extension (just to header file).
- Revision 32, 2015-06-26 (James Jones)
 - Minor adjustments to the language describing the behavior of “oldSwapchain”
 - Fixed the version date on my previous two updates.
- Revision 33, 2015-06-26 (Jesse Hall)
 - Add usage flags to VkSwapchainCreateInfoKHR
- Revision 34, 2015-06-26 (Ian Elliott)
 - Rename vkQueuePresentKHR()'s 2nd parameter to “pPresentInfo”, for consistency with other functions.
- Revision 35, 2015-06-26 (Jason Ekstrand)
 - Merged the VkRotationFlagBitsKHR and VkMirrorFlagBitsKHR enums into a single VkSurfaceTransformFlagBitsKHR enum.
- Revision 36, 2015-06-26 (Jason Ekstrand)
 - Added a VkSurfaceTransformKHR enum that is not a bitmask. Each value in VkSurfaceTransformKHR corresponds directly to one of the bits in VkSurfaceTransformFlagBitsKHR so transforming from one to the other is easy. Having a separate enum means that currentTransform and preTransform are now unambiguous by definition.
- Revision 37, 2015-06-29 (Ian Elliott)
 - Corrected one of the signatures of vkAcquireNextImageKHR, which had the last two parameters switched from what it is elsewhere in the specification and header files.
- Revision 38, 2015-06-30 (Ian Elliott)

- Corrected a typo in description of the `vkGetSwapchainInfoKHR()` function.
- Corrected a typo in header file comment for `VkPresentInfoKHR::sType`.
- Revision 39, 2015-07-07 (Daniel Rakos)
 - Added error section describing when each error is expected to be reported.
 - Replaced `bool32_t` with `VkBool32`.
- Revision 40, 2015-07-10 (Ian Elliott)
 - Updated to work with version 138 of the `vulkan.h` header. This includes declaring the `VkSwapchainKHR` type using the new `VK_DEFINE_NONDISP_HANDLE` macro, and no longer extending `VkObjectType` (which was eliminated).
- Revision 41 2015-07-09 (Mathias Heyer)
 - Added color space language.
- Revision 42, 2015-07-10 (Daniel Rakos)
 - Updated query mechanism to reflect the convention changes done in the core spec.
 - Removed “queue” from the name of `VK_STRUCTURE_TYPE_QUEUE_PRESENT_INFO_KHR` to be consistent with the established naming convention.
 - Removed reference to the no longer existing `VkObjectType` enum.
- Revision 43, 2015-07-17 (Daniel Rakos)
 - Added support for concurrent sharing of swapchain images across queue families.
 - Updated sample code based on recent changes
- Revision 44, 2015-07-27 (Ian Elliott)
 - Noted that support for `VK_PRESENT_MODE_FIFO_KHR` is required. That is ICDs may optionally support IMMEDIATE and MAILBOX, but must support FIFO.
- Revision 45, 2015-08-07 (Ian Elliott)
 - Corrected a typo in spec file (type and variable name had wrong case for the `imageColorSpace` member of the `VkSwapchainCreateInfoKHR` struct).
 - Corrected a typo in header file (last parameter in `PFN_vkGetSurfacePropertiesKHR` was missing “KHR” at the end of type: `VkSurfacePropertiesKHR`).
- Revision 46, 2015-08-20 (Ian Elliott)
 - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
 - Switched from “revision” to “version”, including use of the `VK_MAKE_VERSION` macro in the header file.
 - Made improvements to several descriptions.
 - Changed the status of several issues from PROPOSED to RESOLVED, leaving no unresolved issues.
 - Resolved several TODOs, did miscellaneous cleanup, etc.
- Revision 47, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)

- Moved the surface transform enums to VK_WSI_swapchain so they could be reused by VK_WSI_display.
- Revision 48, 2015-09-01 (James Jones)
 - Various minor cleanups.
- Revision 49, 2015-09-01 (James Jones)
 - Restore single-field revision number.
- Revision 50, 2015-09-01 (James Jones)
 - Update Example #4 to include code that illustrates how to use the oldSwapchain field.
- Revision 51, 2015-09-01 (James Jones)
 - Fix example code compilation errors.
- Revision 52, 2015-09-08 (Matthaeus G. Chajdas)
 - Corrected a typo.
- Revision 53, 2015-09-10 (Alon Or-bach)
 - Removed underscore from SWAP_CHAIN left in VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR.
- Revision 54, 2015-09-11 (Jesse Hall)
 - Described the execution and memory coherence requirements for image transitions to and from VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR.
- Revision 55, 2015-09-11 (Ray Smith)
 - Added errors for destroying and binding memory to presentable images
- Revision 56, 2015-09-18 (James Jones)
 - Added fence argument to vkAcquireNextImageKHR
 - Added example of how to meter a host thread based on presentation rate.
- Revision 57, 2015-09-26 (Jesse Hall)
 - Replace VkSurfaceDescriptionKHR with VkSurfaceKHR.
 - Added issue 25 with agreed resolution.
- Revision 58, 2015-09-28 (Jesse Hall)
 - Renamed from VK_EXT_KHR_device_swapchain to VK_EXT_KHR_swapchain.
- Revision 59, 2015-09-29 (Ian Elliott)
 - Changed vkDestroySwapchainKHR() to return void.
- Revision 60, 2015-10-01 (Jeff Vigil)
 - Added error result VK_ERROR_SURFACE_LOST_KHR.
- Revision 61, 2015-10-05 (Jason Ekstrand)
 - Added the VkCompositeAlpha enum and corresponding structure fields.
- Revision 62, 2015-10-12 (Daniel Rakos)

- Added VK_PRESENT_MODE_FIFO_RELAXED_KHR.
- Revision 63, 2015-10-15 (Daniel Rakos)
 - Moved surface capability queries to VK_EXT_KHR_surface.
- Revision 64, 2015-10-26 (Ian Elliott)
 - Renamed from VK_EXT_KHR_swapchain to VK_KHR_swapchain.
- Revision 65, 2015-10-28 (Ian Elliott)
 - Added optional pResult member to VkPresentInfoKHR, so that per-swapchain results can be obtained from vkQueuePresentKHR().
- Revision 66, 2015-11-03 (Daniel Rakos)
 - Added allocation callbacks to create and destroy functions.
 - Updated resource transition language.
 - Updated sample code.
- Revision 67, 2015-11-10 (Jesse Hall)
 - Add reserved flags bitmask to VkSwapchainCreateInfoKHR.
 - Modify naming and member ordering to match API style conventions, and so the VkSwapchainCreateInfoKHR image property members mirror corresponding VkImageCreateInfo members but with an 'image' prefix.
 - Make VkPresentInfoKHR::pResults non-const; it is an output array parameter.
 - Make pPresentInfo parameter to vkQueuePresentKHR const.
- Revision 68, 2016-04-05 (Ian Elliott)
 - Moved the “validity” include for vkAcquireNextImage to be in its proper place, after the prototype and list of parameters.
 - Clarified language about presentable images, including how they are acquired, when applications can and cannot use them, etc. As part of this, removed language about “ownership” of presentable images, and replaced it with more-consistent language about presentable images being “acquired” by the application.
- 2016-08-23 (Ian Elliott)
 - Update the example code, to use the final API command names, to not have so many characters per line, and to split out a new example to show how to obtain function pointers. This code is more similar to the LunarG “cube” demo program.
- 2016-08-25 (Ian Elliott)
 - A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.
- Revision 69, 2017-09-07 (Tobias Hector)
 - Added interactions with Vulkan 1.1
- Revision 70, 2017-10-06 (Ian Elliott)
 - Corrected interactions with Vulkan 1.1

VK_KHR_swapchain mutable format

- Ray Smith, ARM

Description

This extension allows processing of swapchain images as different formats to that used by the window system, which is particularly useful for switching between sRGB and linear RGB formats.

It adds a new swapchain creation flag that enables creating image views from presentable images with a different format than the one used to create the swapchain.

New Enum Constants

- `VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_EXTENSION_NAME`
- `VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_SPEC_VERSION`
- Extending [VkSwapchainCreateInfoFlagsKHR](#):
 - `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR`

Issues

1) Are there any new capabilities needed?

RESOLVED: No. It is expected that all implementations exposing this extension support swapchain image format mutability.

2) Do we need a separate `VK_SWAPCHAIN_CREATE_EXTENDED_USAGE_BIT_KHR`?

RESOLVED: No. This extension requires `VK_KHR_maintenance2` and presentable images of swapchains created with `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` are created internally in a way equivalent to specifying both `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR`.

3) Do we need a separate structure to allow specifying an image format list for swapchains?

RESOLVED: No. We simply use the same [VkImageFormatListCreateInfoKHR](#) structure introduced by `VK_KHR_image_format_list`. The structure is required to be included in the `pNext` chain of [VkSwapchainCreateInfoKHR](#) for swapchains created with `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR`.

Version History

Description

The [VK_KHR_wayland_surface](#) extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the [VK_KHR_surface](#) extension) that refers to a Wayland `wl_surface`, as well as a query to determine support for rendering to a Wayland compositor.

New Commands

- `vkCreateWaylandSurfaceKHR`

- [vkGetPhysicalDeviceWaylandPresentationSupportKHR](#)

New Structures

- [VkWaylandSurfaceCreateInfoKHR](#)

New Bitmasks

- [VkWaylandSurfaceCreateFlagsKHR](#)

New Enum Constants

- [VK_KHR_WAYLAND_SURFACE_EXTENSION_NAME](#)
- [VK_KHR_WAYLAND_SURFACE_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR](#)

Issues

1) Does Wayland need a way to query for compatibility between a particular physical device and a specific Wayland display? This would be a more general query than [vkGetPhysicalDeviceSurfaceSupportKHR](#): if the Wayland-specific query returned [VK_TRUE](#) for a ([VkPhysicalDevice](#), [struct wl_display*](#)) pair, then the physical device could be assumed to support presentation to any [VkSurfaceKHR](#) for surfaces on the display.

RESOLVED: Yes. [vkGetPhysicalDeviceWaylandPresentationSupportKHR](#) was added to address this issue.

2) Should we require surfaces created with [vkCreateWaylandSurfaceKHR](#) to support the [VK_PRESENT_MODE_MAILBOX_KHR](#) present mode?

RESOLVED: Yes. Wayland is an inherently mailbox window system and mailbox support is required for some Wayland compositor interactions to work as expected. While handling these interactions may be possible with [VK_PRESENT_MODE_FIFO_KHR](#), it is much more difficult to do without deadlock and requiring all Wayland applications to be able to support implementations which only support [VK_PRESENT_MODE_FIFO_KHR](#) would be an onerous restriction on application developers.

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
 - Initial draft, based on the previous contents of [VK_EXT_KHR_swapchain](#) (later renamed [VK_EXT_KHR_surface](#)).
- Revision 2, 2015-10-02 (James Jones)
 - Added [vkGetPhysicalDeviceWaylandPresentationSupportKHR\(\)](#) to resolve issue #1.
 - Adjusted wording of issue #1 to match the agreed-upon solution.
 - Renamed “window” parameters to “surface” to match Wayland conventions.

- Revision 3, 2015-10-26 (Ian Elliott)
 - Renamed from VK_EXT_KHR_wayland_surface to VK_KHR_wayland_surface.
- Revision 4, 2015-11-03 (Daniel Rakos)
 - Added allocation callbacks to vkCreateWaylandSurfaceKHR.
- Revision 5, 2015-11-28 (Daniel Rakos)
 - Updated the surface create function to take a pCreateInfo structure.
- Revision 6, 2017-02-08 (Jason Ekstrand)
 - Added the requirement that implementations support `VK_PRESENT_MODE_MAILBOX_KHR`.
 - Added wording about interactions between `vkQueuePresentKHR` and the Wayland requests sent to the compositor.

VK_KHR_win32_keyed_mutex

Description

Applications that wish to import Direct3D 11 memory objects into the Vulkan API may wish to use the native keyed mutex mechanism to synchronize access to the memory between Vulkan and Direct3D. This extension provides a way for an application to access the keyed mutex associated with an imported Vulkan memory object when submitting command buffers to a queue.

New Structures

- Extending [VkSubmitInfo](#), [VkSubmitInfo2](#):
 - [VkWin32KeyedMutexAcquireReleaseInfoKHR](#)

New Enum Constants

Description

The [VK_KHR_win32_surface](#) extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the [VK_KHR_surface](#) extension) that refers to a Win32 `HWND`, as well as a query to determine support for rendering to the windows desktop.

New Commands

- [vkCreateWin32SurfaceKHR](#)
- [vkGetPhysicalDeviceWin32PresentationSupportKHR](#)

New Structures

- [VkWin32SurfaceCreateInfoKHR](#)

New Bitmasks

- [VkWin32SurfaceCreateFlagsKHR](#)

New Enum Constants

- [VK_KHR_WIN32_SURFACE_EXTENSION_NAME](#)
- [VK_KHR_WIN32_SURFACE_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR](#)

Issues

1) Does Win32 need a way to query for compatibility between a particular physical device and a specific screen? Compatibility between a physical device and a window generally only depends on what screen the window is on. However, there is not an obvious way to identify a screen without already having a window on the screen.

RESOLVED: No. While it may be useful, there is not a clear way to do this on Win32. However, a method was added to query support for presenting to the windows desktop as a whole.

2) If a native window object ([HWND](#)) is used by one graphics API, and then is later used by a different graphics API (one of which is Vulkan), can these uses interfere with each other?

RESOLVED: Yes.

Uses of a window object by multiple graphics APIs results in undefined behavior. Such behavior may succeed when using one Vulkan implementation but fail when using a different Vulkan implementation. Potential failures include:

- Creating then destroying a flip presentation model DXGI swapchain on a window object can prevent [vkCreateSwapchainKHR](#) from succeeding on the same window object.
- Creating then destroying a [VkSwapchainKHR](#) on a window object can prevent creation of a bitblt model DXGI swapchain on the same window object.
- Creating then destroying a [VkSwapchainKHR](#) on a window object can effectively [SetPixelFormat](#) to a different format than the format chosen by an OpenGL application.
- Creating then destroying a [VkSwapchainKHR](#) on a window object on one [VkPhysicalDevice](#) can prevent [vkCreateSwapchainKHR](#) from succeeding on the same window object, but on a different [VkPhysicalDevice](#) that is associated with a different Vulkan ICD.

In all cases the problem can be worked around by creating a new window object.

Technical details include:

- Creating a DXGI swapchain over a window object can alter the object for the remainder of its lifetime. The alteration persists even after the DXGI swapchain has been destroyed. This alteration can make it impossible for a conformant Vulkan implementation to create a [VkSwapchainKHR](#) over the same window object. Mention of this alteration can be found in the

remarks section of the MSDN documentation for [DXGI_SWAP_EFFECT](#).

- Calling GDI's [SetPixelFormat](#) (needed by OpenGL's WGL layer) on a window object alters the object for the remainder of its lifetime. The MSDN documentation for [SetPixelFormat](#) explains that a window object's pixel format can be set only one time.
- Creating a [VkSwapchainKHR](#) over a window object can alter the object for its remaining lifetime. Either of the above alterations may occur as a side effect of [vkCreateSwapchainKHR](#).

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
 - Initial draft, based on the previous contents of VK_EXT_KHR_swapchain (later renamed VK_EXT_KHR_surface).
- Revision 2, 2015-10-02 (James Jones)
 - Added presentation support query for win32 desktops.
- Revision 3, 2015-10-26 (Ian Elliott)
 - Renamed from VK_EXT_KHR_win32_surface to VK_KHR_win32_surface.
- Revision 4, 2015-11-03 (Daniel Rakos)
 - Added allocation callbacks to [vkCreateWin32SurfaceKHR](#).
- Revision 5, 2015-11-28 (Daniel Rakos)
 - Updated the surface create function to take a pCreateInfo structure.
- Revision 6, 2017-04-24 (Jeff Juliano)
 - Add issue 2 addressing reuse of a native window object in a different Graphics API, or by a different Vulkan ICD.

Interactions and External Dependencies

- This extension requires `SPV_KHR_workgroup_memory_explicit_layout`
- This extension provides API support for `GL_EXT_shared_memory_block`

Contributors

- Caio Marcelo de Oliveira Filho, Intel
- Jeff Bolz, NVIDIA
- Graeme Leese, Broadcom
- Jason Ekstrand, Intel
- Daniel Koch, NVIDIA

Description

This extension adds Vulkan support for the `SPV_KHR_workgroup_memory_explicit_layout` SPIR-V extension, which allows shaders to explicitly define the layout of `Workgroup` storage class memory and create aliases between variables from that storage class in a compute shader.

The aliasing feature allows different “views” on the same data, so the shader can bulk copy data from another storage class using one type (e.g. an array of large vectors), and then use the data with a more specific type. It also enables reducing the amount of workgroup memory consumed by allowing the shader to alias data whose lifetimes do not overlap.

The explicit layout support and some form of aliasing is also required for layering OpenCL on top of Vulkan.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR`

New Enum Constants

- `VK_KHR_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_EXTENSION_NAME`
- `VK_KHR_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_SPEC_VERSION`

- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_FEATURES_KHR`

New SPIR-V Capabilities

- [WorkgroupMemoryExplicitLayoutKHR](#)
- [WorkgroupMemoryExplicitLayout8BitAccessKHR](#)
- [WorkgroupMemoryExplicitLayout16BitAccessKHR](#)

Version History

- Revision 1, 2020-06-01 (Caio Marcelo de Oliveira Filho)
 - Initial version

Description

The `VK_KHR_xcb_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) that refers to an X11 `Window`, using the XCB client-side library, as well as a query to determine support for rendering via XCB.

New Commands

- `vkCreateXcbSurfaceKHR`
- `vkGetPhysicalDeviceXcbPresentationSupportKHR`

New Structures

- `VkXcbSurfaceCreateInfoKHR`

New Bitmasks

- `VkXcbSurfaceCreateFlagsKHR`

New Enum Constants

- `VK_KHR_XCB_SURFACE_EXTENSION_NAME`
- `VK_KHR_XCB_SURFACE_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR`

Issues

1) Does XCB need a way to query for compatibility between a particular physical device and a specific screen? This would be a more general query than `vkGetPhysicalDeviceSurfaceSupportKHR`: If it returned `VK_TRUE`, then the physical device could be assumed to support presentation to any window on that screen.

RESOLVED: Yes, this is needed for toolkits that want to create a `VkDevice` before creating a window. To ensure the query is reliable, it must be made against a particular X visual rather than the screen in general.

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
 - Initial draft, based on the previous contents of `VK_EXT_KHR_swapchain` (later renamed `VK_EXT_KHR_surface`).
- Revision 2, 2015-10-02 (James Jones)
 - Added presentation support query for an (`xcb_connection_t*`, `xcb_visualid_t`) pair.
 - Removed “root” parameter from `CreateXcbSurfaceKHR()`, as it is redundant when a window on the same screen is specified as well.
 - Adjusted wording of issue #1 and added agreed upon resolution.
- Revision 3, 2015-10-14 (Ian Elliott)
 - Removed “root” parameter from `CreateXcbSurfaceKHR()` in one more place.
- Revision 4, 2015-10-26 (Ian Elliott)
 - Renamed from `VK_EXT_KHR_xcb_surface` to `VK_KHR_xcb_surface`.
- Revision 5, 2015-10-23 (Daniel Rakos)
 - Added allocation callbacks to `vkCreateXcbSurfaceKHR`.
- Revision 6, 2015-11-28 (Daniel Rakos)
 - Updated the surface create function to take a `pCreateInfo` structure.

Description

This extension allows an application to take exclusive control on a display currently associated with an X11 screen. When control is acquired, the display will be deassociated from the X11 screen until control is released or the specified display connection is closed. Essentially, the X11 screen will behave as if the monitor has been unplugged until control is released.

- [VK_EXT_ACQUIRE_XLIB_DISPLAY_SPEC_VERSION](#)

Issues

1) Should [vkAcquireXlibDisplayEXT](#) take an RandR display ID, or a Vulkan display handle as input?

RESOLVED: A Vulkan display handle. Otherwise there would be no way to specify handles to displays that had been prevented from being included in the X11 display list by some native platform or vendor-specific mechanism.

2) How does an application figure out which RandR display corresponds to a Vulkan display?

RESOLVED: A new function, [vkGetRandROutputDisplayEXT](#), is introduced for this purpose.

3) Should [vkGetRandROutputDisplayEXT](#) be part of this extension, or a general Vulkan / RandR or Vulkan / Xlib extension?

RESOLVED: To avoid yet another extension, include it in this extension.

Description

The existing specification requires that low dynamic range (LDR) ASTC textures are decompressed to FP16 values per component. In many cases, decompressing LDR textures to a lower precision intermediate result gives acceptable image quality. Source material for LDR textures is typically authored as 8-bit UNORM values, so decoding to FP16 values adds little value. On the other hand, reducing precision of the decoded result reduces the size of the decompressed data, potentially improving texture cache performance and saving power.

The goal of this extension is to enable this efficiency gain on existing ASTC texture data. This is achieved by giving the application the ability to select the intermediate decoding precision.

Three decoding options are provided:

- Decode to `VK_FORMAT_R16G16B16A16_SFLOAT` precision: This is the default, and matches the required behavior in the core API.
- Decode to `VK_FORMAT_R8G8B8A8_UNORM` precision: This is provided as an option in LDR mode.

- Decode to `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32` precision: This is provided as an option in both LDR and HDR mode. In this mode, negative values cannot be represented and are clamped to zero. The alpha component is ignored, and the results are as if alpha was 1.0. This decode mode is optional and support can be queried via the physical device properties.

New Structures

- Extending `VkImageViewCreateInfo`:
 - `VkImageviewASTCDecodeModeEXT`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceASTCDecodeFeaturesEXT`

New Enum Constants

- `VK_EXT_ASTC_DECODE_MODE_EXTENSION_NAME`
- `VK_EXT_ASTC_DECODE_MODE_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT`

Issues

1) Are implementations allowed to decode at a higher precision than what is requested?

RESOLUTION: No.

If we allow this, then this extension could be exposed on all implementations that support ASTC.

But developers would have no way of knowing what precision was actually used, and thus whether the image quality is sufficient at reduced precision.

2) Should the decode mode be image view state and/or sampler state?

RESOLUTION: Image view state only.

Some implementations treat the different decode modes as different texture formats.

Example

Create an image view that decodes to `VK_FORMAT_R8G8B8A8_UNORM` precision:

```

VkImageViewASTCDecodeModeEXT decodeMode =
{
    VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT, // sType
    NULL, // pNext
    VK_FORMAT_R8G8B8A8_UNORM // decode mode
};

VkImageViewCreateInfo createInfo =
{
    VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO, // sType
    &decodeMode, // pNext
    // flags, image, viewType set to application-desired values
    VK_FORMAT_ASTC_8x8_UNORM_BLOCK, // format
    // components, subresourceRange set to application-desired values
};

VkImageView imageView;
VkResult result = vkCreateImageView(
    device,
    &createInfo,
    NULL,
    &imageView);

```

Description

This extension adds a number of “advanced” blending operations that **can** be used to perform new color blending operations, many of which are more complex than the standard blend modes provided by unextended Vulkan. This extension requires different styles of usage, depending on the level of hardware support and the enabled features:

- If `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations` is `VK_FALSE`, the new blending operations are supported, but a memory dependency **must** separate each advanced blend operation on a given sample. `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` is used to synchronize reads using advanced blend operations.
- If `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations` is `VK_TRUE`, advanced blend operations obey primitive order just like basic blend operations.

In unextended Vulkan, the set of blending operations is limited, and **can** be expressed very simply. The `VK_BLEND_OP_MIN` and `VK_BLEND_OP_MAX` blend operations simply compute component-wise minimums or maximums of source and destination color components. The `VK_BLEND_OP_ADD`, `VK_BLEND_OP_SUBTRACT`, and `VK_BLEND_OP_REVERSE_SUBTRACT` modes multiply the source and destination colors by source and destination factors and either add the two products together or subtract one from the other. This limited set of operations supports many common blending operations but precludes the use of more sophisticated transparency and blending operations commonly available in many dedicated imaging APIs.

This extension provides a number of new “advanced” blending operations. Unlike traditional blending operations using `VK_BLEND_OP_ADD`, these blending equations do not use source and destination factors specified by `VkBlendFactor`. Instead, each blend operation specifies a complete equation based on the source and destination colors. These new blend operations are used for both RGB and alpha components; they **must** not be used to perform separate RGB and alpha blending (via different values of color and alpha `VkBlendOp`).

These blending operations are performed using premultiplied colors, where RGB colors **can** be considered premultiplied or non-premultiplied by alpha, according to the `srcPremultiplied` and `dstPremultiplied` members of `VkPipelineColorBlendAdvancedStateCreateInfoEXT`. If a color is considered non-premultiplied, the (R,G,B) color components are multiplied by the alpha component prior to blending. For non-premultiplied color components in the range [0,1], the corresponding premultiplied color component would have values in the range $[0 \times A, 1 \times A]$.

Many of these advanced blending equations are formulated where the result of blending source and destination colors with partial coverage have three separate contributions: from the portions covered by both the source and the destination, from the portion covered only by the source, and

from the portion covered only by the destination. The blend parameter `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap` can be used to specify a correlation between source and destination pixel coverage. If set to `VK_BLEND_OVERLAP_CONJOINT_EXT`, the source and destination are considered to have maximal overlap, as would be the case if drawing two objects on top of each other. If set to `VK_BLEND_OVERLAP_DISJOINT_EXT`, the source and destination are considered to have minimal overlap, as would be the case when rendering a complex polygon tessellated into individual non-intersecting triangles. If set to `VK_BLEND_OVERLAP_UNCORRELATED_EXT`, the source and destination coverage are assumed to have no spatial correlation within the pixel.

In addition to the coherency issues on implementations not supporting `advancedBlendCoherentOperations`, this extension has several limitations worth noting. First, the new blend operations have a limit on the number of color attachments they can be used with, as indicated by `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments`. Additionally, blending precision may be limited to 16-bit floating-point, which may result in a loss of precision and dynamic range for framebuffer formats with 32-bit floating-point components, and in a loss of precision for formats with 12- and 16-bit signed or unsigned normalized integer components.

New Structures

Description

After the publication of `VK_EXT_custom_border_color`, it was discovered that some implementations had undefined behavior when combining a sampler that uses a custom border color with image views whose component mapping is not the identity mapping.

Since `VK_EXT_custom_border_color` has already shipped, this new extension `VK_EXT_border_color_swizzle` was created to define the interaction between custom border colors and non-identity image view swizzles, and provide a work-around for implementations that must pre-swizzle the sampler border color to match the image view component mapping it is combined with.

This extension also defines the behavior between samplers with an opaque black border color and image views with a non-identity component swizzle, which was previously left undefined.

New Structures

Description

This extension provides an interface to query calibrated timestamps obtained quasi simultaneously from two time domains.

New Commands

- [vkGetCalibratedTimestampsEXT](#)
- [vkGetPhysicalDeviceCalibrateableTimeDomainsEXT](#)

New Structures

- [VkCalibratedTimestampInfoEXT](#)

New Enums

- [VkTimeDomainEXT](#)

New Enum Constants

- [VK_EXT_CALIBRATED_TIMESTAMPS_EXTENSION_NAME](#)
- [VK_EXT_CALIBRATED_TIMESTAMPS_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_EXT](#)

Issues

1) Is the device timestamp value returned in the same time domain as the timestamp values written by [vkCmdWriteTimestamp](#)?

RESOLVED: Yes.

2) What time domain is the host timestamp returned in?

RESOLVED: A query is provided to determine the calibrateable time domains. The expected host time domain used on Windows is that of QueryPerformanceCounter, and on Linux that of CLOCK_MONOTONIC.

3) Should we support other time domain combinations than just one host and the device time domain?

RESOLVED: Supporting that would need the application to query the set of supported time

domains, while supporting only one host and the device time domain would only need a query for the host time domain type. The proposed API chooses the general approach for the sake of extensibility.

4) Should we use CLOCK_MONOTONIC_RAW instead of CLOCK_MONOTONIC?

RESOLVED: CLOCK_MONOTONIC is usable in a wider set of situations, however, it is subject to NTP adjustments so some use cases may prefer CLOCK_MONOTONIC_RAW. Thus this extension allows both to be exposed.

5) How can the application extrapolate future device timestamp values from the calibrated timestamp value?

RESOLVED: [VkPhysicalDeviceLimits::timestampPeriod](#) makes it possible to calculate future device timestamps as follows:

6) In what queue are timestamp values in time domain [VK_TIME_DOMAIN_DEVICE_EXT](#) captured by [vkGetCalibratedTimestampsEXT](#)?

RESOLVED: An implementation supporting this extension will have all its VkQueue share the same time domain.

```
futureTimestamp = calibratedTimestamp + deltaNanoseconds / timestampPeriod
```

6) Can the host and device timestamp values drift apart over longer periods of time?

RESOLVED: Yes, especially as some time domains by definition allow for that to happen (e.g. CLOCK_MONOTONIC is subject to NTP adjustments). Thus it is recommended that applications re-calibrate from time to time.

7) Should we add a query for reporting the maximum deviation of the timestamp values returned by calibrated timestamp queries?

RESOLVED: A global query seems inappropriate and difficult to enforce. However, it is possible to return the maximum deviation any single calibrated timestamp query can have by sampling one of the time domains twice as follows:

```
timestampX = timestampX_before = SampleTimeDomain(X)
for each time domain Y != X
    timestampY = SampleTimeDomain(Y)
timestampX_after = SampleTimeDomain(X)
maxDeviation = timestampX_after - timestampX_before
```

8) Can the maximum deviation reported ever be zero?

RESOLVED: Unless the tick of each clock corresponding to the set of time domains coincides and all clocks can literally be sampled simultaneously, there is not really a possibility for the maximum deviation to be zero, so by convention the maximum deviation is always at least the maximum of the length of the ticks of the set of time domains calibrated and thus can never be zero.

Description

This extension allows for selectively enabling and disabling writes to output color attachments via a pipeline dynamic state.

The intended use cases for this new state are mostly identical to those of colorWriteMask, such as selectively disabling writes to avoid feedback loops between subpasses or bandwidth savings for unused outputs. By making the state dynamic, one additional benefit is the ability to reduce pipeline counts and pipeline switching via shaders that write a superset of the desired data of which subsets are selected dynamically. The reason for a new state, colorWriteEnable, rather than making colorWriteMask dynamic is that, on many implementations, the more flexible per-component semantics of the colorWriteMask state cannot be made dynamic in a performant manner.

New Commands

Description

This extension allows the execution of one or more rendering commands to be conditional on a value in buffer memory. This may help an application reduce the latency by conditionally discarding rendering commands without application intervention. The conditional rendering commands are limited to draws, compute dispatches and clearing attachments within a conditional rendering block.

New Commands

- [vkCmdBeginConditionalRenderingEXT](#)
- [vkCmdEndConditionalRenderingEXT](#)

New Structures

- [VkConditionalRenderingBeginInfoEXT](#)
- Extending [VkCommandBufferInheritanceInfo](#):

- [VkCommandBufferInheritanceConditionalRenderingInfoEXT](#)
- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceConditionalRenderingFeaturesEXT](#)

New Enums

 - [VK_STRUCTURE_TYPE_CONDITIONAL_RENDERING_BEGIN_INFO_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONDITIONAL_RENDERING_FEATURES_EXT](#)

Issues

1) Should conditional rendering affect copy and blit commands?

RESOLVED: Conditional rendering should not affect copies and blits.

2) Should secondary command buffers be allowed to execute while conditional rendering is active in the primary command buffer?

RESOLVED: The rendering commands in secondary command buffer will be affected by an active conditional rendering in primary command buffer if the `conditionalRenderingEnable` is set to `VK_TRUE`. Conditional rendering **must** not be active in the primary command buffer if `conditionalRenderingEnable` is `VK_FALSE`.

Examples

None.

Description

This extension adds a new rasterization mode called conservative rasterization. There are two modes of conservative rasterization; overestimation and underestimation.

When overestimation is enabled, if any part of the primitive, including its edges, covers any part of the rectangular pixel area, including its sides, then a fragment is generated with all coverage samples turned on. This extension allows for some variation in implementations by accounting for differences in overestimation, where the generating primitive size is increased at each of its edges by some sub-pixel amount to further increase conservative pixel coverage. Implementations can allow the application to specify an extra overestimation beyond the base overestimation the implementation already does. It also allows implementations to either cull degenerate primitives or rasterize them.

When underestimation is enabled, fragments are only generated if the rectangular pixel area is fully covered by the generating primitive. If supported by the implementation, when a pixel rectangle is fully covered the fragment shader input variable builtin called `FullyCoveredEXT` is set to true. The shader variable works in either overestimation or underestimation mode.

Implementations can process degenerate triangles and lines by either discarding them or generating conservative fragments for them. Degenerate triangles are those that end up with zero area after the rasterizer quantizes them to the fixed-point pixel grid. Degenerate lines are those with zero length after quantization.

Description

This extension provides cross-vendor functionality to specify a custom border color for use when the sampler address mode `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` is used.

To create a sampler which uses a custom border color set `VkSamplerCreateInfo::borderColor` to one of:

- `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
- `VK_BORDER_COLOR_INT_CUSTOM_EXT`

When `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT` is used, applications must provide a `VkSamplerCustomBorderColorCreateInfoEXT` in the `pNext` chain for `VkSamplerCreateInfo`.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceCustomBorderColorFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:

- [VkPhysicalDeviceCustomBorderColorPropertiesEXT](#)
- Extending [VkSamplerCreateInfo](#):
 - [VkSamplerCustomBorderColorCreateInfoEXT](#)

New Enum Constants

- [VK_EXT_CUSTOM_BORDER_COLOR_EXTENSION_NAME](#)
- [VK_EXT_CUSTOM_BORDER_COLOR_SPEC_VERSION](#)
- Extending [VkBorderColor](#):
 - [VK_BORDER_COLOR_FLOAT_CUSTOM_EXT](#)
 - [VK_BORDER_COLOR_INT_CUSTOM_EXT](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_PROPERTIES_EXT](#)
 - [VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_CREATE_INFO_EXT](#)

Issues

1) Should `VkClearColorValue` be used for the border color value, or should we have our own struct/union? Do we need to specify the type of the input values for the components? This is more of a concern if `VkClearColorValue` is used here because it provides a union of float,int,uint types.

RESOLVED: Will reuse existing `VkClearColorValue` structure in order to easily take advantage of float,int,uint borderColor types.

2) For hardware which supports a limited number of border colors what happens if that number is exceeded? Should this be handled by the driver unbeknownst to the application? In Revision 1 we had solved this issue using a new Object type, however that may have lead to additional system resource consumption which would otherwise not be required.

RESOLVED: Added `VkPhysicalDeviceCustomBorderColorPropertiesEXT::maxCustomBorderColorSamplers` for tracking implementation-specific limit, and Valid Usage statement handling overflow.

3) Should this be supported for immutable samplers at all, or by a feature bit? Some implementations may not be able to support custom border colors on immutable samplers—is it worthwhile enabling this to work on them for implementations that can support it, or forbidding it entirely.

RESOLVED: Samplers created with a custom border color are forbidden from being immutable. This resolves concerns for implementations where the custom border color is an index to a LUT instead of being directly embedded into sampler state.

4) Should `UINT` and `SINT` (unsigned integer and signed integer) border color types be separated or should they be combined into one generic `INT` (integer) type?

RESOLVED: Separating these does not make much sense as the existing fixed border color types do

not have this distinction, and there is no reason in hardware to do so. This separation would also create unnecessary work and considerations for the application.

Version History

- Revision 1, 2019-10-10 (Joshua Ashton)
 - Internal revisions.
- Revision 2, 2019-10-11 (Liam Middlebrook)
 - Remove `VkCustomBorderColor` object and associated functions
 - Add issues concerning HW limitations for custom border color count
- Revision 3, 2019-10-12 (Joshua Ashton)
 - Re-expose the limits for the maximum number of unique border colors
 - Add extra details about border color tracking
 - Fix typos
- Revision 4, 2019-10-12 (Joshua Ashton)
 - Changed `maxUniqueCustomBorderColors` to a `uint32_t` from a `VkDeviceSize`
- Revision 5, 2019-10-14 (Liam Middlebrook)
 - Added features bit
- Revision 6, 2019-10-15 (Joshua Ashton)
 - Type-ize `VK_BORDER_COLOR_CUSTOM`
 - Fix const-ness on `pNext` of `VkSamplerCustomBorderColorCreateInfoEXT`
- Revision 7, 2019-11-26 (Liam Middlebrook)
 - Renamed `maxUniqueCustomBorderColors` to `maxCustomBorderColors`
- Revision 8, 2019-11-29 (Joshua Ashton)
 - Renamed `borderColor` member of `VkSamplerCustomBorderColorCreateInfoEXT` to `customBorderColor`
- Revision 9, 2020-02-19 (Joshua Ashton)
 - Renamed `maxCustomBorderColors` to `maxCustomBorderColorSamplers`
- Revision 10, 2020-02-21 (Joshua Ashton)
 - Added format to `VkSamplerCustomBorderColorCreateInfoEXT` and feature bit
- Revision 11, 2020-04-07 (Joshua Ashton)
 - Dropped `UINT/SINT` border color differences, consolidated types
- Revision 12, 2020-04-16 (Joshua Ashton)
 - Renamed `VK_BORDER_COLOR_CUSTOM_FLOAT_EXT` to `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` for consistency

Description

Due to the nature of the Vulkan interface, there is very little error information available to the developer and application. By using the `VK_EXT_debug_utils` extension, developers **can** obtain more information. When combined with validation layers, even more detailed feedback on the application's use of Vulkan will be provided.

This extension provides the following capabilities:

- The ability to create a debug messenger which will pass along debug messages to an application supplied callback.
- The ability to identify specific Vulkan objects using a name or tag to improve tracking.
- The ability to identify specific sections within a `VkQueue` or `VkCommandBuffer` using labels to aid organization and offline analysis in external tools.

The main difference between this extension and `VK_EXT_debug_report` and `VK_EXT_debug_marker` is that those extensions use `VkDebugReportObjectTypeEXT` to identify objects. This extension uses the core `VkObjectType` in place of `VkDebugReportObjectTypeEXT`. The primary reason for this move is that no future object type handle enumeration values will be added to `VkDebugReportObjectTypeEXT` since the creation of `VkObjectType`.

In addition, this extension combines the functionality of both `VK_EXT_debug_report` and `VK_EXT_debug_marker` by allowing object name and debug markers (now called labels) to be returned to the application's callback function. This should assist in clarifying the details of a debug message including: what objects are involved and potentially which location within a `VkQueue` or `VkCommandBuffer` the message occurred.

New Object Types

- `VkDebugUtilsMessengerEXT`

New Commands

- `vkCmdBeginDebugUtilsLabelEXT`
- `vkCmdEndDebugUtilsLabelEXT`
- `vkCmdInsertDebugUtilsLabelEXT`

- VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT
- VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT
- VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_TAG_INFO_EXT

Examples

Example 1

`VK_EXT_debug_utils` allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application defined behavior. An application **can** register callbacks even when no validation layers are enabled, but they will only be called for loader and, if implemented, driver events.

To capture events that occur while creating or destroying an instance an application **can** link a `VkDebugUtilsMessengerCreateInfoEXT` structure to the `pNext` element of the `VkInstanceCreateInfo` structure given to `vkCreateInstance`.

Example uses: Create three callback objects. One will log errors and warnings to the debug console using Windows `OutputDebugString`. The second will cause the debugger to break at that callback when an error happens and the third will log warnings to stdout.

```

extern VkInstance instance;
VkResult res;
VkDebugUtilsMessengerEXT cb1, cb2, cb3;

// Must call extension functions through a function pointer:
PFN_vkCreateDebugUtilsMessengerEXT pfnCreateDebugUtilsMessengerEXT =
(PFN_vkCreateDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance,
"vkCreateDebugUtilsMessengerEXT");
PFN_vkDestroyDebugUtilsMessengerEXT pfnDestroyDebugUtilsMessengerEXT =
(PFN_vkDestroyDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance,
"vkDestroyDebugUtilsMessengerEXT");

VkDebugUtilsMessengerCreateInfoEXT callback1 = {
    VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT, // sType
    NULL, // pNext
    0, // flags
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT | // messageSeverity
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT, // messageType
    VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT | // myOutputDebugString,
    VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT, // pfnUserCallback
    NULL // pUserData
}

```

```

};

res = pfnCreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb1);
if (res != VK_SUCCESS) {
    // Do error handling for VK_ERROR_OUT_OF_MEMORY
}

callback1.messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT;
callback1.pfnUserCallback = myDebugBreak;
callback1.pUserData = NULL;
res = pfnCreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb2);
if (res != VK_SUCCESS) {
    // Do error handling for VK_ERROR_OUT_OF_MEMORY
}

VkDebugUtilsMessengerCreateInfoEXT callback3 = {
    VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT, // sType
    NULL, // pNext
    0, // flags
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT, // messageSeverity
    VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT | // messageType
    VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT,
    mystdOutLogger, // pfnUserCallback
    NULL // pUserData
};
res = pfnCreateDebugUtilsMessengerEXT(instance, &callback3, NULL, &cb3);
if (res != VK_SUCCESS) {
    // Do error handling for VK_ERROR_OUT_OF_MEMORY
}

...

// Remove callbacks when cleaning up
pfnDestroyDebugUtilsMessengerEXT(instance, cb1, NULL);
pfnDestroyDebugUtilsMessengerEXT(instance, cb2, NULL);
pfnDestroyDebugUtilsMessengerEXT(instance, cb3, NULL);

```

Example 2

Associate a name with an image, for easier debugging in external tools or with validation layers that can print a friendly name when referring to objects in error messages.

```

extern VkInstance instance;
extern VkDevice device;
extern VkImage image;

// Must call extension functions through a function pointer:
PFN_vkSetDebugUtilsObjectNameEXT pfnSetDebugUtilsObjectNameEXT =
(PFN_vkSetDebugUtilsObjectNameEXT)vkGetInstanceProcAddr(instance,
"vkSetDebugUtilsObjectNameEXT");

// Set a name on the image
const VkDebugUtilsObjectNameInfoEXT imageNameInfo =
{
    VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT, // sType
    NULL, // pNext
    VK_OBJECT_TYPE_IMAGE, // objectType
    (uint64_t)image, // objectHandle
    "Brick Diffuse Texture", // pObjectName
};

pfnSetDebugUtilsObjectNameEXT(device, &imageNameInfo);

// A subsequent error might print:
// Image 'Brick Diffuse Texture' (0xc0dec0dedeadbeef) is used in a
// command buffer with no memory bound to it.

```

Example 3

Annotating regions of a workload with naming information so that offline analysis tools can display a more usable visualization of the commands submitted.

```

extern VkInstance instance;
extern VkCommandBuffer commandBuffer;

// Must call extension functions through a function pointer:
PFN_vkQueueBeginDebugUtilsLabelEXT pfnQueueBeginDebugUtilsLabelEXT =
(PFN_vkQueueBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkQueueBeginDebugUtilsLabelEXT");
PFN_vkQueueEndDebugUtilsLabelEXT pfnQueueEndDebugUtilsLabelEXT =
(PFN_vkQueueEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkQueueEndDebugUtilsLabelEXT");
PFN_vkCmdBeginDebugUtilsLabelEXT pfnCmdBeginDebugUtilsLabelEXT =
(PFN_vkCmdBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkCmdBeginDebugUtilsLabelEXT");
PFN_vkCmdEndDebugUtilsLabelEXT pfnCmdEndDebugUtilsLabelEXT =
(PFN_vkCmdEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkCmdEndDebugUtilsLabelEXT");
PFN_vkCmdInsertDebugUtilsLabelEXT pfnCmdInsertDebugUtilsLabelEXT =
(PFN_vkCmdInsertDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkCmdInsertDebugUtilsLabelEXT");

```

```

// Describe the area being rendered
const VkDebugUtilsLabelEXT houseLabel =
{
    VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT, // sType
    NULL, // pNext
    "Brick House", // pLabelName
    { 1.0f, 0.0f, 0.0f, 1.0f }, // color
};

// Start an annotated group of calls under the 'Brick House' name
pfnCmdBeginDebugUtilsLabelEXT(commandBuffer, &houseLabel);
{
    // A mutable structure for each part being rendered
    VkDebugUtilsLabelEXT housePartLabel =
    {
        VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT, // sType
        NULL, // pNext
        NULL, // pLabelName
        { 0.0f, 0.0f, 0.0f, 0.0f }, // color
    };

    // Set the name and insert the marker
    housePartLabel.pLabelName = "Walls";
    pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

    // Insert the drawcall for the walls
    vkCmdDrawIndexed(commandBuffer, 1000, 1, 0, 0, 0);

    // Insert a recursive region for two sets of windows
    housePartLabel.pLabelName = "Windows";
    pfnCmdBeginDebugUtilsLabelEXT(commandBuffer, &housePartLabel);
    {
        vkCmdDrawIndexed(commandBuffer, 75, 6, 1000, 0, 0);
        vkCmdDrawIndexed(commandBuffer, 100, 2, 1450, 0, 0);
    }
    pfnCmdEndDebugUtilsLabelEXT(commandBuffer);

    housePartLabel.pLabelName = "Front Door";
    pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

    vkCmdDrawIndexed(commandBuffer, 350, 1, 1650, 0, 0);

    housePartLabel.pLabelName = "Roof";
    pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

    vkCmdDrawIndexed(commandBuffer, 500, 1, 2000, 0, 0);
}

// End the house annotation started above
pfnCmdEndDebugUtilsLabelEXT(commandBuffer);

```

```

// Do other work

vkEndCommandBuffer(commandBuffer);

// Describe the queue being used
const VkDebugUtilsLabelEXT queueLabel =
{
    VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT, // sType
    NULL, // pNext
    "Main Render Work", // pLabelName
    { 0.0f, 1.0f, 0.0f, 1.0f }, // color
};

// Identify the queue label region
pfnQueueBeginDebugUtilsLabelEXT(queue, &queueLabel);

// Submit the work for the main render thread
const VkCommandBuffer cmd_bufs[] = {commandBuffer};
VkSubmitInfo submit_info = {.sType = VK_STRUCTURE_TYPE_SUBMIT_INFO,
                           .pNext = NULL,
                           .waitSemaphoreCount = 0,
                           .pWaitSemaphores = NULL,
                           .pWaitDstStageMask = NULL,
                           .commandBufferCount = 1,
                           .pCommandBuffers = cmd_bufs,
                           .signalSemaphoreCount = 0,
                           .pSignalSemaphores = NULL};
vkQueueSubmit(queue, 1, &submit_info, fence);

// End the queue label region
pfnQueueEndDebugUtilsLabelEXT(queue);

```

Issues

- 1) Should we just name this extension **VK_EXT_debug_report2**

RESOLVED: No. There is enough additional changes to the structures to break backwards compatibility. So, a new name was decided that would not indicate any interaction with the previous extension.

- 2) Will validation layers immediately support all the new features.

RESOLVED: Not immediately. As one can imagine, there is a lot of work involved with converting the validation layer logging over to the new functionality. Basic logging, as seen in the origin **VK_EXT_debug_report** extension will be made available immediately. However, adding the labels and object names will take time. Since the priority for Khronos at this time is to continue focusing on Valid Usage statements, it may take a while before the new functionality is fully exposed.

- 3) If the validation layers will not expose the new functionality immediately, then what is the point of this extension?

RESOLVED: We needed a replacement for `VK_EXT_debug_report` because the `VkDebugReportObjectTypeEXT` enumeration will no longer be updated and any new objects will need to be debugged using the new functionality provided by this extension.

4) Should this extension be split into two separate parts (1 extension that is an instance extension providing the callback functionality, and another device extension providing the general debug marker and annotation functionality)?

RESOLVED: No, the functionality for this extension is too closely related. If we did split up the extension, where would the structures and enums live, and how would you define that the device behavior in the instance extension is really only valid if the device extension is enabled, and the functionality is passed in. It is cleaner to just define this all as an instance extension, plus it allows the application to enable all debug functionality provided with one enable string during `vkCreateInstance`.

Version History

- Revision 1, 2017-09-14 (Mark Young and all listed Contributors)
 - Initial draft, based on `VK_EXT_debug_report` and `VK_EXT_debug_marker` in addition to previous feedback supplied from various companies including Valve, Epic, and Oxide games.
- Revision 2, 2020-04-03 (Mark Young and Piers Daniell)
 - Updated to allow either `NULL` or an empty string to be passed in for `pObjectName` in `VkDebugUtilsObjectNameInfoEXT`, because the loader and various drivers support `NULL` already.

Description

This extension allows the application to use the OpenGL depth range in NDC, i.e. with depth in range [-1, 1], as opposed to Vulkan's default of [0, 1]. The purpose of this extension is to allow efficient layering of OpenGL over Vulkan, by avoiding emulation in the pre-rasterization shader stages. This emulation, which effectively duplicates gl_Position but with a different depth value, costs ALU and consumes shader output components that the implementation may not have to spare to meet OpenGL minimum requirements.

- Revision 1, 2020-11-26 (Shahbaz Youssefi)
 - Language fixes

Issues

- 1) Should this extension include an origin control option to match GL_LOWER_LEFT found in

ARB_clip_control?

RESOLVED: No. The fix for porting over the origin is a simple y-axis flip. The depth clip control is a much harder problem to solve than what this extension is aimed to solve. Adding an equivalent to GL_LOWER_LEFT would require more testing.

2) Should this pipeline state be dynamic?

RESOLVED: Yes. The purpose of this extension is to emulate the OpenGL depth range, which is expected to be globally fixed (in case of OpenGL ES) or very infrequently changed (with `glClipControl` in OpenGL).

3) Should the control provided in this extension be an enum that could be extended in the future?

RESOLVED: No. It is highly unlikely that the depth range is changed to anything other than [0, 1] in the future. Should that happen a new extension will be required to extend such an enum, and that extension might as well add a new struct to chain to `VkPipelineViewportStateCreateInfo::pNext` instead.

- Philip Rebohle, DXVK
- Tobias Hector, AMD

Description

This extension allows the depth clipping operation, that is normally implicitly controlled by `VkPipelineRasterizationStateCreateInfo::depthClampEnable`, to instead be controlled explicitly by `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable`.

This is useful for translating DX content which assumes depth clamping is always enabled, but depth clip can be controlled by the `DepthClipEnable` rasterization state (`D3D12_RASTERIZER_DESC`).

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceDepthClipEnableFeaturesEXT`
- Extending `VkPipelineRasterizationStateCreateInfo`:
 - `VkPipelineRasterizationDepthClipStateCreateInfoEXT`

New Bitmasks

Description

This extension removes the `VkViewport` `minDepth` and `maxDepth` restrictions that the values must be between `0.0` and `1.0`, inclusive. It also removes the same restriction on `VkPipelineDepthStencilStateCreateInfo` `minDepthBounds` and `maxDepthBounds`. Finally it removes the restriction on the `depth` value in `VkClearDepthStencilValue`.

New Enum Constants

- `VK_EXT_DEPTH_RANGE_UNRESTRICTED_EXTENSION_NAME`
- `VK_EXT_DEPTH_RANGE_UNRESTRICTED_SPEC_VERSION`

Issues

1) How do `VkViewport` `minDepth` and `maxDepth` values outside of the `0.0` to `1.0` range interact with [Primitive Clipping](#)?

RESOLVED: The behavior described in [Primitive Clipping](#) still applies. If depth clamping is disabled the depth values are still clipped to $0 \leq z_c \leq w_c$ before the viewport transform. If depth clamping is enabled the above equation is ignored and the depth values are instead clamped to the `VkViewport` `minDepth` and `maxDepth` values, which in the case of this extension can be outside of the `0.0` to `1.0` range.

2) What happens if a resulting depth fragment is outside of the `0.0` to `1.0` range and the depth

buffer is fixed-point rather than floating-point?

RESOLVED: The supported range of a fixed-point depth buffer is `0.0` to `1.0` and depth fragments are clamped to this range.

Description

This device extension allows registration of device memory event callbacks upon device creation, so that applications or middleware can obtain detailed information about memory usage and how memory is associated with Vulkan objects. This extension exposes the actual underlying device memory usage, including allocations that are not normally visible to the application, such as memory consumed by [vkCreateGraphicsPipelines](#). It is intended primarily for use by debug tooling rather than for production applications.

 - [VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_MEMORY_REPORT_FEATURES_EXT](#)

Issues

1) Should this be better expressed as an extension to `VK_EXT_debug_utils` and its general-purpose messenger construct?

RESOLVED: No. The intended lifecycle is quite different. We want to make this extension tied to the device's lifecycle. Each ICD just handles its own implementation of this extension, and this

extension will only be directly exposed from the ICD. So we can avoid the extra implementation complexity used to accommodate the flexibility of [VK_EXT_debug_utils](#) extension.

2) Can we extend and use the existing internal allocation callbacks instead of adding the new callback structure in this extension?

RESOLVED: No. Our memory reporting layer that combines this information with other memory information it collects directly (e.g. bindings of resources to [VkDeviceMemory](#)) would have to intercept all entry points that take a [VkAllocationCallbacks](#) parameter and inject its own [pfnInternalAllocation](#) and [pfnInternalFree](#). That may be doable for the extensions we know about, but not for ones we do not. The proposal would work fine in the face of most unknown extensions. But even for ones we know about, since apps can provide a different set of callbacks and userdata and those can be retained by the driver and used later (esp. for pool object, but not just those), we would have to dynamically allocate the interception trampoline every time. That is getting to be an unreasonably large amount of complexity and (possibly) overhead.

We are interested in both alloc/free and import/unimport. The latter is fairly important for tracking (and avoiding double-counting) of swapchain images (still true with “native swapchains” based on external memory) and media/camera interop. Though we might be able to handle this with additional [VkInternalAllocationType](#) values, for import/export we do want to be able to tie this to the external resource, which is one thing that the [memoryObjectId](#) is for.

The internal alloc/free callbacks are not extensible except via new [VkInternalAllocationType](#) values. The [VkDeviceMemoryReportCallbackDataEXT](#) in this extension is extensible. That was deliberate: there is a real possibility we will want to get extra information in the future. As one example, currently this reports only physical allocations, but we believe there are interesting cases for tracking how populated that VA region is.

The callbacks are clearly specified as only callable within the context of a call from the app into Vulkan. We believe there are some cases where drivers can allocate device memory asynchronously. This was one of the sticky issues that derailed the internal device memory allocation reporting design (which is essentially what this extension is trying to do) leading up to 1.0.

[VkAllocationCallbacks](#) is described in a section called “Host memory” and the intro to it is very explicitly about host memory. The other callbacks are all inherently about host memory. But this extension is very focused on device memory.

3) Should the callback be reporting which heap is used?

RESOLVED: Yes. It is important for non-UMA systems to have all the device memory allocations attributed to the corresponding device memory heaps. For internally-allocated device memory, [heapIndex](#) will always correspond to an advertised heap, rather than having a magic value indicating a non-advertised heap. Drivers can advertise heaps that do not have any corresponding memory types if they need to.

4) Should we use an array of callback for the layers to intercept instead of chaining multiple of the [VkDeviceDeviceMemoryReportCreateInfoEXT](#) structures in the [pNext](#) of [VkDeviceCreateInfo](#)?

RESOLVED No. The pointer to the [VkDeviceDeviceMemoryReportCreateInfoEXT](#) structure itself is

const and you cannot just cast it away. Thus we cannot update the callback array inside the structure. In addition, we cannot drop this `pNext` chain either, so making a copy of this whole structure does not work either.

5) Should we track bulk allocations shared among multiple objects?

RESOLVED No. Take the shader heap as an example. Some implementations will let multiple `VkPipeline` objects share the same shader heap. We are not asking the implementation to report `VK_OBJECT_TYPE_PIPELINE` along with a `VK_NULL_HANDLE` for this bulk allocation. Instead, this bulk allocation is considered as a layer below what this extension is interested in. Later, when the actual `VkPipeline` objects are created by suballocating from the bulk allocation, we ask the implementation to report the valid handles of the `VkPipeline` objects along with the actual suballocated sizes and different `memoryObjectId`.

6) Can we require the callbacks to be always called in the same thread with the Vulkan commands?

RESOLVED No. Some implementations might choose to multiplex work from multiple application threads into a single backend thread and perform JIT allocations as a part of that flow. Since this behavior is theoretically legit, we cannot require the callbacks to be always called in the same thread with the Vulkan commands, and the note is to remind the applications to handle this case properly.

7) Should we add an additional “allocation failed” event type with things like size and heap index reported?

RESOLVED Yes. This fits in well with the callback infrastructure added in this extension, and implementation touches the same code and has the same overheads as the rest of the extension. It could help debugging things like getting an `VK_ERROR_OUT_OF_HOST_MEMORY` error when ending a command buffer. Right now the allocation failure could have happened anywhere during recording, and a callback would be really useful to understand where and why.

Description

This extension, along with related platform extensions, allows applications to take exclusive control of displays associated with a native windowing system. This is especially useful for virtual reality applications that wish to hide HMDs (head mounted displays) from the native platform's display management system, desktop, and/or other applications.

New Commands

- [vkReleaseDisplayEXT](#)

New Enum Constants

- [VK_EXT_DIRECT_MODE_DISPLAY_EXTENSION_NAME](#)
- [VK_EXT_DIRECT_MODE_DISPLAY_SPEC_VERSION](#)

Issues

1) Should this extension and its related platform-specific extensions leverage [VK_KHR_display](#), or provide separate equivalent interfaces.

RESOLVED: Use `VK_KHR_display` concepts and objects. `VK_KHR_display` can be used to enumerate all displays on the system, including those attached to/in use by a window system or native platform, but `VK_KHR_display_swapchain` will fail to create a swapchain on in-use displays. This extension and its platform-specific children will allow applications to grab in-use displays away from window systems and/or native platforms, allowing them to be used with `VK_KHR_display_swapchain`.

2) Are separate calls needed to acquire displays and enable direct mode?

RESOLVED: No, these operations happen in one combined command. Acquiring a display puts it into direct mode.

Description

The `VK_EXT_directfb_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) that refers to a DirectFB `IDirectFBSurface`, as well as a query to determine support for rendering via DirectFB.

New Commands

- `vkCreateDirectFBSurfaceEXT`
- `vkGetPhysicalDeviceDirectFBPresentationSupportEXT`

New Structures

- `VkDirectFBSurfaceCreateInfoEXT`

- Jeff Bolz, NVIDIA

Description

This extension provides additional orthogonally aligned “discard rectangles” specified in framebuffer-space coordinates that restrict rasterization of all points, lines and triangles.

From zero to an implementation-dependent limit (specified by `maxDiscardRectangles`) number of discard rectangles can be operational at once. When one or more discard rectangles are active, rasterized fragments can either survive if the fragment is within any of the operational discard rectangles (`VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT` mode) or be rejected if the fragment is within any of the operational discard rectangles (`VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT` mode).

These discard rectangles operate orthogonally to the existing scissor test functionality. The discard rectangles can be different for each physical device in a device group by specifying the device mask and setting discard rectangle dynamic state.

- VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT
- VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT
- VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT

Issues

1) Should this extension add an explicit “WaitForVsync” API or a fence signaled at vsync that the application can wait on?

RESOLVED: A fence. A separate API could later be provided that allows exporting the fence to a native object that could be inserted into standard run loops on POSIX and Windows systems.

2) Should callbacks be added for a vsync event, or in general to monitor events in Vulkan?

RESOLVED: No, fences should be used. Some events are generated by interrupts which are managed in the kernel. In order to use a callback provided by the application, drivers would need to have the userspace driver spawn threads that would wait on the kernel event, and hence the callbacks could be difficult for the application to synchronize with its other work given they would arrive on a foreign thread.

3) Should vblank or scanline events be exposed?

RESOLVED: Vblank events. Scanline events could be added by a separate extension, but the latency of processing an interrupt and waking up a userspace event is high enough that the accuracy of a scanline event would be rather low. Further, per-scanline interrupts are not supported by all hardware.

- James Jones, NVIDIA
- Jason Ekstrand, Intel

Description

A `dma_buf` is a type of file descriptor, defined by the Linux kernel, that allows sharing memory across kernel device drivers and across processes. This extension enables applications to import a

`dma_buf` as `VkDeviceMemory`, to export `VkDeviceMemory` as a `dma_buf`, and to create `VkBuffer` objects that **can** be bound to that memory.

New Enum Constants

- `VK_EXT_EXTERNAL_MEMORY_DMA_BUF_EXTENSION_NAME`
- `VK_EXT_EXTERNAL_MEMORY_DMA_BUF_SPEC_VERSION`
- Extending `VkExternalMemoryHandleTypeFlagBits`:
 - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`

Issues

1) How does the application, when creating a `VkImage` that it intends to bind to `dma_buf` `VkDeviceMemory` containing an externally produced image, specify the memory layout (such as row pitch and DRM format modifier) of the `VkImage`? In other words, how does the application achieve behavior comparable to that provided by `EGL_EXT_image_dma_buf_import` and `EGL_EXT_image_dma_buf_import_modifiers`?

RESOLVED: Features comparable to those in `EGL_EXT_image_dma_buf_import` and `EGL_EXT_image_dma_buf_import_modifiers` will be provided by an extension layered atop this one.

2) Without the ability to specify the memory layout of external `dma_buf` images, how is this extension useful?

RESOLVED: This extension provides exactly one new feature: the ability to import/export between `dma_buf` and `VkDeviceMemory`. This feature, together with features provided by `VK_KHR_external_memory_fd`, is sufficient to bind a `VkBuffer` to `dma_buf`.

Description

This extension enables an application to import host allocations and host mapped foreign device memory to Vulkan memory objects.

New Commands

- [vkGetMemoryHostPointerPropertiesEXT](#)

New Structures

- [VkMemoryHostPointerPropertiesEXT](#)
- Extending [VkMemoryAllocateInfo](#):
 - [VkImportMemoryHostPointerInfoEXT](#)
- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDeviceExternalMemoryHostPropertiesEXT](#)

New Enum Constants

- [VK_EXT_EXTERNAL_MEMORY_HOST_EXTENSION_NAME](#)
- [VK_EXT_EXTERNAL_MEMORY_HOST_SPEC_VERSION](#)

- Extending [VkExternalMemoryHandleTypeFlagBits](#):
 - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`
 - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT`
 - `VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_HOST_PROPERTIES_EXT`

Issues

1) What memory type has to be used to import host pointers?

RESOLVED: Depends on the implementation. Applications have to use the new [vkGetMemoryHostPointerPropertiesEXT](#) command to query the supported memory types for a particular host pointer. The reported memory types may include memory types that come from a memory heap that is otherwise not usable for regular memory object allocation and thus such a heap's size may be zero.

2) Can the application still access the contents of the host allocation after importing?

RESOLVED: Yes. However, usual synchronization requirements apply.

3) Can the application free the host allocation?

RESOLVED: No, it violates valid usage conditions. Using the memory object imported from a host allocation that is already freed thus results in undefined behavior.

4) Is [vkMapMemory](#) expected to return the same host address which was specified when importing it to the memory object?

RESOLVED: No. Implementations are allowed to return the same address but it is not required. Some implementations might return a different virtual mapping of the allocation, although the same physical pages will be used.

5) Is there any limitation on the alignment of the host pointer and/or size?

RESOLVED: Yes. Both the address and the size have to be an integer multiple of [minImportedHostPointerAlignment](#). In addition, some platforms and foreign devices may have additional restrictions.

6) Can the same host allocation be imported multiple times into a given physical device?

RESOLVED: No, at least not guaranteed by this extension. Some platforms do not allow locking the same physical pages for device access multiple times, so attempting to do it may result in undefined behavior.

7) Does this extension support exporting the new handle type?

RESOLVED: No.

8) Should we include the possibility to import host mapped foreign device memory using this API?

RESOLVED: Yes, through a separate handle type. Implementations are still allowed to support only one of the handle types introduced by this extension by not returning import support for a particular handle type as returned in [VkExternalMemoryPropertiesKHR](#).

Description

This extension allows an application to specify areas of the render target where the fragment shader may be invoked fewer times. These fragments are broadcasted out to multiple pixels to cover the render target.

The primary use of this extension is to reduce workloads in areas where lower quality may not be perceived such as the distorted edges of a lens or the periphery of a user's gaze.

Description

This extension adds support for the `FragmentShaderPixelInterlockEXT`, `FragmentShaderSampleInterlockEXT`, and `FragmentShaderShadingRateInterlockEXT` capabilities from the `SPV_EXT_fragment_shader_interlock` extension to Vulkan.

Enabling these capabilities provides a critical section for fragment shaders to avoid overlapping pixels being processed at the same time, and certain guarantees about the ordering of fragment shader invocations of fragments of overlapping pixels.

This extension can be useful for algorithms that need to access per-pixel data structures via shader loads and stores. Algorithms using this extension can access per-pixel data structures in critical sections without other invocations accessing the same per-pixel data. Additionally, the ordering guarantees are useful for cases where the API ordering of fragments is meaningful. For example, applications may be able to execute programmable blending operations in the fragment shader, where the destination buffer is read via image loads and the final value is written via image stores.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT`

New Enum Constants

Description

This extension allows applications to set the policy for swapchain creation and presentation mechanisms relating to full-screen access. Implementations may be able to acquire exclusive access to a particular display for an application window that covers the whole screen. This can increase performance on some systems by bypassing composition, however it can also result in disruptive or expensive transitions in the underlying windowing system when a change occurs.

Applications can choose between explicitly disallowing or allowing this behavior, letting the implementation decide, or managing this mode of operation directly using the new [vkAcquireFullScreenExclusiveModeEXT](#) and [vkReleaseFullScreenExclusiveModeEXT](#) commands.

New Commands

- [vkAcquireFullScreenExclusiveModeEXT](#)
- [vkGetPhysicalDeviceSurfacePresentModes2EXT](#)
- [vkReleaseFullScreenExclusiveModeEXT](#)

If [VK_KHR_device_group](#) is supported:

- [vkGetDeviceGroupSurfacePresentModes2EXT](#)

If [Version 1.1](#) is supported:

- [vkGetDeviceGroupSurfacePresentModes2EXT](#)

New Structures

- Extending [VkPhysicalDeviceSurfaceInfo2KHR](#), [VkSwapchainCreateInfoKHR](#):
 - [VkSurfaceFullScreenExclusiveInfoEXT](#)
- Extending [VkSurfaceCapabilities2KHR](#):
 - [VkSurfaceCapabilitiesFullScreenExclusiveEXT](#)

If [VK_KHR_win32_surface](#) is supported:

- Extending [VkPhysicalDeviceSurfaceInfo2KHR](#), [VkSwapchainCreateInfoKHR](#):
 - [VkSurfaceFullScreenExclusiveWin32InfoEXT](#)

New Enums

- [VkFullScreenExclusiveEXT](#)

New Enum Constants

- [VK_EXT_FULLSCREEN_EXCLUSIVE_EXTENSION_NAME](#)
- [VK_EXT_FULLSCREEN_EXCLUSIVE_SPEC_VERSION](#)
- Extending [VkResult](#):
 - [VK_ERROR_FULLSCREEN_EXCLUSIVE_MODE_LOST_EXT](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULLSCREEN_EXCLUSIVE_EXT](#)
 - [VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_INFO_EXT](#)

If [VK_KHR_win32_surface](#) is supported:

- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_WIN32_INFO_EXT](#)

Issues

1) What should the extension & flag be called?

RESOLVED: VK_FULLSCREEN_EXCLUSIVE.

Other options considered (prior to the app-controlled mode) were:

- VK_EXT_smooth_fullscreen_transition
- VK_EXT_fullscreen_behavior

- VK_EXT_fullscreen_preference
- VK_EXT_fullscreen_hint
- VK_EXT_fastFullscreen_transition
- VK_EXT_avoidFullscreen_exclusive

2) Do we need more than a boolean toggle?

RESOLVED: Yes.

Using an enum with default/allowed/disallowed/app-controlled enables applications to accept driver default behavior, specifically override it in either direction without implying the driver is ever required to use full-screen exclusive mechanisms, or manage this mode explicitly.

3) Should this be a KHR or EXT extension?

RESOLVED: EXT, in order to allow it to be shipped faster.

4) Can the fullscreen hint affect the surface capabilities, and if so, should the hint also be specified as input when querying the surface capabilities?

RESOLVED: Yes on both accounts.

While the hint does not guarantee a particular fullscreen mode will be used when the swapchain is created, it can sometimes imply particular modes will NOT be used. If the driver determines that it will opt-out of using a particular mode based on the policy, and knows it can only support certain capabilities if that mode is used, it would be confusing at best to the application to report those capabilities in such cases. Not allowing implementations to report this state to applications could result in situations where applications are unable to determine why swapchain creation fails when they specify certain hint values, which could result in never-terminating surface creation loops.

5) Should full-screen be one word or two?

RESOLVED: Two words.

"Fullscreen" is not in my dictionary, and web searches did not turn up definitive proof that it is a colloquially accepted compound word. Documentation for the corresponding Windows API mechanisms dithers. The text consistently uses a hyphen, but none-the-less, there is a SetFullscreenState method in the DXGI swapchain object. Given this inconclusive external guidance, it is best to adhere to the Vulkan style guidelines and avoid inventing new compound words.

Version History

- Revision 4, 2019-03-12 (Tobias Hector)
 - Added application-controlled mode, and related functions
 - Tidied up appendix
- Revision 3, 2019-01-03 (James Jones)
 - Renamed to VK_EXT_full_screen_exclusive

- Made related adjustments to the tri-state enumerant names.
- Revision 2, 2018-11-27 (James Jones)
 - Renamed to VK_KHR_fullscreen_behavior
 - Switched from boolean flag to tri-state enum
- Revision 1, 2018-11-06 (James Jones)
 - Internal revision

Description

This extension defines two new structures and a function to assign SMPTE (the Society of Motion Picture and Television Engineers) 2086 metadata and CTA (Consumer Technology Association) 861.3 metadata to a swapchain. The metadata includes the color primaries, white point, and luminance range of the reference monitor, which all together define the color volume containing all the possible colors the reference monitor can produce. The reference monitor is the display where

creative work is done and creative intent is established. To preserve such creative intent as much as possible and achieve consistent color reproduction on different viewing displays, it is useful for the display pipeline to know the color volume of the original reference monitor where content was created or tuned. This avoids performing unnecessary mapping of colors that are not displayable on the original reference monitor. The metadata also includes the `maxContentLightLevel` and `maxFrameAverageLightLevel` as defined by CTA 861.3.

While the general purpose of the metadata is to assist in the transformation between different color volumes of different displays and help achieve better color reproduction, it is not in the scope of this extension to define how exactly the metadata should be used in such a process. It is up to the implementation to determine how to make use of the metadata.

New Commands

- [vkSetHdrMetadataEXT](#)

New Structures

- [VkHdrMetadataEXT](#)
- [VkXYColorEXT](#)

New Enum Constants

- `VK_EXT_HDR_METADATA_EXTENSION_NAME`
- `VK_EXT_HDR_METADATA_SPEC_VERSION`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`

Issues

1) Do we need a query function?

PROPOSED: No, Vulkan does not provide queries for state that the application can track on its own.

2) Should we specify default if not specified by the application?

PROPOSED: No, that leaves the default up to the display.

Description

The `VK_EXT_headless_surface` extension is an instance extension. It provides a mechanism to create `VkSurfaceKHR` objects independently of any window system or display device. The presentation operation for a swapchain created from a headless surface is by default a no-op, resulting in no externally-visible result.

Because there is no real presentation target, future extensions can layer on top of the headless surface to introduce arbitrary or customisable sets of restrictions or features. These could include features like saving to a file or restrictions to emulate a particular presentation target.

This functionality is expected to be useful for application and driver development because it allows any platform to expose an arbitrary or customisable set of restrictions and features of a presentation engine. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application

development.

Description

This extension provides the ability to use *DRM format modifiers* with images, enabling Vulkan to better integrate with the Linux ecosystem of graphics, video, and display APIs.

Its functionality closely overlaps with [EGL_EXT_image_dma_buf_import_modifiers²](#) and [EGL_MESA_image_dma_buf_export³](#). Unlike the EGL extensions, this extension does not require the use of a specific handle type (such as a `dma_buf`) for external memory and provides more explicit control of image creation.

Introduction to DRM Format Modifiers

A *DRM format modifier* is a 64-bit, vendor-prefixed, semi-opaque unsigned integer. Most *modifiers* represent a concrete, vendor-specific tiling format for images. Some exceptions are `DRM_FORMAT_MOD_LINEAR` (which is not vendor-specific); `DRM_FORMAT_MOD_NONE` (which is an alias of `DRM_FORMAT_MOD_LINEAR` due to historical accident); and `DRM_FORMAT_MOD_INVALID` (which does not represent a tiling format). The *modifier*'s vendor prefix consists of the 8 most significant bits. The canonical list of *modifiers* and vendor prefixes is found in `drm_fourcc.h` in the Linux kernel source. The other dominant source of *modifiers* are vendor kernel trees.

One goal of *modifiers* in the Linux ecosystem is to enumerate for each vendor a reasonably sized set of tiling formats that are appropriate for images shared across processes, APIs, and/or devices, where each participating component may possibly be from different vendors. A non-goal is to

enumerate all tiling formats supported by all vendors. Some tiling formats used internally by vendors are inappropriate for sharing; no *modifiers* should be assigned to such tiling formats.

Modifier values typically do not *describe* memory layouts. More precisely, a *modifier*'s lower 56 bits usually have no structure. Instead, modifiers *name* memory layouts; they name a small set of vendor-preferred layouts for image sharing. As a consequence, in each vendor namespace the modifier values are often sequentially allocated starting at 1.

Each *modifier* is usually supported by a single vendor and its name matches the pattern `{VENDOR}_FORMAT_MOD_*` or `DRM_FORMAT_MOD_{VENDOR}_*`. Examples are `I915_FORMAT_MOD_X_TILED` and `DRM_FORMAT_MOD_BROADCOM_VC4_T_TILED`. An exception is `DRM_FORMAT_MOD_LINEAR`, which is supported by most vendors.

Many APIs in Linux use *modifiers* to negotiate and specify the memory layout of shared images. For example, a Wayland compositor and Wayland client may, by relaying *modifiers* over the Wayland protocol `zwp_linux_dmabuf_v1`, negotiate a vendor-specific tiling format for a shared `wl_buffer`. The client may allocate the underlying memory for the `wl_buffer` with GBM, providing the chosen *modifier* to `gbm_bo_create_with_modifiers`. The client may then import the `wl_buffer` into Vulkan for producing image content, providing the resource's `dma_buf` to `VkImportMemoryFdInfoKHR` and its *modifier* to `VkImageDrmFormatModifierExplicitCreateInfoEXT`. The compositor may then import the `wl_buffer` into OpenGL for sampling, providing the resource's `dma_buf` and *modifier* to `eglCreateImage`. The compositor may also bypass OpenGL and submit the `wl_buffer` directly to the kernel's display API, providing the `dma_buf` and *modifier* through `drm_mode_fb_cmd2`.

Format Translation

Modifier-capable APIs often pair *modifiers* with DRM formats, which are defined in `drm_fourcc.h`. However, `VK_EXT_image_drm_format_modifier` uses `VkFormat` instead of DRM formats. The application must convert between `VkFormat` and DRM format when it sends or receives a DRM format to or from an external API.

The mapping from `VkFormat` to DRM format is lossy. Therefore, when receiving a DRM format from an external API, often the application must use information from the external API to accurately map the DRM format to a `VkFormat`. For example, DRM formats do not distinguish between RGB and sRGB (as of 2018-03-28); external information is required to identify the image's colorspace.

The mapping between `VkFormat` and DRM format is also incomplete. For some DRM formats there exist no corresponding Vulkan format, and for some Vulkan formats there exist no corresponding DRM format.

Usage Patterns

Three primary usage patterns are intended for this extension:

- **Negotiation.** The application negotiates with *modifier*-aware, external components to determine sets of image creation parameters supported among all components.

In the Linux ecosystem, the negotiation usually assumes the image is a 2D, single-sampled, non-mipmapped, non-array image; this extension permits that assumption but does not require it. The result of the negotiation usually resembles a set of tuples such as `(drmFormat,`

drmFormatModifier), where each participating component supports all tuples in the set.

Many details of this negotiation—such as the protocol used during negotiation, the set of image creation parameters expressable in the protocol, and how the protocol chooses which process and which API will create the image—are outside the scope of this specification.

In this extension, [vkGetPhysicalDeviceFormatProperties2](#) with [VkDrmFormatModifierPropertiesListEXT](#) serves a primary role during the negotiation, and [vkGetPhysicalDeviceImageFormatProperties2](#) with [VkPhysicalDeviceImageDrmFormatModifierInfoEXT](#) serves a secondary role.

- **Import.** The application imports an image with a *modifier*.

In this pattern, the application receives from an external source the image’s memory and its creation parameters, which are often the result of the negotiation described above. Some image creation parameters are implicitly defined by the external source; for example, [VK_IMAGE_TYPE_2D](#) is often assumed. Some image creation parameters are usually explicit, such as the image’s [format](#), [drmFormatModifier](#), and [extent](#); and each plane’s [offset](#) and [rowPitch](#).

Before creating the image, the application first verifies that the physical device supports the received creation parameters by querying [vkGetPhysicalDeviceFormatProperties2](#) with [VkDrmFormatModifierPropertiesListEXT](#) and [vkGetPhysicalDeviceImageFormatProperties2](#) with [VkPhysicalDeviceImageDrmFormatModifierInfoEXT](#). Then the application creates the image by chaining [VkImageDrmFormatModifierExplicitCreateInfoEXT](#) and [VkExternalMemoryImageCreateInfo](#) onto [VkImageCreateInfo](#).

- **Export.** The application creates an image and allocates its memory. Then the application exports to *modifier*-aware consumers the image’s memory handles; its creation parameters; its *modifier*; and the [offset](#), [size](#), and [rowPitch](#) of each *memory plane*.

In this pattern, the Vulkan device is the authority for the image; it is the allocator of the image’s memory and the decider of the image’s creation parameters. When choosing the image’s creation parameters, the application usually chooses a tuple (*format*, *drmFormatModifier*) from the result of the negotiation described above. The negotiation’s result often contains multiple tuples that share the same *format* but differ in their *modifier*. In this case, the application should defer the choice of the image’s *modifier* to the Vulkan implementation by providing all such *modifiers* to [VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers](#); and the implementation should choose from [pDrmFormatModifiers](#) the optimal *modifier* in consideration with the other image parameters.

The application creates the image by chaining [VkImageDrmFormatModifierListCreateInfoEXT](#) and [VkExternalMemoryImageCreateInfo](#) onto [VkImageCreateInfo](#). The protocol and APIs by which the application will share the image with external consumers will likely determine the value of [VkExternalMemoryImageCreateInfo::handleTypes](#). The implementation chooses for the image an optimal *modifier* from [VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers](#). The application then queries the implementation-chosen *modifier* with [vkGetImageDrmFormatModifierPropertiesEXT](#), and queries the memory layout of each plane with [vkGetImageSubresourceLayout](#).

The application then allocates the image’s memory with [VkMemoryAllocateInfo](#), adding

chained extending structures for external memory; binds it to the image; and exports the memory, for example, with `vkGetMemoryFdKHR`.

Finally, the application sends the image's creation parameters, its *modifier*, its per-plane memory layout, and the exported memory handle to the external consumers. The details of how the application transmits this information to external consumers is outside the scope of this specification.

Prior Art

Extension `EGL_EXT_image_dma_buf_import`¹ introduced the ability to create an `EGLImage` by importing for each plane a `dma_buf`, offset, and row pitch.

Later, extension `EGL_EXT_image_dma_buf_import_modifiers`² introduced the ability to query which combination of formats and *modifiers* the implementation supports and to specify *modifiers* during creation of the `EGLImage`.

Extension `EGL_MESA_image_dma_buf_export`³ is the inverse of `EGL_EXT_image_dma_buf_import_modifiers`.

The Linux kernel modesetting API (KMS), when configuring the display's framebuffer with `struct drm_mode_fb_cmd`⁴, allows one to specify the framebuffer's *modifier* as well as a per-plane memory handle, offset, and row pitch.

GBM, a graphics buffer manager for Linux, allows creation of a `gbm_bo` (that is, a graphics *buffer object*) by importing data similar to that in `EGL_EXT_image_dma_buf_import_modifiers`¹; and symmetrically allows exporting the same data from the `gbm_bo`. See the references to *modifier* and *plane* in `gbm.h`⁵.

If [VK_KHR_format_feature_flags2](#) is supported:

- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_2_EXT](#)

Issues

1) Should this extension define a single DRM format modifier per [VkImage](#)? Or define one per plane?

+

RESOLVED: There exists a single DRM format modifier per [VkImage](#).

DISCUSSION: Prior art, such as [EGL_EXT_image_dma_buf_import_modifiers](#)², [struct drm_mode_fb_cmd2](#)⁴, and [struct gbm_import_fd_modifier_data](#)⁵, allows defining one *modifier* per plane. However, developers of the GBM and kernel APIs concede it was a mistake. Beginning in Linux 4.10, the kernel requires that the application provide the same DRM format *modifier* for each plane. (See Linux commit [bae781b259269590109e8a4a8227331362b88212](#)). And GBM provides an entry point,

`gbm_bo_get_modifier`, for querying the *modifier* of the image but does not provide one to query the modifier of individual planes.

2) When creating an image with `VkImageDrmFormatModifierExplicitCreateInfoEXT`, which is typically used when *importing* an image, should the application explicitly provide the size of each plane?

+

RESOLVED: No. The application **must** not provide the size. To enforce this, the API requires that `VkImageDrmFormatModifierExplicitCreateInfoEXT::pPlaneLayouts->size` **must** be 0.

DISCUSSION: Prior art, such as `EGL_EXT_image_dma_buf_import_modifiers`², `struct drm_mode_fb_cmd2`⁴, and `struct gbm_import_fd_modifier_data`⁵, omits from the API the size of each plane. Instead, the APIs infer each plane's size from the import parameters, which include the image's pixel format and a dma_buf, offset, and row pitch for each plane.

However, Vulkan differs from EGL and GBM with regards to image creation in the following ways:

Differences in Image Creation

- **Undedicated allocation by default.** When importing or exporting a set of dma_bufs as an `EGLImage` or `gbm_bo`, common practice mandates that each dma_buf's memory be dedicated (in the sense of `VK_KHR_dedicated_allocation`) to the image (though not necessarily dedicated to a single plane). In particular, neither the GBM documentation nor the EGL extension specifications explicitly state this requirement, but in light of common practice this is likely due to under-specification rather than intentional omission. In contrast, `VK_EXT_image_drm_format_modifier` permits, but does not require, the implementation to require dedicated allocations for images created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.
- **Separation of image creation and memory allocation.** When importing a set of dma_bufs as an `EGLImage` or `gbm_bo`, EGL and GBM create the image resource and bind it to memory (the dma_bufs) simultaneously. This allows EGL and GBM to query each dma_buf's size during image creation. In Vulkan, image creation and memory allocation are independent unless a dedicated allocation is used (as in `VK_KHR_dedicated_allocation`). Therefore, without requiring dedicated allocation, Vulkan cannot query the size of each dma_buf (or other external handle) when calculating the image's memory layout. Even if dedication allocation were required, Vulkan cannot calculate the image's memory layout until after the image is bound to its `dma_ufs`.

The above differences complicate the potential inference of plane size in Vulkan. Consider the following problematic cases:

Problematic Plane Size Calculations

- **Padding.** Some plane of the image may require implementation-dependent padding.
- **Metadata.** For some *modifiers*, the image may have a metadata plane which requires a non-trivial calculation to determine its size.
- **Mipmapped, array, and 3D images.** The implementation may support `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` for images whose `mipLevels`, `arrayLayers`, or `depth` is greater than 1. For such images with certain *modifiers*, the calculation of each plane's size may

be non-trivial.

However, an application-provided plane size solves none of the above problems.

For simplicity, consider an external image with a single memory plane. The implementation is obviously capable calculating the image's size when its tiling is `VK_IMAGE_TILING_OPTIMAL`. Likewise, any reasonable implementation is capable of calculating the image's size when its tiling uses a supported *modifier*.

Suppose that the external image's size is smaller than the implementation-calculated size. If the application provided the external image's size to `vkCreateImage`, the implementation would observe the mismatched size and recognize its inability to comprehend the external image's layout (unless the implementation used the application-provided size to select a refinement of the tiling layout indicated by the *modifier*, which is strongly discouraged). The implementation would observe the conflict, and reject image creation with `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`. On the other hand, if the application did not provide the external image's size to `vkCreateImage`, then the application would observe after calling `vkGetImageMemoryRequirements` that the external image's size is less than the size required by the implementation. The application would observe the conflict and refuse to bind the `VkImage` to the external memory. In both cases, the result is explicit failure.

Suppose that the external image's size is larger than the implementation-calculated size. If the application provided the external image's size to `vkCreateImage`, for reasons similar to above the implementation would observe the mismatched size and recognize its inability to comprehend the image data residing in the extra size. The implementation, however, must assume that image data resides in the entire size provided by the application. The implementation would observe the conflict and reject image creation with `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`. On the other hand, if the application did not provide the external image's size to `vkCreateImage`, then the application would observe after calling `vkGetImageMemoryRequirements` that the external image's size is larger than the implementation-usable size. The application would observe the conflict and refuse to bind the `VkImage` to the external memory. In both cases, the result is explicit failure.

Therefore, an application-provided size provides no benefit, and this extension should not require it. This decision renders `VkSubresourceLayout::size` an unused field during image creation, and thus introduces a risk that implementations may require applications to submit sideband creation parameters in the unused field. To prevent implementations from relying on sideband data, this extension *requires* the application to set `size` to 0.

- Jason Ekstrand, Intel

Description

This extension adds some line rasterization features that are commonly used in CAD applications and supported in other APIs like OpenGL. Bresenham-style line rasterization is supported, smooth rectangular lines (coverage to alpha) are supported, and stippled lines are supported for all three line rasterization modes.

New Commands

- [vkCmdSetLineStippleEXT](#)

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceLineRasterizationFeaturesEXT](#)

- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDeviceLineRasterizationPropertiesEXT](#)
- Extending [VkPipelineRasterizationStateCreateInfo](#):
 - [VkPipelineRasterizationLineStateCreateInfoEXT](#)

New Enums

- [VkLineRasterizationModeEXT](#)

New Enum Constants

- [VK_EXT_LINE_RASTERIZATION_EXTENSION_NAME](#)
- [VK_EXT_LINE_RASTERIZATION_SPEC_VERSION](#)
- Extending [VkDynamicState](#):
 - [VK_DYNAMIC_STATE_LINE_STIPPLE_EXT](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_EXT](#)
 - [VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT](#)

Issues

(1) Do we need to support Bresenham-style and smooth lines with more than one rasterization sample? i.e. the equivalent of `glDisable(GL_MULTISAMPLE)` in OpenGL when the framebuffer has more than one sample?

RESOLVED: Yes.

For simplicity, Bresenham line rasterization carries forward a few restrictions from OpenGL, such as not supporting per-sample shading, alpha to coverage, or alpha to one.

Description

This extension incorporates `VK_ATTACHMENT_STORE_OP_NONE_EXT` from `VK_QCOM_render_pass_store_ops`, enabling applications to avoid unnecessary synchronization when an attachment is not written during a render pass.

Additionally, `VK_ATTACHMENT_LOAD_OP_NONE_EXT` is introduced to avoid unnecessary synchronization when an attachment is not used during a render pass at all. In combination with `VK_ATTACHMENT_STORE_OP_NONE_EXT`, this is useful as an alternative to preserve attachments in applications that cannot decide if an attachment will be used in a render pass until after the necessary pipelines have been created.

New Enum Constants

- `VK_EXT_LOAD_STORE_OP_NONE_EXTENSION_NAME`
- `VK_EXT_LOAD_STORE_OP_NONE_SPEC_VERSION`
- Extending `VkAttachmentLoadOp`:
 - `VK_ATTACHMENT_LOAD_OP_NONE_EXT`
- Extending `VkAttachmentStoreOp`:
 - `VK_ATTACHMENT_STORE_OP_NONE_EXT`

Version History

- Revision 1, 2021-06-06 (Shahbaz Youssefi)
 - Initial revision, based on VK_QCOM_render_pass_store_ops.
 - Added VK_ATTACHMENT_LOAD_OP_NONE_EXT.

Description

While running a Vulkan application, other processes on the machine might also be attempting to use the same device memory, which can pose problems. This extension adds support for querying the amount of memory used and the total memory budget for a memory heap. The values returned by this query are implementation-dependent and can depend on a variety of factors including operating system and system load.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapBudget` values can be used as a guideline for how much total memory from each heap the **current process** can use at any given time, before allocations may start failing or causing performance degradation. The values may change based on

other activity in the system that is outside the scope and control of the Vulkan implementation.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage` will display the **current process** estimated heap usage.

With this information, the idea is for an application at some interval (once per frame, per few seconds, etc) to query `heapBudget` and `heapUsage`. From here the application can notice if it is over budget and decide how it wants to handle the memory situation (free it, move to host memory, changing mipmap levels, etc). This extension is designed to be used in concert with `VK_EXT_memory_priority` to help with this part of memory management.

New Structures

- Extending `VkPhysicalDeviceMemoryProperties2`:
 - `VkPhysicalDeviceMemoryBudgetPropertiesEXT`

New Enum Constants

- `VK_EXT_MEMORY_BUDGET_EXTENSION_NAME`
- `VK_EXT_MEMORY_BUDGET_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_BUDGET_PROPERTIES_EXT`

Description

This extension adds a `priority` value specified at memory allocation time. On some systems with both device-local and non-device-local memory heaps, the implementation may transparently move memory from one heap to another when a heap becomes full (for example, when the total memory used across all processes exceeds the size of the heap). In such a case, this priority value may be used to determine which allocations are more likely to remain in device-local memory.

Description

Processing multiple draw commands in sequence incurs measurable overhead within drivers due to repeated state checks and updates during dispatch. This extension enables passing the entire sequence of draws directly to the driver in order to avoid any such overhead, using an array of `VkMultiDrawInfoEXT` or `VkMultiDrawIndexedInfoEXT` structs with `vkCmdDrawMultiEXT` or `vkCmdDrawMultiIndexedEXT`, respectively. These functions could be used any time multiple draw commands are being recorded without any state changes between them in order to maximize performance.

New Commands

Description

Vulkan is frequently implemented on multi-user and multi-process operating systems where the device-local memory can be shared by more than one process. On such systems the size of the device-local memory available to the application may not be the full size of the memory heap at all times. In order for these operating systems to support multiple applications the device-local memory is virtualized and paging is used to move memory between device-local and host-local memory heaps, transparent to the application.

The current Vulkan specification does not expose this behavior well and may cause applications to make suboptimal memory choices when allocating memory. For example, in a system with multiple applications running, the application may think that device-local memory is full and revert to making performance-sensitive allocations from host-local memory. In reality the memory heap might not have been full, it just appeared to be at the time memory consumption was queried, and a device-local allocation would have succeeded. A well designed operating system that implements pageable device-local memory will try to have all memory allocations for the foreground application paged into device-local memory, and paged out for other applications as needed when not in use.

When this extension is exposed by the Vulkan implementation it indicates to the application that the operating system implements pageable device-local memory and the application should adjust its memory allocation strategy accordingly. The extension also exposes a new [vkSetDeviceMemoryPriorityEXT](#) function to allow the application to dynamically adjust the priority of existing memory allocations based on its current needs. This will help the operating system page out lower priority memory allocations before higher priority allocations when needed. It will also help the operating system decide which memory allocations to page back into device-local memory first.

To take best advantage of pageable device-local memory the application must create the Vulkan device with the [VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT](#) `::pageableDeviceLocalMemory` feature enabled. When enabled the Vulkan implementation will allow device-local memory allocations to be paged in and out by the operating system, and **may** not return `VK_ERROR_OUT_OF_DEVICE_MEMORY` even if device-local memory appears to be full, but will instead page this, or other allocations, out to make room. The Vulkan implementation will also ensure that host-local memory allocations will never be promoted to device-local memory by the operating system, or consume device-local memory.

Description

This extension adds a new query to obtain PCI bus information about a physical device.

Not all physical devices have PCI bus information, either due to the device not being connected to the system through a PCI interface or due to platform specific restrictions and policies. Thus this extension is only expected to be supported by physical devices which can provide the information.

As a consequence, applications should always check for the presence of the extension string for each individual physical device for which they intend to issue the new query for and should not have any assumptions about the availability of the extension on any given platform.

New Structures

Description

This extension provides new facilities to query DRM properties for physical devices, enabling users to match Vulkan physical devices with DRM nodes on Linux.

Its functionality closely overlaps with [EGL_EXT_device_drm](#)¹. Unlike the EGL extension, this extension does not expose a string containing the name of the device file and instead exposes device minor numbers.

DRM defines multiple device node types. Each physical device may have one primary node and one render node associated. Physical devices may have no primary node (e.g. if the device does not have a display subsystem), may have no render node (e.g. if it is a software rendering engine), or may have neither (e.g. if it is a software rendering engine without a display subsystem).

To query DRM properties for a physical device, chain [VkPhysicalDeviceDrmPropertiesEXT](#) to [VkPhysicalDeviceProperties2](#).

New Structures

Interactions and External Dependencies

- This extension requires `SPV_KHR_post_depth_coverage`
- This extension provides API support for `GL_ARB_post_depth_coverage` and `GL_EXT_post_depth_coverage`

Contributors

- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_post_depth_coverage`

which allows the fragment shader to control whether values in the `SampleMask` built-in input variable reflect the coverage after early `depth` and `stencil` tests are applied.

This extension adds a new `PostDepthCoverage` execution mode under the `SampleMaskPostDepthCoverage` capability. When this mode is specified along with `EarlyFragmentTests`, the value of an input variable decorated with the `SampleMask` built-in reflects the coverage after the `early fragment tests` are applied. Otherwise, it reflects the coverage before the depth and stencil tests.

When using GLSL source-based shading languages, the `post_depth_coverage` layout qualifier from `GL_ARB_post_depth_coverage` or `GL_EXT_post_depth_coverage` maps to the `PostDepthCoverage` execution mode.

Description

This extension allows changing the provoking vertex convention between Vulkan's default convention (first vertex) and OpenGL's convention (last vertex).

This extension is intended for use by API-translation layers that implement APIs like OpenGL on top of Vulkan, and need to match the source API's provoking vertex convention. Applications using Vulkan directly should use Vulkan's default convention.

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceProvokingVertexFeaturesEXT](#)

- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDeviceProvokingVertexPropertiesEXT](#)
- Extending [VkPipelineRasterizationStateCreateInfo](#):
 - [VkPipelineRasterizationProvokingVertexStateCreateInfoEXT](#)

New Enums

- [VkProvokingVertexModeEXT](#)

New Enum Constants

- [VK_EXT_PROVOKING_VERTEX_EXTENSION_NAME](#)
- [VK_EXT_PROVOKING_VERTEX_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROVOKING_VERTEX_FEATURES_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROVOKING_VERTEX_PROPERTIES_EXT](#)
 - [VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT](#)

Issues

1) At what granularity should this state be set?

RESOLVED: At pipeline bind, with an optional per-render pass restriction.

The most natural place to put this state is in the graphics pipeline object. Some implementations require it to be known when creating the pipeline, and pipeline state is convenient for implementing OpenGL 3.2's `glProvokingVertex`, which can change the state between draw calls. However, some implementations can only change it approximately render pass granularity. To accommodate both, provoking vertex will be pipeline state, but implementations can require that only one mode is used within a render pass instance; the render pass's mode is chosen implicitly when the first pipeline is bound.

2) Does the provoking vertex mode affect the order that vertices are written to transform feedback buffers?

RESOLVED: Yes, to enable layered implementations of OpenGL and D3D.

All of OpenGL, OpenGL ES, and Direct3D 11 require that vertices are written to transform feedback buffers such that flat-shaded attributes have the same value when drawing the contents of the transform feedback buffer as they did in the original drawing when the transform feedback buffer was written (assuming the provoking vertex mode has not changed, in APIs that support more than one mode).

Version History

- Revision 1, (1c) 2021-02-22 (Jesse Hall)

- Added `VkPhysicalDeviceProvokingVertexPropertiesEXT::transformFeedbackPreservesTriangleFan` `ProvokingVertex` to accommodate implementations that cannot change the transform feedback vertex order for triangle fans.
- Revision 1, (1b) 2020-06-14 (Jesse Hall)
 - Added `VkPhysicalDeviceProvokingVertexFeaturesEXT::transformFeedbackPreservesProvokingVert` ex and required that transform feedback write vertices so as to preserve the provoking vertex of each primitive.
- Revision 1, (1a) 2019-10-23 (Jesse Hall)
 - Initial draft, based on a proposal by Alexis Hétu

Description

This extension defines a special queue family, `VK_QUEUE_FAMILY_FOREIGN_EXT`, which can be used to transfer ownership of resources backed by external memory to foreign, external queues. This is similar to `VK_QUEUE_FAMILY_EXTERNAL_KHR`, defined in `VK_KHR_external_memory`. The key differences between the two are:

- The queues represented by `VK_QUEUE_FAMILY_EXTERNAL_KHR` must share the same physical device and the same driver version as the current `VkInstance`. `VK_QUEUE_FAMILY_FOREIGN_EXT` has no such restrictions. It can represent devices and drivers from other vendors, and can even represent non-Vulkan-capable devices.
- All resources backed by external memory support `VK_QUEUE_FAMILY_EXTERNAL_KHR`. Support for `VK_QUEUE_FAMILY_FOREIGN_EXT` is more restrictive.
- Applications should expect transitions to/from `VK_QUEUE_FAMILY_FOREIGN_EXT` to be more expensive than transitions to/from `VK_QUEUE_FAMILY_EXTERNAL_KHR`.

New Enum Constants

Description

This extension enables the [VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16](#) format to be used without a [Sampler Y'CbCr conversion](#) enabled.

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT](#)

New Enum Constants

- [VK_EXT_RGBA10X6_FORMATS_EXTENSION_NAME](#)
- [VK_EXT_RGBA10X6_FORMATS_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RGBA10X6_FORMATS_FEATURES_EXT](#)

Issues

- 1) Should we reuse the existing format enumeration or introduce a new one?

RESOLVED: We reuse an existing format enumeration, [VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16](#), that was previously exclusively used for YCbCr and therefore had a set of limitations related to that usage. The alternative was to introduce a new format token with exactly the same bit representation as the existing token, but without the limitations.

2) Should we only introduce `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16` or also 1-3 component variations?

RESOLVED: Only the 4-component format is introduced because the 1- and 2- component variations are already not exclusive to YCbCr, and the 3-component variation is not a good match for hardware capabilities.

- Jeff Bolz, NVIDIA

Description

This extension adds stricter requirements for how out of bounds reads and writes are handled. Most accesses **must** be tightly bounds-checked, out of bounds writes **must** be discarded, out of

bound reads **must** return zero. Rather than allowing multiple possible (0,0,0,x) vectors, the out of bounds values are treated as zero, and then missing components are inserted based on the format as described in [Conversion to RGBA](#) and [vertex input attribute extraction](#).

These additional requirements **may** be expensive on some implementations, and should only be enabled when truly necessary.

This extension also adds support for “null descriptors”, where `VK_NULL_HANDLE` **can** be used instead of a valid handle. Accesses to null descriptors have well-defined behavior, and do not rely on robustness.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceRobustness2FeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
 - `VkPhysicalDeviceRobustness2PropertiesEXT`

New Enum Constants

- `VK_EXT_ROBUSTNESS_2_EXTENSION_NAME`
- `VK_EXT_ROBUSTNESS_2_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_FEATURES_EXT`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_PROPERTIES_EXT`

Issues

1. Why do `VkPhysicalDeviceRobustness2PropertiesEXT::robustUniformBufferAccessSizeAlignment` and `VkPhysicalDeviceRobustness2PropertiesEXT::robustStorageBufferAccessSizeAlignment` exist?

RESOLVED: Some implementations cannot efficiently tightly bounds-check all buffer accesses. Rather, the size of the bound range is padded to some power of two multiple, up to 256 bytes for uniform buffers and up to 4 bytes for storage buffers, and that padded size is bounds-checked. This is sufficient to implement D3D-like behavior, because D3D only allows binding whole uniform buffers or ranges that are a multiple of 256 bytes, and D3D raw and structured buffers only support 32-bit accesses.

Examples

None.

Description

This extension allows an application to modify the locations of samples within a pixel used in rasterization. Additionally, it allows applications to specify different sample locations for each pixel in a group of adjacent pixels, which **can** increase antialiasing quality (particularly if a custom resolve shader is used that takes advantage of these different locations).

It is common for implementations to optimize the storage of depth values by storing values that **can** be used to reconstruct depth at each sample location, rather than storing separate depth values for each sample. For example, the depth values from a single triangle **may** be represented using plane equations. When the depth value for a sample is needed, it is automatically evaluated at the sample

location. Modifying the sample locations causes the reconstruction to no longer evaluate the same depth values as when the samples were originally generated, thus the depth aspect of a depth/stencil attachment **must** be cleared before rendering to it using different sample locations.

Some implementations **may** need to evaluate depth image values while performing image layout transitions. To accommodate this, instances of the [VkSampleLocationsInfoEXT](#) structure **can** be specified for each situation where an explicit or automatic layout transition has to take place. [VkSampleLocationsInfoEXT](#) **can** be chained from [VkImageMemoryBarrier](#) structures to provide sample locations for layout transitions performed by [vkCmdWaitEvents](#) and [vkCmdPipelineBarrier](#) calls, and [VkRenderPassSampleLocationsBeginInfoEXT](#) **can** be chained from [VkRenderPassBeginInfo](#) to provide sample locations for layout transitions performed implicitly by a render pass instance.

Other Extension Metadata

Last Modified Date

2020-08-14

IP Status

No known IP claims.

Interactions and External Dependencies

- This extension requires the `VK_EXT_shader_atomic_float` extension.
- This extension requires `SPV_EXT_shader_atomic_float_min_max` and `SPV_EXT_shader_atomic_float16_add`
- This extension provides API support for `GLSL_EXT_shader_atomic_float2`

Contributors

- Jason Ekstrand, Intel

Description

This extension allows a shader to perform 16-bit floating-point atomic operations on buffer and workgroup memory as well as floating-point atomic minimum and maximum operations on buffer, workgroup, and image memory. It advertises the SPIR-V `AtomicFloat16AddEXT` capability which allows atomic add operations on 16-bit floating-point numbers and the SPIR-V `AtomicFloat16MinMaxEXT`, `AtomicFloat32MinMaxEXT` and `AtomicFloat64MinMaxEXT` capabilities which allow atomic minimum and maximum operations on floating-point numbers. The supported operations include `OpAtomicFAddEXT`, `OpAtomicFMinEXT` and `OpAtomicFMaxEXT`.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT`

New Enum Constants

- `VK_EXT_SHADER_ATOMIC_FLOAT_2_EXTENSION_NAME`
- `VK_EXT_SHADER_ATOMIC_FLOAT_2_SPEC_VERSION`

- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_2_FEATURES_EXT`

Issues

- 1) Should this extension add support for 16-bit image atomics?

RESOLVED: No. While Vulkan supports creating storage images with `VK_FORMAT_R16_SFLOAT` and doing load and store on them, the data in the shader has a 32-bit representation. Vulkan currently has no facility for even basic reading or writing such images using 16-bit float values in the shader. Adding such functionality would be required before 16-bit image atomics would make sense and is outside the scope of this extension.

New SPIR-V Capabilities

- `AtomicFloat32MinMaxEXT`
- `AtomicFloat32MinMaxEXT`
- `AtomicFloat32MinMaxEXT`
- `AtomicFloat64MinMaxEXT`

- Graham Wihlidal, Epic Games
- Tobias Hector, AMD
- Jeff Bolz, Nvidia
- Jason Ekstrand, Intel

Description

This extension extends existing 64-bit integer atomic support to enable these operations on images as well.

When working with large 2- or 3-dimensional data sets (e.g. rasterization or screen-space effects), image accesses are generally more efficient than equivalent buffer accesses. This extension allows applications relying on 64-bit integer atomics in this manner to quickly improve performance with only relatively minor code changes.

64-bit integer atomic support is guaranteed for optimally tiled images with the [VK_FORMAT_R64_UINT](#) and [VK_FORMAT_R64_SINT](#) formats.

Description

To be done.

New Enum Constants

- `VK_EXT_SWAPCHAIN_COLOR_SPACE_EXTENSION_NAME`
- `VK_EXT_SWAPCHAIN_COLOR_SPACE_SPEC_VERSION`
- Extending `VkColorSpaceKHR`:
 - `VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT`
 - `VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT`
 - `VK_COLOR_SPACE_BT2020_LINEAR_EXT`
 - `VK_COLOR_SPACE_BT709_LINEAR_EXT`
 - `VK_COLOR_SPACE_BT709_NONLINEAR_EXT`
 - `VK_COLOR_SPACE_DCI_P3_LINEAR_EXT`
 - `VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT`
 - `VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT`
 - `VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT`
 - `VK_COLOR_SPACE_DOLBYVISION_EXT`
 - `VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT`
 - `VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT`
 - `VK_COLOR_SPACE_HDR10_HLG_EXT`
 - `VK_COLOR_SPACE_HDR10_ST2084_EXT`
 - `VK_COLOR_SPACE_PASS_THROUGH_EXT`

Issues

1) Does the spec need to specify which kinds of image formats support the color spaces?

RESOLVED: Pixel format is independent of color space (though some color spaces really want / need floating point color components to be useful). Therefore, do not plan on documenting what formats support which colorspace. An application can call `vkGetPhysicalDeviceSurfaceFormatsKHR` to query what a particular implementation supports.

2) How does application determine if HW supports appropriate transfer function for a colorspace?

RESOLVED: Extension indicates that implementation **must** not do the OETF encoding if it is not sRGB. That responsibility falls to the application shaders. Any other native OETF / EOTF functions supported by an implementation can be described by separate extension.

Version History

- Revision 1, 2016-12-27 (Courtney Goeltzenleuchter)
 - Initial version
- Revision 2, 2017-01-19 (Courtney Goeltzenleuchter)

- Add pass through and multiple options for BT2020.
- Clean up some issues with equations not displaying properly.
- Revision 3, 2017-06-23 (Courtney Goeltzenleuchter)
 - Add extended sRGB non-linear enum.
- Revision 4, 2019-04-26 (Graeme Leese)
 - Clarify colorspace transfer function usage.
 - Refer to normative definitions in the Data Format Specification.
 - Clarify DCI-P3 and Display P3 usage.

Description

This extension adds transform feedback to the Vulkan API by exposing the SPIR-V [TransformFeedback](#) and [GeometryStreams](#) capabilities to capture vertex, tessellation or geometry shader outputs to one or more buffers. It adds API functionality to bind transform feedback buffers to capture the primitives emitted by the graphics pipeline from SPIR-V outputs decorated for transform feedback. The transform feedback capture can be paused and resumed by way of storing and retrieving a byte counter. The captured data can be drawn again where the vertex count is derived from the byte counter without CPU intervention. If the implementation is capable, a vertex stream other than zero can be rasterized.

All these features are designed to match the full capabilities of OpenGL core transform feedback functionality and beyond. Many of the features are optional to allow base OpenGL ES GPUs to also implement this extension.

The primary purpose of the functionality exposed by this extension is to support translation layers from other 3D APIs. This functionality is not considered forward looking, and is not expected to be promoted to a KHR extension or to core Vulkan. Unless this is needed for translation, it is recommended that developers use alternative techniques of using the GPU to process and capture vertex data.

New Commands

- [vkCmdBeginQueryIndexedEXT](#)
- [vkCmdBeginTransformFeedbackEXT](#)
- [vkCmdBindTransformFeedbackBuffersEXT](#)
- [vkCmdDrawIndirectByteCountEXT](#)

- [vkCmdEndQueryIndexedEXT](#)

- Extending [VkPipelineStageFlagBits](#):
 - [VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT](#)
- Extending [VkQueryType](#):
 - [VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_FEATURES_EXT](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_PROPERTIES_EXT](#)
 - [VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT](#)

Issues

- 1) Should we include pause/resume functionality?

RESOLVED: Yes, this is needed to ease layering other APIs which have this functionality. To pause use `vkCmdEndTransformFeedbackEXT` and provide valid buffer handles in the `pCounterBuffers` array and offsets in the `pCounterBufferOffsets` array for the implementation to save the resume points. Then to resume use `vkCmdBeginTransformFeedbackEXT` with the previous `pCounterBuffers` and `pCounterBufferOffsets` values. Between the pause and resume there needs to be a memory barrier for the counter buffers with a source access of `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` at pipeline stage `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` to a destination access of `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT` at pipeline stage `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

2) How does this interact with multiview?

RESOLVED: Transform feedback cannot be made active in a render pass with multiview enabled.

3) How should queries be done?

RESOLVED: There is a new query type `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT`. A query pool created with this type will capture 2 integers - `numPrimitivesWritten` and `numPrimitivesNeeded` - for the specified vertex stream output from the last `pre-rasterization shader stage`. The vertex stream output queried is zero by default, but can be specified with the new `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` commands.

Description

This extension provides the `VkValidationFeaturesEXT` struct that can be included in the `pNext` chain of the `VkInstanceCreateInfo` structure passed as the `pCreateInfo` parameter of `vkCreateInstance`. The structure contains an array of `VkValidationFeatureEnableEXT` enum values that enable specific validation features that are disabled by default. The structure also contains an array of `VkValidationFeatureDisableEXT` enum values that disable specific validation layer features that are enabled by default.

Note

The `VK_EXT_validation_features` extension subsumes all the functionality provided in the `VK_EXT_validation_flags` extension.

New Structures

- Extending `VkInstanceCreateInfo`:
 - `VkValidationFeaturesEXT`

New Enums

- `VkValidationFeatureDisableEXT`
- `VkValidationFeatureEnableEXT`

New Enum Constants

Description

This extension allows instance-rate vertex attributes to be repeated for certain number of instances instead of advancing for every instance when instanced rendering is enabled.

New Structures

- [VkVertexInputBindingDivisorDescriptionEXT](#)
- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT](#)
- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT](#)
- Extending [VkPipelineVertexInputStateCreateInfo](#):
 - [VkPipelineVertexInputDivisorStateCreateInfoEXT](#)

New Enum Constants

- `VK_EXT_VERTEX_ATTRIBUTE_DIVISOR_EXTENSION_NAME`
- `VK_EXT_VERTEX_ATTRIBUTE_DIVISOR_SPEC_VERSION`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES_EXT`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_PROPERTIES_EXT`
 - `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT`

Issues

1) What is the effect of a non-zero value for `firstInstance`?

RESOLVED: The Vulkan API should follow the OpenGL convention and offset attribute fetching by `firstInstance` while computing vertex attribute offsets.

2) Should zero be an allowed divisor?

RESOLVED: Yes. A zero divisor means the vertex attribute is repeated for all instances.

Examples

To create a vertex binding such that the first binding uses instanced rendering and the same attribute is used for every 4 draw instances, an application could use the following set of structures:

```

const VkVertexInputBindingDivisorDescriptionEXT divisorDesc =
{
    0,
    4
};

const VkPipelineVertexInputDivisorStateCreateInfoEXT divisorInfo =
{
    VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT, // sType
    NULL, // pNext
    1, // vertexBindingDivisorCount
    &divisorDesc // pVertexBindingDivisors
};

const VkVertexInputBindingDescription binding =
{
    0, // binding
    sizeof(Vertex), // stride
    VK_VERTEX_INPUT_RATE_INSTANCE // inputRate
};

const VkPipelineVertexInputStateCreateInfo viInfo =
{
    VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_CREATE_INFO, // sType
    &divisorInfo, // pNext
    ...
};
//...

```

Description

One of the states that contributes to the combinatorial explosion of pipeline state objects that need to be created, is the vertex input binding and attribute descriptions. By allowing them to be dynamic applications may reduce the number of pipeline objects they need to create.

This extension adds dynamic state support for what is normally static state in `VkPipelineVertexInputStateCreateInfo`.

New Commands

- `vkCmdSetVertexInputEXT`

Other Extension Metadata

Last Modified Date

2019-02-04

Contributors

- Ping Fu, AMD
- Timothy Lottes, AMD
- Tobias Hector, AMD

Description

This extension adds the device coherent and device uncached memory types. Any device accesses to device coherent memory are automatically made visible to any other device access. Device uncached memory indicates to applications that caches are disabled for a particular memory type, which guarantees device coherence.

Device coherent and uncached memory are expected to have lower performance for general access than non-device coherent memory, but can be useful in certain scenarios; particularly so for debugging.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceCoherentMemoryFeaturesAMD`

New Enum Constants

- `VK_AMD_DEVICE_COHERENT_MEMORY_EXTENSION_NAME`

- Matthaeus G. Chajdas, AMD
- Maciej Jesionowski, AMD
- Daniel Rakos, AMD

Description

This extension enables applications to use multisampled rendering with a depth/stencil sample count that is larger than the color sample count. Having a depth/stencil sample count larger than the color sample count allows maintaining geometry and coverage information at a higher sample rate than color information. All samples are depth/stencil tested, but only the first color sample count number of samples get a corresponding color output.

No known IP claims.

Contributors

- Matthaeus G. Chajdas, AMD
- Jaakko Konttinen, AMD
- Daniel Rakos, AMD
- Graham Sellers, AMD
- Dominik Witczak, AMD

Description

This extension introduces the possibility for the application to control the order of primitive rasterization. In unextended Vulkan, the following stages are guaranteed to execute in *API order*:

- depth bounds test
- stencil test, stencil op, and stencil write
- depth test and depth write
- occlusion queries
- blending, logic op, and color write

This extension enables applications to opt into a relaxed, implementation defined primitive rasterization order that may allow better parallel processing of primitives and thus enabling higher primitive throughput. It is applicable in cases where the primitive rasterization order is known to not affect the output of the rendering or any differences caused by a different rasterization order are not a concern from the point of view of the application's purpose.

A few examples of cases when using the relaxed primitive rasterization order would not have an effect on the final rendering:

- If the primitives rendered are known to not overlap in framebuffer space.
- If depth testing is used with a comparison operator of `VK_COMPARE_OP_LESS`, `VK_COMPARE_OP_LESS_OR_EQUAL`, `VK_COMPARE_OP_GREATER`, or `VK_COMPARE_OP_GREATER_OR_EQUAL`, and the primitives rendered are known to not overlap in clip space.
- If depth testing is not used and blending is enabled for all attachments with a commutative blend operator.

New Structures

- Extending [VkPipelineRasterizationStateCreateInfo](#):
 - [VkPipelineRasterizationStateRasterizationOrderAMD](#)

New Enums

- [VkRasterizationOrderAMD](#)

New Enum Constants

- `VK_AMD_RASTERIZATION_ORDER_EXTENSION_NAME`
- `VK_AMD_RASTERIZATION_ORDER_SPEC_VERSION`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_RASTERIZATION_ORDER_AMD`

Issues

1) How is this extension useful to application developers?

RESOLVED: Allows them to increase primitive throughput for cases when strict API order rasterization is not important due to the nature of the content, the configuration used, or the requirements towards the output of the rendering.

2) How does this extension interact with content optimizations aiming to reduce overdraw by appropriately ordering the input primitives?

RESOLVED: While the relaxed rasterization order might somewhat limit the effectiveness of such content optimizations, most of the benefits of it are expected to be retained even when the relaxed rasterization order is used, so applications **should** still apply these optimizations even if they intend to use the extension.

3) Are there any guarantees about the primitive rasterization order when using the new relaxed mode?

RESOLVED: No. In this case the rasterization order is completely implementation-dependent, but in practice it is expected to partially still follow the order of incoming primitives.

4) Does the new relaxed rasterization order have any adverse effect on repeatability and other invariance rules of the API?

RESOLVED: Yes, in the sense that it extends the list of exceptions when the repeatability requirement does not apply.

Description

This extension exposes shader core properties for a target physical device through the `VK_KHR_get_physical_device_properties2` extension. Please refer to the example below for proper usage.

New Structures

- Extending `VkPhysicalDeviceProperties2`:
 - `VkPhysicalDeviceShaderCorePropertiesAMD`

New Enum Constants

- `VK_AMD_SHADER_CORE_PROPERTIES_EXTENSION_NAME`
- `VK_AMD_SHADER_CORE_PROPERTIES_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_AMD`

Examples

This example retrieves the shader core properties for a physical device.

```
extern VkInstance           instance;

PFN_vkGetPhysicalDeviceProperties2 pfnVkGetPhysicalDeviceProperties2 =
    reinterpret_cast<PFN_vkGetPhysicalDeviceProperties2>
        (vkGetInstanceProcAddr(instance, "vkGetPhysicalDeviceProperties2") );

VkPhysicalDeviceProperties2         general_props;
VkPhysicalDeviceShaderCorePropertiesAMD shader_core_properties;

shader_core_properties.pNext = nullptr;
shader_core_properties.sType =
VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_AMD;

general_props.pNext = &shader_core_properties;
general_props.sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2;

// After this call, shader_core_properties has been populated
pfnVkGetPhysicalDeviceProperties2(device, &general_props);

printf("Number of shader engines: %d\n",
    m_shader_core_properties.shader_engine_count =
        shader_core_properties.shaderEngineCount;
printf("Number of shader arrays: %d\n",
    m_shader_core_properties.shader_arrays_per_engine_count =
```

```

    m_shader_core_properties.shaderArraysPerEngineCount;
printf("Number of CUs per shader array: %d\n",
    m_shader_core_properties.compute_units_per_shader_array =
        shader_core_properties.computeUnitsPerShaderArray;
printf("Number of SIMDs per compute unit: %d\n",
    m_shader_core_propertiessimd_per_compute_unit =
        shader_core_properties SIMDPerComputeUnit;
printf("Number of wavefront slots in each SIMD: %d\n",
    m_shader_core_properties.wavefronts_per_simd =
        shader_core_properties.wavefrontsPerSimd;
printf("Number of threads per wavefront: %d\n",
    m_shader_core_properties.wavefront_size =
        shader_core_properties.wavefrontSize;
printf("Number of physical SGPRs per SIMD: %d\n",
    m_shader_core_properties.sgprs_per_simd =
        shader_core_properties.sgprsPerSimd;
printf("Minimum number of SGPRs that can be allocated by a wave: %d\n",
    m_shader_core_properties.min_sgpr_allocation =

No known IP claims.

Interactions and External Dependencies

- This extension requires `SPV_AMD_shader_fragment_mask`
- This extension provides API support for `GL_AMD_shader_fragment_mask`

Contributors

- Aaron Hagan, AMD
- Daniel Rakos, AMD
- Timothy Lottes, AMD

Description

This extension provides efficient read access to the fragment mask in compressed multisampled color surfaces. The fragment mask is a lookup table that associates color samples with color fragment values.

From a shader, the fragment mask can be fetched with a call to `fragmentMaskFetchAMD`, which returns a single `uint` where each subsequent four bits specify the color fragment index corresponding to the color sample, starting from the least significant bit. For example, when eight color samples are used, the color fragment index for color sample 0 will be in bits 0-3 of the fragment mask, for color sample 7 the index will be in bits 28-31.

The color fragment for a particular color sample may then be fetched with the corresponding fragment mask value using the `fragmentFetchAMD` shader function.

New Enum Constants

- `VK_AMD_SHADER_FRAGMENT_MASK_EXTENSION_NAME`
- `VK_AMD_SHADER_FRAGMENT_MASK_SPEC_VERSION`

New SPIR-V Capabilities

- `FragmentMaskAMD`

Examples

This example shows a shader that queries the fragment mask from a multisampled compressed surface and uses it to query fragment values.

```

#version 450 core

#extension GL_AMD_shader_fragment_mask: enable

layout(binding = 0) uniform sampler2DMS      s2DMS;
layout(binding = 1) uniform isampler2DMSArray is2DMSArray;

layout(binding = 2, input_attachment_index = 0) uniform usubpassInputMS usubpassMS;

layout(location = 0) out vec4 fragColor;

void main()
{
    vec4 fragOne = vec4(0.0);

    uint fragMask = fragmentMaskFetchAMD(s2DMS, ivec2(2, 3));
    uint fragIndex = (fragMask & 0xF0) >> 4;
    fragOne += fragmentFetchAMD(s2DMS, ivec2(2, 3), 1);

    fragMask = fragmentMaskFetchAMD(is2DMSArray, ivec3(2, 3, 1));
    fragIndex = (fragMask & 0xF0) >> 4;
    fragOne += fragmentFetchAMD(is2DMSArray, ivec3(2, 3, 1), fragIndex);

    fragMask = fragmentMaskFetchAMD(usubpassMS);
    fragIndex = (fragMask & 0xF0) >> 4;
    fragOne += fragmentFetchAMD(usubpassMS, fragIndex);

    fragColor = fragOne;
}

```

Other Extension Metadata

Last Modified Date

2017-10-09

IP Status

No known IP claims.

Contributors

- Jaakko Konttinen, AMD

Description

This extension adds a way to query certain information about a compiled shader which is part of a pipeline. This information may include shader disassembly, shader binary and various statistics about a shader's resource usage.

While this extension provides a mechanism for extracting this information, the details regarding the contents or format of this information are not specified by this extension and may be provided by the vendor externally.

Furthermore, all information types are optionally supported, and users should not assume every implementation supports querying every type of information.

New Commands

- [vkGetShaderInfoAMD](#)

New Structures

- [VkShaderResourceUsageAMD](#)
- [VkShaderStatisticsInfoAMD](#)

New Enums

- [VkShaderInfoTypeAMD](#)

New Enum Constants

- `VK_AMD_SHADER_INFO_EXTENSION_NAME`
- `VK_AMD_SHADER_INFO_SPEC_VERSION`

Examples

This example extracts the register usage of a fragment shader within a particular graphics pipeline:

```
extern VkDevice device;
extern VkPipeline gfxPipeline;

PFN_vkGetShaderInfoAMD pfnGetShaderInfoAMD = (PFN_vkGetShaderInfoAMD
)vkGetProcAddress(
    device, "vkGetShaderInfoAMD");

VkShaderStatisticsInfoAMD statistics = {};

size_t dataSize = sizeof(statistics);

if (pfnGetShaderInfoAMD(device,
    gfxPipeline,
    VK_SHADER_STAGE_FRAGMENT_BIT,
    VK_SHADER_INFO_TYPE_STATISTICS_AMD,
    &dataSize,
    &statistics) == VK_SUCCESS)
{
    printf("VGPR usage: %d\n", statistics.resourceUsage.numUsedVgprs);
    printf("SGPR usage: %d\n", statistics.resourceUsage.numUsedSgprs);
}
```

The following example continues the previous example by subsequently attempting to query and print shader disassembly about the fragment shader:

```

// Query disassembly size (if available)
if (pfnGetShaderInfoAMD(device,
    gfxPipeline,
    VK_SHADER_STAGE_FRAGMENT_BIT,
    VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD,
    &dataSize,
    nullptr) == VK_SUCCESS)
{
    printf("Fragment shader disassembly:\n");

    void* disassembly = malloc(dataSize);

    // Query disassembly and print
    if (pfnGetShaderInfoAMD(device,
        gfxPipeline,
        VK_SHADER_STAGE_FRAGMENT_BIT,
        VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD,
        &dataSize,
        disassembly) == VK_SUCCESS)
    {
        printf((char*)disassembly);
    }

    free(disassembly);
}

```

- Qun Lin, AMD
- Rex Xu, AMD
- Timothy Lottes, AMD

Description

This extension adds two related features.

Firstly, support for the following SPIR-V extension in Vulkan is added:

- `SPV_AMD_texture_gather_bias_lod`

Secondly, the extension allows the application to query which formats can be used together with the new function prototypes introduced by the SPIR-V extension.

New Structures

- Extending [VkImageFormatProperties2](#):
 - [VkTextureLODGatherFormatPropertiesAMD](#)

New Enum Constants

- [VK_AMD_TEXTURE_GATHER_BIAS_LOD_EXTENSION_NAME](#)
- [VK_AMD_TEXTURE_GATHER_BIAS_LOD_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_TEXTURE_LOD_GATHER_FORMAT_PROPERTIES_AMD](#)

New SPIR-V Capabilities

- [ImageGatherBiasLodAMD](#)

Examples

```

struct VkTextureLODGatherFormatPropertiesAMD
{
    VkStructureType sType;
    const void* pNext;
    VkBool32 supportsTextureGatherLODBiasAMD;
};

<-->

// How to detect if an image format can be used with the new function prototypes.
VkPhysicalDeviceImageFormatInfo2 formatInfo;
VkImageFormatProperties2 formatProps;
VkTextureLODGatherFormatPropertiesAMD textureLODGatherSupport;

textureLODGatherSupport.sType =
VK_STRUCTURE_TYPE_TEXTURE_LOD_GATHER_FORMAT_PROPERTIES_AMD;
textureLODGatherSupport.pNext = nullptr;

formatInfo.sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_FORMAT_INFO_2;
formatInfo.pNext = nullptr;
formatInfo.format = ...;
formatInfo.type = ...;
formatInfo.tiling = ...;
formatInfo.usage = ...;
formatInfo.flags = ...;

formatProps.sType = VK_STRUCTURE_TYPE_IMAGE_FORMAT_PROPERTIES_2;
formatProps.pNext = &textureLODGatherSupport;

vkGetPhysicalDeviceImageFormatProperties2(physical_device, &formatInfo, &formatProps);

if (textureLODGatherSupport.supportsTextureGatherLODBiasAMD == VK_TRUE)
{
    // physical device supports SPV_AMD_texture_gather_bias_lod for the specified
    // format configuration.
}
else
{
    // physical device does not support SPV_AMD_texture_gather_bias_lod for the
    // specified format configuration.
}

```

Description

This extension enables an application to import Android `AHardwareBuffer` objects created outside of the Vulkan device into Vulkan memory objects, where they **can** be bound to images and buffers. It also allows exporting an `AHardwareBuffer` from a Vulkan memory object for symmetry with other operating systems. But since not all `AHardwareBuffer` usages and formats have Vulkan equivalents, exporting from Vulkan provides strictly less functionality than creating the `AHardwareBuffer` externally and importing it.

Some `AHardwareBuffer` images have implementation-defined *external formats* that **may** not correspond to Vulkan formats. Sampler Y'C_BC_R conversion **can** be used to sample from these images and convert them to a known color space.

New Base Types

- `AHardwareBuffer`

New Commands

- `vkGetAndroidHardwareBufferPropertiesANDROID`
- `vkGetMemoryAndroidHardwareBufferANDROID`

New Structures

- `VkAndroidHardwareBufferPropertiesANDROID`
- `VkMemoryGetAndroidHardwareBufferInfoANDROID`
- Extending `VkAndroidHardwareBufferPropertiesANDROID`:
 - `VkAndroidHardwareBufferFormatPropertiesANDROID`
- Extending `VkImageCreateInfo`, `VkSamplerYcbcrConversionCreateInfo`:
 - `VkExternalFormatANDROID`
- Extending `VkImageFormatProperties2`:
 - `VkAndroidHardwareBufferUsageANDROID`
- Extending `VkMemoryAllocateInfo`:
 - `VkImportAndroidHardwareBufferInfoANDROID`

If `VK_KHR_format_feature_flags2` is supported:

- Extending `VkAndroidHardwareBufferPropertiesANDROID`:
 - `VkAndroidHardwareBufferFormatProperties2ANDROID`

New Enum Constants

- `VK_ANDROID_EXTERNAL_MEMORY_ANDROID_HARDWARE_BUFFER_EXTENSION_NAME`
- `VK_ANDROID_EXTERNAL_MEMORY_ANDROID_HARDWARE_BUFFER_SPEC_VERSION`

- Extending [VkExternalMemoryHandleTypeFlagBits](#):
 - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_ANDROID`
 - `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_PROPERTIES_ANDROID`
 - `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_USAGE_ANDROID`
 - `VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_ANDROID`
 - `VK_STRUCTURE_TYPE_IMPORT_ANDROID_HARDWARE_BUFFER_INFO_ANDROID`
 - `VK_STRUCTURE_TYPE_MEMORY_GET_ANDROID_HARDWARE_BUFFER_INFO_ANDROID`

If [VK_KHR_format_feature_flags2](#) is supported:

- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_2_ANDROID`

Issues

1) Other external memory objects are represented as weakly-typed handles (e.g. Win32 `HANDLE` or POSIX file descriptor), and require a handle type parameter along with handles. `AHardwareBuffer` is strongly typed, so naming the handle type is redundant. Does symmetry justify adding handle type parameters/fields anyway?

RESOLVED: No. The handle type is already provided in places that treat external memory objects generically. In the places we would add it, the application code that would have to provide the handle type value is already dealing with `AHardwareBuffer`-specific commands/structures; the extra symmetry would not be enough to make that code generic.

2) The internal layout and therefore size of a `AHardwareBuffer` image may depend on native usage flags that do not have corresponding Vulkan counterparts. Do we provide this information to [vkCreateImage](#) somehow, or allow the allocation size reported by [vkGetImageMemoryRequirements](#) to be approximate?

RESOLVED: Allow the allocation size to be unspecified when allocating the memory. It has to work this way for exported image memory anyway, since `AHardwareBuffer` allocation happens in [vkAllocateMemory](#), and internally is performed by a separate HAL, not the Vulkan implementation itself. There is a similar issue with [vkGetImageSubresourceLayout](#): the layout is determined by the allocator HAL, so it is not known until the image is bound to memory.

3) Should the result of sampling an external-format image with the suggested $Y'C_BC_R$ conversion parameters yield the same results as using a `samplerExternalOES` in OpenGL ES?

RESOLVED: This would be desirable, so that apps converting from OpenGL ES to Vulkan could get the same output given the same input. But since sampling and conversion from $Y'C_BC_R$ images is so loosely defined in OpenGL ES, multiple implementations do it in a way that does not conform to Vulkan's requirements. Modifying the OpenGL ES implementation would be difficult, and would change the output of existing unmodified applications. Changing the output only for applications

that are being modified gives developers the chance to notice and mitigate any problems. Implementations are encouraged to minimize differences as much as possible without causing compatibility problems for existing OpenGL ES applications or violating Vulkan requirements.

4) Should an `AHardwareBuffer` with `AHARDWAREBUFFER_USAGE_CPU_*` usage be mappable in Vulkan? Should it be possible to export an `AHardwareBuffers` with such usage?

RESOLVED: Optional, and mapping in Vulkan is not the same as `AHardwareBuffer_lock`. The semantics of these are different: mapping in memory is persistent, just gives a raw view of the memory contents, and does not involve ownership. `AHardwareBuffer_lock` gives the host exclusive access to the buffer, is temporary, and allows for reformatting copy-in/copy-out. Implementations are not required to support host-visible memory types for imported Android hardware buffers or resources backed by them. If a host-visible memory type is supported and used, the memory can be mapped in Vulkan, but doing so follows Vulkan semantics: it is just a raw view of the data and does not imply ownership (this means implementations must not internally call `AHardwareBuffer_lock` to implement `vkMapMemory`, or assume the application has done so). Implementations are not required to support linear-tiled images backed by Android hardware buffers, even if the `AHardwareBuffer` has CPU usage. There is no reliable way to allocate memory in Vulkan that can be exported to a `AHardwareBuffer` with CPU usage.

5) Android may add new `AHardwareBuffer` formats and usage flags over time. Can reference to them be added to this extension, or do they need a new extension?

RESOLVED: This extension can document the interaction between the new AHB formats/usages and existing Vulkan features. No new Vulkan features or implementation requirements can be added. The extension version number will be incremented when this additional documentation is added, but the version number does not indicate that an implementaiton supports Vulkan memory or resources that map to the new `AHardwareBuffer` features: support for that must be queried with `vkGetPhysicalDeviceImageFormatProperties2` or is implied by successfully allocating a `AHardwareBuffer` outside of Vulkan that uses the new feature and has a GPU usage flag.

In essence, these are new features added to a new Android API level, rather than new Vulkan features. The extension will only document how existing Vulkan features map to that new Android feature.

Description

Renderpasses, and specifically [subpass self-dependencies](#) enable much of the same functionality as the framebuffer fetch and pixel local storage extensions did for OpenGL ES. But certain techniques such as programmable blending are awkward or impractical to implement with these alone, in part because a self-dependency is required every time a fragment will read a value at a given sample coordinate.

This extension extends the mechanism of input attachments to allow access to framebuffer attachments when used as both input and color, or depth/stencil, attachments from one fragment to the next, in rasterization order, without explicit synchronization.

See [renderpass feedback loops](#) for more information.

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM](#)

New Enums

- [VkPipelineColorBlendStateCreateFlagBits](#)
- [VkPipelineDepthStencilStateCreateFlagBits](#)

New Enum Constants

- [VK_ARM_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_EXTENSION_NAME](#)
- [VK_ARM_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_SPEC_VERSION](#)
- Extending [VkPipelineColorBlendStateCreateFlagBits](#):
 - [VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_ARM](#)
- Extending [VkPipelineDepthStencilStateCreateFlagBits](#):
 - [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM](#)
 - [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_FEATURES_ARM](#)
- Extending [VkSubpassDescriptionFlagBits](#):
 - [VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_ARM](#)
 - [VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM](#)
 - [VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM](#)

Issues

1) Is there any interaction with the [VK_KHR_dynamic_rendering](#) extension?

No. This extension only affects reads from input attachments. Render pass instances begun with [vkCmdBeginRenderingKHR](#) do not have input attachments and a different mechanism will be needed to provide similar functionality in this case.

Examples

None.

Description

A buffer collection is a collection of one or more buffers which were allocated together as a group and which all have the same properties. These properties describe the buffers' internal representation such as its dimensions and memory layout. This ensures that all of the buffers can be used interchangeably by tasks that require swapping among multiple buffers, such as double-buffered graphics rendering.

By sharing such a collection of buffers between components, communication about buffer lifecycle can be made much simpler and more efficient. For example, when a content producer finishes writing to a buffer, it can message the consumer of the buffer with the buffer index, rather than passing a handle to the shared memory.

On Fuchsia, the Sysmem service uses buffer collections as a core construct in its design. VK_FUCHSIA_buffer_collection is the Vulkan extension that allows Vulkan applications to interoperate with the Sysmem service on Fuchsia.

New Object Types

 - `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_IMAGE_CREATE_INFO_FUCHSIA`
 - `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_PROPERTIES_FUCHSIA`
 - `VK_STRUCTURE_TYPE_BUFFER_CONSTRAINTS_INFO_FUCHSIA`
 - `VK_STRUCTURE_TYPE_IMAGE_CONSTRAINTS_INFO_FUCHSIA`
 - `VK_STRUCTURE_TYPE_IMAGE_FORMAT_CONSTRAINTS_INFO_FUCHSIA`
 - `VK_STRUCTURE_TYPE_IMPORT_MEMORY_BUFFER_COLLECTION_FUCHSIA`
 - `VK_STRUCTURE_TYPE_SYSMEM_COLOR_SPACE_FUCHSIA`

Issues

1) When configuring a `VkImageConstraintsInfoFUCHSIA` structure for constraint setting, should a NULL `pFormatConstraints` parameter be allowed ?

RESOLVED: No. Specifying a NULL `pFormatConstraints` results in logical complexity of interpreting the relationship between the `VkImageCreateInfo::usage` settings of the elements of the `pImageCreateInfos` array and the implied or desired `VkFormatFeatureFlags`.

The explicit requirement for `pFormatConstraints` to be non-NUL simplifies the implied logic of the implementation and expectations for the Vulkan application.

Description

Vulkan apps may wish to export or import device memory handles to or from other logical devices, instances or APIs.

This memory sharing can eliminate copies of memory buffers when different subsystems need to interoperate on them. Sharing memory buffers may also facilitate a better distribution of processing workload for more complex memory manipulation pipelines.

Description

An application using external memory may wish to synchronize access to that memory using semaphores. This extension enables an application to export semaphore payload to and import semaphore payload from Zircon event handles.

New Commands

- `vkGetSemaphoreZirconHandleFUCHSIA`
- `vkImportSemaphoreZirconHandleFUCHSIA`

New Structures

- `VkImportSemaphoreZirconHandleInfoFUCHSIA`
- `VkSemaphoreGetZirconHandleInfoFUCHSIA`

New Enum Constants

- `VK_FUCHSIA_EXTERNAL_SEMAPHORE_EXTENSION_NAME`
- `VK_FUCHSIA_EXTERNAL_SEMAPHORE_SPEC_VERSION`
- Extending `VkExternalSemaphoreHandleTypeFlagBits`:
 - `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA`
- Extending `VkStructureType`:

- `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_ZIRCON_HANDLE_INFO_FUCHSIA`
- `VK_STRUCTURE_TYPE_SEMAPHORE_GET_ZIRCON_HANDLE_INFO_FUCHSIA`

Issues

1) Does the application need to close the Zircon event handle returned by [vkGetSemaphoreZirconHandleFUCHSIA](#)?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the semaphore. A successful get call transfers ownership of the Zircon event handle to the application, and a successful import transfers it back to the driver. Destroying the original semaphore object will not close the Zircon event handle nor remove its reference to the underlying semaphore resource associated with it.

Description

The `VK_GGP_STREAM_DESCRIPTOR_SURFACE` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_SURFACE` extension) that refers to a Google Games Platform `GgpStreamDescriptor`.

New Commands

- `vkCreateStreamDescriptorSurfaceGGP`

New Structures

- `VkStreamDescriptorSurfaceCreateInfoGGP`

New Bitmasks

- `VkStreamDescriptorSurfaceCreateFlagsGGP`

New Enum Constants

- `VK_GGP_STREAM_DESCRIPTOR_SURFACE_EXTENSION_NAME`
- `VK_GGP_STREAM_DESCRIPTOR_SURFACE_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_STREAM_DESCRIPTOR_SURFACE_CREATE_INFO_GGP`

Version History

- Revision 1, 2018-11-26 (Jean-Francois Roy)
 - Initial revision.

Description

This device extension allows an application that uses the [VK_KHR_swapchain](#) extension to obtain information about the presentation engine's display, to obtain timing information about each present, and to schedule a present to happen no earlier than a desired time. An application can use this to minimize various visual anomalies (e.g. stuttering).

Traditional game and real-time animation applications need to correctly position their geometry for when the presentable image will be presented to the user. To accomplish this, applications need various timing information about the presentation engine's display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This allows the application to avoid stuttering, so the animation looks smooth to the user.

This extension treats variable-refresh-rate (VRR) displays as if they are fixed-refresh-rate (FRR) displays.

New Commands

- [vkGetPastPresentationTimingGOOGLE](#)
- [vkGetRefreshCycleDurationGOOGLE](#)

New Structures

- [VkPastPresentationTimingGOOGLE](#)

- [VkPresentTimeGOOGLE](#)

IP Status

No known IP claims.

Contributors

- Ian Elliott, Google
- Shahbaz Youssefi, Google
- James Jones, NVIDIA

Description

This extension allows the `vkGetPhysicalDeviceSurfaceFormatsKHR` and `vkGetPhysicalDeviceSurfacePresentModesKHR` functions to accept `VK_NULL_HANDLE` as their `surface` parameter, allowing potential surface formats, colorspaces and present modes to be queried without providing a surface. Identically, `vkGetPhysicalDeviceSurfaceFormats2KHR` and `vkGetPhysicalDeviceSurfacePresentModes2EXT` would accept `VK_NULL_HANDLE` in `VkPhysicalDeviceSurfaceInfo2KHR::surface`. **This can only be supported on platforms where the results of these queries are surface-agnostic and a single presentation engine is the implicit target of all present operations.**

New Enum Constants

- `VK_GOOGLE_SURFACELESS_QUERY_EXTENSION_NAME`
- `VK_GOOGLE_SURFACELESS_QUERY_SPEC_VERSION`

Version History

- Yunpeng Zhu  Yunxingzhu

Extension Proposal

[VK_HUAWEI_invocation_mask](#)

Other Extension Metadata

Last Modified Date

2021-05-27

Interactions and External Dependencies

- This extension requires `VK_KHR_ray_tracing_pipeline`, which allow to bind an invocation mask image before the ray tracing command
- This extension requires `VK_KHR_synchronization2`, which allows new pipeline stage for the invocation mask image

Contributors

- Yunpeng Zhu, HuaWei

Description

The rays to trace may be sparse in some use cases. For example, the scene only have a few regions to reflect. Providing an invocation mask image to the ray tracing commands could potentially give the hardware the hint to do certain optimization without invoking an additional pass to compact the ray buffer.

New Commands

- [vkCmdBindInvocationMaskHUAWEI](#)

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceInvocationMaskFeaturesHUAWEI](#)

New Enum Constants

- [VK_HUAWEI_INVOCATION_MASK_EXTENSION_NAME](#)
- [VK_HUAWEI_INVOCATION_MASK_SPEC_VERSION](#)

 - [VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INVOCATION_MASK_FEATURES_HUAWEI](#)

Examples

RT mask is updated before each traceRay.

Step 1. Generate InvocationMask.

```
//the rt mask image bind as color attachment in the fragment shader
Layout(location = 2) out vec4 outRTmask
vec4 mask = vec4(x,x,x,x);
outRTmask = mask;
```

Step 2. traceRay with InvocationMask

```

vkCmdBindPipeline(
    commandBuffers[imageIndex],
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR, m_rtPipeline);
vkCmdBindDescriptorSets(commandBuffers[imageIndex],
    VK_PIPELINE_BIND_POINT_RAY_TRACING_NV,
    m_rtPipelineLayout, 0, 1, &m_rtDescriptorSet,
    0, nullptr);

vkCmdBindInvocationMaskHUAWEI(
    commandBuffers[imageIndex],
    InvocationMaskimageView,
    InvocationMaskimageLayout);
vkCmdTraceRaysKHR(commandBuffers[imageIndex],
    pRaygenShaderBindingTable,
    pMissShaderBindingTable,
    swapChainExtent.width,
    swapChainExtent.height, 1);

```

Revision

2

Extension and Version Dependencies

- Requires Vulkan 1.0
- Requires `VK_KHR_create_renderpass2`
- Requires `VK_KHR_synchronization2`

Contact

- Hueilong Wang wyvern@huawei.com

Other Extension Metadata

Last Modified Date

2021-06-01

Interactions and External Dependencies

- This extension requires [SPV_HUAWEI_subpass_shading](#).
- This extension provides API support for [GL_HUAWEI_subpass_shading](#).

Contributors

- Hueilong Wang

Description

This extension allows applications to execute a subpass shading pipeline in a subpass of a render pass in order to save memory bandwidth for algorithms like tile-based deferred rendering and forward plus. A subpass shading pipeline is a pipeline with the compute pipeline ability, allowed to read values from input attachments, and only allowed to be dispatched inside a stand-alone subpass. Its work dimension is defined by the render pass's render area size. Its workgroup size (width, height) shall be a power-of-two number in width or height, with minimum value from 8, and maximum value shall be decided from the render pass attachments and sample counts but depends on implementation.

The [GlobalInvocationId.xy](#) of a subpass shading pipeline is equal to the [FragCoord.xy](#) of a graphic pipeline in the same render pass subtracted the [offset](#) of the [VkRenderPassBeginInfo::renderArea](#). [GlobalInvocationId.z](#) is mapped to the Layer if [VK_EXT_shader_viewport_index_layer](#) is supported. The [GlobalInvocationId.xy](#) is equal to the index of the local workgroup multiplied by the size of the local workgroup plus the [LocalInvocationId](#) and the [offset](#) of the [VkRenderPassBeginInfo::renderArea](#).

This extension allows a subpass's pipeline bind point to be [VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI](#).

New Commands

- [vkCmdSubpassShadingHUAWEI](#)
- [vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI](#)

 - `VK_STRUCTURE_TYPE_SUBPASS_SHADING_PIPELINE_CREATE_INFO_HUAWEI`

Sample Code

Example of subpass shading in a GLSL shader

```
#extension GL_HUAWEI_subpass_shading: enable
#extension GL_KHR_shader_subgroup_arithmetic: enable

layout(constant_id = 0) const uint tileSize = 8;
layout(constant_id = 1) const uint tileHeight = 8;
layout(local_size_x_id = 0, local_size_y_id = 1, local_size_z = 1) in;
layout (set=0, binding=0, input_attachment_index=0) uniform subpassInput depth;

void main()
{
    float d = subpassLoad(depth).x;
    float minD = subgroupMin(d);
    float maxD = subgroupMax(d);
}
```

Example of subpass shading dispatching in a subpass

```

vkCmdNextSubpass(commandBuffer, VK_SUBPASS_CONTENTS_INLINE);
vkCmdBindPipeline(commandBuffer, VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI,
subpassShadingPipeline);
vkCmdBindDescriptorSets(commandBuffer, VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI,
subpassShadingPipelineLayout,
    firstSet, descriptorSetCount, pDescriptorSets, dynamicOffsetCount, pDynamicOffsets);
vkCmdSubpassShadingHUAWEI(commandBuffer)
vkCmdEndRenderPass(commandBuffer);

```

Example of subpass shading render pass creation

```

Other Extension Metadata

Last Modified Date

2016-02-23

Contributors

- Tobias Hector, Imagination Technologies

Description

`VK_IMG_filter_cubic` adds an additional, high quality cubic filtering mode to Vulkan, using a Catmull-Rom bicubic filter. Performing this kind of filtering can be done in a shader by using 16 samples and a number of instructions, but this can be inefficient. The cubic filter mode exposes an optimized high quality texture sampling using fixed texture sampling functionality.

New Enum Constants

- `VK_FILTER_CUBIC_EXTENSION_NAME`
- `VK_FILTER_CUBIC_SPEC_VERSION`
- Extending `VkFilter`:
 - `VK_FILTER_CUBIC_IMG`
- Extending `VkFormatFeatureFlagBits`:

- VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_IMG

Example

Creating a sampler with the new filter for both magnification and minification

```
VkSamplerCreateInfo createInfo =
{
    VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO // sType
    // Other members set to application-desired values
};

createInfo.magFilter = VK_FILTER_CUBIC_IMG;
createInfo.minFilter = VK_FILTER_CUBIC_IMG;

VkSampler sampler;
VkResult result = vkCreateSampler(
    device,
    &createInfo,
    &sampler);
```

Description

This extension allows an application to capture performance data to be interpreted by a external application or library.

Such a library is available at : <https://github.com/intel/metrics-discovery>

Performance analysis tools such as [Graphics Performance Analyzers](#) make use of this extension and the metrics-discovery library to present the data in a human readable way.

IP Status

No known IP claims.

Interactions and External Dependencies

- This extension requires `SPV_INTEL_shader_integer_functions2`.
- This extension provides API support for `GL_INTEL_shader_integer_functions2`.

Contributors

- Ian Romanick, Intel
- Ben Ashbaugh, Intel

Description

This extension adds support for several new integer instructions in SPIR-V for use in graphics shaders. Many of these instructions have pre-existing counterparts in the Kernel environment.

The added integer functions are defined by the `SPV_INTEL_shader_integer_functions2` SPIR-V extension and can be used with the `GL_INTEL_shader_integer_functions2` GLSL extension.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL`

New Enum Constants

- `VK_INTEL_SHADER_INTEGER_FUNCTIONS_2_EXTENSION_NAME`
- `VK_INTEL_SHADER_INTEGER_FUNCTIONS_2_SPEC_VERSION`
- Extending `VkStructureType`:

- Michael Chock, NVIDIA
- Yasuhiro Yoshioka, Nintendo
- Daniel Koch, NVIDIA

Description

The `VK_NN_vi_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) associated with an `nn::vi::Layer`.

New Commands

- `vkCreateViSurfaceNN`

New Structures

- `VkViSurfaceCreateInfoNN`

New Bitmasks

- `VkViSurfaceCreateFlagsNN`

New Enum Constants

- `VK_NN_VI_SURFACE_EXTENSION_NAME`
- `VK_NN_VI_SURFACE_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN`

Issues

1) Does VI need a way to query for compatibility between a particular physical device (and queue family?) and a specific VI display?

RESOLVED: No. It is currently always assumed that the device and display will always be compatible.

2) `VkViSurfaceCreateInfoNN::pWindow` is intended to store an `nn::vi::NativeWindowHandle`, but its declared type is a bare `void*` to store the window handle. Why the discrepancy?

RESOLVED: It is for C compatibility. The definition for the VI native window handle type is defined inside the `nn::vi` C++ namespace. This prevents its use in C source files. `nn::vi::NativeWindowHandle` is always defined to be `void*`, so this extension uses `void*` to match.

Description

This extension allows an application to take exclusive control of a display on Windows 10 provided that the display is not already controlled by a compositor. Examples of compositors include the Windows desktop compositor, other applications using this Vulkan extension, and applications that “Acquire” a “DisplayTarget” using a “WinRT” command such as `“winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()”`.

When control is acquired the application has exclusive access to the display until control is released or the application terminates. An application’s attempt to acquire is denied if a different application has already acquired the display.

New Commands

- [vkAcquireWinrtDisplayNV](#)
- [vkGetWinrtDisplayNV](#)

New Enum Constants

- [VK_NV_ACQUIRE_WINRT_DISPLAY_EXTENSION_NAME](#)
- [VK_NV_ACQUIRE_WINRT_DISPLAY_SPEC_VERSION](#)

Issues

1) What should the platform substring be for this extension:

RESOLVED: The platform substring is “Winrt”.

The substring “Winrt” matches the fact that the OS API exposing the acquire and release functionality is called “WinRT”.

The substring “Win32” is wrong because the related “WinRT” API is explicitly **not** a “Win32” API. “WinRT” is a competing API family to the “Win32” API family.

The substring “Windows” is suboptimal because there could be more than one relevant API on the Windows platform. There is preference to use the more-specific substring “Winrt”.

2) Should [vkAcquireWinrtDisplayNV](#) take a winRT DisplayTarget, or a Vulkan display handle as input?

RESOLVED: A Vulkan display handle. This matches the design of [vkAcquireXlibDisplayEXT](#).

3) Should the acquire command be platform-independent named “[vkAcquireDisplayNV](#)”, or platform-specific named “[vkAcquireWinrtDisplayNV](#)”?

RESOLVED: Add a platform-specific command.

The inputs to the Acquire command are all Vulkan types. None are WinRT types. This opens the possibility of the winrt extension defining a platform-independent acquire command.

The X11 acquire command does need to accept a platform-specific parameter. This could be handled by adding to a platform-independent acquire command a params struct to which platform-dependent types can be chained by [pNext](#) pointer.

The prevailing opinion is that it would be odd to create a second platform-independent function that is used on the Windows 10 platform, but that is not used for the X11 platform. Since a Windows 10 platform-specific command is needed anyway for converting between [vkDisplayKHR](#) and platform-native handles, opinion was to create a platform-specific acquire function.

4) Should the [vkGetWinrtDisplayNV](#) parameter identifying a display be named “deviceRelativeId” or “adapterRelativeId”?

RESOLVED: The WinRT name is “AdapterRelativeId”. The name “adapter” is the Windows analog to a Vulkan “physical device”. Vulkan already has precedent to use the name `deviceLUID` for the concept that Windows APIs call “AdapterLuid”. Keeping form with this precedent, the name “deviceRelativeId” is chosen.

5) Does `vkAcquireWinrtDisplayNV` cause the Windows desktop compositor to release a display?

RESOLVED: No. `vkAcquireWinrtDisplayNV` does not itself cause the Windows desktop compositor to release a display. This action must be performed outside of Vulkan.

Beginning with Windows 10 version 2004 it is possible to cause the Windows desktop compositor to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. See <https://docs.microsoft.com/en-us/windows-hardware/drivers/display/specialized-monitors>

6) Where can one find additional information about custom compositors for Windows 10?

RESOLVED: Relevant references are as follows.

According to Microsoft’s documentation on “[building a custom compositor](#)”, the ability to write a custom compositor is not a replacement for a fullscreen desktop window. The feature is for writing compositor apps that drive specialized hardware.

Only certain editions of Windows 10 support custom compositors, “[documented here](#)”. The product type can be queried from Windows 10. See <https://docs.microsoft.com/en-us/windows/win32/api/sysinfoapi/nf-sysinfoapi-getproductinfo>

Description

Virtual Reality (VR) applications often involve a post-processing step to apply a “barrel” distortion to the rendered image to correct the “pincushion” distortion introduced by the optics in a VR device. The barrel distorted image has lower resolution along the edges compared to the center. Since the original image is rendered at high resolution, which is uniform across the complete image, a lot of pixels towards the edges do not make it to the final post-processed image.

This extension provides a mechanism to render VR scenes at a non-uniform resolution, in particular a resolution that falls linearly from the center towards the edges. This is achieved by scaling the w coordinate of the vertices in the clip space before perspective divide. The clip space w coordinate of the vertices **can** be offset as of a function of x and y coordinates as follows:

$$w' = w + Ax + By$$

In the intended use case for viewport position scaling, an application should use a set of four viewports, one for each of the four quadrants of a Cartesian coordinate system. Each viewport is set to the dimension of the image, but is scissored to the quadrant it represents. The application should specify A and B coefficients of the w-scaling equation above, that have the same value, but different signs, for each of the viewports. The signs of A and B should match the signs of x and y for the quadrant that they represent such that the value of w' will always be greater than or equal to the original w value for the entire image. Since the offset to w, ($Ax + By$), is always positive, and increases with the absolute values of x and y, the effective resolution will fall off linearly from the center of the image to its edges.

New Commands

- [vkCmdSetViewportWScalingNV](#)

New Structures

- [VkViewportWScalingNV](#)
- Extending [VkPipelineViewportStateCreateInfo](#):
 - [VkPipelineViewportWScalingStateCreateInfoNV](#)

New Enum Constants

- `VK_NV_CLIP_SPACE_W_SCALING_EXTENSION_NAME`
- `VK_NV_CLIP_SPACE_W_SCALING_SPEC_VERSION`
- Extending `VkDynamicState`:
 - `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV`

Issues

1) Is the pipeline struct name too long?

RESOLVED: It fits with the naming convention.

2) Separate W scaling section or fold into coordinate transformations?

RESOLVED: Leaving it as its own section for now.

Examples

```

VkViewport viewports[4];
VkRect2D scissors[4];
VkViewportWScalingNV scalings[4];

for (int i = 0; i < 4; i++) {
    int x = (i & 2) ? 0 : currentWindowWidth / 2;
    int y = (i & 1) ? 0 : currentWindowHeight / 2;

    viewports[i].x = 0;
    viewports[i].y = 0;
    viewports[i].width = currentWindowWidth;
    viewports[i].height = currentWindowHeight;
    viewports[i].minDepth = 0.0f;
    viewports[i].maxDepth = 1.0f;

    scissors[i].offset.x = x;
    scissors[i].offset.y = y;
    scissors[i].extent.width = currentWindowWidth/2;
    scissors[i].extent.height = currentWindowHeight/2;

    const float factor = 0.15;
    scalings[i].xcoeff = ((i & 2) ? -1.0 : 1.0) * factor;
    scalings[i].ycoeff = ((i & 1) ? -1.0 : 1.0) * factor;
}

```

```

VKPipelineViewportWScalingStateCreateInfoNV vpWScalingStateInfo = {
VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV };

```

```

vpWScalingStateInfo.viewportWScalingEnable = VK_TRUE;
vpWScalingStateInfo.viewportCount = 4;
vpWScalingStateInfo.pViewportWScalings = &scalings[0];

```

```

VKPipelineViewStateCreateInfo vpStateInfo = {
VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO };
vpStateInfo.viewportCount = 4;
vpStateInfo.pViewports = &viewports[0];
vpStateInfo.scissorCount = 4;
vpStateInfo.pScissors = &scissors[0];
vpStateInfo.pNext = &vpWScalingStateInfo;

```

Example shader to read from a w-scaled texture:

```

// Vertex Shader
// Draw a triangle that covers the whole screen
const vec4 positions[3] = vec4[3](vec4(-1, -1, 0, 1),
                                         vec4( 3, -1, 0, 1),
                                         vec4(-1, 3, 0, 1));
out vec2 uv;
void main()
{
    vec4 pos = positions[ gl_VertexID ];
    gl_Position = pos;
    uv = pos.xy;
}

// Fragment Shader
uniform sampler2D tex;
uniform float xcoeff;
uniform float ycoeff;
out vec4 Color;
in vec2 uv;

void main()
{
    // Handle uv as if upper right quadrant
    vec2 uvabs = abs(uv);

    // unscale: transform w-scaled image into an unscaled image
    // scale: transform unscaled image int a w-scaled image
    float unscale = 1.0 / (1 + xcoeff * uvabs.x + xcoeff * uvabs.y);
    //float scale = 1.0 / (1 - xcoeff * uvabs.x - xcoeff * uvabs.y);

    vec2 P = vec2(unscale * uvabs.x, unscale * uvabs.y);

    // Go back to the right quadrant
    P *= sign(uv);

    Color = texture(tex, P * 0.5 + 0.5);
}

```

Interactions and External Dependencies

- This extension requires `SPV_NV_compute_shader_derivatives`
- This extension provides API support for `GL_NV_compute_shader_derivatives`

Contributors

- Pat Brown, NVIDIA

Description

This extension adds Vulkan support for the `SPV_NV_compute_shader_derivatives` SPIR-V extension.

The SPIR-V extension provides two new execution modes, both of which allow compute shaders to use built-ins that evaluate compute derivatives explicitly or implicitly. Derivatives will be computed via differencing over a 2x2 group of shader invocations. The `DerivativeGroupQuadsNV` execution mode assembles shader invocations into 2x2 groups, where each group has x and y coordinates of the local invocation ID of the form $(2m+\{0,1}, 2n+\{0,1\})$. The `DerivativeGroupLinearNV` execution mode assembles shader invocations into 2x2 groups, where each group has local invocation index values of the form $4m+\{0,1,2,3\}$.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceComputeShaderDerivativesFeaturesNV`

New Enum Constants

- `VK_NV_COMPUTE_SHADER_DERIVATIVES_EXTENSION_NAME`
- `VK_NV_COMPUTE_SHADER_DERIVATIVES_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_FEATURES_NV`

New SPIR-V Capability

- `ComputeDerivativeGroupQuadsNV`
- `ComputeDerivativeGroupLinearNV`

Issues

(1) Should we specify that the groups of four shader invocations used for derivatives in a compute shader are the same groups of four invocations that form a “quad” in shader subgroups?

RESOLVED: Yes.

Examples

None.

2019-02-05

Interactions and External Dependencies

- This extension requires `SPV_NV_cooperative_matrix`
- This extension provides API support for `GL_NV_cooperative_matrix`

Contributors

- Jeff Bolz, NVIDIA
- Markus Tavenrath, NVIDIA
- Daniel Koch, NVIDIA

Description

This extension adds support for using cooperative matrix types in SPIR-V. Cooperative matrix types are medium-sized matrices that are primarily supported in compute shaders, where the storage for the matrix is spread across all invocations in some scope (usually a subgroup) and those invocations cooperate to efficiently perform matrix multiplies.

Cooperative matrix types are defined by the `SPV_NV_cooperative_matrix` SPIR-V extension and can be used with the `GL_NV_cooperative_matrix` GLSL extension.

This extension includes support for enumerating the matrix types and dimensions that are supported by the implementation.

- Pat Brown, NVIDIA
- Chris Lentini, NVIDIA

Description

This extension adds support for a new image organization, which this extension refers to as “corner-sampled” images. A corner-sampled image differs from a conventional image in the following ways:

- Texels are centered on integer coordinates. See [Unnormalized Texel Coordinate Operations](#)
- Normalized coordinates are scaled using $\text{coord} \times (\text{dim} - 1)$ rather than $\text{coord} \times \text{dim}$, where dim is the size of one dimension of the image. See [normalized texel coordinate transform](#).
- Partial derivatives are scaled using $\text{coord} \times (\text{dim} - 1)$ rather than $\text{coord} \times \text{dim}$. See [Scale Factor Operation](#).
- Calculation of the next higher lod size goes according to $\lceil \text{dim} / 2 \rceil$ rather than $\lfloor \text{dim} / 2 \rfloor$. See [Image Miplevel Sizing](#).
- The minimum level size is 2x2 for 2D images and 2x2x2 for 3D images. See [Image Miplevel Sizing](#).

This image organization is designed to facilitate a system like Ptex with separate textures for each face of a subdivision or polygon mesh. Placing sample locations at pixel corners allows applications to maintain continuity between adjacent patches by duplicating values along shared edges. Additionally, using the modified mipmapping logic along with texture dimensions of the form $2^n + 1$ allows continuity across shared edges even if the adjacent patches use different level-of-detail values.

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceCornerSampledImageFeaturesNV](#)

New Enum Constants

- `VK_NV_CORNER_SAMPLED_IMAGE_SPEC_VERSION`
- Extending `VkImageCreateFlagBits`:
 - `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CORNER_SAMPLED_IMAGE_FEATURES_NV`

Issues

1. What should this extension be named?

DISCUSSION: While naming this extension, we chose the most distinctive aspect of the image organization and referred to such images as “corner-sampled images”. As a result, we decided to name the extension `NV_corner_sampled_image`.

2. Do we need a format feature flag so formats can advertise if they support corner-sampling?

DISCUSSION: Currently NVIDIA supports this for all 2D and 3D formats, but not for cube maps or depth-stencil formats. A format feature might be useful if other vendors would only support this on some formats.

3. Do integer texel coordinates have a different range for corner-sampled images?

RESOLVED: No, these are unchanged.

4. Do unnormalized sampler coordinates work with corner-sampled images? Are there any functional differences?

RESOLVED: Yes. Unnormalized coordinates are treated as already scaled for corner-sample usage.

5. Should we have a diagram in the “Image Operations” chapter demonstrating different texel sampling locations?

UNRESOLVED: Probably, but later.

Description

When using a framebuffer with mixed samples, a per-fragment coverage reduction operation is performed which generates color sample coverage from the pixel coverage. This extension defines the following modes to control how this reduction is performed.

- Merge: When there are more samples in the pixel coverage than color samples, there is an implementation-dependent association of each pixel coverage sample to a color sample. In the merge mode, the color sample coverage is computed such that only if any associated sample in the pixel coverage is covered, the color sample is covered. This is the default mode.
- Truncate: When there are more raster samples (N) than color samples(M), there is one to one association of the first M raster samples to the M color samples; other raster samples are ignored.

When the number of raster samples is equal to the color samples, there is a one to one mapping between them in either of the above modes.

The new command `vkGetPhysicalDeviceSupportedFramebuffersMixedSamplesCombinationsNV` can

be used to query the various raster, color, depth/stencil sample count and reduction mode combinations that are supported by the implementation. This extension would allow an implementation to support the behavior of both `VK_NV_framebuffer_mixed_samples` and `VK_AMD_mixed_attachment_samples` extensions simultaneously.

Description

This extension allows the device to generate a number of critical graphics commands for command buffers.

When rendering a large number of objects, the device can be leveraged to implement a number of critical functions, like updating matrices, or implementing occlusion culling, frustum culling, front to back sorting, etc. Implementing those on the device does not require any special extension, since an application is free to define its own data structures, and just process them using shaders.

However, if the application desires to quickly kick off the rendering of the final stream of objects, then unextended Vulkan forces the application to read back the processed stream and issue graphics command from the host. For very large scenes, the synchronization overhead and cost to generate the command buffer can become the bottleneck. This extension allows an application to generate a device side stream of state changes and commands, and convert it efficiently into a command buffer without having to read it back to the host.

Furthermore, it allows incremental changes to such command buffers by manipulating only partial sections of a command stream—for example pipeline bindings. Unextended Vulkan requires re-creation of entire command buffers in such a scenario, or updates synchronized on the host.

The intended usage for this extension is for the application to:

- create [VkBuffer](#) objects and retrieve physical addresses from them via [vkGetBufferDeviceAddressEXT](#)
- create a graphics pipeline using [VkGraphicsPipelineShaderGroupsCreateInfoNV](#) for the ability to change shaders on the device.
- create a [VkIndirectCommandsLayoutNV](#), which lists the [VkIndirectCommandsTokenTypeNV](#) it wants to dynamically execute as an atomic command sequence. This step likely involves some internal device code compilation, since the intent is for the GPU to generate the command buffer in the pipeline.
- fill the input stream buffers with the data for each of the inputs it needs. Each input is an array that will be filled with token-dependent data.
- set up a preprocess [VkBuffer](#) that uses memory according to the information retrieved via [vkGetGeneratedCommandsMemoryRequirementsNV](#).
- optionally preprocess the generated content using [vkCmdPreprocessGeneratedCommandsNV](#), for example on an asynchronous compute queue, or for the purpose of re-using the data in multiple executions.
- call [vkCmdExecuteGeneratedCommandsNV](#) to create and execute the actual device commands for all sequences based on the inputs provided.

For each draw in a sequence, the following can be specified:

- a different shader group
- a number of vertex buffer bindings
- a different index buffer, with an optional dynamic offset and index type

- a number of different push constants
- a flag that encodes the primitive winding

While the GPU can be faster than a CPU to generate the commands, it will not happen asynchronously to the device, therefore the primary use-case is generating “less” total work (occlusion culling, classification to use specialized shaders, etc.).

 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_GENERATED_COMMANDS_PROPERTIES_NV`

Issues

1) How to name this extension ?

`VK_NV_device_generated_commands`

As usual, one of the hardest issues ;)

Alternatives: `VK_gpu_commands`, `VK_execute_commands`, `VK_device_commands`, `VK_device_execute_commands`,
`VK_device_execute`, `VK_device_created_commands`, `VK_device_recorded_commands`,
`VK_device_generated_commands` `VK_indirect_generated_commands`

2) Should we use a serial stateful token stream or stateless sequence descriptions?

Similarly to `VkPipeline`, fixed layouts have the most likelihood to be cross-vendor adoptable. They also benefit from being processable in parallel. This is a different design choice compared to the serial command stream generated through `GL_NV_command_list`.

3) How to name a sequence description?

`VkIndirectCommandsLayout` as in the NVX extension predecessor.

Alternative: `VkGeneratedCommandsLayout`

4) Do we want to provide `indirectCommands` inputs with layout or at `indirectCommands` time?

Separate layout from data as Vulkan does. Provide full flexibility for `indirectCommands`.

5) Should the input be provided as SoA or AoS?

Both ways are desireable. AoS can provide portability to other APIs and easier to setup, while SoA allows to update individual inputs in a cache-efficient manner, when others remain static.

6) How do we make developers aware of the memory requirements of implementation-dependent data used for the generated commands?

Make the API explicit and introduce a `preprocess` `VkBuffer`. Developers have to allocate it using `vkGetGeneratedCommandsMemoryRequirementsNV`.

In the NVX version the requirements were hidden implicitly as part of the command buffer reservation process, however as the memory requirements can be substantial, we want to give developers the ability to budget the memory themselves. By lowering the `maxSequencesCount` the memory consumption can be reduced. Furthermore reuse of the memory is possible, for example for doing explicit preprocessing and execution in a ping-pong fashion.

The actual buffer size is implementation-dependent and may be zero, i.e. not always required.

When making use of Graphics Shader Groups, the programs should behave similar with regards to vertex inputs, clipping and culling outputs of the geometry stage, as well as sample shading behavior in fragment shaders, to reduce the amount of the worst-case memory approximation.

7) Should we allow additional per-sequence dynamic state changes?

Yes

Introduced a lightweight indirect state flag `VkIndirectStateFlagBitsNV`. So far only switching front face winding state is exposed. Especially in CAD/DCC mirrored transforms that require such changes are common, and similar flexibility is given in the ray tracing instance description.

The flag could be extended further, for example to switch between primitive-lists or -strips, or

make other state modifications.

Furthermore, as new tokens can be added easily, future extension could add the ability to change any [VkDynamicState](#).

8) How do we allow re-using already “generated” [indirectCommands](#)?

Expose a [preprocessBuffer](#) to reuse implementation-dependencyFlags data. Set the [isPreprocessed](#) to true in [vkCmdExecuteGeneratedCommandsNV](#).

9) Under which conditions is [vkCmdExecuteGeneratedCommandsNV](#) legal?

It behaves like a regular draw call command.

10) Is [vkCmdPreprocessGeneratedCommandsNV](#) copying the input data or referencing it?

There are multiple implementations possible:

- one could have some emulation code that parses the inputs, and generates an output command buffer, therefore copying the inputs.
- one could just reference the inputs, and have the processing done in pipe at execution time.

If the data is mandated to be copied, then it puts a penalty on implementation that could process the inputs directly in pipe. If the data is “referenced”, then it allows both types of implementation.

The inputs are “referenced”, and **must** not be modified after the call to [vkCmdExecuteGeneratedCommandsNV](#) has completed.

11) Which buffer usage flags are required for the buffers referenced by [VkGeneratedCommandsInfoNV](#) ?

Reuse existing [VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT](#)

- [VkGeneratedCommandsInfoNV::preprocessBuffer](#)
- [VkGeneratedCommandsInfoNV::sequencesCountBuffer](#)
- [VkGeneratedCommandsInfoNV::sequencesIndexBuffer](#)
- [VkIndirectCommandsStreamNV::buffer](#)

12) In which pipeline stage does the device generated command expansion happen?

[vkCmdPreprocessGeneratedCommandsNV](#) is treated as if it occurs in a separate logical pipeline from either graphics or compute, and that pipeline only includes [VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT](#), a new stage [VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV](#), and [VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT](#). This new stage has two corresponding new access types, [VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV](#) and [VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV](#), used to synchronize reading the buffer inputs and writing the preprocess memory output.

The generated output written in the preprocess buffer memory by [vkCmdExecuteGeneratedCommandsNV](#) is considered to be consumed by the [VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT](#) pipeline stage.

Thus, to synchronize from writing the input buffers to preprocessing via [vkCmdPreprocessGeneratedCommandsNV](#), use:

- `dstStageMask = VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV`
- `dstAccessMask = VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV`

To synchronize from [vkCmdPreprocessGeneratedCommandsNV](#) to executing the generated commands by [vkCmdExecuteGeneratedCommandsNV](#), use:

- `srcStageMask = VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV`
- `srcAccessMask = VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV`
- `dstStageMask = VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
- `dstAccessMask = VK_ACCESS_INDIRECT_COMMAND_READ_BIT`

When [vkCmdExecuteGeneratedCommandsNV](#) is used with a `isPreprocessed` of `VK_FALSE`, the generated commands are implicitly preprocessed, therefore one only needs to synchronize the inputs via:

- `dstStageMask = VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
- `dstAccessMask = VK_ACCESS_INDIRECT_COMMAND_READ_BIT`

13) What if most token data is “static”, but we frequently want to render a subsection?

Added “sequencesIndexBuffer”. This allows to easier sort and filter what should actually be executed.

14) What are the changes compared to the previous NVX extension?

- Compute dispatch support was removed (was never implemented in drivers). There are different approaches how dispatching from the device should work, hence we defer this to a future extension.
- The [ObjectTableNVX](#) was replaced by using physical buffer addresses and introducing Shader Groups for the graphics pipeline.
- Less state changes are possible overall, but the important operations are still there (reduces complexity of implementation).
- The API was redesigned so all inputs must be passed at both preprocessing and execution time (this was implicit in NVX, now it is explicit)
- The reservation of intermediate command space is now mandatory and explicit through a preprocess buffer.
- The [VkIndirectStateFlagBitsNV](#) were introduced

15) When porting from other APIs, their indirect buffers may use different enums, for example for index buffer types. How to solve this?

Added “pIndexTypeValues” to map custom `uint32_t` values to corresponding [VkIndexType](#).

16) Do we need more shader group state overrides?

The NVX version allowed all PSO states to be different, however as the goal is not to replace all state setup, but focus on highly-frequent state changes for drawing lots of objects, we reduced the amount of state overrides. Especially VkPipelineLayout as well as VkRenderPass configuration should be left static, the rest is still open for discussion.

The current focus is just to allow VertexInput changes as well as shaders, while all shader groups use the same shader stages.

Too much flexibility will increase the test coverage requirement as well. However, further extensions could allow more dynamic state as well.

17) Do we need more detailed physical device feature queries/enables?

An EXT version would need detailed implementor feedback to come up with a good set of features. Please contact us if you are interested, we are happy to make more features optional, or add further restrictions to reduce the minimum feature set of an EXT.

18) Is there an interaction with VK_KHR_pipeline_library planned?

Yes, a future version of this extension will detail the interaction, once VK_KHR_pipeline_library is no longer provisional.

Example Code

Open-Source samples illustrating the usage of the extension can be found at the following location (may not yet exist at time of writing):

https://github.com/nvpro-samples/vk_device_generated_cmds

Description

This extension adds a new `VkPolygonMode` enum where a triangle is rasterized by computing and filling its axis-aligned screen-space bounding box, disregarding the actual triangle edges. This can be useful for drawing a rectangle without being split into two triangles with an internal edge. It is also useful to minimize the number of primitives that need to be drawn, particularly for a user interface.

Description

This extension allows the fragment coverage value, represented as an integer bitmask, to be substituted for a color output being written to a single-component color attachment with integer components (e.g. `VK_FORMAT_R8_UINT`). The functionality provided by this extension is different from simply writing the `SampleMask` fragment shader output, in that the coverage value written to the framebuffer is taken after stencil test and depth test, as well as after fragment operations such as alpha-to-coverage.

This functionality may be useful for deferred rendering algorithms, where the second pass needs to know which samples belong to which original fragments.

Interactions and External Dependencies

- This extension requires [SPV_NV_fragment_shader_barycentric](#)
- This extension provides API support for [GL_NV_fragment_shader_barycentric](#)

Contributors

- Pat Brown, NVIDIA
- Daniel Koch, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- [SPV_NV_fragment_shader_barycentric](#)

The extension provides access to three additional fragment shader variable decorations in SPIR-V:

- [PerVertexNV](#), which indicates that a fragment shader input will not have interpolated values, but instead must be accessed with an extra array index that identifies one of the vertices of the primitive producing the fragment
- [BaryCoordNV](#), which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using perspective interpolation
- [BaryCoordNoPerspNV](#), which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using linear interpolation

When using GLSL source-based shader languages, the following variables from [GL_NV_fragment_shader_barycentric](#) maps to these SPIR-V built-in decorations:

- `in vec3 gl_BaryCoordNV;` → [BaryCoordNV](#)
- `in vec3 gl_BaryCoordNoPerspNV;` → [BaryCoordNoPerspNV](#)

GLSL variables declared using the [__pervertexNV](#) GLSL qualifier are expected to be decorated with [PerVertexNV](#) in SPIR-V.

New Built-In Variables

- `BaryCoordNV`
- `BaryCoordNoPerspNV`

New SPIR-V Decorations

- `PerVertexNV`

New SPIR-V Capabilities

- `FragmentBarycentricNV`

Issues

(1) The AMD_shader_explicit_vertex_parameter extension provides similar functionality. Why write a new extension, and how is this extension different?

RESOLVED: For the purposes of Vulkan/SPIR-V, we chose to implement a separate extension due to several functional differences.

First, the hardware supporting this extension can provide a three-component barycentric weight vector for variables decorated with `BaryCoordNV`, while variables decorated with `BaryCoordSmoothAMD` provide only two components. In some cases, it may be more efficient to explicitly interpolate an attribute via:

```
float value = (baryCoordNV.x * v[0].attrib +
               baryCoordNV.y * v[1].attrib +
               baryCoordNV.z * v[2].attrib);
```

instead of

```
float value = (baryCoordSmoothAMD.x * (v[0].attrib - v[2].attrib) +
               baryCoordSmoothAMD.y * (v[1].attrib - v[2].attrib) +
               v[2].attrib);
```

Additionally, the semantics of the decoration `BaryCoordPullModelAMD` do not appear to map to anything supported by the initial hardware implementation of this extension.

This extension provides a smaller number of decorations than the AMD extension, as we expect that shaders could derive variables decorated with things like `BaryCoordNoPerspCentroidAMD` with explicit attribute interpolation instructions. One other relevant difference is that explicit per-vertex attribute access using this extension does not require a constant vertex number.

(2) Why do the built-in SPIR-V decorations for this extension include two separate built-ins `BaryCoordNV` and `BaryCoordNoPerspNV` when a “no perspective” variable could be decorated with `BaryCoordNV` and `NoPerspective`?

RESOLVED: The SPIR-V extension for this feature chose to mirror the behavior of the GLSL extension, which provides two built-in variables. Additionally, it is not clear that its a good idea (or even legal) to have two variables using the “same attribute”, but with different interpolation modifiers.

Description

This extension builds on the fragment shading rate functionality provided by the `VK_KHR_fragment_shading_rate` extension, adding support for “supersample” fragment shading rates that trigger multiple fragment shader invocations per pixel as well as a “no invocations” shading rate that discards any portions of a primitive that would use that shading rate.

 - [VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_ENUM_STATE_CREATE_INFO_NV](#)

Issues

1. Why was this extension created? How should it be named?

RESOLVED: The primary goal of this extension was to expose support for supersample and “no invocations” shading rates, which are supported by the VK_NV_shading_rate_image extension but not by VK_KHR_fragment_shading_rate. Because VK_KHR_fragment_shading_rate specifies the primitive shading rate using a fragment size in pixels, it lacks a good way to specify supersample rates. To deal with this, we defined enums covering shading rates supported by the KHR extension as well as the new shading rates and added structures and APIs accepting shading rate enums instead of fragment sizes.

Since this extension adds two different types of shading rates, both expressed using enums, we chose the extension name VK_NV_fragment_shading_rate_enums.

2. Is this a standalone extension?

RESOLVED: No, this extension requires VK_KHR_fragment_shading_rate. In order to use the

features of this extension, applications must enable the relevant features of KHR extension.

3. How are the shading rate enums used, and how were the enum values assigned?

RESOLVED: The shading rates supported by the enums in this extension are accepted as pipeline, primitive, and attachment shading rates and behave identically. For the shading rates also supported by the KHR extension, the values assigned to the corresponding enums are identical to the values already used for the primitive and attachment shading rates in the KHR extension. For those enums, bits 0 and 1 specify the base two logarithm of the fragment height and bits 2 and 3 specify the base two logarithm of the fragment width. For the new shading rates added by this extension, we chose to use 11 through 14 (10 plus the base two logarithm of the invocation count) for the supersample rates and 15 for the “no invocations” rate. None of those values are supported as primitive or attachment shading rates by the KHR extension.

4. Between this extension, VK_KHR_fragment_shading_rate, and VK_NV_shading_rate_image, there are three different ways to specify shading rate state in a pipeline. How should we handle this?

RESOLVED: We do not allow the concurrent use of VK_NV_shading_rate_image and VK_KHR_fragment_shading_rate; it is an error to enable shading rate features from both extensions. But we do allow applications to enable this extension together with VK_KHR_fragment_shading_rate together. While we expect that applications will never attach pipelineCreateInfo structures for both this extension and the KHR extension concurrently, Vulkan does not have any precedent forbidding such behavior and instead typically treats a pipeline created without an extension-specificCreateInfo structure as equivalent to one containing default values specified by the extension. Rather than adding such a rule considering the presence or absence of our newCreateInfo structure, we instead included a `shadingRateType` member to `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` that selects between using state specified by that structure and state specified by `VkPipelineFragmentShadingRateStateCreateInfoKHR`.

Description

This extension allows multisample rendering with a raster and depth/stencil sample count that is larger than the color sample count. Rasterization and the results of the depth and stencil tests together determine the portion of a pixel that is “covered”. It can be useful to evaluate coverage at a higher frequency than color samples are stored. This coverage is then “reduced” to a collection of covered color samples, each having an opacity value corresponding to the fraction of the color sample covered. The opacity can optionally be blended into individual color samples.

Rendering with fewer color samples than depth/stencil samples greatly reduces the amount of memory and bandwidth consumed by the color buffer. However, converting the coverage values into opacity introduces artifacts where triangles share edges and **may** not be suitable for normal triangle mesh rendering.

One expected use case for this functionality is Stencil-then-Cover path rendering (similar to the OpenGL GL_NV_path_rendering extension). The stencil step determines the coverage (in the stencil buffer) for an entire path at the higher sample frequency, and then the cover step draws the path into the lower frequency color buffer using the coverage information to antialias path edges. With this two-step process, internal edges are fully covered when antialiasing is applied and there is no corruption on these edges.

The key features of this extension are:

- It allows render pass and framebuffer objects to be created where the number of samples in the depth/stencil attachment in a subpass is a multiple of the number of samples in the color attachments in the subpass.
- A coverage reduction step is added to Fragment Operations which converts a set of covered raster/depth/stencil samples to a set of color samples that perform blending and color writes. The coverage reduction step also includes an optional coverage modulation step, multiplying color values by a fractional opacity corresponding to the number of associated raster/depth/stencil samples covered.

Interactions and External Dependencies

- This extension requires `SPV_NV_geometry_shader_passthrough`
- This extension provides API support for `GL_NV_geometry_shader_passthrough`
- This extension requires the `geometryShader` feature.

Contributors

- Piers Daniell, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_NV_geometry_shader_passthrough`

Geometry shaders provide the ability for applications to process each primitive sent through the graphics pipeline using a programmable shader. However, one common use case treats them largely as a “passthrough”. In this use case, the bulk of the geometry shader code simply copies inputs from each vertex of the input primitive to corresponding outputs in the vertices of the output primitive. Such shaders might also compute values for additional built-in or user-defined per-primitive attributes (e.g., `Layer`) to be assigned to all the vertices of the output primitive.

This extension provides access to the `PassthroughNV` decoration under the `GeometryShaderPassthroughNV` capability. Adding this to a geometry shader input variable specifies that the values of this input are copied to the corresponding vertex of the output primitive.

When using GLSL source-based shading languages, the `passthrough` layout qualifier from `GL_NV_geometry_shader_passthrough` maps to the `PassthroughNV` decoration. To use the `passthrough` layout, in GLSL the `GL_NV_geometry_shader_passthrough` extension must be enabled. Behaviour is described in the `GL_NV_geometry_shader_passthrough` extension specification.

New Enum Constants

- `VK_NV_GEOMETRY_SHADER_PASSTHROUGH_EXTENSION_NAME`
- `VK_NV_GEOMETRY_SHADER_PASSTHROUGH_SPEC_VERSION`

New Variable Decoration

- `PassthroughNV` in `Geometry Shader Passthrough`

New SPIR-V Capabilities

- [GeometryShaderPassthroughNV](#)

Issues

1) Should we require or allow a passthrough geometry shader to specify the output layout qualifiers for the output primitive type and maximum vertex count in the SPIR-V?

RESOLVED: Yes they should be required in the SPIR-V. Per GL_NV_geometry_shader_passthrough they are not permitted in the GLSL source shader, but SPIR-V is lower-level. It is straightforward for the GLSL compiler to infer them from the input primitive type and to explicitly emit them in the SPIR-V according to the following table.

Input Layout	Implied Output Layout
points	<code>layout(points, max_vertices=1)</code>
lines	<code>layout(line_strip, max_vertices=2)</code>
triangles	<code>layout(triangle_strip, max_vertices=3)</code>

2) How does interface matching work with passthrough geometry shaders?

RESOLVED: This is described in [Passthrough Interface Matching](#). In GL when using passthrough geometry shaders in separable mode, all inputs must also be explicitly assigned location layout qualifiers. In Vulkan all SPIR-V shader inputs (except built-ins) must also have location decorations specified. Redeclarations of built-in variables that add the passthrough layout qualifier are exempted from the rule requiring location assignment because built-in variables do not have locations and are matched by `BuiltIn` decoration.

Sample Code

Consider the following simple geometry shader in unextended GLSL:

```

layout(triangles) in;
layout(triangle_strip) out;
layout(max_vertices=3) out;

in Inputs {
    vec2 texcoord;
    vec4 baseColor;
} v_in[];
out Outputs {
    vec2 texcoord;
    vec4 baseColor;
};

void main()
{
    int layer = compute_layer();
    for (int i = 0; i < 3; i++) {
        gl_Position = gl_in[i].gl_Position;
        texcoord = v_in[i].texcoord;
        baseColor = v_in[i].baseColor;
        gl_Layer = layer;
        EmitVertex();
    }
}

```

In this shader, the inputs `gl_Position`, `Inputs.texcoord`, and `Inputs.baseColor` are simply copied from the input vertex to the corresponding output vertex. The only “interesting” work done by the geometry shader is computing and emitting a `gl_Layer` value for the primitive.

The following geometry shader, using this extension, is equivalent:

```

#extension GL_NV_geometry_shader_passthrough : require

layout(triangles) in;
// No output primitive layout qualifiers required.

// Redefine gl_PerVertex to pass through "gl_Position".
layout(passthrough) in gl_PerVertex {
    vec4 gl_Position;
} gl_in[];

// Declare "Inputs" with "passthrough" to automatically copy members.
layout(passthrough) in Inputs {
    vec2 texcoord;
    vec4 baseColor;
} v_in[];

// No output block declaration required.

void main()
{
    // The shader simply computes and writes gl_Layer. We do not
    // loop over three vertices or call EmitVertex().
    gl_Layer = compute_layer();
}

```

Contributors

- David Zhao Akeley, NVIDIA
- Jeff Bolz, NVIDIA
- Piers Daniell, NVIDIA
- Christoph Kubisch, NVIDIA

Description

This extension adds the ability for a secondary command buffer to inherit the dynamic viewport and scissor state from a primary command buffer, or a previous secondary command buffer executed within the same `vkCmdExecuteCommands` call. It addresses a frequent scenario in applications that deal with window resizing and want to improve utilization of re-usable secondary command buffers. The functionality is provided through `VkCommandBufferInheritanceViewportScissorInfoNV`. Viewport inheritance is effectively limited to the 2D rectangle; secondary command buffers must re-specify the inherited depth range values.

New Structures

- Extending `VkCommandBufferInheritanceInfo`:
 - `VkCommandBufferInheritanceViewportScissorInfoNV`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceInheritedViewportScissorFeaturesNV`

New Enum Constants

- `VK_NV_INHERITED_VIEWPORT_SCISSOR_EXTENSION_NAME`
- `VK_NV_INHERITED_VIEWPORT_SCISSOR_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_VIEWPORT_SCISSOR_INFO_NV`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INHERITED_VIEWPORT_SCISSOR_FEATURES_NV`

Issues

- (1) Why are viewport depth values configured in the `VkCommandBufferInheritanceViewportScissorInfoNV` struct, rather than by a `vkCmd...NV` function?

DISCUSSION:

We considered both adding a new `vkCmdSetViewportDepthNV` function, and modifying `vkCmdSetViewport` to ignore the `x`, `y`, `width`, and `height` values when called with a secondary command buffer that activates this extension.

The primary design considerations for this extension are debuggability and easy integration into existing applications. The main issue with adding a new `vkCmdSetViewportDepthNV` function is reducing ease-of-integration. A new function pointer will have to be loaded, but more importantly, a new function would require changes to be supported in graphics debuggers; this would delay widespread adoption of the extension.

The proposal to modify `vkCmdSetViewport` would avoid these issues. However, we expect that the intent of applications using this extension is to have the viewport values used for drawing exactly match the inherited values; thus, it would be better for debuggability if no function for modifying the viewport depth alone is provided. By specifying viewport depth values when starting secondary command buffer recording, and requiring the specified depth values to match the inherited depth values, we allow for validation layers that flag depth changes as errors.

This design also better matches the hardware model. In fact, there is no need to re-execute a depth-setting command. The graphics device retains the viewport depth state; it is the CPU-side state of `VkCommandBuffer` that must be re-initialized.

(2) Why are viewport depth values specified as a partial `VkViewport` struct, rather than a leaner depth-only struct?

DISCUSSION:

We considered adding a new `VkViewportDepthNV` struct containing only `minDepth` and `maxDepth`. However, as application developers would need to maintain both a `VK_NV_inherited_viewport_scissor` code path and a fallback code path (at least in the short term), we ultimately chose to continue using the existing `VkViewport` structure. Doing so would allow application developers to reuse the same `VkViewport` array for both code paths, rather than constructing separate `VkViewportDepthNV` and `VkViewport` arrays for each code path.

Description

This extension provides a new mechanism allowing applications to generate collections of geometric primitives via programmable mesh shading. It is an alternative to the existing programmable primitive shading pipeline, which relied on generating input primitives by a fixed function assembler as well as fixed function vertex fetch.

There are new programmable shader types—the task and mesh shader—to generate these collections to be processed by fixed-function primitive assembly and rasterization logic. When task and mesh shaders are dispatched, they replace the core [pre-rasterization stages](#), including vertex array attribute fetching, vertex shader processing, tessellation, and geometry shader processing.

This extension also adds support for the following SPIR-V extension in Vulkan:

- [SPV_NV_mesh_shader](#)

New SPIR-V Capability

- MeshShadingNV

Issues

1. How to name this extension?

RESOLVED: VK_NV_mesh_shader

Other options considered:

- VK_NV_mesh_shading
- VK_NV_programmable_mesh_shading
- VK_NV_primitive_group_shading
- VK_NV_grouped_drawing

2. Do we need a new VkPrimitiveTopology?

RESOLVED: No. We skip the InputAssembler stage.

3. Should we allow Instancing?

RESOLVED: No. There is no fixed function input, other than the IDs. However, allow offsetting with a “first” value.

4. Should we use existing vkCmdDraw or introduce new functions?

RESOLVED: Introduce new functions.

New functions make it easier to separate from “programmable primitive shading” chapter, less “dual use” language about existing functions having alternative behavior. The text around the existing “draws” is heavily based around emitting vertices.

5. If new functions, how to name?

RESOLVED: CmdDrawMeshTasks*

Other options considered:

- CmdDrawMeshed
- CmdDrawTasked
- CmdDrawGrouped

6. Should VK_SHADER_STAGE_ALL_GRAPHICS be updated to include the new stages?

RESOLVED: No. If an application were to be recompiled with headers that include additional shader stage bits in VK_SHADER_STAGE_ALL_GRAPHICS, then the previously valid application would no longer be valid on implementations that do not support mesh or task shaders. This means the change would not be backwards compatible. It is too bad VkShaderStageFlagBits does not have a dedicated “all supported graphics stages” bit like VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT, which would have avoided this problem.

Description

Rasterization has been the dominant method to produce interactive graphics, but increasing performance of graphics hardware has made ray tracing a viable option for interactive rendering. Being able to integrate ray tracing with traditional rasterization makes it easier for applications to incrementally add ray traced effects to existing applications or to do hybrid approaches with rasterization for primary visibility and ray tracing for secondary queries.

To enable ray tracing, this extension adds a few different categories of new functionality:

- Acceleration structure objects and build commands
- A new pipeline type with new shader domains
- An indirection table to link shader groups with acceleration structure items

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_NV_ray_tracing`

- This extension provides API support for [GL_NV_ray_tracing_motion_blur](#)

Contributors

- Eric Werness, NVIDIA
- Ashwin Lele, NVIDIA

Description

Ray tracing support in the API provides an efficient mechanism to intersect rays against static geometry, but rendering algorithms often want to support motion, which is more efficiently supported with motion-specific algorithms. This extension adds a set of mechanisms to support fast tracing of moving geometry:

- A ray pipeline trace call which takes a time parameter
- Flags to enable motion support in an acceleration structure
- Support for time-varying vertex positions in a geometry
- Motion instances to move existing instances over time

The motion represented here is parameterized across a normalized timestep between 0.0 and 1.0. A motion trace using [OpTraceRayMotionNV](#) provides a time within that normalized range to be used when intersecting that ray with geometry. The geometry can be provided with motion by a combination of adding a second vertex position for time of 1.0 using [VkAccelerationStructureGeometryMotionTrianglesDataNV](#) and providing multiple transforms in the instance using [VkAccelerationStructureMotionInstanceNV](#).

Description

This extension provides a new representative fragment test that allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all other early fragment tests, the implementation is permitted to choose one or more “representative” fragments

for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives.

This extension is useful for applications that use an early render pass to determine the full set of primitives that would be visible in the final scene. In this render pass, such applications would set up a fragment shader that enables early fragment tests and writes to an image or shader storage buffer to record the ID of the primitive that generated the fragment. Without this extension, the shader would record the ID separately for each visible fragment of each primitive. With this extension, fewer stores will be performed, particularly for large primitives.

The representative fragment test has no effect if early fragment tests are not enabled via the fragment shader. The set of fragments discarded by the representative fragment test is implementation-dependent and may vary from frame to frame. In some cases, the representative fragment test may not discard any fragments for a given primitive.

New Structures

 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_REPRESENTATIVE_FRAGMENT_TEST_FEATURES_NV](#)
 - [VK_STRUCTURE_TYPE_PIPELINE_REPRESENTATIVE_FRAGMENT_TEST_STATE_CREATE_INFO_NV](#)

Issues

(1) Is the representative fragment test guaranteed to have any effect?

RESOLVED: No. As specified, we only guarantee that each primitive with at least one fragment that passes prior tests will have one fragment passing the representative fragment tests. We do not guarantee that any particular fragment will fail the test.

In the initial implementation of this extension, the representative fragment test is treated as an optimization that may be completely disabled for some pipeline states. This feature was designed for a use case where the fragment shader records information on individual primitives using shader storage buffers or storage images, with no writes to color or depth buffers.

(2) Will the set of fragments that pass the representative fragment test be repeatable if you draw the same scene over and over again?

RESOLVED: No. The set of fragments that pass the representative fragment test is implementation-dependent and may vary due to the timing of operations performed by the GPU.

(3) What happens if you enable the representative fragment test with writes to color and/or depth render targets enabled?

RESOLVED: If writes to the color or depth buffer are enabled, they will be performed for any fragments that survive the relevant tests. Any fragments that fail the representative fragment test will not update color buffers. For the use cases intended for this feature, we do not expect color or depth writes to be enabled.

(4) How do derivatives and automatic texture level of detail computations work with the representative fragment test enabled?

RESOLVED: If a fragment shader uses derivative functions or texture lookups using automatic level of detail computation, derivatives will be computed identically whether or not the representative fragment test is enabled. For the use cases intended for this feature, we do not expect the use of derivatives in the fragment shader.

- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- [SPV_NV_sample_mask_override_coverage](#)

The extension provides access to the `OverrideCoverageNV` decoration under the `SampleMaskOverrideCoverageNV` capability. Adding this decoration to a variable with the `SampleMask` builtin decoration allows the shader to modify the coverage mask and affect which samples are used to process the fragment.

When using GLSL source-based shader languages, the `override_coverage` layout qualifier from `GL_NV_sample_mask_override_coverage` maps to the `OverrideCoverageNV` decoration. To use the `override_coverage` layout qualifier in GLSL the `GL_NV_sample_mask_override_coverage` extension must be enabled. Behavior is described in the `GL_NV_sample_mask_override_coverage` extension spec.

Description

This extension adds support for an exclusive scissor test to Vulkan. The exclusive scissor test behaves like the scissor test, except that the exclusive scissor test fails for pixels inside the corresponding rectangle and passes for pixels outside the rectangle. If the same rectangle is used for both the scissor and exclusive scissor tests, the exclusive scissor test will pass if and only if the

scissor test fails.

Interactions and External Dependencies

- This extension requires `SPV_NV_shader_image_footprint`
- This extension provides API support for `GL_NV_shader_texture_footprint`

Contributors

- Pat Brown, NVIDIA
- Chris Lentini, NVIDIA
- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension adds Vulkan support for the `SPV_NV_shader_image_footprint` SPIR-V extension. That SPIR-V extension provides a new instruction `OpImageSampleFootprintNV` allowing shaders to determine the set of texels that would be accessed by an equivalent filtered texture lookup.

Instead of returning a filtered texture value, the instruction returns a structure that can be interpreted by shader code to determine the footprint of a filtered texture lookup. This structure includes integer values that identify a small neighborhood of texels in the image being accessed and a bitfield that indicates which texels in that neighborhood would be used. The structure also includes a bitfield where each bit identifies whether any texel in a small aligned block of texels would be fetched by the texture lookup. The size of each block is specified by an access *granularity* provided by the shader. The minimum granularity supported by this extension is 2x2 (for 2D textures) and 2x2x2 (for 3D textures); the maximum granularity is 256x256 (for 2D textures) or 64x32x32 (for 3D textures). Each footprint query returns the footprint from a single texture level.

When using minification filters that combine accesses from multiple mipmap levels, shaders must perform separate queries for the two levels accessed (“fine” and “coarse”). The footprint query also returns a flag indicating if the texture lookup would access texels from only one mipmap level or from two neighboring levels.

This extension should be useful for multi-pass rendering operations that do an initial expensive rendering pass to produce a first image that is then used as a texture for a second pass. If the second pass ends up accessing only portions of the first image (e.g., due to visibility), the work spent rendering the non-accessed portion of the first image was wasted. With this feature, an application can limit this waste using an initial pass over the geometry in the second image that performs a footprint query for each visible pixel to determine the set of pixels that it needs from the first image. This pass would accumulate an aggregate footprint of all visible pixels into a separate “footprint image” using shader atomics. Then, when rendering the first image, the application can kill all shading work for pixels not in this aggregate footprint.

This extension has a number of limitations. The [OpImageSampleFootprintNV](#) instruction only supports for two- and three-dimensional textures. Footprint evaluation only supports the CLAMP_TO_EDGE wrap mode; results are undefined for all other wrap modes. Only a limited set of granularity values and that set does not support separate coverage information for each texel in the original image.

When using SPIR-V generated from the OpenGL Shading Language, the new instruction will be generated from code using the new [textureFootprint*NV](#) built-in functions from the [GL_NV_shader_texture_footprint](#) shading language extension.

New Structures

- [VK_NV_SHADER_IMAGE_FOOTPRINT_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_FOOTPRINT_FEATURES_NV](#)

New SPIR-V Capability

- [ImageFootprintNV](#)

Issues

(1) The footprint returned by the SPIR-V instruction is a structure that includes an anchor, an offset, and a mask that represents a 8x8 or 4x4x4 neighborhood of texel groups. But the bits of the mask are not stored in simple pitch order. Why is the footprint built this way?

RESOLVED: We expect that applications using this feature will want to use a fixed granularity and accumulate coverage information from the returned footprints into an aggregate “footprint image”

that tracks the portions of an image that would be needed by regular texture filtering. If an application is using a two-dimensional image with 4x4 pixel granularity, we expect that the footprint image will use 64-bit texels where each bit in an 8x8 array of bits corresponds to coverage for a 4x4 block in the original image. Texel (0,0) in the footprint image would correspond to texels (0,0) through (31,31) in the original image.

In the usual case, the footprint for a single access will fully contained in a 32x32 aligned region of the original texture, which corresponds to a single 64-bit texel in the footprint image. In that case, the implementation will return an anchor coordinate pointing at the single footprint image texel, an offset vector of (0,0), and a mask whose bits are aligned with the bits in the footprint texel. For this case, the shader can simply atomically OR the mask bits into the contents of the footprint texel to accumulate footprint coverage.

In the worst case, the footprint for a single access spans multiple 32x32 aligned regions and may require updates to four separate footprint image texels. In this case, the implementation will return an anchor coordinate pointing at the lower right footprint image texel and an offset will identify how many “columns” and “rows” of the returned 8x8 mask correspond to footprint texels to the left and above the anchor texel. If the anchor is (2,3), the 64 bits of the returned mask are arranged spatially as follows, where each 4x4 block is assigned a bit number that matches its bit number in the footprint image texels:

+-----+	-----+-----+	-----+-----+	-----+-----+
-----	-----	-----	-----
-----	-----	-----	-----
-----	-----	-----	-----
-----	-----	-----	-----
-----	46 47	40 41 42 43 44 45	-----
-----	54 55	48 49 50 51 52 53	-----
-----	62 63	56 57 58 59 60 61	-----
+-----+	-----+-----+	-----+-----+	-----+-----+
-----	06 07	00 01 02 03 04 05	-----
-----	14 15	08 09 10 11 12 13	-----
-----	22 23	16 17 18 19 20 21	-----
-----	30 31	24 25 26 27 28 29	-----
-----	38 39	32 33 34 35 36 37	-----
-----	-----	-----	-----
-----	-----	-----	-----
+-----+	-----+-----+	-----+-----+	-----+-----+

To accumulate coverage for each of the four footprint image texels, a shader can AND the returned mask with simple masks derived from the x and y offset values and then atomically OR the updated mask bits into the contents of the corresponding footprint texel.

```

uint64_t returnedMask = (uint64_t(footprint.mask.x) | (uint64_t(footprint.mask.y)
<< 32));
uint64_t rightMask    = ((0xFF >> footprint.offset.x) * 0x0101010101010101UL);
uint64_t bottomMask   = 0xFFFFFFFFFFFFFFFUL >> (8 * footprint.offset.y);
uint64_t bottomRight  = returnedMask & bottomMask & rightMask;
uint64_t bottomLeft   = returnedMask & bottomMask & (~rightMask);
uint64_t topRight     = returnedMask & (~bottomMask) & rightMask;
uint64_t topLeft      = returnedMask & (~bottomMask) & (~rightMask);

```

(2) What should an application do to ensure maximum performance when accumulating footprints into an aggregate footprint image?

RESOLVED: We expect that the most common usage of this feature will be to accumulate aggregate footprint coverage, as described in the previous issue. Even if you ignore the anisotropic filtering case where the implementation may return a granularity larger than that requested by the caller, each shader invocation will need to use atomic functions to update up to four footprint image texels for each level of detail accessed. Having each active shader invocation perform multiple atomic operations can be expensive, particularly when neighboring invocations will want to update the same footprint image texels.

Techniques can be used to reduce the number of atomic operations performed when accumulating coverage include:

- Have logic that detects returned footprints where all components of the returned offset vector are zero. In that case, the mask returned by the footprint function is guaranteed to be aligned with the footprint image texels and affects only a single footprint image texel.
- Have fragment shaders communicate using built-in functions from the `VK_NV_shader_subgroup_partitioned` extension or other shader subgroup extensions. If you have multiple invocations in a subgroup that need to update the same texel (x,y) in the footprint image, compute an aggregate footprint mask across all invocations in the subgroup updating that texel and have a single invocation perform an atomic operation using that aggregate mask.
- When the returned footprint spans multiple texels in the footprint image, each invocation need to perform four atomic operations. In the previous issue, we had an example that computed separate masks for “topLeft”, “topRight”, “bottomLeft”, and “bottomRight”. When the invocations in a subgroup have good locality, it might be the case the “top left” for some invocations might refer to footprint image texel (10,10), while neighbors might have their “top left” texels at (11,10), (10,11), and (11,11). If you compute separate masks for even/odd x and y values instead of left/right or top/bottom, the “odd/odd” mask for all invocations in the subgroup hold coverage for footprint image texel (11,11), which can be updated by a single atomic operation for the entire subgroup.

Other Extension Metadata

Last Modified Date

2019-05-28

Interactions and External Dependencies

- This extension requires `SPV_NV_shader_sm_builtins`.
- This extension provides API support for `GL_NV_shader_sm_builtins`

Contributors

- Jeff Bolz, NVIDIA
- Eric Werness, NVIDIA

Description

This extension provides the ability to determine device-specific properties on NVIDIA GPUs. It provides the number of streaming multiprocessors (SMs), the maximum number of warps (subgroups) that can run on an SM, and shader builtins to enable invocations to identify which SM and warp a shader invocation is executing on.

This extension enables support for the SPIR-V `ShaderSMBuiltinsNV` capability.

These properties and built-ins **should** typically only be used for debugging purposes.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV`
- Extending `VkPhysicalDeviceProperties2`:
 - `VkPhysicalDeviceShaderSMBuiltinsPropertiesNV`

New Enum Constants

- `VK_NV_SHADER_SM_BUILTINS_EXTENSION_NAME`
- `VK_NV_SHADER_SM_BUILTINS_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SM_BUILTINS_FEATURES_NV`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SM_BUILTINS_PROPERTIES_NV`

New or Modified Built-In Variables

- `WarpPerSMNV`
- `SMCountNV`
- `WarpIDNV`
- `SMIDNV`

New SPIR-V Capabilities

- `ShaderSMBuiltinsNV`

Issues

- What should we call this extension?

RESOLVED: `NV_shader_sm_builtins`. Other options considered included:

- `NV_shader_smid` - but SMID is really easy to typo/confuse as SIMD.
- `NV_shader_sm_info` - but **Info** is typically reserved for input structures

Description

This extension enables support for a new class of group operations on subgroups via the `GL_NV_shader_subgroup_partitioned` GLSL extension and `SPV_NV_shader_subgroup_partitioned` SPIR-V extension. Support for these new operations is advertised via the `VK_SUBGROUP_FEATURE_PARTITIONED_BIT_NV` bit.

This extension requires Vulkan 1.1, for general subgroup support.

Description

This extension allows applications to use a variable shading rate when processing fragments of rasterized primitives. By default, Vulkan will spawn one fragment shader for each pixel covered by a primitive. In this extension, applications can bind a *shading rate image* that can be used to vary the number of fragment shader invocations across the framebuffer. Some portions of the screen may be configured to spawn up to 16 fragment shaders for each pixel, while other portions may use a single fragment shader invocation for a 4x4 block of pixels. This can be useful for use cases like eye tracking, where the portion of the framebuffer that the user is looking at directly can be processed at high frequency, while distant corners of the image can be processed at lower frequency. Each texel in the shading rate image represents a fixed-size rectangle in the framebuffer, covering 16x16 pixels in the initial implementation of this extension. When rasterizing a primitive covering one of these rectangles, the Vulkan implementation reads a texel in the bound shading rate image and looks up the fetched value in a palette to determine a base shading rate.

In addition to the API support controlling rasterization, this extension also adds Vulkan support for the [SPV_NV_shading_rate](#) extension to SPIR-V. That extension provides two fragment shader variable decorations that allow fragment shaders to determine the shading rate used for processing the fragment:

- [FragmentSizeNV](#), which indicates the width and height of the set of pixels processed by the fragment shader.
- [InvocationsPerPixel](#), which indicates the maximum number of fragment shader invocations that could be spawned for the pixel(s) covered by the fragment.

When using SPIR-V in conjunction with the OpenGL Shading Language (GLSL), the fragment shader capabilities are provided by the [GL_NV_shading_rate_image](#) language extension and correspond to the built-in variables [gl_FragmentSizeNV](#) and [gl_InvocationsPerPixelNV](#), respectively.

Issues

(1) When using shading rates specifying “coarse” fragments covering multiple pixels, we will generate a combined coverage mask that combines the coverage masks of all pixels covered by the fragment. By default, these masks are combined in an implementation-dependent order. Should we provide a mechanism allowing applications to query or specify an exact order?

RESOLVED: Yes, this feature is useful for cases where most of the fragment shader can be evaluated once for an entire coarse fragment, but where some per-pixel computations are also required. For example, a per-pixel alpha test may want to kill all the samples for some pixels in a coarse fragment. This sort of test can be implemented using an output sample mask, but such a shader would need to know which bit in the mask corresponds to each sample in the coarse

fragment. We are including a mechanism to allow applications to specify the orders of coverage samples for each shading rate and sample count, either as static pipeline state or dynamically via a command buffer. This portion of the extension has its own feature bit.

We will not be providing a query to determine the implementation-dependent default ordering. The thinking here is that if an application cares enough about the coarse fragment sample ordering to perform such a query, it could instead just set its own order, also using custom per-pixel sample locations if required.

(2) For the pipeline stage `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`, should we specify a precise location in the pipeline the shading rate image is accessed (after geometry shading, but before the early fragment tests) or leave it under-specified in case there are other implementations that access the image in a different pipeline location?

RESOLVED We are specifying the pipeline stage to be between the final [pre-rasterization shader stage](#) (`VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`) and before the first stage used for fragment processing (`VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`), which seems to be the natural place to access the shading rate image.

(3) How do centroid-sampled variables work with fragments larger than one pixel?

RESOLVED For single-pixel fragments, fragment shader inputs decorated with `Centroid` are sampled at an implementation-dependent location in the intersection of the area of the primitive being rasterized and the area of the pixel that corresponds to the fragment. With multi-pixel fragments, we follow a similar pattern, using the intersection of the primitive and the `set` of pixels corresponding to the fragment.

One important thing to keep in mind when using such “coarse” shading rates is that fragment attributes are sampled at the center of the fragment by default, regardless of the set of pixels/samples covered by the fragment. For fragments with a size of 4x4 pixels, this center location will be more than two pixels ($1.5 * \sqrt{2}$) away from the center of the pixels at the corners of the fragment. When rendering a primitive that covers only a small part of a coarse fragment, sampling a color outside the primitive can produce overly bright or dark color values if the color values have a large gradient. To deal with this, an application can use centroid sampling on attributes where “extrapolation” artifacts can lead to overly bright or dark pixels. Note that this same problem also exists for multisampling with single-pixel fragments, but is less severe because it only affects certain samples of a pixel and such bright/dark samples may be averaged with other samples that do not have a similar problem.

- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_NV_viewport_array2`

which allows a single primitive to be broadcast to multiple viewports and/or multiple layers. A new shader built-in output `ViewportMaskNV` is provided, which allows a single primitive to be output to multiple viewports simultaneously. Also, a new SPIR-V decoration is added to control whether the effective viewport index is added into the variable decorated with the `Layer` built-in decoration. These capabilities allow a single primitive to be output to multiple layers simultaneously.

This extension allows variables decorated with the `Layer` and `ViewportIndex` built-ins to be exported from vertex or tessellation shaders, using the `ShaderViewportIndexLayerNV` capability.

This extension adds a new `ViewportMaskNV` built-in decoration that is available for output variables in vertex, tessellation evaluation, and geometry shaders, and a new `ViewportRelativeNV` decoration that can be added on variables decorated with `Layer` when using the `ShaderViewportMaskNV` capability.

When using GLSL source-based shading languages, the `gl_ViewportMask[]` built-in output variable and `viewport_relative` layout qualifier from `GL_NV_viewport_array2` map to the `ViewportMaskNV` and `ViewportRelativeNV` decorations, respectively. Behaviour is described in the `GL_NV_viewport_array2` extension specification.

Note

The `ShaderViewportIndexLayerNV` capability is equivalent to the `ShaderViewportIndexLayerEXT` capability added by `VK_EXT_shader_viewport_index_layer`.

Interactions and External Dependencies

- This extension requires `multiViewport` and `geometryShader` features to be useful.

Contributors

- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension provides a new per-viewport swizzle that can modify the position of primitives sent to each viewport. New viewport swizzle state is added for each viewport, and a new position vector is computed for each vertex by selecting from and optionally negating any of the four components of the original position vector.

This new viewport swizzle is useful for a number of algorithms, including single-pass cube map rendering (broadcasting a primitive to multiple faces and reorienting the vertex position for each face) and voxel rasterization. The per-viewport component remapping and negation provided by the swizzle allows application code to re-orient three-dimensional geometry with a view along any of the X, Y, or Z axes. If a perspective projection and depth buffering is required, 1/W buffering should be used, as described in the single-pass cube map rendering example in the “Issues” section below.

Issues

1) Where does viewport swizzling occur in the pipeline?

RESOLVED: Despite being associated with the viewport, viewport swizzling must happen prior to the viewport transform. In particular, it needs to be performed before clipping and perspective division.

The viewport mask expansion ([VK_NV_viewport_array2](#)) and the viewport swizzle could potentially be performed before or after transform feedback, but feeding back several viewports worth of primitives with different swizzles does not seem particularly useful. This specification applies the viewport mask and swizzle after transform feedback, and makes primitive queries only count each primitive once.

2) Any interesting examples of how this extension, [VK_NV_viewport_array2](#), and [VK_NV_geometry_shader_passthrough](#) can be used together in practice?

RESOLVED: One interesting use case for this extension is for single-pass rendering to a cube map. In this example, the application would attach a cube map texture to a layered FBO where the six cube faces are treated as layers. Vertices are sent through the vertex shader without applying a projection matrix, where the [gl_Position](#) output is (x,y,z,1) and the center of the cube map is at (0,0,0). With unextended Vulkan, one could have a conventional instanced geometry shader that looks something like the following:

```

layout(invocations = 6) in;      // separate invocation per face
layout(triangles) in;
layout(triangle_strip) out;
layout(max_vertices = 3) out;

in Inputs {
vec2 texcoord;
vec3 normal;
vec4 baseColor;
} v[];

out Outputs {
vec2 texcoord;
vec3 normal;
vec4 baseColor;
};

void main()
{
int face = gl_InvocationID; // which face am I?

// Project gl_Position for each vertex onto the cube map face.
vec4 positions[3];
for (int i = 0; i < 3; i++) {
    positions[i] = rotate(gl_in[i].gl_Position, face);
}

// If the primitive does not project onto this face, we are done.
if (shouldCull(positions)) {
    return;
}

// Otherwise, emit a copy of the input primitive to the
// appropriate face (using gl_Layer).
for (int i = 0; i < 3; i++) {
    gl_Layer = face;
    gl_Position = positions[i];
    texcoord = v[i].texcoord;
    normal = v[i].normal;
    baseColor = v[i].baseColor;
    EmitVertex();
}
}

```

With passthrough geometry shaders, this can be done using a much simpler shader:

```

layout(triangles) in;
layout(passthrough) in Inputs {
    vec2 texcoord;
    vec3 normal;
    vec4 baseColor;
}
layout(passthrough) in gl_PerVertex {
    vec4 gl_Position;
} gl_in[];
layout(viewport_relative) out int gl_Layer;

void main()
{
    // Figure out which faces the primitive projects onto and
    // generate a corresponding viewport mask.
    uint mask = 0;
    for (int i = 0; i < 6; i++) {
        if (!shouldCull(face)) {
            mask |= 1U << i;
        }
    }
    gl_ViewportMask = mask;
    gl_Layer = 0;
}

```

The application code is set up so that each of the six cube faces has a separate viewport (numbered 0 to 5). Each face also has a separate swizzle, programmed via the `VkPipelineViewportSwizzleStateCreateInfoNV` pipeline state. The viewport swizzle feature performs the coordinate transformation handled by the `rotate()` function in the original shader. The `viewport_relative` layout qualifier says that the viewport number (0 to 5) is added to the base `gl_Layer` value of 0 to determine which layer (cube face) the primitive should be sent to.

Note that the use of the passed through input `normal` in this example suggests that the fragment shader in this example would perform an operation like per-fragment lighting. The viewport swizzle would transform the position to be face-relative, but `normal` would remain in the original coordinate system. It seems likely that the fragment shader in either version of the example would want to perform lighting in the original coordinate system. It would likely do this by reconstructing the position of the fragment in the original coordinate system using `gl_FragCoord`, a constant or uniform holding the size of the cube face, and the input `gl_ViewportIndex` (or `gl_Layer`), which identifies the cube face. Since the value of `normal` is in the original coordinate system, it would not need to be modified as part of this coordinate transformation.

Note that while the `rotate()` operation in the regular geometry shader above could include an arbitrary post-rotation projection matrix, the viewport swizzle does not support arbitrary math. To get proper projection, 1/W buffering should be used. To do this:

1. Program the viewport swizzles to move the pre-projection W eye coordinate (typically 1.0) into the Z coordinate of the swizzle output and the eye coordinate component used for depth into the W coordinate. For example, the viewport corresponding to the +Z face might use a swizzle of

(+X, -Y, +W, +Z). The Z normalized device coordinate computed after swizzling would then be $z'/w' = 1/Z_{\text{eye}}$.

2. On NVIDIA implementations supporting floating-point depth buffers with values outside [0,1], prevent unwanted near plane clipping by enabling `depthClampEnable`. Ensure that the depth clamp does not mess up depth testing by programming the depth range to very large values, such as `minDepthBounds=-z`, `maxDepthBounds=+z`, where $z = 2^{127}$. It should be possible to use IEEE infinity encodings also (`0xFF800000` for `-INF`, `0x7F800000` for `+INF`). Even when near/far clipping is disabled, primitives extending behind the eye will still be clipped because one or more vertices will have a negative W coordinate and fail X/Y clipping tests.

On other implementations, scale X, Y, and Z eye coordinates so that vertices on the near plane have a post-swizzle W coordinate of 1.0. For example, if the near plane is at $Z_{\text{eye}} = 1/256$, scale X, Y, and Z by 256.

3. Adjust depth testing to reflect the fact that $1/W$ values are large near the eye and small away from the eye. Clear the depth buffer to zero (infinitely far away) and use a depth test of `VK_COMPARE_OP_GREATER` instead of `VK_COMPARE_OP_LESS`.

```
// Provided by VK_NVX_binary_import
VkResult vkCreateCuModuleNVX(
    VkDevice                                     device,
    const VkCuModuleCreateInfoNVX* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkCuModuleNVX* pModule);
```

Valid Usage (Implicit)

- VUID-vkCreateCuModuleNVX-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateCuModuleNVX-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkCuModuleCreateInfoNVX](#) structure
- VUID-vkCreateCuModuleNVX-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateCuModuleNVX-pModule-parameter
pModule **must** be a valid pointer to a [VkCuModuleNVX](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_INITIALIZATION_FAILED](#)

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_NVX_binary_import
typedef struct VkCuModuleCreateInfoNVX {
    VkStructureType    sType;
    const void*        pNext;
    size_t              dataSize;
    const void*        pData;
} VkCuModuleCreateInfoNVX;
```

Valid Usage (Implicit)

- VUID-VkCuModuleCreateInfoNVX-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_CU_MODULE_CREATE_INFO_NVX`
- VUID-VkCuModuleCreateInfoNVX-pNext-pNext
pNext **must** be `NULL`
- VUID-VkCuModuleCreateInfoNVX-pData-parameter
pData **must** be a valid pointer to an array of **dataSize** bytes
- VUID-VkCuModuleCreateInfoNVX-dataSize-arraylength
dataSize **must** be greater than `0`

There is currently no specification language written for this command. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_NVX_binary_import
void vkDestroyCuModuleNVX(  
    VkDevice device,  
    VkCuModuleNVX module,  
    const VkAllocationCallbacks* pAllocator);
```

Valid Usage (Implicit)

- VUID-vkDestroyCuModuleNVX-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkDestroyCuModuleNVX-module-parameter
module **must** be a valid `VkCuModuleNVX` handle
- VUID-vkDestroyCuModuleNVX-pAllocator-parameter
If **pAllocator** is not `NULL`, **pAllocator** **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyCuModuleNVX-module-parent
module **must** have been created, allocated, or retrieved from **device**

There is currently no specification language written for this command. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_NVX_binary_import
void vkCmdCuLaunchKernelNVX(  
    VkCommandBuffer commandBuffer,  
    const VkCuLaunchInfoNVX* pLaunchInfo);
```

Valid Usage (Implicit)

- VUID-vkCmdCuLaunchKernelNVX-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdCuLaunchKernelNVX-pLaunchInfo-parameter
pLaunchInfo **must** be a valid pointer to a valid [VkCuLaunchInfoNVX](#) structure
- VUID-vkCmdCuLaunchKernelNVX-commandBuffer-recording
commandBuffer **must** be in the [recording](#) state
- VUID-vkCmdCuLaunchKernelNVX-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support graphics, or compute operations

Host Synchronization

- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Both	Graphics Compute

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

Interactions and External Dependencies

- This extension requires `SPV_NVX_multiview_per_view_attributes`
- This extension provides API support for `GL_NVX_multiview_per_view_attributes`
- This extension interacts with `VK_NV_viewport_array2`.

Contributors

- Jeff Bolz, NVIDIA
- Daniel Koch, NVIDIA

Description

This extension adds a new way to write shaders to be used with multiview subpasses, where the attributes for all views are written out by a single invocation of the [pre-rasterization shader stages](#). Related SPIR-V and GLSL extensions [SPV_NVX_multiview_per_view_attributes](#) and [GL_NVX_multiview_per_view_attributes](#) introduce per-view position and viewport mask attributes arrays, and this extension defines how those per-view attribute arrays are interpreted by Vulkan. Pipelines using per-view attributes **may** only execute the [pre-rasterization shader stages](#) once for all views rather than once per-view, which reduces redundant shading work.

A subpass creation flag controls whether the subpass uses this extension. A subpass **must** either exclusively use this extension or not use it at all.

Some Vulkan implementations only support the position attribute varying between views in the X component. A subpass can declare via a second creation flag whether all pipelines compiled for this subpass will obey this restriction.

Shaders that use the new per-view outputs (e.g. [gl_PositionPerViewNV](#)) **must** also write the non-per-view output ([gl_Position](#)), and the values written **must** be such that [gl_Position = gl_PositionPerViewNV\[gl_ViewIndex\]](#) for all views in the subpass. Implementations are free to either use the per-view outputs or the non-per-view outputs, whichever would be more efficient.

If [VK_NV_viewport_array2](#) is not also supported and enabled, the per-view viewport mask **must** not be used.

Description

This extension allows a shader resolve to replace fixed-function resolve.

Fixed-function resolve is limited in function to simple filters of multisample buffers to a single sample buffer.

Fixed-function resolve is more performance efficient and/or power efficient than shader resolve for such simple filters.

Shader resolve allows a shader writer to create complex, non-linear filtering of a multisample buffer in the last subpass of a subpass dependency chain.

This extension also provides a bit which **can** be used to enlarge a sample region dependency to a fragment region dependency, so that a framebuffer-region dependency **can** replace a framebuffer-global dependency in some cases.

New Enum Constants

- `VK_QCOM_RENDER_PASS_SHADER_RESOLVE_EXTENSION_NAME`
- `VK_QCOM_RENDER_PASS_SHADER_RESOLVE_SPEC_VERSION`
- Extending `VkSubpassDescriptionFlagBits`:
 - `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`
 - `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`

Issues

1) Should this extension be named `render_pass_shader_resolve`?

RESOLVED Yes.

This is part of suite of small extensions to render pass.

Following the style guide, instead of following `VK_KHR_create_renderpass2`.

2) Should the `VK_SAMPLE_COUNT_1_BIT` be required for each `pColorAttachment` and the `DepthStencilAttachment`?

RESOLVED No.

While this may not be a common use case, and while most fixed-function resolve hardware has this limitation, there is little reason to require a shader resolve to resolve to a single sample buffer.

3) Should a shader resolve subpass be the last subpass in a render pass?

RESOLVED Yes.

To be more specific, it should be the last subpass in a subpass dependency chain.

4) Do we need the `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM` bit?

RESOLVED Yes.

This applies when an input attachment's sample count is equal to `rasterizationSamples`. Further, if `sampleShading` is enabled (explicitly or implicitly) then `minSampleShading` **must** equal 0.0.

However, this bit may be set on any subpass, it is not restricted to a shader resolve subpass.

Description

Renderpass attachments **can** be read-only for the duration of a render pass.

Examples include input attachments and depth attachments where depth tests are enabled but depth writes are not enabled.

In such cases, there **can** be no contents generated for an attachment within the render area.

This extension adds a new `VkAttachmentStoreOp VK_ATTACHMENT_STORE_OP_NONE_QCOM` specifying that the contents within the render area **may** not be written to memory, but that the prior contents of the attachment in memory are preserved. However, if any contents were generated within the render area during rendering, the contents of the attachment will be undefined inside the render area.

Note

The `VkAttachmentStoreOp VK_ATTACHMENT_STORE_OP_STORE` **may** force an implementation to assume that the attachment was written and force an implementation to flush data to memory or to a higher level cache. The `VkAttachmentStoreOp VK_ATTACHMENT_STORE_OP_NONE_QCOM` **may** allow an implementation to assume that the attachment was not written and allow an implementation to avoid such a flush..

New Enum Constants

- `VK_QCOM_RENDER_PASS_STORE_OPS_EXTENSION_NAME`
- `VK_QCOM_RENDER_PASS_STORE_OPS_SPEC_VERSION`
- Extending `VkAttachmentStoreOp`:
 - `VK_ATTACHMENT_STORE_OP_NONE_QCOM`

- Matthew Netsch, Qualcomm Technologies, Inc.

Description

This extension provides a mechanism for applications to enable driver support for [render pass transform](#).

Mobile devices can be rotated and mobile applications need to render properly when a device is held in a landscape or portrait orientation. When the current orientation differs from the device's native orientation, a rotation is required so that the "up" direction of the rendered scene matches the current orientation.

If the Display Processing Unit (DPU) doesn't natively support rotation, the Vulkan presentation engine can handle this rotation in a separate composition pass. Alternatively, the application can render frames "pre-rotated" to avoid this extra pass. The latter is preferred to reduce power consumption and achieve the best performance because it avoids tasking the GPU with extra work to perform the copy/rotate operation.

Unlike OpenGL ES, the burden of pre-rotation in Vulkan falls on the application. To implement pre-

rotation, applications render into swapchain images matching the device native aspect ratio of the display and “pre-rotate” the rendering content to match the device’s current orientation. The burden is more than adjusting the Model View Projection (MVP) matrix in the vertex shader to account for rotation and aspect ratio. The coordinate systems of scissors, viewports, derivatives and several shader built-ins may need to be adapted to produce the correct result.

It is difficult for some game engines to manage this burden; many chose to simply accept the performance/power overhead of performing rotation in the presentation engine.

This extension allows applications to achieve the performance benefits of pre-rotated rendering by moving much of the above-mentioned burden to the graphics driver. The following is unchanged with this extension:

- Applications create a swapchain matching the native orientation of the display. Applications must also set the `VkSwapchainCreateInfoKHR::preTransform` equal to the `currentTransform` as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

The following is changed with this extension:

- At `vkCmdBeginRenderPass`, the application provides extension struct `VkRenderPassTransformBeginInfoQCOM` specifying the render pass transform parameters.
- At `vkBeginCommandBuffer` for secondary command buffers, the application provides extension struct `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` specifying the render pass transform parameters.
- The `renderArea`, viewports, scissors, and `fragmentSize` are all provided in the current (non-rotated) coordinate system. The implementation will transform those into the native (rotated) coordinate system.
- The implementation is responsible for transforming shader built-ins (`FragCoord`, `PointCoord`, `SamplePosition`, `PrimitiveShadingRateKHR`, `interpolateAt()`, `dFdx`, `dFdy`, `fWidth`) into the rotated coordinate system.
- The implementation is responsible for transforming `position` to the rotated coordinate system.

New Structures

- Extending `VkCommandBufferInheritanceInfo`:
 - `VkCommandBufferInheritanceRenderPassTransformInfoQCOM`
- Extending `VkRenderPassBeginInfo`:
 - `VkRenderPassTransformBeginInfoQCOM`

New Enum Constants

- `VK_QCOM_RENDER_PASS_TRANSFORM_EXTENSION_NAME`
- `VK_QCOM_RENDER_PASS_TRANSFORM_SPEC_VERSION`
- Extending `VkRenderPassCreateFlagBits`:
 - `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM`

- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM`
 - `VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM`

Issues

1) Some early Adreno drivers (October 2019 through March 2020) advertised support for this extension but expected VK_STRUCTURE_TYPE values different from those in the vulkan headers. To cover all Adreno devices on the market, applications need to detect the driver version and use the appropriate VK_STRUCTURE_TYPE values from the table below.

The driver version reported in `VkPhysicalDeviceProperties.driverVersion` is a `uint32_t` type. You can decode the `uint32_t` value into a major.minor.patch version as shown below:

```
uint32_t major = ((driverVersion) >> 22);
uint32_t minor = ((driverVersion) >> 12) & 0x3ff;
uint32_t patch = ((driverVersion) & 0xffff);
```

If the Adreno major.minor.patch version is greater than or equal to 512.469.0, then simply use the VK_STRUCTURE_TYPE values as defined in `vulkan_core.h`. If the version is less than or equal to 512.468.0, then use the alternate values for the two VK_STRUCTURE_TYPES in the table below.

Table 92. Adreno Driver Requirements

Adreno Driver Version		
	512.468.0 and earlier	512.469.0 and later
<code>VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM</code>	1000282000	1000282001
<code>VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM</code>	1000282001	1000282000

2) Should the extension support only rotations (e.g. 90, 180, 270-degrees), or also mirror transforms (e.g. vertical flips)? Mobile use-cases only require rotation. Other display systems such as projectors might require a flipped transform.

RESOLVED: In this version of the extension, the functionality is restricted to 90, 180, and 270-degree rotations to address mobile use-cases.

3) How does this extension interact with `VK_EXT_fragment_density_map`?

RESOLVED Some implementations may not be able to support a render pass that enables both render pass transform and fragment density maps. For simplicity, this extension disallows enabling both features within a single render pass.

4) What should this extension be named?

We considered names such as “rotated_rendering”, “pre_rotation” and others. Since the functionality is limited to a render pass, it seemed the name should include “render_pass”. While the current extension is limited to rotations, it could be extended to other transforms (like mirror) in the future.

RESOLVED The name “render_pass_transform” seems like the most accurate description of the introduced functionality.

5) How does this extension interact with VK_KHR_fragment_shading_rate?

RESOLVED: For the same reasons as issue 3, this extension disallows enabling both `pFragmentShadingRateAttachment` and render pass transform within a single render pass.

However, pipeline shading rate and primitive shading rate are supported, and their respective `fragmentSize` and `PrimitiveShadingRateKHR` are provided in the current (non-rotated) coordinate system. The implementation is responsible for transforming them to the rotated coordinate system.

The [set of supported shading rates](#) **may** be different per transform. Supported rates queried from `vkGetPhysicalDeviceFragmentShadingRatesKHR` are in the native (rotated) coordinate system. This means that the application **must** swap the x/y of the reported rates to get the set of rates supported for 90 and 270 degree rotation.

Description

This extension adds an optional rotation transform to copy commands `vkCmdBlitImage2KHR`, `vkCmdCopyImageToBuffer2KHR` and `vkCmdCopyBufferToImage2KHR`. When copying between two resources, where one resource contains rotated content and the other does not, a rotated copy may be desired. This extension may be used in combination with `VK_QCOM_render_pass_transform` which adds rotated render passes.

This extension adds an extension structure to the following commands: `vkCmdBlitImage2KHR`, `vkCmdCopyImageToBuffer2KHR` and `vkCmdCopyBufferToImage2KHR`

Issues

1) What is an appropriate name for the added extension structure? The style guide says “Structures which extend other structures through the `pNext` chain should reflect the name of the base structure they extend.”, but in this case a single extension structure is used to extend three base structures (`vkCmdBlitImage2KHR`, `vkCmdCopyImageToBuffer2KHR` and `vkCmdCopyBufferToImage2KHR`). Creating three identical structures with unique names seemed undesirable.

RESOLVED: Deviate from the style guide for extension structure naming.

2) Should this extension add a rotation capability to `vkCmdCopyImage2KHR`?

RESOLVED: No. Use of rotated `vkCmdBlitImage2KHR` can fully address this use-case.

3) Should this extension add a rotation capability to `vkCmdResolveImage2KHR`?

RESOLVED No. Use of `vkCmdResolveImage2KHR` is very slow and extremely bandwidth intensive on Qualcomm’s GPU architecture and use of `pResolveAttachments` in `vkRenderPass` is the strongly preferred approach. Therefore, we choose not to introduce a rotation capability to `vkCmdResolveImage2KHR`.

Description

The `VK_QNX_screen_surface` extension is an instance extension. It provides a mechanism to create a `VkSurfaceKHR` object (defined by the `VK_KHR_surface` extension) that refers to a QNX Screen `window`, as well as a query to determine support for rendering to a QNX Screen compositor.

New Commands

- `vkCreateScreenSurfaceQNX`
- `vkGetPhysicalDeviceScreenPresentationSupportQNX`

New Structures

- `VkScreenSurfaceCreateInfoQNX`

New Bitmasks

- `VkScreenSurfaceCreateFlagsQNX`

New Enum Constants

- `VK_QNX_SCREEN_SURFACE_EXTENSION_NAME`
- `VK_QNX_SCREEN_SURFACE_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_SCREEN_SURFACE_CREATE_INFO_QNX`

Version History

- Revision 1, 2021-01-11 (Mike Gorchak)
 - Initial draft.

Description

This extension allows applications to directly query a host pointer for a [VkDescriptorSet](#) which **can** be used to copy descriptors between descriptor sets without the use of an API command. Memory offsets and sizes for descriptors **can** be queried from a [VkDescriptorSetLayout](#) as well.

Note

There is currently no specification language written for this extension. The links to APIs defined by the extension are to stubs that only include generated content such as API declarations and implicit valid usage statements.

Note

This extension is only intended for use in specific embedded environments with known implementation details, and is therefore undocumented.

New Commands

 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_SET_HOST_MAPPING_FEATURES_VALVE](#)

Stub API References

There is currently no specification language written for this command. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_VALVE_descriptor_set_host_mapping
void vkGetDescriptorSetLayoutHostMappingInfoVALVE(
    VkDevice device,
    const VkDescriptorSetBindingReferenceVALVE* pBindingReference,
    VkDescriptorSetLayoutHostMappingInfoVALVE* pHostMapping);
```

Valid Usage (Implicit)

- VUID-vkGetDescriptorSetLayoutHostMappingInfoVALVE-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetDescriptorSetLayoutHostMappingInfoVALVE-pBindingReference-parameter
pBindingReference **must** be a valid pointer to a [VkDescriptorSetBindingReferenceVALVE](#) structure
- VUID-vkGetDescriptorSetLayoutHostMappingInfoVALVE-pHostMapping-parameter
pHostMapping **must** be a valid pointer to a [VkDescriptorSetLayoutHostMappingInfoVALVE](#) structure

There is currently no specification language written for this command. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_VALVE_descriptor_set_host_mapping
void vkGetDescriptorSetHostMappingVALVE(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    void** ppData);
```

Valid Usage (Implicit)

- VUID-vkGetDescriptorSetHostMappingVALVE-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkGetDescriptorSetHostMappingVALVE-descriptorSet-parameter
descriptorSet **must** be a valid **VkDescriptorSet** handle
- VUID-vkGetDescriptorSetHostMappingVALVE-ppData-parameter
ppData **must** be a valid pointer to a pointer value

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_VALVE_descriptor_set_host_mapping
typedef struct VkPhysicalDeviceDescriptorSetHostMappingFeaturesVALVE {
    VkStructureType sType;
    void* pNext;
    VkBool32 descriptorSetHostMapping;
} VkPhysicalDeviceDescriptorSetHostMappingFeaturesVALVE;
```

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDescriptorSetHostMappingFeaturesVALVE-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_SET_HOST_MAPPING_FEATURES_VALVE**

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_VALVE_descriptor_set_host_mapping
typedef struct VkDescriptorSetBindingReferenceVALVE {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSetLayout descriptorsetLayout;
    uint32_t binding;
} VkDescriptorSetBindingReferenceVALVE;
```

Valid Usage (Implicit)

- VUID-VkDescriptorSetBindingReferenceVALVE-sType-sType
sType must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_BINDING_REFERENCE_VALVE`
- VUID-VkDescriptorSetBindingReferenceVALVE-pNext-pNext
pNext must be `NULL`
- VUID-VkDescriptorSetBindingReferenceVALVE-descriptorsetLayout-parameter
descriptorsetLayout must be a valid `VkDescriptorSetLayout` handle

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_VALVE_descriptor_set_host_mapping
typedef struct VkDescriptorSetLayoutHostMappingInfoVALVE {
    VkStructureType      sType;
    void*               pNext;
    size_t              descriptorOffset;
    uint32_t            descriptorSize;
} VkDescriptorSetLayoutHostMappingInfoVALVE;
```

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutHostMappingInfoVALVE-sType-sType
sType must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_HOST_MAPPING_INFO_VALVE`
- VUID-VkDescriptorSetLayoutHostMappingInfoVALVE-pNext-pNext
pNext must be `NULL`

Description

This extension allows applications to reduce descriptor memory footprint by allowing a descriptor to be able to mutate to a given list of descriptor types depending on which descriptor types are written into, or copied into a descriptor set.

The main use case this extension intends to address is descriptor indexing with [VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT](#) where the descriptor types are completely generic, as this means applications can allocate one large descriptor set, rather than having one large descriptor set per descriptor type, which significantly bloats descriptor memory usage and causes performance issues.

This extension also adds a mechanism to declare that a descriptor pool, and therefore the descriptor sets that are allocated from it, reside only in host memory; as such these descriptors can only be updated/copied, but not bound.

These features together allow much more efficient emulation of the raw D3D12 binding model. This extension is primarily intended to be useful for API layering efforts.

Description

The `VK_KHR_portability_subset` extension allows a non-conformant Vulkan implementation to be built on top of another non-Vulkan graphics API, and identifies differences between that

implementation and a fully-conformant native Vulkan implementation.

This extension provides Vulkan implementations with the ability to mark otherwise-required capabilities as unsupported, or to establish additional properties and limits that the application should adhere to in order to guarantee portable behaviour and operation across platforms, including platforms where Vulkan is not natively supported.

The goal of this specification is to document, and make queryable, capabilities which are required to be supported by a fully-conformant Vulkan 1.0 implementation, but may be optional for an implementation of the Vulkan 1.0 Portability Subset.

The intent is that this extension will be advertised only on implementations of the Vulkan 1.0 Portability Subset, and not on conformant implementations of Vulkan 1.0. Fully-conformant Vulkan implementations provide all the required capabilities, and so will not provide this extension. Therefore, the existence of this extension can be used to determine that an implementation is likely not fully conformant with the Vulkan spec.

If this extension is supported by the Vulkan implementation, the application must enable this extension.

This extension defines several new structures that can be chained to the existing structures used by certain standard Vulkan calls, in order to query for non-conformant portable behavior.

Description

The `VK_KHR_16bit_storage` extension allows use of 16-bit types in shader input and output interfaces, and push constant blocks. This extension introduces several new optional features which map to SPIR-V capabilities and allow access to 16-bit data in `Block`-decorated objects in the `Uniform` and the `StorageBuffer` storage classes, and objects in the `PushConstant` storage class. This extension allows 16-bit variables to be declared and used as user-defined shader inputs and outputs but does not change location assignment and component assignment rules.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. However, if Vulkan 1.1 is supported and this extension is not, the `storageBuffer16BitAccess` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDevice16BitStorageFeaturesKHR`

New Enum Constants

- `VK_KHR_16BIT_STORAGE_EXTENSION_NAME`
- `VK_KHR_16BIT_STORAGE_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES_KHR`

New SPIR-V Capabilities

- `StorageBuffer16BitAccess`
- `UniformAndStorageBuffer16BitAccess`
- `StoragePushConstant16`
- `StorageInputOutput16`

Version History

- Revision 1, 2017-03-23 (Alexander Galazin)
 - Initial draft

Description

The `VK_KHR_8bit_storage` extension allows use of 8-bit types in uniform and storage buffers, and push constant blocks. This extension introduces several new optional features which map to SPIR-V capabilities and allow access to 8-bit data in `Block`-decorated objects in the `Uniform` and the `StorageBuffer` storage classes, and objects in the `PushConstant` storage class.

The `StorageBuffer8BitAccess` capability **must** be supported by all implementations of this extension. The other capabilities are optional.

Promotion to Vulkan 1.2

Functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `StorageBuffer8BitAccess` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDevice8BitStorageFeaturesKHR`

New Enum Constants

- `VK_KHR_8BIT_STORAGE_EXTENSION_NAME`
- `VK_KHR_8BIT_STORAGE_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_8BIT_STORAGE_FEATURES_KHR`

New SPIR-V Capabilities

- `StorageBuffer8BitAccess`
- `UniformAndStorageBuffer8BitAccess`
- `StoragePushConstant8`

Version History

Description

This extension provides versions of [vkBindBufferMemory](#) and [vkBindImageMemory](#) that allow multiple bindings to be performed at once, and are extensible.

This extension also introduces [VK_IMAGE_CREATE_ALIAS_BIT_KHR](#), which allows “identical” images that alias the same memory to interpret the contents consistently, even across image layout changes.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Commands

- [vkBindBufferMemory2KHR](#)
- [vkBindImageMemory2KHR](#)

New Structures

- [VkBindBufferMemoryInfoKHR](#)
- [VkBindImageMemoryInfoKHR](#)

New Enum Constants

- `VK_KHR_BIND_MEMORY_2_EXTENSION_NAME`
- `VK_KHR_BIND_MEMORY_2_SPEC_VERSION`
- Extending `VkImageCreateFlagBits`:
 - `VK_IMAGE_CREATE_ALIAS_BIT_KHR`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO_KHR`
 - `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO_KHR`

Version History

- Revision 1, 2017-05-19 (Tobias Hector)
 - Pulled bind memory functions into their own extension

- Tobias Hector, AMD
- Jason Ekstrand, Intel
- Baldur Karlsson, Valve
- Jan-Harald Fredriksen, Arm

Description

This extension allows the application to query a 64-bit buffer device address value for a buffer, which can be used to access the buffer memory via the `PhysicalStorageBuffer` storage class in the `GL_EXT_buffer_reference` GLSL extension and `SPV_KHR_physical_storage_buffer` SPIR-V extension.

Another way to describe this extension is that it adds “pointers to buffer memory in shaders”. By calling `vkGetBufferDeviceAddress` with a `VkBuffer`, it will return a `VkDeviceAddress` value which represents the address of the start of the buffer.

`vkGetBufferOpaqueCaptureAddress` and `vkGetDeviceMemoryOpaqueCaptureAddress` allow opaque addresses for buffers and memory objects to be queried for the current process. A trace capture and replay tool can then supply these addresses to be used at replay time to match the addresses used when the trace was captured. To enable tools to insert these queries, new memory allocation flags must be specified for memory objects that will be bound to buffers accessed via the `PhysicalStorageBuffer` storage class. Note that this mechanism is intended only to support capture/replay tools, and is not recommended for use in other applications.

There are various use cases this extension is designed for. It is required for ray tracing, useful for DX12 portability, and by allowing buffer addresses to be stored in memory it enables more complex data structures to be created.

This extension can also be used to hardcode a dedicated debug channel into all shaders by querying a pointer at startup and pushing that into shaders as a run-time constant (e.g. specialization constant) that avoids impacting other descriptor limits.

There are examples of usage in the `GL_EXT_buffer_reference` spec for how to use this in a high-level shading language such as GLSL. The `GL_EXT_buffer_reference2` and `GL_EXT_buffer_reference_uvec2` extensions were also added to help cover a few additional edge cases.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the [bufferDeviceAddress](#) feature is optional. The original type, enum and command names are still available as aliases of the core functionality.

Promotion to Vulkan 1.3

Support for the [bufferDeviceAddress](#) feature is mandatory in Vulkan 1.3, regardless of whether this extension is supported.

Description

This extension provides extensible versions of the Vulkan buffer and image copy commands. The new commands are functionally identical to the core commands, except that their copy parameters are specified using extensible structures that can be used to pass extension-specific information.

The following extensible copy commands are introduced with this extension: [vkCmdCopyBuffer2KHR](#), [vkCmdCopyImage2KHR](#), [vkCmdCopyBufferToImage2KHR](#), [vkCmdCopyImageToBuffer2KHR](#), [vkCmdBlitImage2KHR](#), and [vkCmdResolveImage2KHR](#). Each command contains an `*Info2KHR` structure parameter that includes `sType/pNext` members. Lower level structures describing each region to be copied are also extended with `sType/pNext` members.

New Commands

- [vkCmdBlitImage2KHR](#)
- [vkCmdCopyBuffer2KHR](#)
- [vkCmdCopyBufferToImage2KHR](#)
- [vkCmdCopyImage2KHR](#)
- [vkCmdCopyImageToBuffer2KHR](#)

Description

This extension provides a new entry point to create render passes in a way that can be easily extended by other extensions through the substructures of render pass creation. The Vulkan 1.0 render pass creation sub-structures do not include `sType`/`pNext` members. Additionally, the render pass begin/next/end commands have been augmented with new extensible structures for passing additional subpass information.

The `VkRenderPassMultiviewCreateInfo` and `VkInputAttachmentAspectReference` structures that extended the original `VkRenderPassCreateInfo` are not accepted into the new creation functions, and instead their parameters are folded into this extension as follows:

- Elements of `VkRenderPassMultiviewCreateInfo::pViewMasks` are now specified in `VkSubpassDescription2KHR::viewMask`.
- Elements of `VkRenderPassMultiviewCreateInfo::pViewOffsets` are now specified in `VkSubpassDependency2KHR::viewOffset`.
- `VkRenderPassMultiviewCreateInfo::correlationMaskCount` and

`VkRenderPassMultiviewCreateInfo::pCorrelationMasks` are directly specified in `VkRenderPassCreateInfo2KHR`.

- `VkInputAttachmentAspectReference::aspectMask` is now specified in the relevant input attachment description in `VkAttachmentDescription2KHR::aspectMask`

The details of these mappings are explained fully in the new structures.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Commands

Description

This extension enables resources to be bound to a dedicated allocation, rather than suballocated.

For any particular resource, applications **can** query whether a dedicated allocation is recommended, in which case using a dedicated allocation **may** improve the performance of access to that resource. Normal device memory allocations must support multiple resources per allocation, memory aliasing and sparse binding, which could interfere with some optimizations. Applications should query the implementation for when a dedicated allocation **may** be beneficial by adding a `VkMemoryDedicatedRequirementsKHR` structure to the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of a call to `vkGetBufferMemoryRequirements2` or `vkGetImageMemoryRequirements2`. Certain external handle types and external images or buffers **may** also depend on dedicated allocations on implementations that associate image or buffer metadata with OS-level memory objects.

This extension adds a two small structures to memory requirements querying and memory allocation: a new structure that flags whether an image/buffer should have a dedicated allocation, and a structure indicating the image or buffer that an allocation will be bound to.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkMemoryAllocateInfo`:
 - `VkMemoryDedicatedAllocateInfoKHR`
- Extending `VkMemoryRequirements2`:
 - `VkMemoryDedicatedRequirementsKHR`

New Enum Constants

- `VK_KHR_DEDICATED_ALLOCATION_EXTENSION_NAME`
- `VK_KHR_DEDICATED_ALLOCATION_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO_KHR`
 - `VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS_KHR`

Examples

```
// Create an image with a dedicated allocation based on the
// implementation's preference

VkImageCreateInfo imageCreateInfo =
{
    // Image creation parameters
};

VkImage image;
```

```

VkResult result = vkCreateImage(
    device,
    &imageCreateInfo,
    NULL, // pAllocator
    &image);

VkMemoryDedicatedRequirementsKHR dedicatedRequirements =
{
    VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS_KHR,
    NULL, // pNext
};

VkMemoryRequirements2 memoryRequirements =
{
    VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2,
    &dedicatedRequirements, // pNext
};

const VkImageMemoryRequirementsInfo2 imageRequirementsInfo =
{
    VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2,
    NULL, // pNext
    image
};

vkGetImageMemoryRequirements2(
    device,
    &imageRequirementsInfo,
    &memoryRequirements);

if (dedicatedRequirements.prefersDedicatedAllocation) {
    // Allocate memory with VkMemoryDedicatedAllocateInfoKHR::image
    // pointing to the image we are allocating the memory for

    VkMemoryDedicatedAllocateInfoKHR dedicatedInfo =
    {
        VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO_KHR, // sType
        NULL, // pNext
        image, // image
        VK_NULL_HANDLE, // buffer
    };

    VkMemoryAllocateInfo memoryAllocateInfo =
    {
        VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO, // sType
        &dedicatedInfo, // pNext
        memoryRequirements.size, // allocationSize
        FindMemoryTypeIndex(memoryRequirements.memoryTypeBits), // memoryTypeIndex
    };

    VkDeviceMemory memory;
}

```

```

vkAllocateMemory(
    device,
    &memoryAllocateInfo,
    NULL, // pAllocator
    &memory);

// Bind the image to the memory

vkBindImageMemory(
    device,
    image,
    memory,
    0);
} else {
    // Take the normal memory sub-allocation path
}

```

Version History

- Revision 1, 2017-02-27 (James Jones)
 - Copy content from VK_NV_dedicated_allocation
 - Add some references to external object interactions to the overview.
- Revision 2, 2017-03-27 (Jason Ekstrand)
 - Rework the extension to be query-based
- Revision 3, 2017-07-31 (Jason Ekstrand)
 - Clarify that memory objects allocated with VkMemoryDedicatedAllocateInfoKHR can only have the specified resource bound and no others.

Description

This extension adds support for automatically resolving multisampled depth/stencil attachments in a subpass in a similar manner as for color attachments.

Multisampled color attachments can be resolved at the end of a subpass by specifying `pResolveAttachments` entries corresponding to the `pColorAttachments` array entries. This does not allow for a way to map the resolve attachments to the depth/stencil attachment. The `vkCmdResolveImage` command does not allow for depth/stencil images. While there are other ways to resolve the depth/stencil attachment, they can give sub-optimal performance. Extending the `VkSubpassDescription2` in this extension allows an application to add a `pDepthStencilResolveAttachment`, that is similar to the color `pResolveAttachments`, that the `pDepthStencilAttachment` can be resolved into.

Depth and stencil samples are resolved to a single value based on the resolve mode. The set of possible resolve modes is defined in the `VkResolveModeFlagBits` enum. The `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` mode is the only mode that is required of all implementations (that support the extension or support Vulkan 1.2 or higher). Some implementations may also support averaging (the same as color sample resolve) or taking the minimum or maximum sample, which may be more suitable for depth/stencil resolve.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Contributors

- Jeff Bolz, NVIDIA
- Michael Worcester, Imagination Technologies

Description

Applications may wish to update a fixed set of descriptors in a large number of descriptor sets very frequently, i.e. during initializaton phase or if it is required to rebuild descriptor sets for each frame. For those cases it is also not unlikely that all information required to update a single descriptor set is stored in a single struct. This extension provides a way to update a fixed set of descriptors in a single [VkDescriptorSet](#) with a pointer to a user defined data structure describing the new descriptors.

Promotion to Vulkan 1.1

`vkCmdPushDescriptorSetWithTemplateKHR` is included as an interaction with `VK_KHR_push_descriptor`. If Vulkan 1.1 and `VK_KHR_push_descriptor` are supported, this is included by `VK_KHR_push_descriptor`.

The base functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted.

The original type, enum and command names are still available as aliases of the core functionality.

Interactions and External Dependencies

- This extension requires [SPV_KHR_device_group](#)
- Promoted to Vulkan 1.1 Core

Contributors

- Jeff Bolz, NVIDIA
- Tobias Hector, Imagination Technologies

Description

This extension provides functionality to use a logical device that consists of multiple physical devices, as created with the [VK_KHR_device_group_creation](#) extension. A device group can allocate memory across the subdevices, bind memory from one subdevice to a resource on another subdevice, record command buffers where some work executes on an arbitrary subset of the subdevices, and potentially present a swapchain image from one or more subdevices.

Promotion to Vulkan 1.1

The following enums, types and commands are included as interactions with [VK_KHR_swapchain](#):

- [VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR](#)
- [VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR](#)
- [VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR](#)

Interactions and External Dependencies

- Promoted to Vulkan 1.1 Core

Contributors

- Jeff Bolz, NVIDIA

Description

This extension provides instance-level commands to enumerate groups of physical devices, and to create a logical device from a subset of one of those groups. Such a logical device can then be used with new features in the [VK_KHR_device_group](#) extension.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Commands

- [vkEnumeratePhysicalDeviceGroupsKHR](#)

New Structures

- [VkPhysicalDeviceGroupPropertiesKHR](#)
- Extending [VkDeviceCreateInfo](#):
 - [VkDeviceGroupDeviceCreateInfoKHR](#)

New Enum Constants

- [VK_KHR_DEVICE_GROUP_CREATION_EXTENSION_NAME](#)
- [VK_KHR_DEVICE_GROUP_CREATION_SPEC_VERSION](#)
- [VK_MAX_DEVICE_GROUP_SIZE_KHR](#)
- Extending [VkMemoryHeapFlagBits](#):
 - [VK_MEMORY_HEAP_MULTI_INSTANCE_BIT_KHR](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES_KHR](#)

Examples

```

VkDeviceCreateInfo devCreateInfo = { VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO };
// (not shown) fill out devCreateInfo as usual.
uint32_t deviceGroupCount = 0;
VkPhysicalDeviceGroupPropertiesKHR *props = NULL;

// Query the number of device groups
vkEnumeratePhysicalDeviceGroupsKHR(g_vkInstance, &deviceGroupCount, NULL);

// Allocate and initialize structures to query the device groups
props = (VkPhysicalDeviceGroupPropertiesKHR *)malloc(deviceGroupCount*sizeof(VkPhysicalDeviceGroupPropertiesKHR));
for (i = 0; i < deviceGroupCount; ++i) {
    props[i].sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES_KHR;
    props[i].pNext = NULL;
}
vkEnumeratePhysicalDeviceGroupsKHR(g_vkInstance, &deviceGroupCount, props);

// If the first device group has more than one physical device. create
// a logical device using all of the physical devices.
VkDeviceGroupDeviceCreateInfoKHR deviceCreateInfo = {
VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO_KHR };
if (props[0].physicalDeviceCount > 1) {
    deviceCreateInfo.physicalDeviceCount = props[0].physicalDeviceCount;
    deviceCreateInfo.pPhysicalDevices = props[0].physicalDevices;
    devCreateInfo.pNext = &deviceCreateInfo;
}

vkCreateDevice(props[0].physicalDevices[0], &devCreateInfo, NULL, &g_vkDevice);
free(props);

Description

This extension is based off the [VK_AMD_draw_indirect_count](#) extension. This extension allows an application to source the number of draws for indirect drawing calls from a buffer.

Applications might want to do culling on the GPU via a compute shader prior to drawing. This enables the application to generate an arbitrary number of drawing commands and execute them without host intervention.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the entry points [vkCmdDrawIndirectCount](#) and [vkCmdDrawIndexedIndirectCount](#) are optional. The original type, enum and command names are still available as aliases of the core functionality.

Description

This extension allows applications to create single-pass render pass instances without needing to create render pass objects or framebuffers. Dynamic render passes can also span across multiple primary command buffers, rather than relying on secondary command buffers.

This extension also incorporates [VK_ATTACHMENT_STORE_OP_NONE_KHR](#) from [VK_QCOM_render_pass_store_ops](#), enabling applications to avoid unnecessary synchronization when an attachment is not written during a render pass.

Issues

1) How do applications correlate two physical devices across process or Vulkan instance boundaries?

RESOLVED: New device ID fields have been introduced by [VK_KHR_external_memory_capabilities](#). These fields, combined with the existing `VkPhysicalDeviceProperties::driverVersion` field can be used to identify compatible devices across processes, drivers, and APIs. `VkPhysicalDeviceProperties::pipelineCacheUUID` is not sufficient for this purpose because despite its description in the specification, it need only identify a unique pipeline cache format in practice. Multiple devices may be able to use the same pipeline cache data, and hence it would be desirable for all of them to have the same pipeline cache UUID. However, only the same concrete physical device can be used when sharing memory, so an actual unique device ID was introduced. Further, the pipeline cache UUID was specific to Vulkan, but correlation with other, non-extensible APIs is required to enable interoperation with those APIs.

2) If memory objects are shared between processes and APIs, is this considered aliasing according to the rules outlined in the [Memory Aliasing](#) section?

RESOLVED: Yes. Applications must take care to obey all restrictions imposed on aliased resources when using memory across multiple Vulkan instances or other APIs.

3) Are new image layouts or metadata required to specify image layouts and layout transitions compatible with non-Vulkan APIs, or with other instances of the same Vulkan driver?

RESOLVED: Separate instances of the same Vulkan driver running on the same GPU should have identical internal layout semantics, so applications have the tools they need to ensure views of images are consistent between the two instances. Other APIs will fall into two categories: Those that are Vulkan-compatible, and those that are Vulkan-incompatible. Vulkan-incompatible APIs will require the image to be in the GENERAL layout whenever they are accessing them.

Note this does not attempt to address cross-device transitions, nor transitions to engines on the same device which are not visible within the Vulkan API. Both of these are beyond the scope of this extension.

4) Is a new barrier flag or operation of some type needed to prepare external memory for handoff to another Vulkan instance or API and/or receive it from another instance or API?

RESOLVED: Yes. Some implementations need to perform additional cache management when transitioning memory between address spaces and other APIs, instances, or processes which may operate in a separate address space. Options for defining this transition include:

- A new structure that can be added to the `pNext` list in `VkMemoryBarrier`, `VkBufferMemoryBarrier`, and `VkImageMemoryBarrier`.
- A new bit in `VkAccessFlags` that can be set to indicate an “external” access.

- A new bit in [VkDependencyFlags](#)
- A new special queue family that represents an “external” queue.

A new structure has the advantage that the type of external transition can be described in as much detail as necessary. However, there is not currently a known need for anything beyond differentiating between external and internal accesses, so this is likely an over-engineered solution. The access flag bit has the advantage that it can be applied at buffer, image, or global granularity, and semantically it maps pretty well to the operation being described. Additionally, the API already includes `VK_ACCESS_MEMORY_READ_BIT` and `VK_ACCESS_MEMORY_WRITE_BIT` which appear to be intended for this purpose. However, there is no obvious pipeline stage that would correspond to an external access, and therefore no clear way to use `VK_ACCESS_MEMORY_READ_BIT` or `VK_ACCESS_MEMORY_WRITE_BIT`. [VkDependencyFlags](#) and [VkPipelineStageFlags](#) operate at command granularity rather than image or buffer granularity, which would make an entire pipeline barrier an internal → external or external → internal barrier. This may not be a problem in practice, but seems like the wrong scope. Another downside of [VkDependencyFlags](#) is that it lacks inherent directionality: there are no `src` and `dst` variants of it in the barrier or dependency description semantics, so two bits might need to be added to describe both internal → external and external → internal transitions. Transitioning a resource to a special queue family corresponds well with the operation of transitioning to a separate Vulkan instance, in that both operations ideally include scheduling a barrier on both sides of the transition: Both the releasing and the acquiring queue or process. Using a special queue family requires adding an additional reserved queue family index. Re-using `VK_QUEUE_FAMILY_IGNORED` would have left it unclear how to transition a concurrent usage resource from one process to another, since the semantics would have likely been equivalent to the currently-ignored transition of `VK_QUEUE_FAMILY_IGNORED` → `VK_QUEUE_FAMILY_IGNORED`. Fortunately, creating a new reserved queue family index is not invasive.

Based on the above analysis, the approach of transitioning to a special “external” queue family was chosen.

5) Do internal driver memory arrangements and/or other internal driver image properties need to be exported and imported when sharing images across processes or APIs.

RESOLVED: Some vendors claim this is necessary on their implementations, but it was determined that the security risks of allowing opaque metadata to be passed from applications to the driver were too high. Therefore, implementations which require metadata will need to associate it with the objects represented by the external handles, and rely on the dedicated allocation mechanism to associate the exported and imported memory objects with a single image or buffer.

6) Most prior interoperation and cross-process sharing APIs have been based on image-level sharing. Should Vulkan sharing be based on memory-object sharing or image sharing?

RESOLVED: These extensions have assumed memory-level sharing is the correct granularity. Vulkan is a lower-level API than most prior APIs, and as such attempts to closely align with the underlying primitives of the hardware and system-level drivers it abstracts. In general, the resource that holds the backing store for both images and buffers of various types is memory. Images and buffers are merely metadata containing brief descriptions of the layout of bits within that memory.

Because memory object-based sharing is aligned with the overall Vulkan API design, it enables the

full range of Vulkan capabilities with external objects. External memory can be used as backing for sparse images, for example, whereas such usage would be awkward at best with a sharing mechanism based on higher-level primitives such as images. Further, aligning the mechanism with the API in this way provides some hope of trivial compatibility with future API enhancements. If new objects backed by memory objects are added to the API, they too can be used across processes with minimal additions to the base external memory APIs.

Earlier APIs implemented interop at a higher level, and this necessitated entirely separate sharing APIs for images and buffers. To co-exist and interoperate with those APIs, the Vulkan external sharing mechanism must accommodate their model. However, if it can be agreed that memory-based sharing is the more desirable and forward-looking design, legacy interoperation constraints can be considered another reason to favor memory-based sharing: while native and legacy driver primitives that may be used to implement sharing may not be as low-level as the API here suggests, raw memory is still the least common denominator among the types. Image-based sharing can be cleanly derived from a set of base memory-object sharing APIs with minimal effort, whereas image-based sharing does not generalize well to buffer or raw-memory sharing. Therefore, following the general Vulkan design principle of minimalism, it is better to expose interoperability with image-based native and external primitives via the memory sharing API, and place sufficient limits on their usage to ensure they can be used only as backing for equivalent Vulkan images. This provides a consistent API for applications regardless of which platform or external API they are targeting, which makes development of multi-API and multi-platform applications simpler.

7) Should Vulkan define a common external handle type and provide Vulkan functions to facilitate cross-process sharing of such handles rather than relying on native handles to define the external objects?

RESOLVED: No. Cross-process sharing of resources is best left to native platforms. There are myriad security and extensibility issues with such a mechanism, and attempting to re-solve all those issues within Vulkan does not align with Vulkan's purpose as a graphics API. If desired, such a mechanism could be built as a layer or helper library on top of the opaque native handle defined in this family of extensions.

8) Must implementations provide additional guarantees about state implicitly included in memory objects for those memory objects that may be exported?

RESOLVED: Implementations must ensure that sharing memory objects does not transfer any information between the exporting and importing instances and APIs other than that required to share the data contained in the memory objects explicitly shared. As specific examples, data from previously freed memory objects that used the same underlying physical memory, and data from memory objects using adjacent physical memory must not be visible to applications importing an exported memory object.

9) Must implementations validate external handles the application provides as inputs to memory import operations?

RESOLVED: Implementations must return an error to the application if the provided memory handle cannot be used to complete the requested import operation. However, implementations need not validate handles are of the exact type specified by the application.

 - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_IMAGE_FORMAT_INFO_KHR
 - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES_KHR

Issues

1) Why do so many external memory capabilities need to be queried on a per-memory-handle-type basis?

PROPOSED RESOLUTION: This is because some handle types are based on OS-native objects that have far more limited capabilities than the very generic Vulkan memory objects. Not all memory handle types can name memory objects that support 3D images, for example. Some handle types cannot even support the deferred image and memory binding behavior of Vulkan and require specifying the image when allocating or importing the memory object.

2) Do the [VkExternalImageFormatPropertiesKHR](#) and [VkExternalBufferPropertiesKHR](#) structs need to include a list of memory type bits that support the given handle type?

PROPOSED RESOLUTION: No. The memory types that do not support the handle types will simply be filtered out of the results returned by [vkGetImageMemoryRequirements](#) and [vkGetBufferMemoryRequirements](#) when a set of handle types was specified at image or buffer creation time.

3) Should the non-opaque handle types be moved to their own extension?

PROPOSED RESOLUTION: Perhaps. However, defining the handle type bits does very little and does not require any platform-specific types on its own, and it is easier to maintain the bitfield values in a single extension for now. Presumably more handle types could be added by separate extensions though, and it would be mildly weird to have some platform-specific ones defined in the

core spec and some in extensions

4) Do we need a [D3D11_TILEPOOL](#) type?

PROPOSED RESOLUTION: No. This is technically possible, but the synchronization is awkward. D3D11 surfaces must be synchronized using shared mutexes, and these synchronization primitives are shared by the entire memory object, so D3D11 shared allocations divided among multiple buffer and image bindings may be difficult to synchronize.

5) Should the Windows 7-compatible handle types be named “KMT” handles or “GLOBAL_SHARE” handles?

PROPOSED RESOLUTION: KMT, simply because it is more concise.

6) How do applications identify compatible devices and drivers across instance, process, and API boundaries when sharing memory?

PROPOSED RESOLUTION: New device properties are exposed that allow applications to correctly correlate devices and drivers. A device and driver UUID that must both match to ensure sharing compatibility between two Vulkan instances, or a Vulkan instance and an extensible external API are added. To allow correlating with Direct3D devices, a device LUID is added that corresponds to a DXGI adapter LUID. A driver ID is not needed for Direct3D because mismatched driver component versions are not currently supported on the Windows OS. Should support for such configurations be introduced at the OS level, further Vulkan extensions would be needed to correlate userspace component builds.

Description

An application using external memory may wish to synchronize access to that memory using semaphores. This extension enables an application to create semaphores from which non-Vulkan handles that reference the underlying synchronization primitive can be exported.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkSemaphoreCreateInfo`:
 - `VkExportSemaphoreCreateInfoKHR`

New Enums

- [VkSemaphoreImportFlagBitsKHR](#)

New Bitmasks

New Enum Constants

- `VK_KHR_EXTERNAL_SEMAPHORE_EXTENSION_NAME`
- `VK_KHR_EXTERNAL_SEMAPHORE_SPEC_VERSION`
- Extending [VkSemaphoreImportFlagBits](#):
 - `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT_KHR`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO_KHR`

Issues

1) Should there be restrictions on what side effects can occur when waiting on imported semaphores that are in an invalid state?

RESOLVED: Yes. Normally, validating such state would be the responsibility of the application, and the implementation would be free to enter an undefined state if valid usage rules were violated. However, this could cause security concerns when using imported semaphores, as it would require the importing application to trust the exporting application to ensure the state is valid. Requiring this level of trust is undesirable for many potential use cases.

2) Must implementations validate external handles the application provides as input to semaphore state import operations?

RESOLVED: Implementations must return an error to the application if the provided semaphore state handle cannot be used to complete the requested import operation. However, implementations need not validate handles are of the exact type specified by the application.

Description

An application may wish to reference device semaphores in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension provides a set of capability queries and handle definitions that allow an application to determine what types of “external” semaphore handles an implementation supports for a given set of use cases.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Description

This extension adds a new `VkFormatFeatureFlagBits2KHR` 64bits format feature flag type to extend

the existing [VkFormatFeatureFlagBits](#) which is limited to 31 flags. At the time of this writing 29 bits of [VkFormatFeatureFlagBits](#) are already used.

Because [VkFormatProperties2](#) is already defined to extend the Vulkan 1.0 [vkGetPhysicalDeviceFormatProperties](#) entry point, this extension defines a new [VkFormatProperties3KHR](#) to extend the [VkFormatProperties](#).

On top of replicating all the bits from [VkFormatFeatureFlagBits](#), [VkFormatFeatureFlagBits2KHR](#) adds the following bits :

- [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT_KHR](#) and [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT_KHR](#) indicate that an implementation supports respectively reading and writing a given [VkFormat](#) through storage operations without specifying the format in the shader.
- [VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT_KHR](#) indicates that an implementation supports depth comparison performed by [OpImage*Dref](#) instructions on a given [VkFormat](#). Previously the result of executing a [OpImage*Dref*](#) instruction on an image view, where the [format](#) was not one of the depth/stencil formats with a depth component, was undefined. This bit clarifies on which formats such instructions can be used.

Description

This extension provides new entry points to query device features, device properties, and format properties in a way that can be easily extended by other extensions, without introducing any further entry points. The Vulkan 1.0 feature/limit/formatproperty structures do not include `sType` /`pNext` members. This extension wraps them in new structures with `sType/pNext` members, so an application can query a chain of feature/limit/formatproperty structures by constructing the chain and letting the implementation fill them in. A new command is added for each `vkGetPhysicalDevice*` command in core Vulkan 1.0. The new feature structure (and a `pNext` chain of extending structures) can also be passed in to device creation to enable features.

This extension also allows applications to use the physical-device components of device extensions before `vkCreateDevice` is called.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

- VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2_KHR
- VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2_KHR

Examples

```

// Get features with a hypothetical future extension.
VkHypotheticalExtensionFeaturesKHR hypotheticalFeatures =
{
    VK_STRUCTURE_TYPE_HYPOTHETICAL_FEATURES_KHR,           // sType
    NULL,                                                 // pNext
};

VkPhysicalDeviceFeatures2KHR features =
{
    VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2_KHR,      // sType
    &hypotheticalFeatures,                                // pNext
};

// After this call, features and hypotheticalFeatures have been filled out.
vkGetPhysicalDeviceFeatures2KHR(physicalDevice, &features);

// Properties/limits can be chained and queried similarly.

// Enable some features:
VkHypotheticalExtensionFeaturesKHR enabledHypotheticalFeatures =
{
    VK_STRUCTURE_TYPE_HYPOTHETICAL_FEATURES_KHR,           // sType
    NULL,                                                 // pNext
};

VkPhysicalDeviceFeatures2KHR enabledFeatures =
{
    VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2_KHR,      // sType
    &enabledHypotheticalFeatures,                          // pNext
};

enabledFeatures.features.xyz = VK_TRUE;
enabledHypotheticalFeatures.abc = VK_TRUE;

VkDeviceCreateInfo deviceCreateInfo =
{
    VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO,                  // sType
    &enabledFeatures,                                    // pNext
    ...
    NULL,                                                 // pEnabledFeatures
};

VkDevice device;
vkCreateDevice(physicalDevice, &deviceCreateInfo, NULL, &device);

```

Description

On some implementations, setting the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` on image creation can cause access to that image to perform worse than an equivalent image created without `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` because the implementation does not know what view formats will be paired with the image.

This extension allows an application to provide the list of all formats that **can** be used with an image when it is created. The implementation may then be able to create a more efficient image that supports the subset of formats required by the application without having to support all formats in the format compatibility class of the image format.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Description

This extension allows framebuffers to be created without the need for creating images first, allowing more flexibility in how they are used, and avoiding the need for many of the confusing compatibility rules.

Framebuffers are now created with a small amount of additional metadata about the image views that will be used in [VkFramebufferAttachmentsCreateInfoKHR](#), and the actual image views are provided at render pass begin time via [VkRenderPassAttachmentBeginInfoKHR](#).

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

- Tom Olson, ARM

Description

`VK_KHR_maintenance1` adds a collection of minor features that were intentionally left out or overlooked from the original Vulkan 1.0 release.

The new features are as follows:

- Allow 2D and 2D array image views to be created from 3D images, which can then be used as color framebuffer attachments. This allows applications to render to slices of a 3D image.
- Support `vkCmdCopyImage` between 2D array layers and 3D slices. This extension allows copying from layers of a 2D array image to slices of a 3D image and vice versa.
- Allow negative height to be specified in the `VkViewport::height` field to perform y-inversion of the clip-space to framebuffer-space transform. This allows apps to avoid having to use `gl_Position.y = -gl_Position.y` in shaders also targeting other APIs.
- Allow implementations to express support for doing just transfers and clears of image formats

that they otherwise support no other format features for. This is done by adding new format feature flags `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT_KHR` and `VK_FORMAT_FEATURE_TRANSFER_DST_BIT_KHR`.

- Support `vkCmdFillBuffer` on transfer-only queues. Previously `vkCmdFillBuffer` was defined to only work on command buffers allocated from command pools which support graphics or compute queues. It is now allowed on queues that just support transfer operations.
- Fix the inconsistency of how error conditions are returned between the `vkCreateGraphicsPipelines` and `vkCreateComputePipelines` functions and the `vkAllocateDescriptorSets` and `vkAllocateCommandBuffers` functions.
- Add new `VK_ERROR_OUT_OF_POOL_MEMORY_KHR` error so implementations can give a more precise reason for `vkAllocateDescriptorSets` failures.
- Add a new command `vkTrimCommandPoolKHR` which gives the implementation an opportunity to release any unused command pool memory back to the system.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

- Piers Daniell, NVIDIA

Description

[VK_KHR_maintenance2](#) adds a collection of minor features that were intentionally left out or overlooked from the original Vulkan 1.0 release.

The new features are as follows:

- Allow the application to specify which aspect of an input attachment might be read for a given subpass.
- Allow implementations to express the clipping behavior of points.
- Allow creating images with usage flags that may not be supported for the base image's format, but are supported for image views of the image that have a different but compatible format.
- Allow creating uncompressed image views of compressed images.
- Allow the application to select between an upper-left and lower-left origin for the tessellation domain space.
- Adds two new image layouts for depth stencil images to allow either the depth or stencil aspect to be read-only while the other aspect is writable.

Input Attachment Specification

Input attachment specification allows an application to specify which aspect of a multi-aspect image (e.g. a combined depth stencil format) will be accessed via a [subpassLoad](#) operation.

On some implementations there **may** be a performance penalty if the implementation does not know (at [vkCreateRenderPass](#) time) which aspect(s) of multi-aspect images **can** be accessed as input attachments.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- [VkInputAttachmentAspectReferenceKHR](#)
- Extending [VkImageViewCreateInfo](#):

 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_POINT_CLIPPING_PROPERTIES_KHR](#)
 - [VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO_KHR](#)
 - [VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO_KHR](#)
- Extending [VkTessellationDomainOrigin](#):
 - [VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR](#)
 - [VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR](#)

Input Attachment Specification Example

Consider the case where a render pass has two subpasses and two attachments.

Attachment 0 has the format `VK_FORMAT_D24_UNORM_S8_UINT`, attachment 1 has some color format.

Subpass 0 writes to attachment 0, subpass 1 reads only the depth information from attachment 0 (using `inputAttachmentRead`) and writes to attachment 1.

```
VkInputAttachmentAspectReferenceKHR references[] = {
    {
        .subpass = 1,
        .inputAttachmentIndex = 0,
        .aspectMask = VK_IMAGE_ASPECT_DEPTH_BIT
    }
};

VkRenderPassInputAttachmentAspectCreateInfoKHR specifyAspects = {
    .sType =
VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO_KHR,
    .pNext = NULL,
    .aspectReferenceCount = 1,
    .pAspectReferences = references
};

VkRenderPassCreateInfo createInfo = {
    ...
    .pNext = &specifyAspects,
    ...
};

vkCreateRenderPass(...);
```

Issues

- 1) What is the default tessellation domain origin?

RESOLVED: Vulkan 1.0 originally inadvertently documented a lower-left origin, but the conformance tests and all implementations implemented an upper-left origin. This extension adds a control to select between lower-left (for compatibility with OpenGL) and upper-left, and we retroactively fix unextended Vulkan to have a default of an upper-left origin.

Description

`VK_KHR_maintenance3` adds a collection of minor features that were intentionally left out or overlooked from the original Vulkan 1.0 release.

The new features are as follows:

- A limit on the maximum number of descriptors that are supported in a single descriptor set layout. Some implementations have a limit on the total size of descriptors in a set, which cannot be expressed in terms of the limits in Vulkan 1.0.
- A limit on the maximum size of a single memory allocation. Some platforms have kernel interfaces that limit the maximum size of an allocation.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

- Stu Smith, AMD
- Yiwei Zhang, Google

Description

[VK_KHR_maintenance4](#) adds a collection of minor features, none of which would warrant an entire extension of their own.

The new features are as follows:

- Allow the application to destroy their [VkPipelineLayout](#) object immediately after it was used to create another object. It is no longer necessary to keep its handle valid while the created object is in use.
- Add a new [maxBufferSize](#) implementation-defined limit for the maximum size [VkBuffer](#) that can be created.
- Add support for the SPIR-V 1.2 [LocalSizeId](#) execution mode, which can be used as an alternative to [LocalSize](#) to specify the local workgroup size with specialization constants.
- Add a guarantee that images created with identical creation parameters will always have the same alignment requirements.
- Add [vkGetDeviceBufferMemoryRequirementsKHR](#)

[vkGetDeviceImageMemoryRequirementsKHR](#), and [vkGetDeviceImageSparseMemoryRequirementsKHR](#) to allow the application to query the image memory requirements without having to create an image object and query it.

- Relax the requirement that push constants must be initialized before they are dynamically accessed.
- Relax the interface matching rules to allow a larger output vector to match with a smaller input vector, with additional values being discarded.
- Add a guarantee for buffer memory requirement that the size memory requirement is never greater than the result of aligning create size with the alignment memory requirement.

New Commands

- [vkGetDeviceBufferMemoryRequirementsKHR](#)
- [vkGetDeviceImageMemoryRequirementsKHR](#)
- [vkGetDeviceImageSparseMemoryRequirementsKHR](#)

Interactions and External Dependencies

- Promoted to Vulkan 1.1 Core
- This extension requires [SPV_KHR_multiview](#)

- This extension provides API support for [GL_EXT_multiview](#)

Contributors

- Jeff Bolz, NVIDIA

Description

This extension has the same goal as the OpenGL ES [GL_OVR_multiview](#) extension. Multiview is a rendering technique originally designed for VR where it is more efficient to record a single set of commands to be executed with slightly different behavior for each “view”.

It includes a concise way to declare a render pass with multiple views, and gives implementations freedom to render the views in the most efficient way possible. This is done with a multiview configuration specified during [render pass](#) creation with the [VkRenderPassMultiviewCreateInfo](#) passed into [VkRenderPassCreateInfo::pNext](#).

This extension enables the use of the [SPV_KHR_multiview](#) shader extension, which adds a new [ViewIndex](#) built-in type that allows shaders to control what to do for each view. If using GLSL there is also the [GL_EXT_multiview](#) extension that introduces a `highp int gl_ViewIndex;` built-in variable for vertex, tessellation, geometry, and fragment shaders.

Promotion to Vulkan 1.1

Description

The `VK_KHR_relaxed_block_layout` extension allows implementations to indicate they can support more variation in block `Offset` decorations. For example, placing a vector of three floats at an offset of $16 \times N + 4$.

See [Offset and Stride Assignment](#) for details.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Interactions and External Dependencies

- Promoted to Vulkan 1.2 Core

Contributors

- Tobias Hector, Imagination Technologies
- Jon Leech, Khronos

Description

`VK_KHR_sampler_mirror_clamp_to_edge` extends the set of sampler address modes to include an additional mode (`VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`) that effectively uses a texture map twice as large as the original image in which the additional half of the new image is a mirror image of the original image.

This new mode relaxes the need to generate images whose opposite edges match by using the original image to generate a matching “mirror image”. This mode allows the texture to be mirrored only once in the negative s, t, and r directions.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2. However, if Vulkan 1.2 is supported and this extension is not, the `VkSamplerAddressMode` `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` is optional. Since the original extension did not use an author suffix on the enum `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`, it is used by both core and extension implementations.

New Enum Constants

- `VK_KHR_SAMPLER_MIRROR_CLAMP_TO_EDGE_EXTENSION_NAME`
- `VK_KHR_SAMPLER_MIRROR_CLAMP_TO_EDGE_SPEC_VERSION`
- Extending `VkSamplerAddressMode`:
 - `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`
 - `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR`

Example

Creating a sampler with the new address mode in each dimension

```

VkSamplerCreateInfo createInfo =
{
    VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO // sType
    // Other members set to application-desired values
};

createInfo.addressModeU = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE;
createInfo.addressModeV = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE;
createInfo.addressModeW = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE;

VkSampler sampler;
VkResult result = vkCreateSampler(
    device,
    &createInfo,
    &sampler);

```

Issues

- 1) Why are both KHR and core versions of the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` token present?

RESOLVED: This functionality was intended to be required in Vulkan 1.0. We realized shortly before public release that not all implementations could support it, and moved the functionality into an optional extension, but did not apply the KHR extension suffix. Adding a KHR-suffixed alias of the non-suffixed enum has been done to comply with our own naming rules.

In a related change, before spec revision 1.1.121 this extension was hardwiring into the spec Makefile so it was always included with the Specification, even in the core-only versions. This has now been reverted, and it is treated as any other extension.

Version History

- Revision 1, 2016-02-16 (Tobias Hector)
 - Initial draft
- Revision 2, 2019-08-14 (Jon Leech)
 - Add KHR-suffixed alias of non-suffixed enum.
- Revision 3, 2019-08-17 (Jon Leech)
 - Add an issue explaining the reason for the extension API not being suffixed with KHR.

Description

The use of Y'CbCr sampler conversion is an area in 3D graphics not used by most Vulkan developers. It is mainly used for processing inputs from video decoders and cameras. The use of the extension assumes basic knowledge of Y'CbCr concepts.

This extension provides the ability to perform specified color space conversions during texture sampling operations for the Y'CbCr color space natively. It also adds a selection of multi-planar formats, image aspect plane, and the ability to bind memory to the planes of an image collectively or separately.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. However, if Vulkan 1.1 is supported and this extension is not, the `samplerYcbcrConversion` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

2019-06-25

Interactions and External Dependencies

- Promoted to Vulkan 1.2 Core

Contributors

- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA
- Jesse Barker, Unity
- Tobias Hector, AMD

Description

This extension allows image memory barriers for depth/stencil images to have just one of the `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` aspect bits set, rather than require both. This allows their layouts to be set independently. To support depth/stencil images with different layouts for the depth and stencil aspects, the depth/stencil attachment interface has been updated to support a separate layout for stencil.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

Interactions and External Dependencies

- Promoted to Vulkan 1.2 Core
- This extension provides API support for `GL_ARB_gpu_shader_int64` and `GL_EXT_shader_atomic_int64`

Contributors

- Aaron Hagan, AMD

- Daniel Rakos, AMD
- Jeff Bolz, NVIDIA
- Neil Henning, Codeplay

Description

This extension advertises the SPIR-V **Int64Atomics** capability for Vulkan, which allows a shader to contain 64-bit atomic operations on signed and unsigned integers. The supported operations include OpAtomicMin, OpAtomicMax, OpAtomicAnd, OpAtomicOr, OpAtomicXor, OpAtomicAdd, OpAtomicExchange, and OpAtomicCompareExchange.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `shaderBufferInt64Atomics` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceShaderAtomicInt64FeaturesKHR`

New Enum Constants

- `VK_KHR_SHADER_ATOMIC_INT64_EXTENSION_NAME`
- `VK_KHR_SHADER_ATOMIC_INT64_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES_KHR`

New SPIR-V Capabilities

- `Int64Atomics`

Interactions and External Dependencies

- This extension requires [SPV_KHR_shader_draw_parameters](#)
- This extension provides API support for [GL_ARB_shader_draw_parameters](#)
- Promoted to Vulkan 1.1 Core

Contributors

- Daniel Koch, NVIDIA Corporation
- Jeff Bolz, NVIDIA
- Daniel Rakos, AMD
- Jan-Harald Fredriksen, ARM
- John Kessenich, Google
- Stuart Smith, IMG

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- [SPV_KHR_shader_draw_parameters](#)

The extension provides access to three additional built-in shader variables in Vulkan:

- `BaseInstance`, containing the `firstInstance` parameter passed to drawing commands,

- `BaseVertex`, containing the `firstVertex` or `vertexOffset` parameter passed to drawing commands, and
- `DrawIndex`, containing the index of the draw call currently being processed from an indirect drawing call.

When using GLSL source-based shader languages, the following variables from `GL_ARB_shader_draw_parameters` can map to these SPIR-V built-in decorations:

- `in int gl_BaseInstanceARB; → BaseInstance`,
- `in int gl_BaseVertexARB; → BaseVertex`, and
- `in int gl_DrawIDARB; → DrawIndex`.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, however a [feature bit was added](#) to distinguish whether it is actually available or not.

New Enum Constants

- `VK_KHR_SHADER_DRAW_PARAMETERS_EXTENSION_NAME`
- `VK_KHR_SHADER_DRAW_PARAMETERS_SPEC_VERSION`

New Built-In Variables

- `BaseInstance`
- `BaseVertex`
- `DrawIndex`

New SPIR-V Capabilities

- `DrawParameters`

Issues

1) Is this the same functionality as `GL_ARB_shader_draw_parameters`?

RESOLVED: It is actually a superset, as it also adds in support for arrayed drawing commands.

In GL for `GL_ARB_shader_draw_parameters`, `gl_BaseVertexARB` holds the integer value passed to the parameter to the command that resulted in the current shader invocation. In the case where the command has no `baseVertex` parameter, the value of `gl_BaseVertexARB` is zero. This means that `gl_BaseVertexARB = baseVertex` (for `glDrawElements` commands with `baseVertex`) or 0. In particular there are no `glDrawArrays` commands that take a `baseVertex` parameter.

Now in Vulkan, we have `BaseVertex = vertexOffset` (for indexed drawing commands) or `firstVertex` (for arrayed drawing commands), and so Vulkan's version is really a superset of GL functionality.

- Graeme Leese, Broadcom
- Daniel Rakos, AMD

Description

The `VK_KHR_shader_float16_int8` extension allows use of 16-bit floating-point types and 8-bit integer types in shaders for arithmetic operations.

It introduces two new optional features `shaderFloat16` and `shaderInt8` which directly map to the `Float16` and the `Int8` SPIR-V capabilities. The `VK_KHR_shader_float16_int8` extension also specifies precision requirements for half-precision floating-point SPIR-V operations. This extension does not enable use of 8-bit integer types or 16-bit floating-point types in any `shader input and output interfaces` and therefore does not supersede the `VK_KHR_8bit_storage` or `VK_KHR_16bit_storage` extensions.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, both the `shaderFloat16` and `shaderInt8` capabilities are optional. The original type, enum and command names are still available as aliases of the core functionality.

- Daniel Rakos, AMD

Description

The `VK_KHR_shader_float_controls` extension enables efficient use of floating-point computations

through the ability to query and override the implementation's default behavior for rounding modes, denormals, signed zero, and infinity.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDeviceFloatControlsPropertiesKHR](#)

New Enums

- [VkShaderFloatControlsIndependenceKHR](#)

New Enum Constants

- `VK_KHR_SHADER_FLOAT_CONTROLS_EXTENSION_NAME`
- `VK_KHR_SHADER_FLOAT_CONTROLS_SPEC_VERSION`
- Extending [VkShaderFloatControlsIndependence](#):
 - `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY_KHR`
 - `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL_KHR`
 - `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE_KHR`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FLOAT_CONTROLS_PROPERTIES_KHR`

New SPIR-V Capabilities

- `DenormPreserve`
- `DenormFlushToZero`
- `SignedZeroInfNanPreserve`
- `RoundingModeRTE`
- `RoundingModeRTZ`

Issues

1) Which instructions must flush denorms?

RESOLVED: Only floating-point conversion, floating-point arithmetic, floating-point relational (except `OpIsNaN`, `OpIsInf`), and floating-point GLSL.std.450 extended instructions must flush denormals.

2) What is the denorm behavior for intermediate results?

RESOLVED: When a SPIR-V instruction is implemented as a sequence of other instructions:

- in the `DenormFlushToZero` execution mode, the intermediate instructions may flush denormals, the final result of the sequence **must** not be denormal.
- in the `DenormPreserve` execution mode, denormals must be preserved throughout the whole sequence.

3) Do denorm and rounding mode controls apply to `OpSpecConstantOp`?

RESOLVED: Yes, except when the opcode is `OpQuantizeToF16`.

4) The SPIR-V specification says that `OpConvertFToU` and `OpConvertFToS` unconditionally round towards zero. Do the rounding mode controls specified through the execution modes apply to them?

RESOLVED: No, these instructions unconditionally round towards zero.

5) Do any of the “Pack” GLSL.std.450 instructions count as conversion instructions and have the rounding mode applied?

RESOLVED: No, only instructions listed in “section 3.32.11. Conversion Instructions” of the SPIR-V specification count as conversion instructions.

6) When using inf/nan-ignore mode, what is expected of `OpIsNan` and `OpIsInf`?

RESOLVED: These instructions must always accurately detect inf/nan if it is passed to them.

Version 4 API incompatibility

The original versions of `VK_KHR_shader_float_controls` shipped with booleans named “separateDenormSettings” and “separateRoundingModeSettings”, which at first glance could have indicated “they can all be set independently, or not”. However the spec language as written indicated that the 32-bit value could always be set independently, and only the 16- and 64-bit controls needed to be the same if these values were `VK_FALSE`.

As a result of this slight disparity, and lack of test coverage for this facet of the extension, we ended up with two different behaviors in the wild, where some implementations worked as written, and others worked based on the naming. As these are hard limits in hardware with reasons for exposure as written, it was not possible to standardise on a single way to make this work within the existing API.

No known users of this part of the extension exist in the wild, and as such the Vulkan WG took the unusual step of retroactively changing the once boolean value into a tri-state enum, breaking source compatibility. This was however done in such a way as to retain ABI compatibility, in case any code using this did exist; with the numerical values 0 and 1 retaining their original specified meaning, and a new value signifying the additional “all need to be set together” state. If any applications exist today, compiled binaries will continue to work as written in most cases, but will need changes before the code can be recompiled.

- Ralph Potter, Samsung
- Tom Olson, Arm

Description

This extension adds Vulkan support for the `SPV_KHR_terminate_invocation` SPIR-V extension. That SPIR-V extension provides a new instruction, `OpTerminateInvocation`, which causes a shader invocation to immediately terminate and sets the coverage of shaded samples to `0`; only previously executed instructions will have observable effects. The `OpTerminateInvocation` instruction, along with the `OpDemoteToHelperInvocation` instruction from the `VK_EXT_shader_demote_to_helper_invocation` extension, together replace the `OpKill` instruction, which could behave like either of these instructions. `OpTerminateInvocation` provides the behavior required by the GLSL `discard` statement, and should be used when available by GLSL compilers and applications that need the GLSL `discard` behavior.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceShaderTerminateInvocationFeaturesKHR`

New Enum Constants

- `VK_KHR_SHADER_TERMINATE_INVOCATION_EXTENSION_NAME`

- Jesse Hall, Google
- John Kessenich, Google
- Neil Henning, AMD
- Tom Olson, Arm

Description

This extension allows the use of SPIR-V 1.4 shader modules. SPIR-V 1.4's new features primarily make it an easier target for compilers from high-level languages, rather than exposing new hardware functionality.

SPIR-V 1.4 incorporates features that are also available separately as extensions. SPIR-V 1.4 shader modules do not need to enable those extensions with the `OpExtension` opcode, since they are integral parts of SPIR-V 1.4.

SPIR-V 1.4 introduces new floating point execution mode capabilities, also available via `SPV_KHR_float_controls`. Implementations are not required to support all of these new capabilities; support can be queried using `VkPhysicalDeviceFloatControlsPropertiesKHR` from the `VK_KHR_shader_float_controls` extension.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

New Enum Constants

- `VK_KHR_SPIRV_1_4_EXTENSION_NAME`
- `VK_KHR_SPIRV_1_4_SPEC_VERSION`

Issues

1. Should we have an extension specific to this SPIR-V version, or add a version-generic query for SPIR-V version? SPIR-V 1.4 does not need any other API changes.

RESOLVED: Just expose SPIR-V 1.4.

Most new SPIR-V versions introduce optionally-required capabilities or have implementation-defined limits, and would need more API and specification changes specific to that version to make them available in Vulkan. For example, to support the subgroup capabilities added in SPIR-V 1.3 required introducing `VkPhysicalDeviceSubgroupProperties` to allow querying the supported group operation categories, maximum supported subgroup size, etc. While we could expose the parts of a new SPIR-V version that do not need accompanying changes generically, we will still end up writing extensions specific to each version for the remaining parts. Thus the generic mechanism will not reduce future spec-writing effort. In addition, making it clear which parts of a future version are supported by the generic mechanism and which cannot be used without specific support would be difficult to get right ahead of time.

2. Can different stages of the same pipeline use shaders with different SPIR-V versions?

RESOLVED: Yes.

Mixing SPIR-V versions 1.0-1.3 in the same pipeline has not been disallowed, so it would be inconsistent to disallow mixing 1.4 with previous versions.. SPIR-V 1.4 does not introduce anything

that should cause new difficulties here.

3. Must Vulkan extensions corresponding to SPIR-V extensions that were promoted to core in 1.4 be enabled in order to use that functionality in a SPIR-V 1.4 module?

RESOLVED: No, with caveats.

The SPIR-V 1.4 module does not need to declare the SPIR-V extensions, since the functionality is now part of core, so there is no need to enable the Vulkan extension that allows SPIR-V modules to declare the SPIR-V extension. However, when the functionality that is now core in SPIR-V 1.4 is optionally supported, the query for support is provided by a Vulkan extension, and that query can only be used if the extension is enabled.

This applies to any SPIR-V version; specifically for SPIR-V 1.4 this only applies to the functionality from `SPV_KHR_float_controls`, which was made available in Vulkan by `VK_KHR_shader_float_controls`. Even though the extension was promoted in SPIR-V 1.4, the capabilities are still optional in implementations that support `VK_KHR_spirv_1_4`.

A SPIR-V 1.4 module does not need to enable `SPV_KHR_float_controls` in order to use the capabilities, so if the application has *a priori* knowledge that the implementation supports the capabilities, it does not need to enable `VK_KHR_shader_float_controls`. However, if it does not have this knowledge and has to query for support at runtime, it must enable `VK_KHR_shader_float_controls` in order to use `VkPhysicalDeviceFloatControlsPropertiesKHR`.

- David Neto, Google

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_storage_buffer_storage_class`

This extension provides a new SPIR-V `StorageBuffer` storage class. A `Block`-decorated object in this class is equivalent to a `BufferBlock`-decorated object in the `Uniform` storage class.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1.

Description

This extension modifies the original core synchronization APIs to simplify the interface and improve usability of these APIs. It also adds new pipeline stage and access flag types that extend into the 64-bit range, as we have run out within the 32-bit range. The new flags are identical to the old values within the 32-bit range, with new stages and bits beyond that.

Pipeline stages and access flags are now specified together in memory barrier structures, making the connection between the two more obvious. Additionally, scoping the pipeline stages into the barrier structs allows the use of the `MEMORY_READ` and `MEMORY_WRITE` flags without sacrificing precision. The per-stage access flags should be used to disambiguate specific accesses in a given stage or set of stages - for instance, between uniform reads and sampling operations.

Layout transitions have been simplified as well; rather than requiring a different set of layouts for depth/stencil/color attachments, there are generic `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` and `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR` layouts which are contextually applied based on the image format. For example, for a depth format image, `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR` is

equivalent to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`. `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR` also functionally replaces `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`.

Events are now more efficient, because they include memory dependency information when you set them on the device. Previously, this information was only known when waiting on an event, so the dependencies could not be satisfied until the wait occurred. That sometimes meant stalling the pipeline when the wait occurred. The new API provides enough information for implementations to satisfy these dependencies in parallel with other tasks.

Queue submission has been changed to wrap command buffers and semaphores in extensible structures, which incorporate changes from Vulkan 1.1, `VK_KHR_device_group`, and `VK_KHR_timeline_semaphore`. This also adds a pipeline stage to the semaphore signal operation, mirroring the existing pipeline stage specification for wait operations.

Other miscellaneous changes include:

- Events can now be specified as interacting only with the device, allowing more efficient access to the underlying object.
- Image memory barriers that do not perform an image layout transition can be specified by setting `oldLayout` equal to `newLayout`.
 - E.g. the old and new layout can both be set to `VK_IMAGE_LAYOUT_UNDEFINED`, without discarding data in the image.
- Queue family ownership transfer parameters are simplified in some cases.
- Where two synchronization commands need to be matched up (queue transfer operations, events), the dependency information specified in each place must now match completely for consistency.
- Extensions with commands or functions with a `VkPipelineStageFlags` or `VkPipelineStageFlagBits` parameter have had those APIs replaced with equivalents using `VkPipelineStageFlags2KHR`.
- The new event and barrier interfaces are now more extensible for future changes.
- Relevant pipeline stage masks can now be specified as empty with the new `VK_PIPELINE_STAGE_NONE_KHR` and `VK_PIPELINE_STAGE_2_NONE_KHR` values.
- `VkMemoryBarrier2KHR` can be chained to `VkSubpassDependency2`, overriding the original 32-bit stage and access masks.

- Extending `VkPipelineStageFlagBits2`:
 - `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

If `VK_KHR_acceleration_structure` is supported:

- Extending `VkAccessFlagBits2`:
 - `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`
 - `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`
- Extending `VkPipelineStageFlagBits2`:
 - `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

If `VK_KHR_fragment_shading_rate` is supported:

- Extending `VkAccessFlagBits2`:
 - `VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR`
- Extending `VkPipelineStageFlagBits2`:
 - `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

If `VK_KHR_ray_tracing_pipeline` is supported:

- Extending `VkPipelineStageFlagBits2`:
 - `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

If `VK_NV_device_diagnostic_checkpoints` is supported:

- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_CHECKPOINT_DATA_2_NV`
 - `VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_2_NV`

If `VK_NV_device_generated_commands` is supported:

- Extending `VkAccessFlagBits2`:
 - `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV`
 - `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV`
- Extending `VkPipelineStageFlagBits2`:

- `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV`

If `VK_NV_mesh_shader` is supported:

- Extending `VkPipelineStageFlagBits2`:
 - `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV`
 - `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV`

If `VK_NV_ray_tracing` is supported:

- Extending `VkAccessFlagBits2`:
 - `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_NV`
 - `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_NV`
- Extending `VkPipelineStageFlagBits2`:
 - `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_NV`
 - `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_NV`

If `VK_NV_shading_rate_image` is supported:

- Extending `VkAccessFlagBits2`:
 - `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV`
- Extending `VkPipelineStageFlagBits2`:
 - `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Description

This extension introduces a new type of semaphore that has an integer payload identifying a point in a timeline. Such timeline semaphores support the following operations:

- Host query - A host operation that allows querying the payload of the timeline semaphore.
- Host wait - A host operation that allows a blocking wait for a timeline semaphore to reach a specified value.
- Host signal - A host operation that allows advancing the timeline semaphore to a specified value.
- Device wait - A device operation that allows waiting for a timeline semaphore to reach a specified value.
- Device signal - A device operation that allows advancing the timeline semaphore to a specified value.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

 - `VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO_KHR`
 - `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO_KHR`
 - `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO_KHR`
 - `VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO_KHR`

Issues

1) Do we need a new object type for this?

RESOLVED: No, we just introduce a new type of semaphore object, as `VK_KHR_external_semaphore_win32` already uses semaphores as the destination for importing D3D12 fence objects, which are semantically close/identical to the proposed synchronization primitive.

2) What type of payload the new synchronization primitive has?

RESOLVED: A 64-bit unsigned integer that can only be set to strictly increasing values by signal operations and is not changed by wait operations.

3) Does the new synchronization primitive have the same signal-before-wait requirement as the existing semaphores do?

RESOLVED: No. Timeline semaphores support signaling and waiting entirely asynchronously. It is the responsibility of the client to avoid deadlock.

4) Does the new synchronization primitive allow resetting its payload?

RESOLVED: No, allowing the payload value to “go backwards” is problematic. Applications looking for reset behavior should create a new instance of the synchronization primitive instead.

5) How do we enable host waits on the synchronization primitive?

RESOLVED: Both a non-blocking query of the current payload value of the synchronization primitive, and a blocking wait operation are provided.

6) How do we enable device waits and signals on the synchronization primitive?

RESOLVED: Similar to `VK_KHR_external_semaphore_win32`, this extension introduces a new structure that can be chained to `VkSubmitInfo` to specify the values signaled semaphores should be set to, and the values waited semaphores need to reach.

7) Can the new synchronization primitive be used to synchronize presentation and swapchain image acquisition operations?

RESOLVED: Some implementations may have problems with supporting that directly, thus it is not allowed in this extension.

8) Do we want to support external sharing of the new synchronization primitive type?

RESOLVED: Yes. Timeline semaphore specific external sharing capabilities can be queried using `vkGetPhysicalDeviceExternalSemaphoreProperties` by chaining the new `VkSemaphoreTypeCreateInfoKHR` structure to its `pExternalSemaphoreInfo` structure. This allows having a different set of external semaphore handle types supported for timeline semaphores vs binary semaphores.

9) Do we need to add a host signal operation for the new synchronization primitive type?

RESOLVED: Yes. This helps in situations where one host thread submits a workload but another host thread has the information on when the workload is ready to be executed.

10) How should the new synchronization primitive interact with the ordering requirements of the original `VkSemaphore`?

RESOLVED: Prior to calling any command which **may** cause a wait operation on a binary semaphore, the client **must** ensure that the semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution.

11) Should we have separate feature bits for different sub-features of timeline semaphores?

RESOLVED: No. The only feature which cannot be supported universally is timeline semaphore import/export. For import/export, the client is already required to query available external handle types via `vkGetPhysicalDeviceExternalSemaphoreProperties` and provide the semaphore type by adding a `VkSemaphoreTypeCreateInfoKHR` structure to the `pNext` chain of `VkPhysicalDeviceExternalSemaphoreInfo` so no new feature bit is required.

Description

This extension enables tighter array and struct packing to be used with uniform buffers.

It modifies the alignment rules for uniform buffers, allowing for tighter packing of arrays and structures. This allows, for example, the std430 layout, as defined in [GLSL](#) to be supported in uniform buffers.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

- Jason Ekstrand, Intel
- Jesse Hall, Google

Description

The [VK_KHR_variable_pointers](#) extension allows implementations to indicate their level of support for the [SPV_KHR_variable_pointers](#) SPIR-V extension. The SPIR-V extension allows shader modules to use invocation-private pointers into uniform and/or storage buffers, where the pointer values can be dynamic and non-uniform.

The [SPV_KHR_variable_pointers](#) extension introduces two capabilities. The first, [VariablePointersStorageBuffer](#), **must** be supported by all implementations of this extension. The second, [VariablePointers](#), is optional.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted, however support for the [variablePointersStorageBuffer](#) feature is made optional. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceVariablePointerFeaturesKHR](#)

- [VkPhysicalDeviceVariablePointersFeaturesKHR](#)

New Enum Constants

- `VK_KHR_VARIABLE_POINTERS_EXTENSION_NAME`
- `VK_KHR_VARIABLE_POINTERS_SPEC_VERSION`
- Extending [VkStructureType](#):
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES_KHR`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTER_FEATURES_KHR`

New SPIR-V Capabilities

- [VariablePointers](#)
- [VariablePointersStorageBuffer](#)

Issues

1) Do we need an optional property for the SPIR-V [VariablePointersStorageBuffer](#) capability or should it be mandatory when this extension is advertised?

RESOLVED: Add it as a distinct feature, but make support mandatory. Adding it as a feature makes the extension easier to include in a future core API version. In the extension, the feature is mandatory, so that presence of the extension guarantees some functionality. When included in a core API version, the feature would be optional.

2) Can support for these capabilities vary between shader stages?

RESOLVED: No, if the capability is supported in any stage it must be supported in all stages.

3) Should the capabilities be features or limits?

RESOLVED: Features, primarily for consistency with other similar extensions.

- Jason Ekstrand, Intel

Description

This extension defines the `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT` and `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT` formats which are defined in other current graphics APIs.

This extension may be useful for building translation layers for those APIs or for porting applications that use these formats without having to resort to swizzles.

When `VK_EXT_custom_border_color` is used, these formats are not subject to the same restrictions for border color without format as with `VK_FORMAT_B4G4R4A4_UNORM_PACK16`.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDevice4444FormatsFeaturesEXT`

New Enum Constants

- `VK_EXT_4444_FORMATS_EXTENSION_NAME`
- `VK_EXT_4444_FORMATS_SPEC_VERSION`
- Extending `VkFormat`:
 - `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT`
 - `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT`

Promotion to Vulkan 1.3

This extension has been partially promoted. The format enumerants introduced by the extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, runtime support for these formats is optional in core Vulkan 1.3, while if this extension is supported, runtime support is mandatory. The feature structure is not promoted. The original enum names are still available as aliases of the core functionality.

Version History

Last Modified Date

2019-01-06

IP Status

No known IP claims.

Interactions and External Dependencies

- This extension requires `SPV_EXT_physical_storage_buffer`
- This extension provides API support for `GLSL_EXT_buffer_reference` and `GLSL_EXT_buffer_reference_uvec2`

Contributors

- Jeff Bolz, NVIDIA
- Neil Henning, AMD

- Tobias Hector, AMD
- Jason Ekstrand, Intel
- Baldur Karlsson, Valve

Description

This extension allows the application to query a 64-bit buffer device address value for a buffer, which can be used to access the buffer memory via the `PhysicalStorageBufferEXT` storage class in the `GL_EXT_buffer_reference` GLSL extension and `SPV_EXT_physical_storage_buffer` SPIR-V extension.

It also allows buffer device addresses to be provided by a trace replay tool, so that it matches the address used when the trace was captured.

New Commands

- `vkGetBufferDeviceAddressEXT`

New Structures

- `VkBufferDeviceAddressCreateInfoEXT`
- Extending `VkBufferCreateInfo`:
 - `VkBufferDeviceAddressCreateInfoEXT`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceBufferAddressFeaturesEXT`
 - `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT`

New Enum Constants

- `VK_EXT_BUFFER_DEVICE_ADDRESS_EXTENSION_NAME`
- `VK_EXT_BUFFER_DEVICE_ADDRESS_SPEC_VERSION`
- Extending `VkBufferCreateFlagBits`:
 - `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT`
- Extending `VkBufferUsageFlagBits`:
 - `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_EXT`
- Extending `VkResult`:
 - `VK_ERROR_INVALID_DEVICE_ADDRESS_EXT`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_CREATE_INFO_EXT`
 - `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO_EXT`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_ADDRESS_FEATURES_EXT`
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES_EXT`

New SPIR-V Capabilities

- `PhysicalStorageBufferAddressesEXT`

Issues

1) Where is `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_ADDRESS_FEATURES_EXT` and `VkPhysicalDeviceBufferAddressFeaturesEXT`?

RESOLVED: They were renamed as `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES_EXT` and `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT` accordingly for consistency. Even though, the old names can still be found in the generated header files for compatibility.

- Kyle Spagnoli, NVIDIA

Description

The `VK_EXT_debug_marker` extension is a device extension. It introduces concepts of object naming and tagging, for better tracking of Vulkan objects, as well as additional commands for recording annotations of named sections of a workload to aid organization and offline analysis in external tools.

New Commands

- `vkCmdDebugMarkerBeginEXT`
- `vkCmdDebugMarkerEndEXT`
- `vkCmdDebugMarkerInsertEXT`
- `vkDebugMarkerSetObjectNameEXT`
- `vkDebugMarkerSetObjectTagEXT`

New Structures

- `VkDebugMarkerMarkerInfoEXT`
- `VkDebugMarkerObjectNameInfoEXT`
- `VkDebugMarkerObjectTagInfoEXT`

New Enums

- `VkDebugReportObjectTypeEXT`

New Enum Constants

- `VK_EXT_DEBUG_MARKER_EXTENSION_NAME`
- `VK_EXT_DEBUG_MARKER_SPEC_VERSION`
- Extending `VkStructureType`:

- VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT
- VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_NAME_INFO_EXT
- VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_TAG_INFO_EXT

Examples

Example 1

Associate a name with an image, for easier debugging in external tools or with validation layers that can print a friendly name when referring to objects in error messages.

```
extern VkDevice device;
extern VkImage image;

// Must call extension functions through a function pointer:
PFN_vkDebugMarkerSetObjectNameEXT pfnDebugMarkerSetObjectNameEXT =
(PFN_vkDebugMarkerSetObjectNameEXT)vkGetDeviceProcAddr(device,
"vkDebugMarkerSetObjectNameEXT");

// Set a name on the image
const VkDebugMarkerObjectNameInfoEXT imageNameInfo =
{
    VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_NAME_INFO_EXT, // sType
    NULL, // pNext
    VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_EXT, // objectType
    (uint64_t)image, // object
    "Brick Diffuse Texture", // pObjectName
};

pfnDebugMarkerSetObjectNameEXT(device, &imageNameInfo);

// A subsequent error might print:
// Image 'Brick Diffuse Texture' (0xc0dec0dedeadbeef) is used in a
// command buffer with no memory bound to it.
```

Example 2

Annotating regions of a workload with naming information so that offline analysis tools can display a more usable visualisation of the commands submitted.

```
extern VkDevice device;
extern VkCommandBuffer commandBuffer;

// Must call extension functions through a function pointer:
PFN_vkCmdDebugMarkerBeginEXT pfnCmdDebugMarkerBeginEXT =
(PFN_vkCmdDebugMarkerBeginEXT)vkGetDeviceProcAddr(device, "vkCmdDebugMarkerBeginEXT");
PFN_vkCmdDebugMarkerEndEXT pfnCmdDebugMarkerEndEXT = (PFN_vkCmdDebugMarkerEndEXT)
vkGetDeviceProcAddr(device, "vkCmdDebugMarkerEndEXT");
```

```

PFN_vkCmdDebugMarkerInsertEXT pfnCmdDebugMarkerInsertEXT =
(PFN_vkCmdDebugMarkerInsertEXT)vkGetDeviceProcAddr(device,
"vkCmdDebugMarkerInsertEXT");

// Describe the area being rendered
const VkDebugMarkerMarkerInfoEXT houseMarker =
{
    VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT, // sType
    NULL, // pNext
    "Brick House", // pMarkerName
    { 1.0f, 0.0f, 0.0f, 1.0f }, // color
};

// Start an annotated group of calls under the 'Brick House' name
pfnCmdDebugMarkerBeginEXT(commandBuffer, &houseMarker);
{
    // A mutable structure for each part being rendered
    VkDebugMarkerMarkerInfoEXT housePartMarker =
    {
        VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT, // sType
        NULL, // pNext
        NULL, // pMarkerName
        { 0.0f, 0.0f, 0.0f, 0.0f }, // color
    };

    // Set the name and insert the marker
    housePartMarker.pMarkerName = "Walls";
    pfnCmdDebugMarkerInsertEXT(commandBuffer, &housePartMarker);

    // Insert the drawcall for the walls
    vkCmdDrawIndexed(commandBuffer, 1000, 1, 0, 0, 0);

    // Insert a recursive region for two sets of windows
    housePartMarker.pMarkerName = "Windows";
    pfnCmdDebugMarkerBeginEXT(commandBuffer, &housePartMarker);
    {
        vkCmdDrawIndexed(commandBuffer, 75, 6, 1000, 0, 0);
        vkCmdDrawIndexed(commandBuffer, 100, 2, 1450, 0, 0);
    }
    pfnCmdDebugMarkerEndEXT(commandBuffer);

    housePartMarker.pMarkerName = "Front Door";
    pfnCmdDebugMarkerInsertEXT(commandBuffer, &housePartMarker);

    vkCmdDrawIndexed(commandBuffer, 350, 1, 1650, 0, 0);

    housePartMarker.pMarkerName = "Roof";
    pfnCmdDebugMarkerInsertEXT(commandBuffer, &housePartMarker);

    vkCmdDrawIndexed(commandBuffer, 500, 1, 2000, 0, 0);
}

```

```
// End the house annotation started above  
pfnCmdDebugMarkerEndEXT(commandBuffer);
```

Issues

- 1) Should the tag or name for an object be specified using the `pNext` parameter in the object's `VkCreateInfo` structure?

RESOLVED: No. While this fits with other Vulkan patterns and would allow more type safety and future proofing against future objects, it has notable downsides. In particular passing the name at `VkCreateInfo` time does not allow renaming, prevents late binding of naming information, and does not allow naming of implicitly created objects such as queues and swapchain images.

- 2) Should the command annotation functions `vkCmdDebugMarkerBeginEXT` and `vkCmdDebugMarkerEndEXT` support the ability to specify a color?

RESOLVED: Yes. The functions have been expanded to take an optional color which can be used at will by implementations consuming the command buffer annotations in their visualisation.

- 3) Should the functions added in this extension accept an extensible structure as their parameter for a more flexible API, as opposed to direct function parameters? If so, which functions?

RESOLVED: Yes. All functions have been modified to take a structure type with extensible `pNext` pointer, to allow future extensions to add additional annotation information in the same commands.

Version History

- Revision 1, 2016-02-24 (Baldur Karlsson)
 - Initial draft, based on LunarG marker spec
- Revision 2, 2016-02-26 (Baldur Karlsson)
 - Renamed Dbg to DebugMarker in function names
 - Allow markers in secondary command buffers under certain circumstances
 - Minor language tweaks and edits
- Revision 3, 2016-04-23 (Baldur Karlsson)
 - Reorganise spec layout to closer match desired organisation
 - Added optional color to markers (both regions and inserted labels)
 - Changed functions to take extensible structs instead of direct function parameters
- Revision 4, 2017-01-31 (Baldur Karlsson)
 - Added explicit dependency on VK_EXT_debug_report
 - Moved definition of `VkDebugReportObjectTypeEXT` to debug report chapter.
 - Fixed typo in dates in revision history

Description

Due to the nature of the Vulkan interface, there is very little error information available to the developer and application. By enabling optional validation layers and using the `VK_EXT_debug_report` extension, developers **can** obtain much more detailed feedback on the application's use of Vulkan. This extension defines a way for layers and the implementation to call back to the application for events of interest to the application.

New Object Types

- [VkDebugReportCallbackEXT](#)

New Commands

 - [VK_STRUCTURE_TYPE_DEBUG_REPORT_CREATE_INFO_EXT](#)

If [Version 1.1](#) is supported:

- Extending [VkDebugReportObjectTypeEXT](#):
 - [VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_EXT](#)

- `VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_EXT`

Examples

`VK_EXT_debug_report` allows an application to register multiple callbacks with the validation layers. Some callbacks may log the information to a file, others may cause a debug break point or other application defined behavior. An application **can** register callbacks even when no validation layers are enabled, but they will only be called for loader and, if implemented, driver events.

To capture events that occur while creating or destroying an instance an application **can** link a `VkDebugReportCallbackCreateInfoEXT` structure to the `pNext` element of the `VkInstanceCreateInfo` structure given to `vkCreateInstance`.

Example uses: Create three callback objects. One will log errors and warnings to the debug console using Windows `OutputDebugString`. The second will cause the debugger to break at that callback when an error happens and the third will log warnings to stdout.

```

VkResult res;
VkDebugReportCallbackEXT cb1, cb2, cb3;

VkDebugReportCallbackCreateInfoEXT callback1 = {
    VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT, // sType
    NULL, // pNext
    VK_DEBUG_REPORT_ERROR_BIT_EXT | // flags
    VK_DEBUG_REPORT_WARNING_BIT_EXT,
    myOutputDebugString, // pfnCallback
    NULL // pUserData
};
res = vkCreateDebugReportCallbackEXT(instance, &callback1, &cb1);
if (res != VK_SUCCESS)
    /* Do error handling for VK_ERROR_OUT_OF_MEMORY */

callback.flags = VK_DEBUG_REPORT_ERROR_BIT_EXT;
callback.pfnCallback = myDebugBreak;
callback.pUserData = NULL;
res = vkCreateDebugReportCallbackEXT(instance, &callback, &cb2);
if (res != VK_SUCCESS)
    /* Do error handling for VK_ERROR_OUT_OF_MEMORY */

VkDebugReportCallbackCreateInfoEXT callback3 = {
    VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT, // sType
    NULL, // pNext
    VK_DEBUG_REPORT_WARNING_BIT_EXT, // flags
    mystdOutLogger, // pfnCallback
    NULL // pUserData
};
res = vkCreateDebugReportCallbackEXT(instance, &callback3, &cb3);
if (res != VK_SUCCESS)
    /* Do error handling for VK_ERROR_OUT_OF_MEMORY */

...

/* remove callbacks when cleaning up */
vkDestroyDebugReportCallbackEXT(instance, cb1);
vkDestroyDebugReportCallbackEXT(instance, cb2);
vkDestroyDebugReportCallbackEXT(instance, cb3);

```

Note

 In the initial release of the `VK_EXT_debug_report` extension, the token `VK_STRUCTURE_TYPE_DEBUG_REPORT_CREATE_INFO_EXT` was used. Starting in version 2 of the extension branch, `VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT` is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

Note

In the initial release of the `VK_EXT_debug_report` extension, the token `VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_EXT` was used. Starting in version 8 of the extension branch, `VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT_EXT` is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

Issues

1) What is the hierarchy / seriousness of the message flags? E.g. `ERROR > WARN > PERF_WARN ...`

RESOLVED: There is no specific hierarchy. Each bit is independent and should be checked via bitwise AND. For example:

```
if (localFlags & VK_DEBUG_REPORT_ERROR_BIT_EXT) {  
    process error message  
}  
if (localFlags & VK_DEBUG_REPORT_DEBUG_BIT_EXT) {  
    process debug message  
}
```

The validation layers do use them in a hierarchical way (`ERROR > WARN > PERF, WARN > DEBUG > INFO`) and they (at least at the time of this writing) only set one bit at a time. But it is not a requirement of this extension.

It is possible that a layer may intercept and change, or augment the flags with extension values the application's debug report handler may not be familiar with, so it is important to treat each flag independently.

2) Should there be a VU requiring `VkDebugReportCallbackCreateInfoEXT::flags` to be non-zero?

RESOLVED: It may not be very useful, but we do not need VU statement requiring the `VkDebugReportCallbackCreateInfoEXT::msgFlags` at create-time to be non-zero. One can imagine that apps may prefer it as it allows them to set the mask as desired - including nothing - at runtime without having to check.

3) What is the difference between `VK_DEBUG_REPORT_DEBUG_BIT_EXT` and `VK_DEBUG_REPORT_INFORMATION_BIT_EXT`?

RESOLVED: `VK_DEBUG_REPORT_DEBUG_BIT_EXT` specifies information that could be useful debugging the Vulkan implementation itself.

4) How do you compare handles returned by the `debug_report` callback to the application's handles?

RESOLVED: Due to the different nature of dispatchable and nondispatchable handles there is no generic way (that we know of) that works for common compilers with 32bit, 64bit, C and C++. We recommend applications use the same cast that the validation layers use:

+

```
reinterpret_cast<uint64_t &>(dispatchableHandle)
(uint64_t)(nondispatchableHandle)
```

+ This does require that the app treat dispatchable and nondispatchable handles differently.

Version History

- Revision 1, 2015-05-20 (Courtney Goetzenleuchter)
 - Initial draft, based on LunarG KHR spec, other KHR specs
- Revision 2, 2016-02-16 (Courtney Goetzenleuchter)
 - Update usage, documentation
- Revision 3, 2016-06-14 (Courtney Goetzenleuchter)
 - Update VK_EXT_DEBUG_REPORT_SPEC_VERSION to indicate added support for vkCreateInstance and vkDestroyInstance
- Revision 4, 2016-12-08 (Mark Lobodzinski)
 - Added Display_KHR, DisplayModeKHR extension objects
 - Added ObjectTable_NVX, IndirectCommandsLayout_NVX extension objects
 - Bumped spec revision
 - Retroactively added version history
- Revision 5, 2017-01-31 (Baldur Karlsson)
 - Moved definition of [VkDebugReportObjectTypeEXT](#) from debug marker chapter
- Revision 6, 2017-01-31 (Baldur Karlsson)
 - Added VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_KHR_EXT
- Revision 7, 2017-04-20 (Courtney Goeltzenleuchter)
 - Clarify wording and address questions from developers.
- Revision 8, 2017-04-21 (Courtney Goeltzenleuchter)
 - Remove unused enum VkDebugReportErrorEXT
- Revision 9, 2017-09-12 (Tobias Hector)
 - Added interactions with Vulkan 1.1
- Revision 10, 2020-12-14 (Courtney Goetzenleuchter)
 - Add issue 4 discussing matching handles returned by the extension, based on suggestion in public issue 368.

Other Extension Metadata

Last Modified Date

2017-10-02

Interactions and External Dependencies

- Promoted to Vulkan 1.2 Core
- This extension requires `SPV_EXT_descriptor_indexing`
- This extension provides API support for `GL_EXT_nonuniform_qualifier`

Contributors

- Jeff Bolz, NVIDIA
- Daniel Rakos, AMD
- Slawomir Grajewski, Intel
- Tobias Hector, Imagination Technologies

Description

This extension adds several small features which together enable applications to create large descriptor sets containing substantially all of their resources, and selecting amongst those resources with dynamic (non-uniform) indexes in the shader. There are feature enables and SPIR-V capabilities for non-uniform descriptor indexing in the shader, and non-uniform indexing in the

shader requires use of a new `NonUniformEXT` decoration defined in the `SPV_EXT_descriptor_indexing` SPIR-V extension. There are descriptor set layout binding creation flags enabling several features:

- Descriptors can be updated after they are bound to a command buffer, such that the execution of the command buffer reflects the most recent update to the descriptors.
- Descriptors that are not used by any pending command buffers can be updated, which enables writing new descriptors for frame N+1 while frame N is executing.
- Relax the requirement that all descriptors in a binding that is “statically used” must be valid, such that descriptors that are not accessed by a submission need not be valid and can be updated while that submission is executing.
- The final binding in a descriptor set layout can have a variable size (and unsized arrays of resources are allowed in the `GL_EXT_nonuniform_qualifier` and `SPV_EXT_descriptor_indexing` extensions).

Note that it is valid for multiple descriptor arrays in a shader to use the same set and binding number, as long as they are all compatible with the descriptor type in the pipeline layout. This means a single array binding in the descriptor set can serve multiple texture dimensionalities, or an array of buffer descriptors can be used with multiple different block layouts.

There are new descriptor set layout and descriptor pool creation flags that are required to opt in to the update-after-bind functionality, and there are separate `maxPerStage*` and `maxDescriptorSet*` limits that apply to these descriptor set layouts which **may** be much higher than the pre-existing limits. The old limits only count descriptors in non-updateAfterBind descriptor set layouts, and the new limits count descriptors in all descriptor set layouts in the pipeline layout.

New Structures

- Extending `VkDescriptorSetAllocateInfo`:
 - `VkDescriptorSetVariableDescriptorCountAllocateInfoEXT`
- Extending `VkDescriptorSetLayoutCreateInfo`:
 - `VkDescriptorSetLayoutBindingFlagsCreateInfoEXT`
- Extending `VkDescriptorSetLayoutSupport`:
 - `VkDescriptorSetVariableDescriptorCountLayoutSupportEXT`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
 - `VkPhysicalDeviceDescriptorIndexingPropertiesEXT`

New Enums

 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_PROPERTIES_EXT`

Promotion to Vulkan 1.2

Functionality in this extension is included in core Vulkan 1.2, with the EXT suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `descriptorIndexing` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

Description

In Vulkan, users can specify device-scope queue priorities. In some cases it may be useful to extend this concept to a system-wide scope. This extension provides a mechanism for callers to set their system-wide priority. The default queue priority is [VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT](#).

The driver implementation will attempt to skew hardware resource allocation in favour of the higher-priority task. Therefore, higher-priority work may retain similar latency and throughput characteristics even if the system is congested with lower priority work.

The global priority level of a queue shall take precedence over the per-process queue priority ([VkDeviceQueueCreateInfo::pQueuePriorities](#)).

Abuse of this feature may result in starving the rest of the system from hardware resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority ([VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT](#)) if the caller does not have sufficient privileges. In this scenario [VK_ERROR_NOT_PERMITTED_EXT](#) is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario [VK_ERROR_INITIALIZATION_FAILED](#) is returned.

2021-03-29

IP Status

No known IP claims.

Contributors

- Yiwei Zhang, Google

Description

This device extension allows applications to query the global queue priorities supported by a queue family. It allows implementations to report which global priority levels are treated differently by the implementation, instead of silently mapping multiple requested global priority levels to the same internal priority, or using device creation failure to signal that a requested priority is not supported. It is intended primarily for use by system integration along with certain platform-specific priority enforcement rules.

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceGlobalPriorityQueryFeaturesEXT](#)
- Extending [VkQueueFamilyProperties2](#):
 - [VkQueueFamilyGlobalPriorityPropertiesEXT](#)

New Enum Constants

- [VK_EXT_GLOBAL_PRIORITY_QUERY_EXTENSION_NAME](#)
- [VK_EXT_GLOBAL_PRIORITY_QUERY_SPEC_VERSION](#)
- [VK_MAX_GLOBAL_PRIORITY_SIZE_EXT](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GLOBAL_PRIORITY_QUERY_FEATURES_EXT](#)
 - [VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_EXT](#)

Issues

1) Can we additionally query whether a caller is permitted to acquire a specific global queue priority in this extension?

RESOLVED: No. Whether a caller has enough privilege goes with the OS, and the Vulkan driver cannot really guarantee that the privilege will not change in between this query and the actual queue creation call.

2) If more than 1 queue using global priority is requested, is there a good way to know which queue is failing the device creation?

RESOLVED: No. There is not a good way at this moment, and it is also not quite actionable for the applications to know that because the information may not be accurate. Queue creation can fail because of runtime constraints like insufficient privilege or lack of resource, and the failure is not necessarily tied to that particular queue configuration requested.

Description

This extension adds stricter requirements for how out of bounds reads from images are handled. Rather than returning undefined values, most out of bounds reads return R, G, and B values of zero and alpha values of either zero or one. Components not present in the image format may be set to zero or to values based on the format as described in [Conversion to RGBA](#).

New Structures

- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceImageRobustnessFeaturesEXT](#)

New Enum Constants

- [VK_EXT_IMAGE_ROBUSTNESS_EXTENSION_NAME](#)
- [VK_EXT_IMAGE_ROBUSTNESS_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ROBUSTNESS_FEATURES_EXT](#)

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Issues

1. How does this extension differ from VK_EXT_robustness2?

The guarantees provided by this extension are a subset of those provided by the robustImageAccess2 feature of VK_EXT_robustness2. Where this extension allows return values of (0, 0, 0, 0) or (0, 0, 0, 1), robustImageAccess2 requires that a particular value dependent on the image format be returned. This extension provides no guarantees about the values returned for an access to an invalid Lod.

Examples

None.

Description

This extension introduces the ability to back uniform blocks directly with descriptor sets by storing inline uniform data within descriptor pool storage. Compared to push constants this new construct allows uniform data to be reused across multiple disjoint sets of drawing or dispatching commands and **may** enable uniform data to be accessed with fewer indirections compared to uniforms backed by buffer memory.

New Structures

- Extending [VkDescriptorPoolCreateInfo](#):
 - [VkDescriptorPoolInlineUniformBlockCreateInfoEXT](#)
- Extending [VkPhysicalDeviceFeatures2](#), [VkDeviceCreateInfo](#):
 - [VkPhysicalDeviceInlineUniformBlockFeaturesEXT](#)
- Extending [VkPhysicalDeviceProperties2](#):
 - [VkPhysicalDeviceInlineUniformBlockPropertiesEXT](#)
- Extending [VkWriteDescriptorSet](#):
 - [VkWriteDescriptorSetInlineUniformBlockEXT](#)

New Enum Constants

- [VK_EXT_INLINE_UNIFORM_BLOCK_EXTENSION_NAME](#)
- [VK_EXT_INLINE_UNIFORM_BLOCK_SPEC_VERSION](#)
- Extending [VkDescriptorType](#):
 - [VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO_EXT](#)

- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_FEATURES_EXT`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_PROPERTIES_EXT`
- `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK_EXT`

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Vulkan 1.3 adds [additional functionality related to this extension](#) in the form of the `maxInlineUniformTotalSize` limit.

Issues

1) Do we need a new storage class for inline uniform blocks vs uniform blocks?

RESOLVED: No. The `Uniform` storage class is used to allow the same syntax used for both uniform buffers and inline uniform blocks.

2) Is the descriptor array index and array size expressed in terms of bytes or dwords for inline uniform block descriptors?

RESOLVED: In bytes, but both `must` be a multiple of 4, similar to how push constant ranges are specified. The `descriptorCount` of `VkDescriptorSetLayoutBinding` thus provides the total number of bytes a particular binding with an inline uniform block descriptor type can hold, while the `srcArrayElement`, `dstArrayElement`, and `descriptorCount` members of `VkWriteDescriptorSet`, `VkCopyDescriptorSet`, and `VkDescriptorUpdateTemplateEntry` (where applicable) specify the byte offset and number of bytes to write/copy to the binding's backing store. Additionally, the `stride` member of `VkDescriptorUpdateTemplateEntry` is ignored for inline uniform blocks and a default value of one is used, meaning that the data to update inline uniform block bindings with must be contiguous in memory.

3) What layout rules apply for uniform blocks corresponding to inline constants?

RESOLVED: They use the same layout rules as uniform buffers.

4) Do we need to add non-uniform indexing features/properties as introduced by `VK_EXT_descriptor_indexing` for inline uniform blocks?

RESOLVED: No, because inline uniform blocks are not allowed to be “arrayed”. A single binding with an inline uniform block descriptor type corresponds to a single uniform block instance and the array indices inside that binding refer to individual offsets within the uniform block (see issue #2). However, this extension does introduce new features/properties about the level of support for update-after-bind inline uniform blocks.

5) Is the `descriptorBindingVariableDescriptorCount` feature introduced by `VK_EXT_descriptor_indexing` supported for inline uniform blocks?

RESOLVED: Yes, as long as other inline uniform block specific limits are respected.

6) Do the robustness guarantees of `robustBufferAccess` apply to inline uniform block accesses?

RESOLVED: No, similarly to push constants, as they are not backed by buffer memory like uniform buffers.

Description

This extension adds flags to `Vk*PipelineCreateInfo` and `VkPipelineCacheCreateInfo` structures with the aim of improving the predictability of pipeline creation cost. The goal is to provide information about potentially expensive hazards within the client driver during pipeline creation to the application before carrying them out rather than after.

Background

Pipeline creation is a costly operation, and the explicit nature of the Vulkan design means that cost is not hidden from the developer. Applications are also expected to schedule, prioritize, and load balance all calls for pipeline creation. It is strongly advised that applications create pipelines sufficiently ahead of their usage. Failure to do so will result in an unresponsive application, intermittent stuttering, or other poor user experiences. Proper usage of pipeline caches and/or derivative pipelines help mitigate this but is not assured to eliminate disruption in all cases. In the event that an ahead-of-time creation is not possible, considerations should be taken to ensure that the current execution context is suitable for the workload of pipeline creation including possible shader compilation.

Applications making API calls to create a pipeline must be prepared for any of the following to occur:

- OS/kernel calls to be made by the ICD
- Internal memory allocation not tracked by the `pAllocator` passed to `vkCreate*Pipelines`
- Internal thread synchronization or yielding of the current thread's core
- Extremely long (multi-millisecond+), blocking, compilation times
- Arbitrary call stacks depths and stack memory usage

The job or task based game engines that are being developed to take advantage of explicit graphics APIs like Vulkan may behave exceptionally poorly if any of the above scenarios occur. However, most game engines are already built to “stream” in assets dynamically as the user plays the game. By adding control by way of `VkPipelineCreateFlags`, we can require an ICD to report back a failure in critical execution paths rather than forcing an unexpected wait.

Applications can prevent unexpected compilation by setting `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT` on `Vk*PipelineCreateInfo::flags`. When set, an ICD must not attempt pipeline or shader compilation to create the pipeline object. The ICD will return the result `VK_PIPELINE_COMPILE_REQUIRED_EXT`. An ICD may still return a valid `VkPipeline` object by either re-using existing pre-compiled objects such as those from a pipeline cache, or derivative pipelines.

By default `vkCreate*Pipelines` calls must attempt to create all pipelines before returning. Setting `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT` on `Vk*PipelineCreateInfo::flags` can be used as an escape hatch for batched pipeline creates.

Hidden locks also add to the unpredictability of the cost of pipeline creation. The most common case of locks inside the `vkCreate*Pipelines` is internal synchronization of the `VkPipelineCache` object. `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT` can be set when calling `vkCreatePipelineCache` to state the cache is [externally synchronized](#).

The hope is that armed with this information application and engine developers can leverage existing asset streaming systems to recover from "just-in-time" pipeline creation stalls.

Description

This extension is a device extension which enables attaching arbitrary payloads to Vulkan objects. It introduces the idea of private data slots as a means of storing a 64-bit unsigned integer of application defined data. Private data slots can be created or destroyed any time an associated device is available. Private data slots can be reserved at device creation time, and limiting use to the amount reserved will allow the extension to exhibit better performance characteristics.

Description

In unextended Vulkan, minification and magnification filters such as LINEAR allow sampled image lookups to return a filtered texel value produced by computing a weighted average of a collection of texels in the neighborhood of the texture coordinate provided.

This extension provides a new sampler parameter which allows applications to produce a filtered texel value by computing a component-wise minimum (MIN) or maximum (MAX) of the texels that would normally be averaged. The reduction mode is orthogonal to the minification and magnification filter parameters. The filter parameters are used to identify the set of texels used to produce a final filtered value; the reduction mode identifies how these texels are combined.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

- Graeme Leese
- Jason Ekstrand
- John Kessenich

Description

This extension enables C-like structure layout for SPIR-V blocks. It modifies the alignment rules for uniform buffers, storage buffers and push constants, allowing non-scalar types to be aligned solely based on the size of their components, without additional requirements.

Promotion to Vulkan 1.2

Functionality in this extension is included in core Vulkan 1.2, with the EXT suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `scalarBlockLayout` capability is optional. The original type, enum and command names are still available as aliases of the core functionality.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceScalarBlockLayoutFeaturesEXT`

New Enum Constants

- `VK_EXT_SCALAR_BLOCK_LAYOUT_EXTENSION_NAME`
- `VK_EXT_SCALAR_BLOCK_LAYOUT_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCALAR_BLOCK_LAYOUT_FEATURES_EXT`

Version History

- Revision 1, 2018-11-14 (Tobias Hector)
 - Initial draft

Interactions and External Dependencies

- This extension requires `SPV_EXT_demote_to_helper_invocation`
- This extension provides API support for `GL_EXT_demote_to_helper_invocation`

Contributors

- Jeff Bolz, NVIDIA

Description

This extension adds Vulkan support for the `SPV_EXT_demote_to_helper_invocation` SPIR-V extension. That SPIR-V extension provides a new instruction `OpDemoteToHelperInvocationEXT` allowing shaders to “demote” a fragment shader invocation to behave like a helper invocation for its duration. The demoted invocation will have no further side effects and will not output to the framebuffer, but remains active and can participate in computing derivatives and in `group operations`. This is a better match for the “discard” instruction in HLSL.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
 - `VkPhysicalDeviceShaderDemoteToHelperInvocationFeaturesEXT`

New Enum Constants

- `VK_EXT_SHADER_DEMOTE_TO_HELPER_INVOCATION_EXTENSION_NAME`
- `VK_EXT_SHADER_DEMOTE_TO_HELPER_INVOCATION_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DEMOTE_TO_HELPER_INVOCATION_FEATURES_EXT`

New SPIR-V Capability

- `DemoteToHelperInvocationEXT`

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Interactions and External Dependencies

- This extension requires [SPV_KHR_shader_ballot](#)
- This extension provides API support for [GL_ARB_shader_ballot](#)

Contributors

- Jeff Bolz, NVIDIA
- Neil Henning, Codeplay
- Daniel Koch, NVIDIA Corporation

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- [SPV_KHR_shader_ballot](#)

This extension provides the ability for a group of invocations, which execute in parallel, to do limited forms of cross-invocation communication via a group broadcast of a invocation value, or broadcast of a bitarray representing a predicate value from each invocation in the group.

This extension provides access to a number of additional built-in shader variables in Vulkan:

- [SubgroupEqMaskKHR](#), containing the subgroup mask of the current subgroup invocation,

- `SubgroupGeMaskKHR`, containing the subgroup mask of the invocations greater than or equal to the current invocation,
- `SubgroupGtMaskKHR`, containing the subgroup mask of the invocations greater than the current invocation,
- `SubgroupLeMaskKHR`, containing the subgroup mask of the invocations less than or equal to the current invocation,
- `SubgroupLtMaskKHR`, containing the subgroup mask of the invocations less than the current invocation,
- `SubgroupLocalInvocationId`, containing the index of an invocation within a subgroup, and
- `SubgroupSize`, containing the maximum number of invocations in a subgroup.

Additionally, this extension provides access to the new SPIR-V instructions:

- `OpSubgroupBallotKHR`,
- `OpSubgroupFirstInvocationKHR`, and
- `OpSubgroupReadInvocationKHR`,

When using GLSL source-based shader languages, the following variables and shader functions from `GL_ARB_shader_ballot` can map to these SPIR-V built-in decorations and instructions:

- `in uint64_t gl_SubGroupEqMaskARB;` → `SubgroupEqMaskKHR`,
- `in uint64_t gl_SubGroupGeMaskARB;` → `SubgroupGeMaskKHR`,
- `in uint64_t gl_SubGroupGtMaskARB;` → `SubgroupGtMaskKHR`,
- `in uint64_t gl_SubGroupLeMaskARB;` → `SubgroupLeMaskKHR`,
- `in uint64_t gl_SubGroupLtMaskARB;` → `SubgroupLtMaskKHR`,
- `in uint gl_SubGroupInvocationARB;` → `SubgroupLocalInvocationId`,
- `uniform uint gl_SubGroupSizeARB;` → `SubgroupSize`,
- `ballotARB()` → `OpSubgroupBallotKHR`,
- `readFirstInvocationARB()` → `OpSubgroupFirstInvocationKHR`, and
- `readInvocationARB()` → `OpSubgroupReadInvocationKHR`.

Deprecated by Vulkan 1.2

Most of the functionality in this extension is superseded by the core Vulkan 1.1 [subgroup operations](#). However, Vulkan 1.1 required the `OpGroupNonUniformBroadcast` “`Id`” to be constant. This restriction was removed in Vulkan 1.2 with the addition of the `subgroupBroadcastDynamicId` feature.

New Enum Constants

- `VK_EXT_SHADER_SUBGROUP_BALLOT_EXTENSION_NAME`
- `VK_EXT_SHADER_SUBGROUP_BALLOT_SPEC_VERSION`

New Built-In Variables

- `SubgroupEqMaskKHR`
- `SubgroupGeMaskKHR`
- `SubgroupGtMaskKHR`
- `SubgroupLeMaskKHR`
- `SubgroupLtMaskKHR`
- `SubgroupLocalInvocationId`
- `SubgroupSize`

New SPIR-V Capabilities

- `SubgroupBallotKHR`

Interactions and External Dependencies

- This extension requires [SPV_KHR_subgroup_vote](#)
- This extension provides API support for [GL_ARB_shader_group_vote](#)

Contributors

- Neil Henning, Codeplay
- Daniel Koch, NVIDIA Corporation

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- [SPV_KHR_subgroup_vote](#)

This extension provides new SPIR-V instructions:

- [OpSubgroupAllKHR](#),
- [OpSubgroupAnyKHR](#), and
- [OpSubgroupAllEqualKHR](#).

to compute the composite of a set of boolean conditions across a group of shader invocations that are running concurrently (a *subgroup*). These composite results may be used to execute shaders more efficiently on a [VkPhysicalDevice](#).

When using GLSL source-based shader languages, the following shader functions from [GL_ARB_shader_group_vote](#) can map to these SPIR-V instructions:

- [anyInvocationARB\(\)](#) → [OpSubgroupAnyKHR](#),
- [allInvocationsARB\(\)](#) → [OpSubgroupAllKHR](#), and
- [allInvocationsEqualARB\(\)](#) → [OpSubgroupAllEqualKHR](#).

The subgroup across which the boolean conditions are evaluated is implementation-dependent, and this extension provides no guarantee over how individual shader invocations are assigned to subgroups. In particular, a subgroup has no necessary relationship with the compute shader *local workgroup*—any pair of shader invocations in a compute local workgroup may execute in different subgroups as used by these instructions.

Compute shaders operate on an explicitly specified group of threads (a local workgroup), but many implementations will also group non-compute shader invocations and execute them concurrently. When executing code like

```
if (condition) {
    result = do_fast_path();
} else {
    result = do_general_path();
}
```

where `condition` diverges between invocations, an implementation might first execute `do_fast_path()` for the invocations where `condition` is true and leave the other invocations dormant. Once `do_fast_path()` returns, it might call `do_general_path()` for invocations where `condition` is `false` and leave the other invocations dormant. In this case, the shader executes **both** the fast and the general path and might be better off just using the general path for all invocations.

This extension provides the ability to avoid divergent execution by evaluating a condition across an entire subgroup using code like:

```
if (allInvocationsARB(condition)) {
    result = do_fast_path();
} else {
    result = do_general_path();
}
```

The built-in function `allInvocationsARB()` will return the same value for all invocations in the group, so the group will either execute `do_fast_path()` or `do_general_path()`, but never both. For example, shader code might want to evaluate a complex function iteratively by starting with an approximation of the result and then refining the approximation. Some input values may require a small number of iterations to generate an accurate result (`do_fast_path`) while others require a larger number (`do_general_path`). In another example, shader code might want to evaluate a complex function (`do_general_path`) that can be greatly simplified when assuming a specific value for one of its inputs (`do_fast_path`).

Deprecated by Vulkan 1.1

All functionality in this extension is superseded by the core Vulkan 1.1 [subgroup operations](#).

Description

This extension adds support for the `ShaderViewportIndexLayerEXT` capability from the `SPV_EXT_shader_viewport_index_layer` extension in Vulkan.

This extension allows variables decorated with the `Layer` and `ViewportIndex` built-ins to be exported from vertex or tessellation shaders, using the `ShaderViewportIndexLayerEXT` capability.

When using GLSL source-based shading languages, the `gl_ViewportIndex` and `gl_Layer` built-in variables map to the SPIR-V `ViewportIndex` and `Layer` built-in decorations, respectively. Behaviour of these variables is extended as described in the `GL_ARB_shader_viewport_layer_array` (or the precursor `GL_AMD_vertex_shader_layer`, `GL_AMD_vertex_shader_viewport_index`, and `GL_NV_viewport_array2` extensions).

Note

The `ShaderViewportIndexLayerEXT` capability is equivalent to the `ShaderViewportIndexLayerNV` capability added by `VK_NV_viewport_array2`.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2.

The single `ShaderViewportIndexLayerEXT` capability from the `SPV_EXT_shader_viewport_index_layer` extension is replaced by the `ShaderViewportIndex` and `ShaderLayer` capabilities from SPIR-V 1.5 which are enabled by the `shaderOutputViewportIndex` and `shaderOutputLayer` features, respectively. Additionally, if Vulkan 1.2 is supported but this extension is not, these capabilities are optional.

Enabling both features is equivalent to enabling the `VK_EXT_shader_viewport_index_layer` extension.

New Enum Constants

- `VK_EXT_SHADER_VIEWPORT_INDEX_LAYER_EXTENSION_NAME`
- `VK_EXT_SHADER_VIEWPORT_INDEX_LAYER_SPEC_VERSION`

Description

This extension enables an implementation to control the subgroup size by allowing a varying subgroup size and also specifying a required subgroup size.

It extends the subgroup support in Vulkan 1.1 to allow an implementation to expose a varying subgroup size. Previously Vulkan exposed a single subgroup size per physical device, with the expectation that implementations will behave as if all subgroups have the same size. Some implementations **may** dispatch shaders with a varying subgroup size for different subgroups. As a result they could implicitly split a large subgroup into smaller subgroups or represent a small subgroup as a larger subgroup, some of whose invocations were inactive on launch.

To aid developers in understanding the performance characteristics of their programs, this extension exposes a minimum and maximum subgroup size that a physical device supports and a pipeline create flag to enable that pipeline to vary its subgroup size. If enabled, any **SubgroupSize** decorated variables in the SPIR-V shader modules provided to pipeline creation **may** vary between the **minimum** and **maximum** subgroup sizes.

An implementation is also optionally allowed to support specifying a required subgroup size for a given pipeline stage. Implementations advertise which **stages support a required subgroup size**, and any pipeline of a supported stage can be passed a **VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT** structure to set the subgroup size for that shader stage of the pipeline. For compute shaders, this requires the developer to query the **maxComputeWorkgroupSubgroups** and ensure that:

$s = WorkGroupSize.x \times WorkGroupSize.y \times WorkgroupSize.z \leq SubgroupSize \times maxComputeWorkgroupSubgroups$

Developers can also specify a new pipeline shader stage create flag that requires the implementation to have fully populated subgroups within local workgroups. This requires the workgroup size in the X dimension to be a multiple of the subgroup size.

 - [VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK_EXT](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXTURE_COMPRESSION_ASTC_HDR_FEATURES_EXT](#)

Promotion to Vulkan 1.3

This extension has been partially promoted. Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. However, the feature is made optional in Vulkan 1.3. The original type, enum and command names are still available as aliases of the core functionality.

Issues

1) Should we add a feature or limit for this functionality?

Yes. It is consistent with the ASTC LDR support to add a feature like `textureCompressionASTC_HDR`.

The feature is strictly speaking redundant as long as this is just an extension; it would be sufficient to just enable the extension. But adding the feature is more forward-looking if wanted to make this

an optional core feature in the future.

2) Should we introduce new format enums for HDR?

Yes. Vulkan 1.0 describes the ASTC format enums as UNORM, e.g. `VK_FORMAT_ASTC_4x4_UNORM_BLOCK`, so it is confusing to make these contain HDR data. Note that the OpenGL (ES) extensions did not make this distinction because a single ASTC HDR texture may contain both unorm and float blocks. Implementations **may** not be able to distinguish between LDR and HDR ASTC textures internally and just treat them as the same format, i.e. if this extension is supported then sampling from a `VK_FORMAT_ASTC_4x4_UNORM_BLOCK` image format **may** return HDR results. Applications **can** get predictable results by using the appropriate image format.

Description

When an error occurs during application development, a common question is "What tools are actually running right now?" This extension adds the ability to query that information directly from the Vulkan implementation.

Outdated versions of one tool might not play nicely with another, or perhaps a tool is not actually running when it should have been. Trying to figure that out can cause headaches as it is necessary to consult each known tool to figure out what is going on—in some cases the tool might not even be known.

Typically, the expectation is that developers will simply print out this information for visual inspection when an issue occurs, however a small amount of semantic information about what the tool is doing is provided to help identify it programmatically. For example, if the advertised limits or features of an implementation are unexpected, is there a tool active which modifies these limits? Or if an application is providing debug markers, but the implementation is not actually doing anything with that information, this can quickly point that out.

Examples

Printing Tool Information

```
uint32_t num_tools;
VkPhysicalDeviceToolPropertiesEXT *pToolProperties;
vkGetPhysicalDeviceToolPropertiesEXT(physicalDevice, &num_tools, NULL);

pToolProperties =
(VkPhysicalDeviceToolPropertiesEXT*)malloc(sizeof(VkPhysicalDeviceToolPropertiesEXT) *
num_tools);

vkGetPhysicalDeviceToolPropertiesEXT(physicalDevice, &num_tools, pToolProperties);

for (int i = 0; i < num_tools; ++i) {
    printf("%s:\n", pToolProperties[i].name);
    printf("Version:\n");
    printf("%s:\n", pToolProperties[i].version);
    printf("Description:\n");
    printf("\t%s\n", pToolProperties[i].description);
    printf("Purposes:\n");
    printf("\t%s\n", VkToolPurposeFlagBitsEXT_to_string(pToolProperties[i].purposes));
    if (strnlen_s(pToolProperties[i].layer, VK_MAX_EXTENSION_NAME_SIZE) > 0) {
        printf("Corresponding Layer:\n");
        printf("\t%s\n", pToolProperties[i].layer);
    }
}
```

Issues

- 1) Why is this information separate from the layer mechanism?

Some tooling may be built into a driver, or be part of the Vulkan loader etc. Tying this information directly to layers would have been awkward at best.

Other Extension Metadata

Last Modified Date

2019-08-19

IP Status

No known IP claims.

Contributors

- Tobin Ehlis, Google

- Courtney Goeltzenleuchter, Google

Description

This extension provides the `VkValidationFlagsEXT` struct that can be included in the `pNext` chain of the `VkInstanceCreateInfo` structure passed as the `pCreateInfo` parameter of `vkCreateInstance`. The structure contains an array of `VkValidationCheckEXT` values that will be disabled by the validation layers.

Deprecation by `VK_EXT_validation_features`

Functionality in this extension is subsumed into the `VK_EXT_validation_features` extension.

New Structures

- Extending `VkInstanceCreateInfo`:
 - `VkValidationFlagsEXT`

New Enums

- `VkValidationCheckEXT`

New Enum Constants

- `VK_EXT_VALIDATION_FLAGS_EXTENSION_NAME`
- `VK_EXT_VALIDATION_FLAGS_SPEC_VERSION`
- Extending `VkStructureType`:
 - `VK_STRUCTURE_TYPE_VALIDATION_FLAGS_EXT`

Version History

 - [VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16_EXT](#)

- VK_FORMAT_G16_B16R16_2PLANE_444_UNORM_EXT
 - VK_FORMAT_G8_B8R8_2PLANE_444_UNORM_EXT
- Extending `VkStructureType`:
 - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_2_PLANE_444_FORMATS_FEATURES_EXT

Promotion to Vulkan 1.3

This extension has been partially promoted. The format enumerants introduced by the extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, runtime support for these formats is optional in core Vulkan 1.3, while if this extension is supported, runtime support is mandatory. The feature structure is not promoted. The original enum names are still available as aliases of the core functionality.

Description

This extension allows an application to specify a negative viewport height. The result is that the viewport transformation will flip along the y-axis.

- Allow negative height to be specified in the `VkViewport::height` field to perform y-inversion of the clip-space to framebuffer-space transform. This allows apps to avoid having to use `gl_Position.y = -gl_Position.y` in shaders also targeting other APIs.

Obsoletion by [VK_KHR_maintenance1](#) and [Vulkan 1.1](#)

Functionality in this extension is included in [VK_KHR_maintenance1](#) and subsequently Vulkan 1.1. Due to some slight behavioral differences, this extension **must** not be enabled alongside [VK_KHR_maintenance1](#), or in an instance created with version 1.1 or later requested in `VkApplicationInfo::apiVersion`.

Description

This extension allows device memory to be allocated for a particular buffer or image resource, which on some devices can significantly improve the performance of that resource. Normal device memory allocations must support memory aliasing and sparse binding, which could interfere with optimizations like framebuffer compression or efficient page table usage. This is important for render targets and very large resources, but need not (and probably should not) be used for smaller resources that can benefit from suballocation.

This extension adds a few small structures to resource creation and memory allocation: a new structure that flags whether an image/buffer will have a dedicated allocation, and a structure indicating the image or buffer that an allocation will be bound to.

New Structures

- Extending [VkBufferCreateInfo](#):
 - [VkDedicatedAllocationBufferCreateInfoNV](#)
- Extending [VkImageCreateInfo](#):
 - [VkDedicatedAllocationImageCreateInfoNV](#)
- Extending [VkMemoryAllocateInfo](#):
 - [VkDedicatedAllocationMemoryAllocateInfoNV](#)

New Enum Constants

- [VK_NV_DEDICATED_ALLOCATION_EXTENSION_NAME](#)
- [VK_NV_DEDICATED_ALLOCATION_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_BUFFER_CREATE_INFO_NV](#)
 - [VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV](#)
 - [VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV](#)

Examples

```
// Create an image with
// VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation
// set to VK_TRUE

VkDedicatedAllocationImageCreateInfoNV dedicatedImageInfo =
{
    VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV,           // sType
    NULL,                                                               // pNext
    VK_TRUE,                                                            // dedicatedAllocation
};

VkImageCreateInfo imageCreateInfo =
{
    VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO,          // sType
    &dedicatedImageInfo,                      // pNext
    // Other members set as usual
};

VkImage image;
VkResult result = vkCreateImage(
    device,
    &imageCreateInfo,
    NULL,                                     // pAllocator
    &image);

VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(
    device,
    image,
    &memoryRequirements);

// Allocate memory with VkDedicatedAllocationMemoryAllocateCreateInfoNV::image
// pointing to the image we are allocating the memory for

VkDedicatedAllocationMemoryAllocateCreateInfoNV dedicatedInfo =
{
    VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV,           // sType
    NULL,                                                               // pNext
    image,                                                               // image
    VK_NULL_HANDLE,                                         // buffer
};
```

```

VkMemoryAllocateInfo memoryAllocateInfo =
{
    VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO,           // sType
    &dedicatedInfo,                                // pNext
    memoryRequirements.size,                        // allocationSize
    FindMemoryTypeIndex(memoryRequirements.memoryTypeBits), // memoryTypeIndex
};

VkDeviceMemory memory;
vkAllocateMemory(
    device,
    &memoryAllocateInfo,
    NULL,                                         // pAllocator
    &memory);

// Bind the image to the memory

vkBindImageMemory(
    device,
    image,
    memory,
    0);

```

Description

Applications may wish to export memory to other Vulkan instances or other APIs, or import memory from other Vulkan instances or other APIs to enable Vulkan workloads to be split up across application module, process, or API boundaries. This extension enables applications to create exportable Vulkan memory objects such that the underlying resources can be referenced outside the Vulkan instance that created them.

New Structures

- Extending [VkImageCreateInfo](#):
 - [VkExternalMemoryImageCreateInfoNV](#)
- Extending [VkMemoryAllocateInfo](#):
 - [VkExportMemoryAllocateInfoNV](#)

New Enum Constants

- [VK_NV_EXTERNAL_MEMORY_EXTENSION_NAME](#)
- [VK_NV_EXTERNAL_MEMORY_SPEC_VERSION](#)
- Extending [VkStructureType](#):
 - [VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_NV](#)
 - [VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO_NV](#)

Issues

1) If memory objects are shared between processes and APIs, is this considered aliasing according to the rules outlined in the [Memory Aliasing](#) section?

RESOLVED: Yes, but strict exceptions to the rules are added to allow some forms of aliasing in these cases. Further, other extensions may build upon these new aliasing rules to define specific support usage within Vulkan for imported native memory objects, or memory objects from other APIs.

2) Are new image layouts or metadata required to specify image layouts and layout transitions compatible with non-Vulkan APIs, or with other instances of the same Vulkan driver?

RESOLVED: No. Separate instances of the same Vulkan driver running on the same GPU should have identical internal layout semantics, so applications have the tools they need to ensure views of images are consistent between the two instances. Other APIs will fall into two categories: Those that are Vulkan compatible (a term to be defined by subsequent interoperability extensions), or Vulkan incompatible. When sharing images with Vulkan incompatible APIs, the Vulkan image must be transitioned to the [VK_IMAGE_LAYOUT_GENERAL](#) layout before handing it off to the external API.

Note this does not attempt to address cross-device transitions, nor transitions to engines on the same device which are not visible within the Vulkan API. Both of these are beyond the scope of this extension.

Examples

```
// TODO: Write some sample code here.
```

Description

Applications may wish to import memory from the Direct 3D API, or export memory to other Vulkan instances. This extension provides a set of capability queries that allow applications determine what types of win32 memory handles an implementation supports for a given set of use cases.

New Commands

- [vkGetPhysicalDeviceExternalImageFormatPropertiesNV](#)

New Structures

- [VkExternalImageFormatPropertiesNV](#)

New Enums

- [VkExternalMemoryFeatureFlagBitsNV](#)
- [VkExternalMemoryHandleTypeFlagBitsNV](#)

New Bitmasks

- [VkExternalMemoryFeatureFlagsNV](#)
- [VkExternalMemoryHandleTypeFlagsNV](#)

New Enum Constants

- [VK_NV_EXTERNAL_MEMORY_CAPABILITIES_EXTENSION_NAME](#)
- [VK_NV_EXTERNAL_MEMORY_CAPABILITIES_SPEC_VERSION](#)

Issues

1) Why do so many external memory capabilities need to be queried on a per-memory-handle-type basis?

RESOLVED: This is because some handle types are based on OS-native objects that have far more limited capabilities than the very generic Vulkan memory objects. Not all memory handle types can name memory objects that support 3D images, for example. Some handle types cannot even support the deferred image and memory binding behavior of Vulkan and require specifying the image when allocating or importing the memory object.

2) Does the [VkExternalImageFormatPropertiesNV](#) struct need to include a list of memory type bits that support the given handle type?

RESOLVED: No. The memory types that do not support the handle types will simply be filtered out of the results returned by [vkGetImageMemoryRequirements](#) when a set of handle types was specified at image creation time.

3) Should the non-opaque handle types be moved to their own extension?

RESOLVED: Perhaps. However, defining the handle type bits does very little and does not require any platform-specific types on its own, and it is easier to maintain the bitmask values in a single extension for now. Presumably more handle types could be added by separate extensions though, and it would be mildly weird to have some platform-specific ones defined in the core spec and some in extensions

1) If memory objects are shared between processes and APIs, is this considered aliasing according to the rules outlined in the [Memory Aliasing](#) section?

RESOLVED: Yes, but strict exceptions to the rules are added to allow some forms of aliasing in these cases. Further, other extensions may build upon these new aliasing rules to define specific support usage within Vulkan for imported native memory objects, or memory objects from other APIs.

2) Are new image layouts or metadata required to specify image layouts and layout transitions compatible with non-Vulkan APIs, or with other instances of the same Vulkan driver?

RESOLVED: No. Separate instances of the same Vulkan driver running on the same GPU should have identical internal layout semantics, so applications have the tools they need to ensure views of images are consistent between the two instances. Other APIs will fall into two categories: Those that are Vulkan compatible (a term to be defined by subsequent interoperability extensions), or Vulkan incompatible. When sharing images with Vulkan incompatible APIs, the Vulkan image must be transitioned to the `VK_IMAGE_LAYOUT_GENERAL` layout before handing it off to the external API.

Note this does not attempt to address cross-device transitions, nor transitions to engines on the same device which are not visible within the Vulkan API. Both of these are beyond the scope of this extension.

3) Do applications need to call `CloseHandle()` on the values returned from `vkGetMemoryWin32HandleNV` when `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV`?

RESOLVED: Yes, unless it is passed back in to another driver instance to import the object. A successful get call transfers ownership of the handle to the application, while an import transfers ownership to the associated driver. Destroying the memory object will not destroy the handle or the handle's reference to the underlying memory resource.

Examples

```
//  
// Create an exportable memory object and export an external  
// handle from it.  
  
//  
  
// Pick an external format and handle type.
```

```

static const VkFormat format = VK_FORMAT_R8G8B8A8_UNORM;

VK_NV_gsl_shader

Name String

`VK_NV_gsl_shader`

Extension Type

Device extension

Registered Extension Number

13

Revision

1

Extension and Version Dependencies

- Requires Vulkan 1.0

Deprecation state

- Deprecated* without replacement

Contact

- Piers Daniell [Opdaniell-nv](#)

Other Extension Metadata

Last Modified Date

2016-02-14

IP Status

No known IP claims.

Contributors

- Piers Daniell, NVIDIA

Description

This extension allows GLSL shaders written to the [GL_KHR_vulkan_glsl](#) extension specification to be used instead of SPIR-V. The implementation will automatically detect whether the shader is SPIR-V or GLSL, and compile it appropriately.

Deprecation

Functionality in this extension is outside of the scope of Vulkan and is better served by a compiler library such as [glslang](#). No new implementations will support this extension, so applications **should** not use it.

New Enum Constants

- [VK_NV_GLSL_SHADER_EXTENSION_NAME](#)
- [VK_NV_GLSL_SHADER_SPEC_VERSION](#)
- Extending [VkResult](#):
 - [VK_ERROR_INVALID_SHADER_NV](#)

Examples

Example 1

Passing in GLSL code

```

char const vss[] =
    "#version 450 core\n"
    "layout(location = 0) in vec2 aVertex;\n"
    "layout(location = 1) in vec4 aColor;\n"
    "out vec4 vColor;\n"
    "void main()\n"
    "{\n        vColor = aColor;\n        gl_Position = vec4(aVertex, 0, 1);\n    }\n"
;
VkShaderModuleCreateInfo vertexShaderInfo = {
VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO };
vertexShaderInfo.codeSize = sizeof vss;
vertexShaderInfo.pCode = vss;
VkShaderModule vertexShader;
vkCreateShaderModule(device, &vertexShaderInfo, 0, &vertexShader);

Description

Applications that wish to import Direct3D 11 memory objects into the Vulkan API may wish to use the native keyed mutex mechanism to synchronize access to the memory between Vulkan and Direct3D. This extension provides a way for an application to access the keyed mutex associated with an imported Vulkan memory object when submitting command buffers to a queue.

Version History

- Revision 2, 2016-08-11 (James Jones)
 - Updated sample code based on the NV external memory extensions.
 - Renamed from NVX to NV extension.
 - Added Overview and Description sections.
 - Updated sample code to use the NV external memory extensions.
- Revision 1, 2016-06-14 (Carsten Rohde)
 - Initial draft.

Appendix F: Vulkan Roadmap Milestones

Roadmap milestones are intended to be supported by mid-to-high-end smartphones, tablets, laptops, consoles, and desktop devices.

Each milestone indicates support for a set of extensions, features, limits, and formats across these devices, and should be supported by all such new hardware shipping by the end of the target year or shortly thereafter.

Roadmap 2022

The Roadmap 2022 milestone is intended to be supported by newer mid-to-high-end devices shipping in 2022 or shortly thereafter across mainstream smartphone, tablet, laptops, console and desktop devices.

Required API versions

This profile requires Vulkan 1.3.

Required Features

The following core optional features are required to be supported:

- Vulkan 1.0 Optional Features
 - `fullDrawIndexUint32`
 - `imageCubeArray`
 - `independentBlend`
 - `sampleRateShading`
 - `drawIndirectFirstInstance`
 - `depthClamp`
 - `depthBiasClamp`
 - `samplerAnisotropy`
 - `occlusionQueryPrecise`
 - `fragmentStoresAndAtomics`
 - `shaderStorageImageExtendedFormats`
 - `shaderUniformBufferArrayDynamicIndexing`
 - `shaderSampledImageArrayDynamicIndexing`
 - `shaderStorageBufferArrayDynamicIndexing`
 - `shaderStorageImageArrayDynamicIndexing`
- Vulkan 1.1 Optional Features
 - `samplerYcbcrConversion`

- Vulkan 1.2 Optional Features
 - `samplerMirrorClampToEdge`
 - `descriptorIndexing`
 - `shaderUniformTexelBufferArrayDynamicIndexing`
 - `shaderStorageTexelBufferArrayDynamicIndexing`
 - `shaderUniformBufferArrayNonUniformIndexing`
 - `shaderSampledImageArrayNonUniformIndexing`
 - `shaderStorageBufferArrayNonUniformIndexing`
 - `shaderStorageImageArrayNonUniformIndexing`
 - `shaderUniformTexelBufferArrayNonUniformIndexing`
 - `shaderStorageTexelBufferArrayNonUniformIndexing`
 - `descriptorBindingSampledImageUpdateAfterBind`
 - `descriptorBindingStorageImageUpdateAfterBind`
 - `descriptorBindingStorageBufferUpdateAfterBind`
 - `descriptorBindingUniformTexelBufferUpdateAfterBind`
 - `descriptorBindingStorageTexelBufferUpdateAfterBind`
 - `descriptorBindingUpdateUnusedWhilePending`
 - `descriptorBindingPartiallyBound`
 - `descriptorBindingVariableDescriptorCount`
 - `runtimeDescriptorArray`
 - `scalarBlockLayout`

Required Limits

The following core increased limits are **required**

Table 93. Vulkan 1.0 Limits

Limit Name	Unsuppo rted Limit	Core Limit	Profile Limit	Limit Type ¹
<code>maxImageDimension1D</code>	-	4096	8192	min
<code>maxImageDimension2D</code>	-	4096	8192	min

Required extensions

The following extensions are **required**

[VK_KHR_global_priority](#)

Appendix G: API Boilerplate

This appendix defines Vulkan API features that are infrastructure required for a complete functional description of Vulkan, but do not logically belong elsewhere in the Specification.

Vulkan Header Files

Vulkan is defined as an API in the C99 language. Khronos provides a corresponding set of header files for applications using the API, which may be used in either C or C++ code. The interface descriptions in the specification are the same as the interfaces defined in these header files, and both are derived from the `vk.xml` XML API Registry, which is the canonical machine-readable description of the Vulkan API. The Registry, scripts used for processing it into various forms, and documentation of the registry schema are available as described at <https://www.khronos.org/registry/vulkan/#apiregistry>.

Language bindings for other languages can be defined using the information in the Specification and the Registry. Khronos does not provide any such bindings, but third-party developers have created some additional bindings.

Vulkan Combined API Header `vulkan.h` (Informative)

Applications normally will include the header `vulkan.h`. In turn, `vulkan.h` always includes the following headers:

- `vk_platform.h`, defining platform-specific macros and headers.
- `vulkan_core.h`, defining APIs for the Vulkan core and all registered extensions *other* than `window system-specific` and `provisional` extensions, which are included in separate header files.

In addition, specific preprocessor macros defined at the time `vulkan.h` is included cause header files for the corresponding window system-specific and provisional interfaces to be included, as described below.

Vulkan Platform-Specific Header `vk_platform.h` (Informative)

Platform-specific macros and interfaces are defined in `vk_platform.h`. These macros are used to control platform-dependent behavior, and their exact definitions are under the control of specific platforms and Vulkan implementations.

Platform-Specific Calling Conventions

On many platforms the following macros are empty strings, causing platform- and compiler-specific default calling conventions to be used.

`VKAPI_ATTR` is a macro placed before the return type in Vulkan API function declarations. This macro controls calling conventions for C++11 and GCC/Clang-style compilers.

`VKAPI_CALL` is a macro placed after the return type in Vulkan API function declarations. This macro controls calling conventions for MSVC-style compilers.

`VKAPI_PTR` is a macro placed between the '`'` and '`*`' in Vulkan API function pointer declarations. This macro also controls calling conventions, and typically has the same definition as `VKAPI_ATTR` or `VKAPI_CALL`, depending on the compiler.

With these macros, a Vulkan function declaration takes the form of:

```
VKAPI_ATTR <return_type> VKAPI_CALL <command_name>(<command_parameters>);
```

Additionally, a Vulkan function pointer type declaration takes the form of:

```
typedef <return_type> (VKAPI_PTR *PFN_<command_name>)(<command_parameters>);
```

Platform-Specific Header Control

If the `VK_NO_STDINT_H` macro is defined by the application at compile time, extended integer types used by the Vulkan API, such as `uint8_t`, **must** also be defined by the application. Otherwise, the Vulkan headers will not compile. If `VK_NO_STDINT_H` is not defined, the system `<stdint.h>` is used to define these types. There is a fallback path when Microsoft Visual Studio version 2008 and earlier versions are detected at compile time.

If the `VK_NO_STDDEF_H` macro is defined by the application at compile time, `size_t`, **must** also be defined by the application. Otherwise, the Vulkan headers will not compile. If `VK_NO_STDDEF_H` is not defined, the system `<stddef.h>` is used to define this type.

Vulkan Core API Header `vulkan_core.h`

Applications that do not make use of window system-specific extensions may simply include `vulkan_core.h` instead of `vulkan.h`, although there is usually no reason to do so. In addition to the Vulkan API, `vulkan_core.h` also defines a small number of C preprocessor macros that are described below.

Vulkan Header File Version Number

`VK_HEADER_VERSION` is the version number of the `vulkan_core.h` header. This value is kept synchronized with the patch version of the released Specification.

```
// Provided by VK_VERSION_1_0
// Version of this file
#define VK_HEADER_VERSION 207
```

`VK_HEADER_VERSION_COMPLETE` is the complete version number of the `vulkan_core.h` header, comprising the major, minor, and patch versions. The major/minor values are kept synchronized with the complete version of the released Specification. This value is intended for use by automated tools to identify exactly which version of the header was used during their generation.

Applications should not use this value as their `VkApplicationInfo::apiVersion`. Instead applications

should explicitly select a specific fixed major/minor API version using, for example, one of the `VK_API_VERSION_*_*` values.

```
// Provided by VK_VERSION_1_0
// Complete version of this file
#define VK_HEADER_VERSION_COMPLETE VK_MAKE_API_VERSION(0, 1, 3, VK_HEADER_VERSION)
```

`VK_API_VERSION` is now commented out of `vulkan_core.h` and **cannot** be used.

```
// Provided by VK_VERSION_1_0
// DEPRECATED: This define has been removed. Specific version defines (e.g.
VK_API_VERSION_1_0), or the VK_MAKE_VERSION macro, should be used instead.
//#define VK_API_VERSION VK_MAKE_VERSION(1, 0, 0) // Patch version should always be
set to 0
```

Vulkan Handle Macros

`VK_DEFINE_HANDLE` defines a [dispatchable handle](#) type.

```
// Provided by VK_VERSION_1_0

#define VK_DEFINE_HANDLE(object) typedef struct object##_T* object;
```

- `object` is the name of the resulting C type.

The only dispatchable handle types are those related to device and instance management, such as `VkDevice`.

`VK_DEFINE_NON_DISPATCHABLE_HANDLE` defines a [non-dispatchable handle](#) type.

```
// Provided by VK_VERSION_1_0

#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
    #if (VK_USE_64_BIT_PTR_DEFINES==1)
        #define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef struct object##_T
*object;
    #else
        #define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef uint64_t object;
    #endif
#endif
```

- `object` is the name of the resulting C type.

Most Vulkan handle types, such as `VkBuffer`, are non-dispatchable.

Note

The `vulkan_core.h` header allows the `VK_DEFINE_NON_DISPATCHABLE_HANDLE` and `VK_NULL_HANDLE` definitions to be overridden by the application. If `VK_DEFINE_NON_DISPATCHABLE_HANDLE` is already defined when `vulkan_core.h` is compiled, the default definitions for `VK_DEFINE_NON_DISPATCHABLE_HANDLE` and `VK_NULL_HANDLE` are skipped. This allows the application to define a binary-compatible custom handle which **may** provide more type-safety or other features needed by the application. Applications **must** not define handles in a way that is not binary compatible - where binary compatibility is platform dependent.

`VK_NULL_HANDLE` is a reserved value representing a non-valid object handle. It may be passed to and returned from Vulkan commands only when [specifically allowed](#).

```
// Provided by VK_VERSION_1_0

#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
    #if (VK_USE_64_BIT_PTR_DEFINES==1)
        #if (defined(__cplusplus) && (__cplusplus >= 201103L)) || (defined(_MSVC_LANG)
&& (_MSVC_LANG >= 201103L))
            #define VK_NULL_HANDLE nullptr
        #else
            #define VK_NULL_HANDLE ((void*)0)
        #endif
    #else
        #define VK_NULL_HANDLE 0ULL
    #endif
#endif
#ifndef VK_NULL_HANDLE
    #define VK_NULL_HANDLE 0
#endif
```

`VK_USE_64_BIT_PTR_DEFINES` defines whether the default non-dispatchable handles are declared using either a 64-bit pointer type or a 64-bit unsigned integer type.

`VK_USE_64_BIT_PTR_DEFINES` is set to '1' to use a 64-bit pointer type or any other value to use a 64-bit unsigned integer type.

```
// Provided by VK_VERSION_1_0

#ifndef VK_USE_64_BIT_PTR_DEFINES
    #if defined(__LP64__) || defined(_WIN64) || (defined(__x86_64__) &&
!defined(__ILP32__)) || defined(_M_X64) || defined(__ia64) || defined(_M_IA64) ||
defined(__aarch64__) || defined(__powerpc64__)
        #define VK_USE_64_BIT_PTR_DEFINES 1
    #else
        #define VK_USE_64_BIT_PTR_DEFINES 0
    #endif
#endif
```

Note

The `vulkan_core.h` header allows the `VK_USE_64_BIT_PTR_DEFINES` definition to be overridden by the application. This allows the application to select either a 64-bit pointer type or a 64-bit unsigned integer type for non-dispatchable handles in the case where the predefined preprocessor check does not identify the desired configuration.

Window System-Specific Header Control (Informative)

To use a Vulkan extension supporting a platform-specific window system, header files for that window systems **must** be included at compile time, or platform-specific types **must** be forward-declared. The Vulkan header files cannot determine whether or not an external header is available at compile time, so platform-specific extensions are provided in separate headers from the core API and platform-independent extensions, allowing applications to decide which ones should be defined and how the external headers are included.

Extensions dependent on particular sets of platform headers, or that forward-declare platform-specific types, are declared in a header named for that platform. Before including these platform-specific Vulkan headers, applications **must** include both `vulkan_core.h` and any external native headers the platform extensions depend on.

As a convenience for applications that do not need the flexibility of separate platform-specific Vulkan headers, `vulkan.h` includes `vulkan_core.h`, and then conditionally includes platform-specific Vulkan headers and the external headers they depend on. Applications control which platform-specific headers are included by #defining macros before including `vulkan.h`.

The correspondence between platform-specific extensions, external headers they require, the platform-specific header which declares them, and the preprocessor macros which enable inclusion by `vulkan.h` are shown in the [following table](#).

Table 97. Window System Extensions and Headers

Extension Name	Window System Name	Platform-specific Header	Required External Headers	Controlling <code>vulkan.h</code> Macro
<code>VK_KHR_android_surface</code>	Android	<code>vulkan_android.h</code>	None	<code>VK_USE_PLATFORM_ANDROID_KHR</code>

Note

This section describes the purpose of the headers independently of the specific underlying functionality of the window system extensions themselves. Each extension name will only link to a description of that extension when viewing a specification built with that extension included.

Provisional Extension Header Control (Informative)

Provisional extensions **should** not be used in production applications. The functionality defined by such extensions **may** change in ways that break backwards compatibility between revisions, and before final release of a non-provisional version of that extension.

Provisional extensions are defined in a separate *provisional header*, `vulkan_beta.h`, allowing applications to decide whether or not to include them. The mechanism is similar to [window system-specific headers](#): before including `vulkan_beta.h`, applications **must** include `vulkan_core.h`.

Note

Sometimes a provisional extension will include a subset of its interfaces in `vulkan_core.h`. This may occur if the provisional extension is promoted from an existing vendor or EXT extension and some of the existing interfaces are defined as aliases of the provisional extension interfaces. All other interfaces of that provisional extension which are not aliased will be included in `vulkan_beta.h`.

As a convenience for applications, `vulkan.h` conditionally includes `vulkan_beta.h`. Applications **can** control inclusion of `vulkan_beta.h` by #defining the macro `VK_ENABLE_BETA_EXTENSIONS` before including `vulkan.h`.

Note

Starting in version 1.2.171 of the Specification, all provisional enumerants are protected by the macro `VK_ENABLE_BETA_EXTENSIONS`. Applications needing to use provisional extensions must always define this macro, even if they are explicitly including `vulkan_beta.h`. This is a minor change to behavior, affecting only provisional extensions.

Note

This section describes the purpose of the provisional header independently of the specific provisional extensions which are contained in that header at any given time. The extension appendices for provisional extensions note their provisional status, and link back to this section for more information. Provisional extensions are intended to provide early access for bleeding-edge developers, with the understanding that extension interfaces may change in response to developer feedback. Provisional extensions are very likely to eventually be updated and released as non-provisional extensions, but there is no guarantee this will happen, or how long it will take if it does happen.

Appendix H: Invariance

The Vulkan specification is not pixel exact. It therefore does not guarantee an exact match between images produced by different Vulkan implementations. However, the specification does specify exact matches, in some cases, for images produced by the same implementation. The purpose of this appendix is to identify and provide justification for those cases that require exact matches.

Repeatability

The obvious and most fundamental case is repeated issuance of a series of Vulkan commands. For any given Vulkan and framebuffer state vector, and for any Vulkan command, the resulting Vulkan and framebuffer state **must** be identical whenever the command is executed on that initial Vulkan and framebuffer state. This repeatability requirement does not apply when using shaders containing side effects (image and buffer variable stores and atomic operations), because these memory operations are not guaranteed to be processed in a defined order.

The repeatability requirement does not apply for rendering done using a graphics pipeline that uses `VK_RASTERIZATION_ORDER_RELAXED_AMD`.

One purpose of repeatability is avoidance of visual artifacts when a double-buffered scene is redrawn. If rendering is not repeatable, swapping between two buffers rendered with the same command sequence **may** result in visible changes in the image. Such false motion is distracting to the viewer. Another reason for repeatability is testability.

Repeatability, while important, is a weak requirement. Given only repeatability as a requirement, two scenes rendered with one (small) polygon changed in position might differ at every pixel. Such a difference, while within the law of repeatability, is certainly not within its spirit. Additional invariance rules are desirable to ensure useful operation.

Multi-pass Algorithms

Invariance is necessary for a whole set of useful multi-pass algorithms. Such algorithms render multiple times, each time with a different Vulkan mode vector, to eventually produce a result in the framebuffer. Examples of these algorithms include:

- “Erasing” a primitive from the framebuffer by redrawing it, either in a different color or using the XOR logical operation.
- Using stencil operations to compute capping planes.

Invariance Rules

For a given Vulkan device:

Rule 1 *For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the resulting Vulkan and framebuffer state **must** be identical each time the command is executed on that initial Vulkan and framebuffer state.*

Rule 2 Changes to the following state values have no side effects (the use of any other state value is not affected by the change):

Required:

- Color and depth/stencil attachment contents
- Scissor parameters (other than enable)
- Write masks (color, depth, stencil)
- Clear values (color, depth, stencil)

Strongly suggested:

- Stencil parameters (other than enable)
- Depth test parameters (other than enable)
- Blend parameters (other than enable)
- Logical operation parameters (other than enable)

Corollary 1 Fragment generation is invariant with respect to the state values listed in Rule 2.

Rule 3 The arithmetic of each per-fragment operation is invariant except with respect to parameters that directly control it.

Corollary 2 Images rendered into different color attachments of the same framebuffer, either simultaneously or separately using the same command sequence, are pixel identical.

Rule 4 Identical pipelines will produce the same result when run multiple times with the same input. The wording “Identical pipelines” means [VkPipeline](#) objects that have been created with identical SPIR-V binaries and identical state, which are then used by commands executed using the same Vulkan state vector. Invariance is relaxed for shaders with side effects, such as performing stores or atomics.

Rule 5 All fragment shaders that either conditionally or unconditionally assign [FragCoord.z](#) to [FragDepth](#) are depth-invariant with respect to each other, for those fragments where the assignment to [FragDepth](#) actually is done.

If a sequence of Vulkan commands specifies primitives to be rendered with shaders containing side effects (image and buffer variable stores and atomic operations), invariance rules are relaxed. In particular, rule 1, corollary 2, and rule 4 do not apply in the presence of shader side effects.

The following weaker versions of rules 1 and 4 apply to Vulkan commands involving shader side effects:

Rule 6 For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the contents of any framebuffer state not directly or indirectly affected by results of shader image or buffer variable stores or atomic operations **must** be identical each time the command is executed on that initial Vulkan and framebuffer state.

Rule 7 Identical pipelines will produce the same result when run multiple times with the same input

as long as:

- *shader invocations do not use image atomic operations;*
- *no framebuffer memory is written to more than once by image stores, unless all such stores write the same value; and*
- *no shader invocation, or other operation performed to process the sequence of commands, reads memory written to by an image store.*

Note

The OpenGL specification has the following invariance rule: Consider a primitive p' obtained by translating a primitive p through an offset (x, y) in window coordinates, where x and y are integers. As long as neither p' nor p is clipped, it **must** be the case that each fragment f' produced from p' is identical to a corresponding fragment f from p except that the center of f' is offset by (x, y) from the center of f .

This rule does not apply to Vulkan and is an intentional difference from OpenGL.

When any sequence of Vulkan commands triggers shader invocations that perform image stores or atomic operations, and subsequent Vulkan commands read the memory written by those shader invocations, these operations **must** be explicitly synchronized.

Tessellation Invariance

When using a pipeline containing tessellation evaluation shaders, the fixed-function tessellation primitive generator consumes the input patch specified by an application and emits a new set of primitives. The following invariance rules are intended to provide repeatability guarantees. Additionally, they are intended to allow an application with a carefully crafted tessellation evaluation shader to ensure that the sets of triangles generated for two adjacent patches have identical vertices along shared patch edges, avoiding “cracks” caused by minor differences in the positions of vertices along shared edges.

Rule 1 *When processing two patches with identical outer and inner tessellation levels, the tessellation primitive generator will emit an identical set of point, line, or triangle primitives as long as the pipeline used to process the patch primitives has tessellation evaluation shaders specifying the same tessellation mode, spacing, vertex order, and point mode decorations. Two sets of primitives are considered identical if and only if they contain the same number and type of primitives and the generated tessellation coordinates for the vertex numbered m of the primitive numbered n are identical for all values of m and n .*

Rule 2 *The set of vertices generated along the outer edge of the subdivided primitive in triangle and quad tessellation, and the tessellation coordinates of each, depend only on the corresponding outer tessellation level and the spacing decorations in the tessellation shaders of the pipeline.*

Rule 3 *The set of vertices generated when subdividing any outer primitive edge is always symmetric. For triangle tessellation, if the subdivision generates a vertex with tessellation coordinates of the form $(0, x, 1-x)$, $(x, 0, 1-x)$, or $(x, 1-x, 0)$, it will also generate a vertex with coordinates of exactly $(0, 1-x, x)$, $(1-x, 0, x)$, or $(1-x, x, 0)$, respectively. For quad tessellation, if the subdivision generates a vertex with*

coordinates of $(x, 0)$ or $(0, x)$, it will also generate a vertex with coordinates of exactly $(1-x, 0)$ or $(0, 1-x)$, respectively. For isoline tessellation, if it generates vertices at $(0, x)$ and $(1, x)$ where x is not zero, it will also generate vertices at exactly $(0, 1-x)$ and $(1, 1-x)$, respectively.

Rule 4 *The set of vertices generated when subdividing outer edges in triangular and quad tessellation **must** be independent of the specific edge subdivided, given identical outer tessellation levels and spacing. For example, if vertices at $(x, 1 - x, 0)$ and $(1-x, x, 0)$ are generated when subdividing the $w = 0$ edge in triangular tessellation, vertices **must** be generated at $(x, 0, 1-x)$ and $(1-x, 0, x)$ when subdividing an otherwise identical $v = 0$ edge. For quad tessellation, if vertices at $(x, 0)$ and $(1-x, 0)$ are generated when subdividing the $v = 0$ edge, vertices **must** be generated at $(0, x)$ and $(0, 1-x)$ when subdividing an otherwise identical $u = 0$ edge.*

Rule 5 *When processing two patches that are identical in all respects enumerated in rule 1 except for vertex order, the set of triangles generated for triangle and quad tessellation **must** be identical except for vertex and triangle order. For each triangle $n1$ produced by processing the first patch, there **must** be a triangle $n2$ produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in $n1$.*

Rule 6 *When processing two patches that are identical in all respects enumerated in rule 1 other than matching outer tessellation levels and/or vertex order, the set of interior triangles generated for triangle and quad tessellation **must** be identical in all respects except for vertex and triangle order. For each interior triangle $n1$ produced by processing the first patch, there **must** be a triangle $n2$ produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in $n1$. A triangle produced by the tessellator is considered an interior triangle if none of its vertices lie on an outer edge of the subdivided primitive.*

Rule 7 *For quad and triangle tessellation, the set of triangles connecting an inner and outer edge depends only on the inner and outer tessellation levels corresponding to that edge and the spacing decorations.*

Rule 8 *The value of all defined components of `TessCoord` will be in the range $[0, 1]$. Additionally, for any defined component x of `TessCoord`, the results of computing $1.0-x$ in a tessellation evaluation shader will be exact. If any floating-point values in the range $[0, 1]$ fail to satisfy this property, such values **must** not be used as tessellation coordinate components.*

Appendix I: Lexicon

This appendix defines terms, abbreviations, and API prefixes used in the Specification.

Glossary

The terms defined in this section are used consistently throughout the Specification and may be used with or without capitalization.

Accessible (Descriptor Binding)

A descriptor binding is accessible to a shader stage if that stage is included in the `stageFlags` of the descriptor binding. Descriptors using that binding **can** only be used by stages in which they are accessible.

Acquire Operation (Resource)

An operation that acquires ownership of an image subresource or buffer range.

Active (Descriptor Type)

When a descriptor with *mutable* type is updated with `vkUpdateDescriptorSets`, the active descriptor type changes. When the descriptor is consumed by shaders, it is the active descriptor type which determines validity, i.e. `VkDescriptorSetLayoutBinding::descriptorType` is replaced with the active descriptor type. A mismatch in active descriptor type and consumption by shader is considered an undefined descriptor.

Active (Transform Feedback)

Transform feedback is made active after `vkCmdBeginTransformFeedbackEXT` executes and remains active until `vkCmdEndTransformFeedbackEXT` executes. While transform feedback is active, data written to variables in the output interface of the last `pre-rasterization shader` stage of the graphics pipeline are captured to the bound transform feedback buffers if those variables are decorated for transform feedback.

Adjacent Vertex

A vertex in an adjacency primitive topology that is not part of a given primitive, but is accessible in geometry shaders.

Active Object (Ray Tracing)

A primitive or instance in a ray tracing acceleration structure which has a corresponding ID, and is not *inactive* (meaning that it is visible to rays).

Advanced Blend Operation

Blending performed using one of the blend operation enums introduced by the `VK_EXT_blend_operation_advanced` extension. See [Advanced Blending Operations](#).

Alias (API type/command)

An identical definition of another API type/command with the same behavior but a different name.

Aliased Range (Memory)

A range of a device memory allocation that is bound to multiple resources simultaneously.

Allocation Scope

An association of a host memory allocation to a parent object or command, where the allocation's lifetime ends before or at the same time as the parent object is freed or destroyed, or during the parent command.

Aspect (Image)

An image **may** contain multiple kinds, or aspects, of data for each pixel, where each aspect is used in a particular way by the pipeline and **may** be stored differently or separately from other aspects. For example, the color components of an image format make up the color aspect of the image, and **may** be used as a framebuffer color attachment. Some operations, like depth testing, operate only on specific aspects of an image.

Attachment (Render Pass)

A zero-based integer index name used in render pass creation to refer to a framebuffer attachment that is accessed by one or more subpasses. The index also refers to an attachment description which includes information about the properties of the image view that will later be attached.

Availability Operation

An operation that causes the values generated by specified memory write accesses to become available for future access.

Available

A state of values written to memory that allows them to be made visible.

Axis-aligned Bounding Box

A box bounding a region in space defined by extents along each axis and thus representing a box where each edge is aligned to one of the major axes.

Back-Facing

See Facingness.

Batch

A single structure submitted to a queue as part of a [queue submission command](#), describing a set of queue operations to execute.

Backwards Compatibility

A given version of the API is backwards compatible with an earlier version if an application, relying only on valid behavior and functionality defined by the earlier specification, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

Binary Semaphore

A semaphore with a boolean payload indicating whether the semaphore is signaled or unsignaled. Represented by a [VkSemaphore](#) object created with a semaphore type of

`VK_SEMAPHORE_TYPE_BINARY`.

Binding (Memory)

An association established between a range of a resource object and a range of a memory object. These associations determine the memory locations affected by operations performed on elements of a resource object. Memory bindings are established using the `vkBindBufferMemory` command for non-sparse buffer objects, using the `vkBindImageMemory` command for non-sparse image objects, and using the `vkQueueBindSparse` command for sparse resources.

Blend Constant

Four floating point (RGBA) values used as an input to blending.

Blending

Arithmetic operations between a fragment color value and a value in a color attachment that produce a final color value to be written to the attachment.

Buffer

A resource that represents a linear array of data in device memory. Represented by a `VkBuffer` object.

Buffer Device Address

A 64-bit value used in a shader to access buffer memory through the `PhysicalStorageBuffer` storage class.

Buffer View

An object that represents a range of a specific buffer, and state controlling how the contents are interpreted. Represented by a `VkBufferView` object.

Built-In Variable

A variable decorated in a shader, where the decoration makes the variable take values provided by the execution environment or values that are generated by fixed-function pipeline stages.

Built-In Interface Block

A block defined in a shader containing only variables decorated with built-in decorations, and is used to match against other shader stages.

Clip Coordinates

The homogeneous coordinate space that vertex positions (`Position` decoration) are written in by `pre-rasterization` shader stages.

Clip Distance

A built-in output from `pre-rasterization` shader stages defining a clip half-space against which the primitive is clipped.

Clip Volume

The intersection of the view volume with all clip half-spaces.

Color Attachment

A subpass attachment point, or image view, that is the target of fragment color outputs and blending.

Color Fragment

A unique color value within a pixel of a multisampled color image. The *fragment mask* will contain indices to the *color fragment*.

Color Renderable Format

A [VkFormat](#) where `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` is set in one of the following, depending on the image's tiling:

- [VkFormatProperties::linearTilingFeatures](#)
- [VkFormatProperties::optimalTilingFeatures](#) or a [VkFormat](#) where `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` is set in [VkFormatProperties::linearTilingFeatures](#)
- [VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures](#)

Combined Image Sampler

A descriptor type that includes both a sampled image and a sampler.

Command Buffer

An object that records commands to be submitted to a queue. Represented by a [VkCommandBuffer](#) object.

Command Pool

An object that command buffer memory is allocated from, and that owns that memory. Command pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a [VkCommandPool](#) object.

Compatible Allocator

When allocators are compatible, allocations from each allocator **can** be freed by the other allocator.

Compatible Image Formats

When formats are compatible, images created with one of the formats **can** have image views created from it using any of the compatible formats. Also see *Size-Compatible Image Formats*.

Compatible Queues

Queues within a queue family. Compatible queues have identical properties.

Complete Mipmap Chain

The entire set of miplevels that can be provided for an image, from the largest application specified mipmap size down to the *minimum mipmap size*. See [Image Miplevel Sizing](#).

Completed Operation

A deferred operation whose corresponding command has been executed to completion. See [Deferred Host Operations](#)

Component (Format)

A distinct part of a format. Color components are represented with R, G, B, and A. Depth and stencil components are represented with D and S. Formats can have multiple instances of the same component. Some formats have other notations such as E or X which are not considered a component of the format.

Compressed Texel Block

An element of an image having a block-compressed format, comprising a rectangular block of texel values that are encoded as a single value in memory. Compressed texel blocks of a particular block-compressed format have a corresponding width, height, and depth defining the dimensions of these elements in units of texels, and a size in bytes of the encoding in memory.

Constant Integral Expressions

A SPIR-V constant instruction whose type is `OpTypeInt`. See *Constant Instruction* in section 2.2.1 “Instructions” of the [Khronos SPIR-V Specification](#).

Cooperative Matrix

A SPIR-V type where the storage for and computations performed on the matrix are spread across a set of invocations such as a subgroup.

Corner-Sampled Image

A `VkImage` where unnormalized texel coordinates are centered on integer values instead of half-integer values. Specified by setting the `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` bit on `VkImageCreateInfo::flags` at image creation.

Coverage Index

The index of a sample in the coverage mask.

Coverage Mask

A bitfield associated with a fragment representing the samples that were determined to be covered based on the result of rasterization, and then subsequently modified by fragment operations or the fragment shader.

Cull Distance

A built-in output from [pre-rasterization shader stages](#) defining a cull half-space where the primitive is rejected if all vertices have a negative value for the same cull distance.

Cull Volume

The intersection of the view volume with all cull half-spaces.

Decoration (SPIR-V)

Auxiliary information such as built-in variables, stream numbers, invariance, interpolation type, relaxed precision, etc., added to variables or structure-type members through decorations.

Deferrable Command

A command which allows deferred execution of host-side work. See [Deferred Host Operations](#).

Deferrable Operation

A single logical item of host-side work which can be deferred. Represented by the [VkDeferredOperationKHR](#) object. See [Deferred Host Operations](#).

Deprecated (feature)

A feature is deprecated if it is no longer recommended as the correct or best way to achieve its intended purpose.

Depth/Stencil Attachment

A subpass attachment point, or image view, that is the target of depth and/or stencil test operations and writes.

Depth/Stencil Format

A [VkFormat](#) that includes depth and/or stencil components.

Depth/Stencil Image (or ImageView)

A [VkImage](#) (or [VkImageView](#)) with a depth/stencil format.

Depth/Stencil Resolve Attachment

A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding depth/stencil attachment at the end of the subpass.

Derivative Group

A set of fragment or compute shader invocations that cooperate to compute derivatives, including implicit derivatives for sampled image operations.

Descriptor

Information about a resource or resource view written into a descriptor set that is used to access the resource or view from a shader.

Descriptor Binding

An entry in a descriptor set layout corresponding to zero or more descriptors of a single descriptor type in a set. Defined by a [VkDescriptorSetLayoutBinding](#) structure.

Descriptor Pool

An object that descriptor sets are allocated from, and that owns the storage of those descriptor sets. Descriptor pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a [VkDescriptorPool](#) object.

Descriptor Set

An object that resource descriptors are written into via the API, and that **can** be bound to a command buffer such that the descriptors contained within it **can** be accessed from shaders. Represented by a [VkDescriptorSet](#) object.

Descriptor Set Layout

An object defining the set of resources (types and counts) and their relative arrangement (in the binding namespace) within a descriptor set. Used when allocating descriptor sets and when creating pipeline layouts. Represented by a [VkDescriptorSetLayout](#) object.

Device

The processor(s) and execution environment that perform tasks requested by the application via the Vulkan API.

Device Group

A set of physical devices that support accessing each other's memory and recording a single command buffer that **can** be executed on all the physical devices.

Device Index

A zero-based integer that identifies one physical device from a logical device. A device index is valid if it is less than the number of physical devices in the logical device.

Device Mask

A bitmask where each bit represents one device index. A device mask value is valid if every bit that is set in the mask is at a bit position that is less than the number of physical devices in the logical device.

Device Memory

Memory accessible to the device. Represented by a [VkDeviceMemory](#) object.

Device-Level Command

Any command that is dispatched from a logical device, or from a child object of a logical device.

Device-Level Functionality

All device-level commands and objects, and their structures, enumerated types, and enumerants.

Device-Level Object

Logical device objects and their child objects. For example, [VkDevice](#), [VkQueue](#), and [VkCommandBuffer](#) objects are device-level objects.

Device-Local Memory

Memory that is connected to the device, and **may** be more performant for device access than host-local memory.

Direct Drawing Commands

Drawing commands that take all their parameters as direct arguments to the command (and not sourced via structures in buffer memory as the *indirect drawing commands*). Includes [vkCmdDrawMultiIndexedEXT](#), [vkCmdDrawMultiEXT](#), [vkCmdDrawMeshTasksNV](#), [vkCmdDraw](#), and [vkCmdDrawIndexed](#).

Disjoint

Disjoint planes are *image planes* to which memory is bound independently.

A *disjoint image* consists of multiple *disjoint planes*, and is created with the

`VK_IMAGE_CREATE_DISJOINT_BIT` bit set.

Dispatchable Command

A non-global command. The first argument to each dispatchable command is a dispatchable handle type.

Dispatchable Handle

A handle of a pointer handle type which **may** be used by layers as part of intercepting API commands.

Dispatching Commands

Commands that provoke work using a compute pipeline. Includes [vkCmdDispatch](#) and [vkCmdDispatchIndirect](#).

Drawing Commands

Commands that provoke work using a graphics pipeline. Includes [vkCmdDraw](#), [vkCmdDrawIndexed](#), [vkCmdDrawIndirectCount](#), [vkCmdDrawIndexedIndirectCount](#), [vkCmdDrawIndirectCountKHR](#), [vkCmdDrawIndexedIndirectCountKHR](#), [vkCmdDrawIndirectCountAMD](#), [vkCmdDrawIndexedIndirectCountAMD](#), [vkCmdDrawMultiIndexedEXT](#), [vkCmdDrawMultiEXT](#), [vkCmdDrawMeshTasksNV](#), [vkCmdDrawMeshTasksIndirectNV](#), [vkCmdDrawMeshTasksIndirectCountNV](#), [vkCmdDrawIndirect](#), and [vkCmdDrawIndexedIndirect](#).

Duration (Command)

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

Dynamic Storage Buffer

A storage buffer whose offset is specified each time the storage buffer is bound to a command buffer via a descriptor set.

Dynamic Uniform Buffer

A uniform buffer whose offset is specified each time the uniform buffer is bound to a command buffer via a descriptor set.

Dynamically Uniform

See *Dynamically Uniform* in section 2.2 “Terms” of the [Khronos SPIR-V Specification](#).

Element

Arrays are composed of multiple elements, where each element exists at a unique index within that array. Used primarily to describe data passed to or returned from the Vulkan API.

Explicitly-Enabled Layer

A layer enabled by the application by adding it to the enabled layer list in [vkCreateInstance](#) or [vkCreateDevice](#).

Event

A synchronization primitive that is signaled when execution of previous commands completes

through a specified set of pipeline stages. Events can be waited on by the device and polled by the host. Represented by a [VkEvent](#) object.

Executable State (Command Buffer)

A command buffer that has ended recording commands and **can** be executed. See also Initial State and Recording State.

Execution Dependency

A dependency that guarantees that certain pipeline stages' work for a first set of commands has completed execution before certain pipeline stages' work for a second set of commands begins execution. This is accomplished via pipeline barriers, subpass dependencies, events, or implicit ordering operations.

Execution Dependency Chain

A sequence of execution dependencies that transitively act as a single execution dependency.

Explicit chroma reconstruction

An implementation of sampler Y'C_BC_R conversion which reconstructs reduced-resolution chroma samples to luma resolution and then separately performs texture sample interpolation. This is distinct from an implicit implementation, which incorporates chroma sample reconstruction into texture sample interpolation.

Extension Scope

The set of objects and commands that **can** be affected by an extension. Extensions are either device scope or instance scope.

Extending Structure

A structure type which may appear in the `pNext` chain of another structure, extending the functionality of the other structure. Extending structures may be defined by either core API versions or extensions.

External Handle

A resource handle which has meaning outside of a specific Vulkan device or its parent instance. External handles **may** be used to share resources between multiple Vulkan devices in different instances, or between Vulkan and other APIs. Some external handle types correspond to platform-defined handles, in which case the resource **may** outlive any particular Vulkan device or instance and **may** be transferred between processes, or otherwise manipulated via functionality defined by the platform for that handle type.

External synchronization

A type of synchronization **required** of the application, where parameters defined to be externally synchronized **must** not be used simultaneously in multiple threads.

Facingness (Polygon)

A classification of a polygon as either front-facing or back-facing, depending on the orientation (winding order) of its vertices.

Facingness (Fragment)

A fragment is either front-facing or back-facing, depending on the primitive it was generated from. If the primitive was a polygon (regardless of polygon mode), the fragment inherits the facingness of the polygon. All other fragments are front-facing.

Fence

A synchronization primitive that is signaled when a set of batches or sparse binding operations complete execution on a queue. Fences **can** be waited on by the host. Represented by a [VkFence](#) object.

Flat Shading

A property of a vertex attribute that causes the value from a single vertex (the provoking vertex) to be used for all vertices in a primitive, and for interpolation of that attribute to return that single value unaltered.

Format Features

A set of features from [VkFormatFeatureFlagBits](#) that a [VkFormat](#) is capable of using for various commands. The list is determined by factors such as [VkImageTiling](#).

Fragment

A rectangular framebuffer region with associated data produced by [rasterization](#) and processed by [fragment operations](#) including the fragment shader.

Fragment Area

The width and height, in pixels, of a fragment.

Fragment Density

The ratio of fragments per framebuffer area in the x and y direction.

Fragment Density Texel Size

The (w,h) framebuffer region in pixels that each texel in a fragment density map applies to.

Fragment Input Attachment Interface

Variables with [UniformConstant](#) storage class and a decoration of [InputAttachmentIndex](#) that are statically used by a fragment shader's entry point, which receive values from input attachments.

Fragment Mask

A lookup table that associates color samples with color fragment values.

Fragment Output Interface

A fragment shader entry point's variables with [Output](#) storage class, which output to color and/or depth/stencil attachments.

Framebuffer

A collection of image views and a set of dimensions that, in conjunction with a render pass, define the inputs and outputs used by drawing commands. Represented by a [VkFramebuffer](#) object.

Framebuffer Attachment

One of the image views used in a framebuffer.

Framebuffer Coordinates

A coordinate system in which adjacent pixels' coordinates differ by 1 in x and/or y, with (0,0) in the upper left corner and pixel centers at half-integers.

Framebuffer-Space

Operating with respect to framebuffer coordinates.

Framebuffer-Local

A framebuffer-local dependency guarantees that only for a single framebuffer region, the first set of operations happens-before the second set of operations.

Framebuffer-Global

A framebuffer-global dependency guarantees that for all framebuffer regions, the first set of operations happens-before the second set of operations.

Framebuffer Region

A framebuffer region is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Front-Facing

See Facingness.

Full Compatibility

A given version of the API is fully compatible with another version if an application, relying only on valid behavior and functionality defined by either of those specifications, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

Global Command

A Vulkan command for which the first argument is not a dispatchable handle type.

Global Workgroup

A collection of local workgroups dispatched by a single dispatching or single mesh task drawing command.

Handle

An opaque integer or pointer value used to refer to a Vulkan object. Each object type has a unique handle type.

Happen-after, happens-after

A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of **A** and a destination of **B** enforces that **B** happens-after **A**. The inverse relation of happens-before.

Happen-before, happens-before

A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of **A** and a destination of **B** enforces that **A** happens-before **B**. The inverse relation of happens-after.

Helper Invocation

A fragment shader invocation that is created solely for the purposes of evaluating derivatives for use in non-helper fragment shader invocations, and which does not have side effects.

Host

The processor(s) and execution environment that the application runs on, and that the Vulkan API is exposed on.

Host Mapped Device Memory

Device memory that is mapped for host access using [vkMapMemory](#).

Host Mapped Foreign Memory

Memory owned by a foreign device that is mapped for host access.

Host Memory

Memory not accessible to the device, used to store implementation data structures.

Host-Accessible Subresource

A buffer, or a linear image subresource in either the `VK_IMAGE_LAYOUT_PREINITIALIZED` or `VK_IMAGE_LAYOUT_GENERAL` layout. Host-accessible subresources have a well-defined addressing scheme which can be used by the host.

Host-Local Memory

Memory that is not local to the device, and **may** be less performant for device access than device-local memory.

Host-Visible Memory

Device memory that **can** be mapped on the host and **can** be read and written by the host.

Identically Defined Objects

Objects of the same type where all arguments to their creation or allocation functions, with the exception of `pAllocator`, are

1. Vulkan handles which refer to the same object or
2. identical scalar or enumeration values or
3. Host pointers which point to an array of values or structures which also satisfy these three constraints.

Image

A resource that represents a multi-dimensional formatted interpretation of device memory. Represented by a [VkImage](#) object.

Image Subresource

A specific mipmap level, layer, and set of aspects of an image.

Image Subresource Range

A set of image subresources that are contiguous mipmap levels and layers.

Image View

An object that represents an image subresource range of a specific image, and state controlling how the contents are interpreted. Represented by a [VkImageView](#) object.

Immutable Sampler

A sampler descriptor provided at descriptor set layout creation time, and that is used for that binding in all descriptor sets allocated from the layout, and cannot be changed.

Implicit chroma reconstruction

An implementation of sampler Y'CbCr conversion which reconstructs the reduced-resolution chroma samples directly at the sample point, as part of the normal texture sampling operation. This is distinct from an *explicit chroma reconstruction* implementation, which reconstructs the reduced-resolution chroma samples to the resolution of the luma samples, then filters the result as part of texture sample interpolation.

Implicitly-Enabled Layer

A layer enabled by a loader-defined mechanism outside the Vulkan API, rather than explicitly by the application during instance or device creation.

Inactive Object (Ray Tracing)

A primitive or instance in a ray tracing acceleration structure which has a corresponding ID, but which will never report an intersection with any ray.

Index Buffer

A buffer bound via [vkCmdBindIndexBuffer](#) which is the source of index values used to fetch vertex attributes for a [vkCmdDrawIndexed](#) or [vkCmdDrawIndexedIndirect](#) command.

Indexed Drawing Commands

Drawing commands which use an *index buffer* as the source of index values used to fetch vertex attributes for a drawing command. Includes [vkCmdDrawIndexed](#), [vkCmdDrawIndexedIndirectCountKHR](#), [vkCmdDrawIndexedIndirectCountAMD](#), [vkCmdDrawMultiIndexedEXT](#), and [vkCmdDrawIndexedIndirect](#).

Indirect Commands

Drawing or dispatching commands that source some of their parameters from structures in buffer memory. Includes [vkCmdDrawIndirect](#), [vkCmdDrawIndexedIndirect](#), [vkCmdDrawIndirectCount](#), [vkCmdDrawIndexedIndirectCount](#), [vkCmdDrawIndirectCountKHR](#), [vkCmdDrawIndexedIndirectCountKHR](#), [vkCmdDrawIndirectCountAMD](#), [vkCmdDrawIndexedIndirectCountAMD](#), [vkCmdDrawMeshTasksIndirectNV](#), [vkCmdDrawMeshTasksIndirectCountNV](#), and [vkCmdDispatchIndirect](#).

Indirect Commands Layout

A definition of a sequence of commands, that are generated on the device via [vkCmdPreprocessGeneratedCommandsNV](#) and [vkCmdExecuteGeneratedCommandsNV](#). Each sequence is comprised of multiple [VkIndirectCommandsTokenTypeNV](#), which represent a subset of traditional command buffer commands. Represented as [VkIndirectCommandsLayoutNV](#).

Indirect Drawing Commands

Drawing commands that source some of their parameters from structures in buffer memory. Includes [vkCmdDrawIndirect](#), [vkCmdDrawIndirectCount](#), [vkCmdDrawIndexedIndirectCount](#), [vkCmdDrawIndirectCountKHR](#), [vkCmdDrawIndexedIndirectCountKHR](#), [vkCmdDrawIndirectCountAMD](#), [vkCmdDrawIndexedIndirectCountAMD](#), [vkCmdDrawMeshTasksIndirectNV](#), [vkCmdDrawMeshTasksIndirectCountNV](#), and [vkCmdDrawIndexedIndirect](#).

Initial State (Command Buffer)

A command buffer that has not begun recording commands. See also Recording State and Executable State.

Inline Uniform Block

A descriptor type that represents uniform data stored directly in descriptor sets, and supports read-only access in a shader.

Input Attachment

A descriptor type that represents an image view, and supports unfiltered read-only access in a shader, only at the fragment's location in the view.

Instance

The top-level Vulkan object, which represents the application's connection to the implementation. Represented by a [VkInstance](#) object.

Instance-Level Command

Any command that is dispatched from an instance, or from a child object of an instance, except for physical devices and their children.

Instance-Level Functionality

All instance-level commands and objects, and their structures, enumerated types, and enumerants.

Instance-Level Object

High-level Vulkan objects, which are not physical devices, nor children of physical devices. For example, [VkInstance](#) is an instance-level object.

Instance (Memory)

In a logical device representing more than one physical device, some device memory allocations have the requested amount of memory allocated multiple times, once for each physical device in a device mask. Each such replicated allocation is an instance of the device memory.

Instance (Resource)

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but **can** be bound to memory differently on each. Each such replicated resource is an instance of the resource.

Internal Synchronization

A type of synchronization **required** of the implementation, where parameters not defined to be externally synchronized **may** require internal mutexing to avoid multithreaded race conditions.

Invocation (Shader)

A single execution of an entry point in a SPIR-V module. For example, a single vertex's execution of a vertex shader or a single fragment's execution of a fragment shader.

Invocation Group

A set of shader invocations that are executed in parallel and that **must** execute the same control flow path in order for control flow to be considered dynamically uniform.

Invocation Repack Instruction

A ray tracing shader call [instruction](#) where the implementation **may** change the set of invocations that are executing.

Join (Deferred Host Operations)

The act of instructing a thread to participate in the execution of a deferred operation. See [Deferred Host Operations](#).

Linear Color Attachment

A color attachment with linear tiling

Linear Resource

A resource is *linear* if it is one of the following:

- a [VkBuffer](#)
- a [VkImage](#) created with `VK_IMAGE_TILING_LINEAR`
- a [VkImage](#) created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and whose [Linux DRM format modifier](#) is `DRM_FORMAT_MOD_LINEAR`
- a [VkAccelerationStructureNV](#)

Because a [VkAccelerationStructureKHR](#) resource does not have memory bound to it directly, it is considered neither linear nor non-linear. However, the [VkBuffer](#) on which a [VkAccelerationStructureKHR](#) resource is placed is a linear resource.

A resource is *non-linear* if it is one of the following:

- a [VkImage](#) created with `VK_IMAGE_TILING_OPTIMAL`
- a [VkImage](#) created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and whose [Linux DRM format modifier](#) is not `DRM_FORMAT_MOD_LINEAR`

Linux DRM Format Modifier

A 64-bit, vendor-prefixed, semi-opaque unsigned integer describing vendor-specific details of an image's memory layout. In Linux graphics APIs, *modifiers* are commonly used to specify the memory layout of externally shared images. An image has a *modifier* if and only if it is created with `tiling` equal to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`. For more details, refer to the appendix for extension `VK_EXT_image_drm_format_modifier`.

Local Workgroup

A collection of compute shader invocations invoked by a single dispatching command, which share data via `WorkgroupLocal` variables and can synchronize with each other.

Logical Device

An object that represents the application's interface to the physical device. The logical device is the parent of most Vulkan objects. Represented by a `VkDevice` object.

Logical Operation

Bitwise operations between a fragment color value and a value in a color attachment, that produce a final color value to be written to the attachment.

Lost Device

A state that a logical device **may** be in as a result of unrecoverable implementation errors, or other exceptional conditions.

Mappable

See Host-Visible Memory.

Memory Dependency

A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation
- The availability operation happens-before the visibility operation
- The visibility operation happens-before the second set of operations

Memory Domain

A memory domain is an abstract place to which memory writes are made available by availability operations and memory domain operations. The memory domains correspond to the set of agents that the write **can** then be made visible to. The memory domains are *host*, *device*, *shader*, *workgroup instance* (for workgroup instance there is a unique domain for each compute workgroup) and *subgroup instance* (for subgroup instance there is a unique domain for each subgroup).

Memory Domain Operation

An operation that makes the writes that are available to one memory domain available to another memory domain.

Memory Heap

A region of memory from which device memory allocations **can** be made.

Memory Type

An index used to select a set of memory properties (e.g. mappable, cached) for a device memory allocation.

Mesh Shading Pipeline

A graphics pipeline where the primitives are assembled explicitly in the shader stages. In contrast to the primitive shading pipeline where input primitives are assembled by fixed function processing.

Mesh Tasks Drawing Commands

Drawing commands which create shader invocations organized in workgroups for drawing mesh tasks. Includes [vkCmdDrawMeshTasksNV](#), [vkCmdDrawMeshTasksIndirectNV](#), and [vkCmdDrawMeshTasksIndirectCountNV](#).

Minimum Miplevel Size

The smallest size that is permitted for a miplevel. For conventional images this is 1x1x1. For corner-sampled images, this is 2x2x2. See [Image Miplevel Sizing](#).

Mip Tail Region

The set of mipmap levels of a sparse residency texture that are too small to fill a sparse block, and that **must** all be bound to memory collectively and opaquely.

Multi-planar

A *multi-planar format* (or “planar format”) is an image format consisting of more than one *plane*, identifiable with a `_2PLANE` or `_3PLANE` component to the format name and listed in [Formats requiring sampler Y'C_BC_R conversion for VK_IMAGE_ASPECT_COLOR_BIT image views](#). A *multi-planar image* (or “planar image”) is an image of a multi-planar format.

Non-Dispatchable Handle

A handle of an integer handle type. Handle values **may** not be unique, even for two objects of the same type.

Non-Indexed Drawing Commands

Drawing commands for which the vertex attributes are sourced in linear order from the vertex input attributes for a drawing command (i.e. they do not use an *index buffer*). Includes [vkCmdDraw](#), [vkCmdDrawIndirectCount](#), [vkCmdDrawIndirectCountKHR](#), [vkCmdDrawIndirectCountAMD](#), [vkCmdDrawMultiEXT](#), and [vkCmdDrawIndirect](#).

Normalized

A value that is interpreted as being in the range [0,1] as a result of being implicitly divided by some other value.

Normalized Device Coordinates

A coordinate space after perspective division is applied to clip coordinates, and before the viewport transformation converts to framebuffer coordinates.

Obsoleted (feature)

A feature is obsolete if it can no longer be used.

Opaque Capture Address

A 64-bit value representing the device address of a buffer or memory object that is expected to be used by trace capture/replay tools in combination with the [bufferDeviceAddress](#) feature.

Overlapped Range (Aliased Range)

The aliased range of a device memory allocation that intersects a given image subresource of an image or range of a buffer.

Ownership (Resource)

If an entity (e.g. a queue family) has ownership of a resource, access to that resource is well-defined for access by that entity.

Packed Format

A format whose components are stored as a single texel block in memory, with their relative locations defined within that element.

Passthrough Geometry Shader

A geometry shader which uses the [PassthroughNV](#) decoration on a variable in its input interface. Output primitives in a passthrough geometry shader always have the same topology as the input primitive and are not produced by emitting vertices.

Payload

Importable or exportable reference to the internal data of an object in Vulkan.

Per-View

A variable that has an array of values which are output, one for each view that is being generated. A mesh shader which uses the [PerViewNV](#) decoration on a variable in its output interface.

Peer Memory

An instance of memory corresponding to a different physical device than the physical device performing the memory access, in a logical device that represents multiple physical devices.

Physical Device

An object that represents a single device in the system. Represented by a [VkPhysicalDevice](#) object.

Physical-Device-Level Command

Any command that is dispatched from a physical device.

Physical-Device-Level Functionality

All physical-device-level commands and objects, and their structures, enumerated types, and enumerants.

Physical-Device-Level Object

Physical device objects. For example, [VkPhysicalDevice](#) is a physical-device-level object.

Pipeline

An object controlling how graphics or compute work is executed on the device. A pipeline includes one or more shaders, as well as state controlling any non-programmable stages of the pipeline. Represented by a [VkPipeline](#) object.

Pipeline Barrier

An execution and/or memory dependency recorded as an explicit command in a command buffer, that forms a dependency between the previous and subsequent commands.

Pipeline Cache

An object that **can** be used to collect and retrieve information from pipelines as they are created, and **can** be populated with previously retrieved information in order to accelerate pipeline creation. Represented by a [VkPipelineCache](#) object.

Pipeline Layout

An object defining the set of resources (via a collection of descriptor set layouts) and push constants used by pipelines that are created using the layout. Used when creating a pipeline and when binding descriptor sets and setting push constant values. Represented by a [VkPipelineLayout](#) object.

Pipeline Library

A pipeline that cannot be directly used, instead defining a set of shaders and shader groups which will be [linked into other pipelines](#).

Pipeline Stage

A logically independent execution unit that performs some of the operations defined by an action command.

Pipeline Trace Ray Instruction

A ray tracing instruction which traces a ray into an acceleration structure when using ray tracing pipelines. One of [OpTraceNV](#), [OpTraceRayMotionNV](#), [OpTraceMotionNV](#), [OpTraceRayKHR](#).

pNext Chain

A set of structures [chained together](#) through their **pNext** members.

Planar

See *multi-planar*.

Plane

An *image plane* is part of the representation of an image, containing a subset of the color components required to represent the texels in the image and with a contiguous mapping of coordinates to bound memory. Most images consist only of a single plane, but some formats spread the components across multiple image planes. The host-accessible properties of each image plane are accessed in a linear layout using [vkGetImageSubresourceLayout](#). If a multi-planar image is created with the [VK_IMAGE_CREATE_DISJOINT_BIT](#) bit set, the image is described as

disjoint, and its planes are therefore bound to memory independently.

Point Sampling (Rasterization)

A rule that determines whether a fragment sample location is covered by a polygon primitive by testing whether the sample location is in the interior of the polygon in framebuffer-space, or on the boundary of the polygon according to the tie-breaking rules.

Potential Format Features

The union of all `VkFormatFeatureFlagBits` that the implementation supports for a specified `VkFormat`, over all supported image tilings. For [external formats](#) the `VkFormatFeatureFlagBits` is provided by the implementation.

Pre-rasterization

Operations that execute before [rasterization](#), and any state associated with those operations.

Presentable image

A `VkImage` object obtained from a `VkSwapchainKHR` used to present to a `VkSurfaceKHR` object.

Preserve Attachment

One of a list of attachments in a subpass description that is not read or written by the subpass, but that is read or written on earlier and later subpasses and whose contents **must** be preserved through this subpass.

Primary Command Buffer

A command buffer that **can** execute secondary command buffers, and **can** be submitted directly to a queue.

Primitive Shading Pipeline

A graphics pipeline where input primitives are assembled by fixed function processing. It is the counterpart to mesh shading.

Primitive Topology

State controlling how vertices are assembled into primitives, e.g. as lists of triangles, strips of lines, etc..

Promoted (feature)

A feature from an older extension is considered promoted if it is made available as part of a new core version or newer extension with wider support.

Protected Buffer

A buffer to which protected device memory **can** be bound.

Protected-capable Device Queue

A device queue to which protected command buffers **can** be submitted.

Protected Command Buffer

A command buffer which **can** be submitted to a protected-capable device queue.

Protected Device Memory

Device memory which **can** be visible to the device but **must** not be visible to the host.

Protected Image

An image to which protected device memory **can** be bound.

Provisional

A feature is released provisionally in order to get wider feedback on the functionality before it is finalized. Provisional features may change in ways that break backwards compatibility, and thus are not recommended for use in production applications.

Provoking Vertex

The vertex in a primitive from which flat shaded attribute values are taken. This is generally the “first” vertex in the primitive, and depends on the primitive topology.

Push Constants

A small bank of values writable via the API and accessible in shaders. Push constants allow the application to set values used in shaders without creating buffers or modifying and binding descriptor sets for each update.

Push Constant Interface

The set of variables with **PushConstant** storage class that are statically used by a shader entry point, and which receive values from push constant commands.

Push Descriptors

Descriptors that are written directly into a command buffer rather than into a descriptor set. Push descriptors allow the application to set descriptors used in shaders without allocating or modifying descriptor sets for each update.

Descriptor Update Template

An object specifying a mapping from descriptor update information in host memory to elements in a descriptor set, which helps enable more efficient descriptor set updates.

Query Pool

An object containing a number of query entries and their associated state and results. Represented by a [VkQueryPool](#) object.

Queue

An object that executes command buffers and sparse binding operations on a device. Represented by a [VkQueue](#) object.

Queue Family

A set of queues that have common properties and support the same functionality, as advertised in [VkQueueFamilyProperties](#).

Queue Operation

A unit of work to be executed by a specific queue on a device, submitted via a [queue submission command](#). Each queue submission command details the specific queue operations that occur as

a result of calling that command. Queue operations typically include work that is specific to each command, and synchronization tasks.

Queue Submission

Zero or more batches and an optional fence to be signaled, passed to a command for execution on a queue. See the [Devices and Queues chapter](#) for more information.

Ray Tracing Command

Commands that provoke work using a ray tracing pipeline. Includes [vkCmdTraceRaysNV](#), [vkCmdTraceRaysKHR](#), and [vkCmdTraceRaysIndirectKHR](#).

Recording State (Command Buffer)

A command buffer that is ready to record commands. See also Initial State and Executable State.

Release Operation (Resource)

An operation that releases ownership of an image subresource or buffer range.

Render Pass

An object that represents a set of framebuffer attachments and phases of rendering using those attachments. Represented by a [VkRenderPass](#) object.

Render Pass Instance

A use of a render pass in a command buffer.

Required Extensions

Extensions that **must** be enabled alongside extensions dependent on them (see [Extension Dependencies](#)).

Reset (Command Buffer)

Resetting a command buffer discards any previously recorded commands and puts a command buffer in the initial state.

Residency Code

An integer value returned by sparse image instructions, indicating whether any sparse unbound texels were accessed.

Resolve Attachment

A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding color attachment at the end of the subpass.

Retired Swapchain

A swapchain that has been used as the `oldSwapchain` parameter to [vkCreateSwapchainKHR](#). Images cannot be acquired from a retired swapchain, however images that were acquired (but not presented) before the swapchain was retired **can** be presented.

Sample Index

The index of a sample within a [single set of samples](#).

Sample Shading

Invoking the fragment shader multiple times per fragment, with the covered samples partitioned among the invocations.

Sampled Image

A descriptor type that represents an image view, and supports filtered (sampled) and unfiltered read-only access in a shader.

Sampler

An object containing state controlling how sampled image data is sampled (or filtered) when accessed in a shader. Also a descriptor type describing the object. Represented by a [VkSampler](#) object.

Secondary Command Buffer

A command buffer that **can** be executed by a primary command buffer, and **must** not be submitted directly to a queue.

Self-Dependency

A subpass dependency from a subpass to itself, i.e. with `srcSubpass` equal to `dstSubpass`. A self-dependency is not automatically performed during a render pass instance, rather a subset of it **can** be performed via [vkCmdPipelineBarrier](#) during the subpass.

Semaphore

A synchronization primitive that supports signal and wait operations, and **can** be used to synchronize operations within a queue or across queues. Represented by a [VkSemaphore](#) object.

Shader

Instructions selected (via an entry point) from a shader module, which are executed in a shader stage.

Shader Call

An [instruction](#) which **may** cause execution to continue in a different shader stage.

Shader Code

A stream of instructions used to describe the operation of a shader.

Shader Group

A set of Shader Stages that are part of a [VkPipeline](#) containing multiple of such sets. This allows the device to make use of all the shader groups from the bound pipeline independently.

Shader Module

A collection of shader code, potentially including several functions and entry points, that is used to create shaders in pipelines. Represented by a [VkShaderModule](#) object.

Shader Stage

A stage of the graphics or compute pipeline that executes shader code.

Shading Rate

The ratio of the number of fragment shader invocations generated in a fully covered framebuffer region to the size (in pixels) of that region.

Shading Rate Image

An image used to establish the shading rate for a framebuffer region, where each pixel controls the shading rate for a corresponding framebuffer region.

Shared presentable image

A presentable image created from a swapchain with `VkPresentModeKHR` set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

Side Effect

A store to memory or atomic operation on memory from a shader invocation.

Single-plane format

A format that is not *multi-planar*.

Size-Compatible Image Formats

When a compressed image format and an uncompressed image format are size-compatible, it means that the texel block size of the uncompressed format **must** equal the texel block size of the compressed format.

Sparse Block

An element of a sparse resource that can be independently bound to memory. Sparse blocks of a particular sparse resource have a corresponding size in bytes that they use in the bound memory.

Sparse Image Block

A sparse block in a sparse partially-resident image. In addition to the sparse block size in bytes, sparse image blocks have a corresponding width, height, and depth defining the dimensions of these elements in units of texels or compressed texel blocks, the latter being used in case of sparse images having a block-compressed format.

Sparse Unbound Texel

A texel read from a region of a sparse texture that does not have memory bound to it.

SRT

A decomposition of a spatial transform separating out scale, rotation, and translation which has better linear interpolation properties for representing motion.

Static Use

An object in a shader is statically used by a shader entry point if any function in the entry point's call tree contains an instruction using the object. Static use is used to constrain the set of descriptors used by a shader entry point.

Storage Buffer

A descriptor type that represents a buffer, and supports reads, writes, and atomics in a shader.

Storage Image

A descriptor type that represents an image view, and supports unfiltered loads, stores, and atomics in a shader.

Storage Texel Buffer

A descriptor type that represents a buffer view, and supports unfiltered, formatted reads, writes, and atomics in a shader.

Subgroup

A set of shader invocations that **can** synchronize and share data with each other efficiently. In compute shaders, the *local workgroup* is a superset of the subgroup.

Subgroup Mask

A bitmask for all invocations in the current subgroup with one bit per invocation, starting with the least significant bit in the first vector component, continuing to the last bit (less than [SubgroupSize](#)) in the last required vector component.

Subpass

A phase of rendering within a render pass, that reads and writes a subset of the attachments.

Subpass Dependency

An execution and/or memory dependency between two subpasses described as part of render pass creation, and automatically performed between subpasses in a render pass instance. A subpass dependency limits the overlap of execution of the pair of subpasses, and **can** provide guarantees of memory coherence between accesses in the subpasses.

Subpass Description

Lists of attachment indices for input attachments, color attachments, depth/stencil attachment, resolve attachments, depth/stencil resolve, and preserve attachments used by the subpass in a render pass.

Subset (Self-Dependency)

A subset of a self-dependency is a pipeline barrier performed during the subpass of the self-dependency, and whose stage masks and access masks each contain a subset of the bits set in the identically named mask in the self-dependency.

Texel Block

A single addressable element of an image with an uncompressed [VkFormat](#), or a single compressed block of an image with a compressed [VkFormat](#).

Texel Block Size

The size (in bytes) used to store a texel block of a compressed or uncompressed image.

Texel Coordinate System

One of three coordinate systems (normalized, unnormalized, integer) defining how texel coordinates are interpreted in an image or a specific mipmap level of an image.

Timeline Semaphore

A semaphore with a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. Represented by a [VkSemaphore](#) object created with a semaphore type of [VK_SEMAPHORE_TYPE_TIMELINE](#).

Uniform Texel Buffer

A descriptor type that represents a buffer view, and supports unfiltered, formatted, read-only access in a shader.

Uniform Buffer

A descriptor type that represents a buffer, and supports read-only access in a shader.

Units in the Last Place (ULP)

A measure of floating-point error loosely defined as the smallest representable step in a floating-point format near a given value. For the precise definition see [Precision and Operation of SPIR-V instructions](#) or Jean-Michel Muller, “On the definition of $\text{ulp}(x)$ ”, RR-5504, INRIA. Other sources may also use the term “unit of least precision”.

Unnormalized

A value that is interpreted according to its conventional interpretation, and is not normalized.

Unprotected Buffer

A buffer to which unprotected device memory **can** be bound.

Unprotected Command Buffer

A command buffer which **can** be submitted to an unprotected device queue or a protected-capable device queue.

Unprotected Device Memory

Device memory which **can** be visible to the device and **can** be visible to the host.

Unprotected Image

An image to which unprotected device memory **can** be bound.

User-Defined Variable Interface

A shader entry point's variables with [Input](#) or [Output](#) storage class that are not built-in variables.

Vertex Input Attribute

A graphics pipeline resource that produces input values for the vertex shader by reading data from a vertex input binding and converting it to the attribute's format.

Vertex Stream

A vertex stream is where the last [pre-rasterization shader stages](#) outputs vertex data, which then goes to the rasterizer, is captured to a transform feedback buffer, or both. Geometry shaders **can** emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams.

Validation Cache

An object that **can** be used to collect and retrieve validation results from the validation layers, and **can** be populated with previously retrieved results in order to accelerate the validation process. Represented by a [VkValidationCacheEXT](#) object.

Variable-Sized Descriptor Binding

A descriptor binding whose size will be specified when a descriptor set is allocated using this layout.

Vertex Input Binding

A graphics pipeline resource that is bound to a buffer and includes state that affects addressing calculations within that buffer.

Vertex Input Interface

A vertex shader entry point's variables with **Input** storage class, which receive values from vertex input attributes.

View Mask

When multiview is enabled, a view mask is a property of a subpass controlling which views the rendering commands are broadcast to.

View Volume

A subspace in homogeneous coordinates, corresponding to post-projection x and y values between -1 and +1, and z values between 0 and +1.

Viewport Transformation

A transformation from normalized device coordinates to framebuffer coordinates, based on a viewport rectangle and depth range.

Visibility Operation

An operation that causes available values to become visible to specified memory accesses.

Visible

A state of values written to memory that allows them to be accessed by a set of operations.

Common Abbreviations

The abbreviations and acronyms defined in this section are sometimes used in the Specification and the API where they are considered clear and commonplace.

Blue color component

A

Alpha color component

RTZ

Round towards zero

RTE

Round to nearest even

Prefixes

Prefixes are used in the API to denote specific semantic meaning of Vulkan names, or as a label to avoid name clashes, and are explained here:

VK/Vk/vk

Vulkan namespace

All types, commands, enumerants and defines in this specification are prefixed with these two characters.

PFN/pfn

Function Pointer

Denotes that a type is a function pointer, or that a variable is of a pointer type.

p

Pointer

Variable is a pointer.

vkCmd

Commands that record commands in command buffers

These API commands do not result in immediate processing on the device. Instead, they record the requested action in a command buffer for execution when the command buffer is submitted to a queue.

s

Structure

Used to denote the `VK_STRUCTURE_TYPE*` member of each structure in `sType`

Appendix J: Credits (Informative)

Vulkan 1.3 is the result of contributions from many people and companies participating in the Khronos Vulkan Working Group, as well as input from the Vulkan Advisory Panel.

Members of the Working Group, including the company that they represented at the time of their most recent contribution, are listed in the following section. Some specific contributions made by individuals are listed together with their name.

Working Group Contributors to Vulkan

- Aaron Greig, Codeplay Software Ltd. (version 1.1)
- Aaron Hagan, AMD (version 1.1)
- Adam Jackson, Red Hat (versions 1.0, 1.1)
- Adam Śmigielski, Mobica (version 1.0)
- Aditi Verma, Qualcomm (version 1.3)
- Ahmed Abdelkhalek, AMD (version 1.3)
- Aidan Fabius, Core Avionics & Industrial Inc. (version 1.2)
- Alan Baker, Google (versions 1.1, 1.2, 1.3)
- Alan Ward, Google (versions 1.1, 1.2)
- Alejandro Piñeiro, Igalia (version 1.1)
- Alex Bourd, Qualcomm Technologies, Inc. (versions 1.0, 1.1)
- Alex Crabb, Caster Communications (versions 1.2, 1.3)
- Alex Walters, Imagination Technologies (versions 1.2, 1.3)
- Alexander Galazin, Arm (versions 1.0, 1.1, 1.2, 1.3)
- Alexey Sachkov, Intel (version 1.3)
- Allan MacKinnon, Google (version 1.3)
- Allen Hux, Intel (version 1.0)
- Alon Or-bach, Google (versions 1.0, 1.1, 1.2, 1.3) (WSI technical sub-group chair)
- Anastasia Stulova, Arm (versions 1.2, 1.3)
- Andreas Vasilakis, Think Silicon (version 1.2)
- Andres Gomez, Igalia (version 1.1)
- Andrew Cox, Samsung Electronics (version 1.0)
- Andrew Ellem, Google (version 1.3)
- Andrew Garrard, Imagination Technologies (versions 1.0, 1.1, 1.2, 1.3) (format wrangler)
- Andrew Poole, Samsung Electronics (version 1.0)
- Andrew Rafter, Samsung Electronics (version 1.0)

- Andrew Richards, Codeplay Software Ltd. (version 1.0)
- Andrew Woloszyn, Google (versions 1.0, 1.1)
- Ann Thorsnes, Khronos (versions 1.2, 1.3)
- Antoine Labour, Google (versions 1.0, 1.1)
- Aras Pranckevičius, Unity Technologies (version 1.0)
- Arseny Kapoulkine, Roblox (version 1.3)
- Ashwin Kolhe, NVIDIA (version 1.0)
- Baldur Karlsson, Valve Software (versions 1.1, 1.2, 1.3)
- Barthold Lichtenbelt, NVIDIA (version 1.1)
- Bas Nieuwenhuizen, Google (versions 1.1, 1.2)
- Ben Bowman, Imagination Technologies (version 1.0)
- Benj Lipchak, Unknown (version 1.0)
- Bill Hollings, Brenwill (versions 1.0, 1.1, 1.2, 1.3)
- Bill Licea-Kane, Qualcomm Technologies, Inc. (versions 1.0, 1.1)
- Blaine Kohl, Khronos (versions 1.2, 1.3)
- Bob Fraser, Google (version 1.3)
- Boris Zanin, Mobica (versions 1.2, 1.3)
- Brent E. Insko, Intel (version 1.0)
- Brian Ellis, Qualcomm Technologies, Inc. (version 1.0)
- Brian Paul, VMware (versions 1.2, 1.3)
- Caio Marcelo de Oliveira Filho, Intel (versions 1.2, 1.3)
- Cass Everitt, Oculus VR (versions 1.0, 1.1)
- Cemil Azizoglu, Canonical (version 1.0)
- Chad Versace, Google (versions 1.0, 1.1, 1.2)
- Chang-Hyo Yu, Samsung Electronics (version 1.0)
- Charles Giessen, LunarG (version 1.3)
- Chia-I Wu, LunarG (version 1.0)
- Chris Frascati, Qualcomm Technologies, Inc. (version 1.0)
- Chris Glover, Google (version 1.3)
- Christian Forfang, Arm (version 1.3)
- Christoph Kubisch, NVIDIA (version 1.3)
- Christophe Riccio, Unity Technologies (versions 1.0, 1.1)
- Cody Northrop, LunarG (version 1.0)
- Colin Riley, AMD (version 1.1)
- Cort Stratton, Google (versions 1.1, 1.2)

- Courtney Goeltzenleuchter, Google (versions 1.0, 1.1, 1.3)
- Craig Davies, Huawei (version 1.2)
- Dae Kim, Imagination Technologies (version 1.1)
- Damien Leone, NVIDIA (version 1.0)
- Dan Baker, Oxide Games (versions 1.0, 1.1)
- Dan Ginsburg, Valve Software (versions 1.0, 1.1, 1.2, 1.3)
- Daniel Johnston, Intel (versions 1.0, 1.1)
- Daniel Koch, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Daniel Rakos, AMD (versions 1.0, 1.1, 1.2, 1.3)
- Daniel Stone, Collabora (versions 1.1, 1.2)
- Daniel Vetter, Intel (version 1.2)
- David Airlie, Red Hat (versions 1.0, 1.1, 1.2, 1.3)
- David Mao, AMD (versions 1.0, 1.2)
- David Miller, Miller & Mattson (versions 1.0, 1.1) (Vulkan reference card)
- David Neto, Google (versions 1.0, 1.1, 1.2, 1.3)
- David Pankratz, Huawei (version 1.3)
- David Wilkinson, AMD (version 1.2)
- David Yu, Pixar (version 1.0)
- Dejan Mircevski, Google (version 1.1)
- Diego Novillo, Google (version 1.3)
- Dimitris Georgakakis, Think Silicon (version 1.3)
- Dominik Witczak, AMD (versions 1.0, 1.1, 1.3)
- Donald Scorgie, Imagination Technologies (version 1.2)
- Dmitry Malyshau, Mozilla (versions 1.1, 1.2, 1.3)
- Ed Hutchins, Oculus (version 1.2)
- Emily Stearns, Khronos (versions 1.2, 1.3)
- François Duranleau, Gameloft (version 1.3)
- Frank (LingJun) Chen, Qualcomm Technologies, Inc. (version 1.0)
- Fred Liao, Mediatek (version 1.0)
- Gabe Dagani, Freescale (version 1.0)
- Gabor Sines, AMD (version 1.2)
- Graeme Leese, Broadcom (versions 1.0, 1.1, 1.2, 1.3)
- Graham Connor, Imagination Technologies (version 1.0)
- Graham Sellers, AMD (versions 1.0, 1.1)
- Graham Wihlidal, Electronic Arts (version 1.3)

- Greg Fischer, LunarG (version 1.1)
- Gregory Grebe, AMD (version 1.3)
- Hai Nguyen, Google (versions 1.2, 1.3)
- Hans-Kristian Arntzen, Valve Software (versions 1.1, 1.2, 1.3)
- Henri Verbeet, Codeweavers (version 1.2)
- Huei Long Wang, Huawei (version 1.3)
- Hwanyong Lee, Kyungpook National University (version 1.0)
- Iago Toral, Igalia (versions 1.1, 1.2)
- Ian Elliott, Google (versions 1.0, 1.1, 1.2)
- Ian Romanick, Intel (versions 1.0, 1.1, 1.3)
- Ivan Briano, Intel (version 1.3)
- James Fitzpatrick, Imagination (version 1.3)
- James Hughes, Oculus VR (version 1.0)
- James Jones, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- James Riordon, Khronos (versions 1.2, 1.3)
- Jamie Madill, Google (version 1.3)
- Jan Hermes, Continental Corporation (versions 1.0, 1.1)
- Jan-Harald Fredriksen, Arm (versions 1.0, 1.1, 1.2, 1.3)
- Jason Ekstrand, Intel (versions 1.0, 1.1, 1.2, 1.3)
- Jean-François Roy, Google (versions 1.1, 1.2, 1.3)
- Jeff Bolz, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Jeff Juliano, NVIDIA (versions 1.0, 1.1, 1.2)
- Jeff Leger, Qualcomm Technologies, Inc. (versions 1.1, 1.3)
- Jeff Phillips, Khronos (version 1.3)
- Jeff Vigil, Samsung Electronics (versions 1.0, 1.1, 1.2, 1.3)
- Jens Owen, Google (versions 1.0, 1.1)
- Jeremy Hayes, LunarG (version 1.0)
- Jesse Barker, Unity Technologies (versions 1.0, 1.1, 1.2, 1.3)
- Jesse Hall, Google (versions 1.0, 1.1, 1.2, 1.3)
- Joe Davis, Samsung Electronics (version 1.1)
- Johannes van Waveren, Oculus VR (versions 1.0, 1.1)
- John Anthony, Arm (version 1.2, 1.3)
- John Kessenich, Google (versions 1.0, 1.1, 1.2, 1.3) (SPIR-V and GLSL for Vulkan spec author)
- John McDonald, Valve Software (versions 1.0, 1.1, 1.2, 1.3)
- John Zulauf, LunarG (versions 1.1, 1.2, 1.3)

- Jon Ashburn, LunarG (version 1.0)
- Jon Leech, Independent (versions 1.0, 1.1, 1.2, 1.3) (XML toolchain, normative language, release wrangler)
- Jonas Gustavsson, Samsung Electronics (versions 1.0, 1.1)
- Jonas Meyer, Epic Games (versions 1.2, 1.3)
- Jonathan Hamilton, Imagination Technologies (version 1.0)
- Jordan Justen, Intel (version 1.1)
- Joshua Ashton, Valve Software (version 1.3)
- Jungwoo Kim, Samsung Electronics (versions 1.0, 1.1)
- Jörg Wagner, Arm (version 1.1)
- Kalle Raita, Google (version 1.1)
- Karen Ghavam, LunarG (versions 1.1, 1.2, 1.3)
- Karl Schultz, LunarG (versions 1.1, 1.2)
- Kathleen Mattson, Khronos (versions 1.0, 1.1, 1.2)
- Kaye Mason, Google (version 1.2)
- Keith Packard, Valve (version 1.2)
- Kenneth Benzie, Codeplay Software Ltd. (versions 1.0, 1.1)
- Kenneth Russell, Google (version 1.1)
- Kerch Holt, NVIDIA (versions 1.0, 1.1)
- Kevin O’Neil, AMD (version 1.1)
- Kevin Petit, Arm (version 1.3)
- Kris Rose, Khronos (versions 1.2, 1.3)
- Kristian Kristensen, Intel (versions 1.0, 1.1)
- Krzysztof Iwanicki, Samsung Electronics (version 1.0)
- Larry Seiler, Intel (version 1.0)
- Laura Shubel, Caster Communications (version 1.3)
- Lauri Ilola, Nokia (version 1.1)
- Lei Zhang, Google (version 1.2)
- Lenny Komow, LunarG (versions 1.1, 1.2)
- Liam Middlebrook, NVIDIA (version 1.3)
- Lionel Landwerlin, Intel (versions 1.1, 1.2)
- Lisie Aartsen, Khronos (version 1.3)
- Liz Maitral, Khronos (version 1.2)
- Lou Kramer, AMD (version 1.3)
- Lutz Latta, Lucasfilm (version 1.0)

- Maciej Jesionowski, AMD (version 1.1)
- Mais Alnasser, AMD (version 1.1)
- Marcin Kantoch, AMD (version 1.3)
- Marcin Rogucki, Mobicia (version 1.1)
- Maria Rovatsou, Codeplay Software Ltd. (version 1.0)
- Mariusz Merecki, Intel (version 1.3)
- Mark Bellamy, Arm (version 1.2, 1.3)
- Mark Callow, Independent (versions 1.0, 1.1, 1.2, 1.3)
- Mark Kilgard, NVIDIA (versions 1.1, 1.2)
- Mark Lobodzinski, LunarG (versions 1.0, 1.1, 1.2)
- Mark Young, LunarG (versions 1.1, 1.3)
- Markus Tavenrath, NVIDIA (version 1.1)
- Marty Johnson, Khronos (version 1.3)
- Mateusz Przybylski, Intel (version 1.0)
- Mathias Heyer, NVIDIA (versions 1.0, 1.1)
- Mathias Schott, NVIDIA (versions 1.0, 1.1)
- Mathieu Robart, Arm (version 1.2)
- Matt Netsch, Qualcomm Technologies, Inc. (version 1.1)
- Matthew Rusch, NVIDIA (version 1.3)
- Matthäus Chajdas, AMD (versions 1.1, 1.2, 1.3)
- Maurice Ribble, Qualcomm Technologies, Inc. (versions 1.0, 1.1)
- Maxim Lukyanov, Samsung Electronics (version 1.0)
- Michael Blumenkrantz, Self (version 1.3)
- Michael Lentine, Google (version 1.0)
- Michael O'Hara, AMD (version 1.1)
- Michael Phillip, Samsung Electronics (version 1.2)
- Michael Wong, Codeplay Software Ltd. (version 1.1)
- Michael Worcester, Imagination Technologies (versions 1.0, 1.1)
- Michal Pietrasik, Intel (versions 1.0, 1.3)
- Mika Isojarvi, Google (versions 1.0, 1.1)
- Mike Schuchardt, LunarG (versions 1.1, 1.2)
- Mike Stroyan, LunarG (version 1.0)
- Mike Weiblen, LunarG (versions 1.1, 1.2, 1.3)
- Minyoung Son, Samsung Electronics (version 1.0)
- Mitch Singer, AMD (versions 1.0, 1.1, 1.2, 1.3)

- Mythri Venugopal, Samsung Electronics (version 1.0)
- Naveen Leekha, Google (version 1.0)
- Neil Henning, AMD (versions 1.0, 1.1, 1.2, 1.3)
- Neil Hickey, Arm (version 1.2)
- Neil Trevett, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Nick Penwarden, Epic Games (version 1.0)
- Nicolai Hähnle, AMD (version 1.1)
- Niklas Smedberg, Unity Technologies (version 1.0)
- Norbert Nopper, Independent (versions 1.0, 1.1)
- Nuno Subtil, NVIDIA (versions 1.1, 1.2, 1.3)
- Pat Brown, NVIDIA (version 1.0)
- Patrick Cozzi, Independent (version 1.1)
- Patrick Doane, Blizzard Entertainment (version 1.0)
- Peter Lohrmann, AMD (versions 1.0, 1.2)
- Petros Bantolas, Imagination Technologies (version 1.1)
- Philip Rebohle, Valve Software (version 1.3)
- Pierre Boudier, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Pierre-Loup Griffais, Valve Software (versions 1.0, 1.1, 1.2, 1.3)
- Piers Daniell, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Ping Liu, Intel (version 1.3)
- Piotr Bialecki, Intel (version 1.0)
- Piotr Byszewski, Mobicia (version 1.3)
- Prabindh Sundareson, Samsung Electronics (version 1.0)
- Pyry Haulos, Google (versions 1.0, 1.1) (Vulkan conformance test subcommittee chair)
- Rachel Bradshaw, Caster Communications (version 1.3)
- Rajeev Rao, Qualcomm (version 1.2)
- Ralph Potter, Samsung Electronics (versions 1.1, 1.2, 1.3)
- Raun Krisch, Samsung Electronics (version 1.3)
- Ray Smith, Arm (versions 1.0, 1.1, 1.2)
- Ricardo Garcia, Igalia (version 1.3)
- Richard Huddy, Samsung Electronics (versions 1.2, 1.3)
- Rob Barris, NVIDIA (version 1.1)
- Rob Stepinski, Transgaming (version 1.0)
- Robert Simpson, Qualcomm Technologies, Inc. (versions 1.0, 1.1, 1.3)
- Rolando Caloca Olivares, Epic Games (versions 1.0, 1.1, 1.2, 1.3)

- Ronan Keryell, Xilinx (version 1.3)
- Roy Ju, Mediatek (version 1.0)
- Rufus Hamade, Imagination Technologies (version 1.0)
- Ruihao Zhang, Qualcomm Technologies, Inc. (versions 1.1, 1.2, 1.3)
- Samuel Huang, Mediatek (version 1.3)
- Samuel Iglesias Gonsalvez, Igalia (version 1.3)
- Sascha Willems, Self (version 1.3)
- Sean Ellis, Arm (version 1.0)
- Sean Harmer, KDAB Group (versions 1.0, 1.1)
- Shannon Woods, Google (versions 1.0, 1.1, 1.2, 1.3)
- Slawomir Cygan, Intel (versions 1.0, 1.1, 1.3)
- Slawomir Grajewski, Intel (versions 1.0, 1.1, 1.3)
- Sorel Bosan, AMD (version 1.1)
- Spencer Fricke, Samsung Electronics (versions 1.2, 1.3)
- Stefanus Du Toit, Google (version 1.0)
- Stephen Huang, Mediatek (version 1.1)
- Steve Hill, Broadcom (versions 1.0, 1.2)
- Steve Viggers, Core Avionics & Industrial Inc. (versions 1.0, 1.2)
- Steve Winston, Holochip (version 1.3)
- Stuart Smith, AMD (versions 1.0, 1.1, 1.2, 1.3)
- Sujeevan Rajayogam, Google (version 1.3)
- Tilmann Scheller, Samsung Electronics (version 1.1)
- Tim Foley, Intel (version 1.0)
- Tim Lewis, Khronos (version 1.3)
- Timo Suoranta, AMD (version 1.0)
- Timothy Lottes, AMD (versions 1.0, 1.1)
- Tobias Hector, AMD (versions 1.0, 1.1, 1.2, 1.3) (validity language and toolchain)
- Tobin Ehlis, LunarG (version 1.0)
- Tom Olson, Arm (versions 1.0, 1.1, 1.2, 1.3) (Working Group chair)
- Tomasz Bednarz, Independent (version 1.1)
- Tomasz Kubale, Intel (version 1.0)
- Tony Barbour, LunarG (versions 1.0, 1.1, 1.2)
- Tony Zlatinski, NVIDIA (version 1.3)
- Victor Eruhimov, Unknown (version 1.1)
- Vikram Kushwaha, NVIDIA (version 1.3)

- Vincent Hindriksen, Stream HPC (versions 1.2, 1.3)
- Wasim Abbas, Arm (version 1.3)
- Wayne Lister, Imagination Technologies (version 1.0)
- Wolfgang Engel, Unknown (version 1.1)
- Yanjun Zhang, VeriSilicon (versions 1.0, 1.1, 1.2, 1.3)
- Yunxing Zhu, Huawei (version 1.3)

Other Credits

The Vulkan Advisory Panel members provided important real-world usage information and advice that helped guide design decisions.

The wider Vulkan community have provided useful feedback, questions and specification changes that have helped improve the quality of the Specification via [GitHub](#).

Administrative support to the Working Group for Vulkan 1.1, 1.2, and 1.3 was provided by Khronos staff including Ann Thorsnes, Blaine Kohl, Dominic Agoro-Ombaka, Emily Stearns, Jeff Phillips, Lisie Aartsen, Liz Maitral, Marty Johnson, Tim Lewis, and Xiao-Yu CHENG; and by Alex Crabb, Laura Shubel, and Rachel Bradshaw of Caster Communications.

Administrative support for Vulkan 1.0 was provided by Andrew Riegel, Elizabeth Riegel, Glenn Fredericks, Kathleen Mattson and Michelle Clark of Gold Standard Group.

Technical support was provided by James Riordon, site administration of Khronos.org and OpenGL.org.
