If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdSubpassShadingHUAWEI-None-02705

If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdSubpassShadingHUAWEI-None-02706

If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-02707

If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by the **VkPipeline** object bound to the pipeline bind point used by this command **must** not be a protected resource

- VUID-vkCmdSubpassShadingHUAWEI-None-06550

If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** only be used with **OpImageSample*** or **OpImageSparseSample*** instructions

- VUID-vkCmdSubpassShadingHUAWEI-ConstOffset-06551

If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** not use the **ConstOffset** and **Offset** operands

- VUID-vkCmdSubpassShadingHUAWEI-None-04115

If a **VkImageView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-04469

If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04470

If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04471

If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04472

If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04473

If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is

accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdSubpassShadingHUAWEI-None-04931

This command must be called in a subpass with bind point `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`. No draw commands can be called in the same subpass. Only one `vkCmdSubpassShadingHUAWEI` command can be called in a subpass

Valid Usage (Implicit)

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-recording

`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSubpassShadingHUAWEI-renderpass

This command **must** only be called inside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Inside	Graphics

Chapter 31. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define via `VkIndirectCommandsLayoutNV` the sequence of commands which should be generated.
- Optionally make use of [device-bindable Shader Groups](#).
- Retrieve device addresses by `vkGetBufferDeviceAddressEXT` for setting buffers on the device.
- Fill one or more `VkBuffer` with the appropriate content that gets interpreted by `VkIndirectCommandsLayoutNV`.
- Create a `preprocess` `VkBuffer` using the allocation information from `vkGetGeneratedCommandsMemoryRequirementsNV`.
- Optionally preprocess the input data using `vkCmdPreprocessGeneratedCommandsNV` in a separate action.
- Generate and execute the actual commands via `vkCmdExecuteGeneratedCommandsNV` passing all required data.

`vkCmdPreprocessGeneratedCommandsNV` executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they **must** be explicitly synchronized against the command execution. When not preprocessing, the preprocessing is automatically synchronized against the command execution.

31.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```
// Provided by VK_NV_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutNV)
```

31.1.1. Creation and Deletion

Indirect command layouts are created by:

```
// Provided by VK_NV_device_generated_commands
VkResult vkCreateIndirectCommandsLayoutNV(
    VkDevice                                     device,
    const VkIndirectCommandsLayoutCreateInfoNV* pCreateInfo,
    const VkAllocationCallbacks*                  pAllocator,
    VkIndirectCommandsLayoutNV*                  pIndirectCommandsLayout);
```

- `device` is the logical device that creates the indirect command layout.
- `pCreateInfo` is a pointer to a `VkIndirectCommandsLayoutCreateInfoNV` structure containing

parameters affecting creation of the indirect command layout.

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pIndirectCommandsLayout` is a pointer to a `VkIndirectCommandsLayoutNV` handle in which the resulting indirect command layout is returned.

Valid Usage

- VUID-vkCreateIndirectCommandsLayoutNV-deviceGeneratedCommands-02929

The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateIndirectCommandsLayoutNV-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateIndirectCommandsLayoutNV-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkIndirectCommandsLayoutCreateInfoNV` structure
- VUID-vkCreateIndirectCommandsLayoutNV-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateIndirectCommandsLayoutNV-pIndirectCommandsLayout-parameter
`pIndirectCommandsLayout` **must** be a valid pointer to a `VkIndirectCommandsLayoutNV` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkIndirectCommandsLayoutCreateInfoNV` structure is defined as:

```

// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsLayoutUsageFlagsNV flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t tokenCount;
    const VkIndirectCommandsLayoutTokenNV* pTokens;
    uint32_t streamCount;
    const uint32_t* pStreamStrides;
} VkIndirectCommandsLayoutCreateInfoNV;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pipelineBindPoint** is the [VkPipelineBindPoint](#) that this layout targets.
- **flags** is a bitmask of [VkIndirectCommandsLayoutUsageFlagBitsNV](#) specifying usage hints of this layout.
- **tokenCount** is the length of the individual command sequence.
- **pTokens** is an array describing each command token in detail. See [VkIndirectCommandsTokenTypeNV](#) and [VkIndirectCommandsLayoutTokenNV](#) below for details.
- **streamCount** is the number of streams used to provide the token inputs.
- **pStreamStrides** is an array defining the byte stride for each input stream.

The following code illustrates some of the flags:

```
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsTokens, sequencesCount, indexbuffer, indexbufferOffset)
{
    for (s = 0; s < sequencesCount; s++)
    {
        sUsed = s;

        if (indirectCommandsLayout.flags &
VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV) {
            sUsed = indexbuffer.load_uint32( sUsed * sizeof(uint32_t) + indexbufferOffset);
        }

        if (indirectCommandsLayout.flags &
VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV) {
            sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
        }

        cmdProcessSequence( cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsTokens, sUsed );
    }
}
```

Valid Usage

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-02930
The `pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_GRAPHICS`
- VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-02931
`tokenCount` **must** be greater than `0` and less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenCount`
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02932
If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` it **must** be the first element of the array and there **must** be only a single element of such token type
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02933
If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV` there **must** be only a single element of such token type
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02934
All state tokens in `pTokens` **must** occur prior work provoking tokens (`VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV`,
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV`,
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV`)
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02935
The content of `pTokens` **must** include one single work provoking token that is compatible with the `pipelineBindPoint`
- VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-02936
`streamCount` **must** be greater than `0` and less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamCount`
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-02937
each element of `pStreamStrides` **must** be greater than `0` and less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStride`. Furthermore the alignment of each token input **must** be ensured

Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutCreateInfoNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_NV`
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pNext-pNext
pNext **must** be `NULL`
- VUID-VkIndirectCommandsLayoutCreateInfoNV-flags-parameter
flags **must** be a valid combination of `VkIndirectCommandsLayoutUsageFlagBitsNV` values
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-parameter
pipelineBindPoint **must** be a valid `VkPipelineBindPoint` value
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-parameter
pTokens **must** be a valid pointer to an array of **tokenCount** valid `VkIndirectCommandsLayoutTokenNV` structures
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-parameter
pStreamStrides **must** be a valid pointer to an array of `streamCount uint32_t` values
- VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-arraylength
tokenCount **must** be greater than `0`
- VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-arraylength
streamCount **must** be greater than `0`

Bits which **can** be set in `VkIndirectCommandsLayoutCreateInfoNV::flags`, specifying usage hints of an indirect command layout, are:

```
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsNV {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV = 0x00000002,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV = 0x00000004,
} VkIndirectCommandsLayoutUsageFlagBitsNV;
```

- `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` specifies that the layout is always used with the manual preprocessing step through calling `vkCmdPreprocessGeneratedCommandsNV` and executed by `vkCmdExecuteGeneratedCommandsNV` with `isPreprocessed` set to `VK_TRUE`.
- `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV` specifies that the input data for the sequences is not implicitly indexed from `0..sequencesUsed` but a user provided `VkBuffer` encoding the index is provided.
- `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV` specifies that the processing of sequences **can** happen at an implementation-dependent order, which is not guaranteed to be coherent using the same input data.

```
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectCommandsLayoutUsageFlagsNV;
```

`VkIndirectCommandsLayoutUsageFlagsNV` is a bitmask type for setting a mask of zero or more `VkIndirectCommandsLayoutUsageFlagBitsNV`.

Indirect command layouts are destroyed by:

```
// Provided by VK_NV_device_generated_commands
void vkDestroyIndirectCommandsLayoutNV(
    VkDevice                                     device,
    VkIndirectCommandsLayoutNV*                  indirectCommandsLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the layout.
- `indirectCommandsLayout` is the layout to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02938
All submitted commands that refer to `indirectCommandsLayout` **must** have completed execution
- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02939
If `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02940
If no `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, `pAllocator` **must** be `NULL`
- VUID-vkDestroyIndirectCommandsLayoutNV-deviceGeneratedCommands-02941
The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkDestroyIndirectCommandsLayoutNV-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parameter
If `indirectCommandsLayout` is not `VK_NULL_HANDLE`, `indirectCommandsLayout` **must** be a valid `VkIndirectCommandsLayoutNV` handle
- VUID-vkDestroyIndirectCommandsLayoutNV-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parent
If `indirectCommandsLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `indirectCommandsLayout` **must** be externally synchronized

31.1.2. Token Input Streams

The `VkIndirectCommandsStreamNV` structure specifies the input data for one or more tokens at processing time.

```
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsStreamNV {
    VkBuffer      buffer;
    VkDeviceSize offset;
} VkIndirectCommandsStreamNV;
```

- `buffer` specifies the `VkBuffer` storing the functional arguments for each sequence. These arguments **can** be written by the device.
- `offset` specified an offset into `buffer` where the arguments start.

Valid Usage

- VUID-VkIndirectCommandsStreamNV-buffer-02942
The `buffer`'s usage flag **must** have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- VUID-VkIndirectCommandsStreamNV-offset-02943
The `offset` **must** be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment`
- VUID-VkIndirectCommandsStreamNV-buffer-02975
If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Valid Usage (Implicit)

- VUID-VkIndirectCommandsStreamNV-buffer-parameter
`buffer` **must** be a valid `VkBuffer` handle

The input streams **can** contain raw `uint32_t` values, existing indirect commands such as:

- `VkDrawIndirectCommand`
- `VkDrawIndexedIndirectCommand`
- `VkDrawMeshTasksIndirectCommandNV`

or additional commands as listed below. How the data is used is described in the next section.

The `VkBindShaderGroupIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` token.

```
// Provided by VK_NV_device_generated_commands
typedef struct VkBindShaderGroupIndirectCommandNV {
    uint32_t groupIndex;
} VkBindShaderGroupIndirectCommandNV;
```

- `index` specifies which shader group of the current bound graphics pipeline is used.

Valid Usage

- VUID-VkBindShaderGroupIndirectCommandNV-None-02944
The current bound graphics pipeline, as well as the pipelines it may reference, **must** have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`
- VUID-VkBindShaderGroupIndirectCommandNV-index-02945
The `index` **must** be within range of the accessible shader groups of the current bound graphics pipeline. See `vkCmdBindPipelineShaderGroupNV` for further details

The `VkBindIndexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV` token.

```
// Provided by VK_NV_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandNV {
    VkDeviceAddress    bufferAddress;
    uint32_t           size;
    VkIndexType        indexType;
} VkBindIndexBufferIndirectCommandNV;
```

- `bufferAddress` specifies a physical address of the `VkBuffer` used as index buffer.
- `size` is the byte size range which is available for this operation from the provided address.
- `indexType` is a `VkIndexType` value specifying how indices are treated. Instead of the Vulkan enum values, a custom `uint32_t` value **can** be mapped to an `VkIndexType` by specifying the `VkIndirectCommandsLayoutTokenNV::pIndexTypes` and `VkIndirectCommandsLayoutTokenNV::pIndexTypeValues` arrays.

Valid Usage

- VUID-VkBindIndexBufferIndirectCommandNV-None-02946
The buffer's usage flag from which the address was acquired **must** have the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` bit set
- VUID-VkBindIndexBufferIndirectCommandNV-bufferAddress-02947
The `bufferAddress` **must** be aligned to the `indexType` used
- VUID-VkBindIndexBufferIndirectCommandNV-None-02948
Each element of the buffer from which the address was acquired and that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Valid Usage (Implicit)

- VUID-VkBindIndexBufferIndirectCommandNV-indexType-parameter
`indexType` **must** be a valid `VkIndexType` value

The `VkBindVertexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV` token.

```
// Provided by VK_NV_device_generated_commands
typedef struct VkBindVertexBufferIndirectCommandNV {
    VkDeviceAddress    bufferAddress;
    uint32_t           size;
    uint32_t           stride;
} VkBindVertexBufferIndirectCommandNV;
```

- `bufferAddress` specifies a physical address of the `VkBuffer` used as vertex input binding.
- `size` is the byte size range which is available for this operation from the provided address.
- `stride` is the byte size stride for this vertex input binding as in `VkVertexInputBindingDescription`::`stride`. It is only used if `VkIndirectCommandsLayoutTokenNV::vertexDynamicStride` was set, otherwise the stride is inherited from the current bound graphics pipeline.

Valid Usage

- VUID-VkBindVertexBufferIndirectCommandNV-None-02949

The buffer's usage flag from which the address was acquired **must** have the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` bit set

- VUID-VkBindVertexBufferIndirectCommandNV-None-02950

Each element of the buffer from which the address was acquired and that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object

The `VkSetStateFlagsIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV` token. Which state is changed depends on the `VkIndirectStateFlagBitsNV` specified at `VkIndirectCommandsLayoutNV` creation time.

```
// Provided by VK_NV_device_generated_commands
typedef struct VkSetStateFlagsIndirectCommandNV {
    uint32_t data;
} VkSetStateFlagsIndirectCommandNV;
```

- `data` encodes packed state that this command alters.
 - Bit 0: If set represents `VK_FRONT_FACE_CLOCKWISE`, otherwise `VK_FRONT_FACE_COUNTER_CLOCKWISE`

A subset of the graphics pipeline state **can** be altered using indirect state flags:

```
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectStateFlagBitsNV {
    VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV = 0x00000001,
} VkIndirectStateFlagBitsNV;
```

- `VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV` allows to toggle the `VkFrontFace` rasterization state for subsequent draw operations.

```
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectStateFlagsNV;
```

`VkIndirectStateFlagsNV` is a bitmask type for setting a mask of zero or more `VkIndirectStateFlagBitsNV`.

31.1.3. Tokenized Command Processing

The processing is in principle illustrated below:

```
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsStreams, s)
{
    for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        uint32_t stream = indirectCommandsLayout.pTokens[t].stream;
        uint32_t offset = indirectCommandsLayout.pTokens[t].offset;
        uint32_t stride = indirectCommandsLayout.pStreamStrides[stream];
        stream         = pIndirectCommandsStreams[stream];
        const void* input = stream.buffer.pointer( stream.offset + stride * s + offset )

        // further details later
        indirectCommandsLayout.pTokens[t].command (cmd, pipeline, input, s);
    }
}

void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsStreams, sequencesCount)
{
    for (s = 0; s < sequencesCount; s++)
    {
        cmdProcessSequence(cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsStreams, s);
    }
}
```

The processing of each sequence is considered stateless, therefore all state changes **must** occur prior work provoking commands within the sequence. A single sequence is strictly targeting the [VkPipelineBindPoint](#) it was created with.

The primary input data for each token is provided through [VkBuffer](#) content at preprocessing using [vkCmdPreprocessGeneratedCommandsNV](#) or execution time using [vkCmdExecuteGeneratedCommandsNV](#), however some functional arguments, for example binding sets, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the [VkIndirectCommandsLayoutCreateInfoNV::pTokens](#) array specifying command tokens (other elements of the array specify command parameters) are:

```

// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsTokenTypeNV {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV = 7,
} VkIndirectCommandsTokenTypeNV;

```

Table 44. Supported indirect command tokens

Token type	Equivalent command
VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV	vkCmdBindPipelineShaderGroupNV
VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV	-
VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV	vkCmdBindIndexBuffer
VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV	vkCmdBindVertexBuffer
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV	vkCmdPushConstants
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV	vkCmdDrawIndexedIndirect
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV	vkCmdDrawIndirect
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV	vkCmdDrawMeshTasksIndirectNV

The [VkIndirectCommandsLayoutTokenNV](#) structure specifies details to the function arguments that need to be known at layout creation time:

```

// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutTokenNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsTokenTypeNV tokenType;
    uint32_t stream;
    uint32_t offset;
    uint32_t vertexBindingUnit;
    VkBool32 vertexDynamicStride;
    VkPipelineLayout pushconstantPipelineLayout;
    VkShaderStageFlags pushconstantShaderStageFlags;
    uint32_t pushconstantOffset;
    uint32_t pushconstantSize;
    VkIndirectStateFlagsNV indirectStateFlags;
    uint32_t indexTypeCount;
    const VkIndexType* pIndexTypes;
    const uint32_t* pIndexTypeValues;
} VkIndirectCommandsLayoutTokenNV;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **tokenType** specifies the token command type.
- **stream** is the index of the input stream containing the token argument data.
- **offset** is a relative starting offset within the input stream memory for the token argument data.
- **vertexBindingUnit** is used for the vertex buffer binding command.
- **vertexDynamicStride** sets if the vertex buffer stride is provided by the binding command rather than the current bound graphics pipeline state.
- **pushconstantPipelineLayout** is the **VkPipelineLayout** used for the push constant command.
- **pushconstantShaderStageFlags** are the shader stage flags used for the push constant command.
- **pushconstantOffset** is the offset used for the push constant command.
- **pushconstantSize** is the size used for the push constant command.
- **indirectStateFlags** are the active states for the state flag command.
- **indexTypeCount** is the optional size of the **pIndexTypes** and **pIndexTypeValues** array pairings. If not zero, it allows to register a custom **uint32_t** value to be treated as specific **VkIndexType**.
- **pIndexTypes** is the used **VkIndexType** for the corresponding **uint32_t** value entry in **pIndexTypeValues**.

Valid Usage

- VUID-VkIndirectCommandsLayoutTokenNV-stream-02951
stream **must** be smaller than `VkIndirectCommandsLayoutCreateInfoNV::streamCount`
- VUID-VkIndirectCommandsLayoutTokenNV-offset-02952
offset **must** be less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenOffset`
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02976
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV`, `vertexBindingUnit` **must** stay within device supported limits for the appropriate commands
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02977
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantPipelineLayout` **must** be valid
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02978
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantOffset` **must** be a multiple of 4
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02979
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantSize` **must** be a multiple of 4
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02980
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantOffset` **must** be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02981
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantSize` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `pushconstantOffset`
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02982
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, for each byte in the range specified by `pushconstantOffset` and `pushconstantSize` and for each shader stage in `pushconstantShaderStageFlags`, there **must** be a push constant range in `pushconstantPipelineLayout` that includes that byte and that stage
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02983
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, for each byte in the range specified by `pushconstantOffset` and `pushconstantSize` and for each push constant range that overlaps that byte, `pushconstantShaderStageFlags` **must** include all stages in that push constant range's `VkPushConstantRange::stageFlags`
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02984
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV`, `indirectStateFlags` **must** not be 0

Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutTokenNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_NV`
- VUID-VkIndirectCommandsLayoutTokenNV-pNext-pNext
pNext **must** be `NULL`
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-parameter
tokenType **must** be a valid `VkIndirectCommandsTokenTypeNV` value
- VUID-VkIndirectCommandsLayoutTokenNV-pushconstantPipelineLayout-parameter
If `pushconstantPipelineLayout` is not `VK_NULL_HANDLE`, `pushconstantPipelineLayout` **must** be a valid `VkPipelineLayout` handle
- VUID-VkIndirectCommandsLayoutTokenNV-pushconstantShaderStageFlags-parameter
`pushconstantShaderStageFlags` **must** be a valid combination of `VkShaderStageFlagBits` values
- VUID-VkIndirectCommandsLayoutTokenNV-indirectStateFlags-parameter
`indirectStateFlags` **must** be a valid combination of `VkIndirectStateFlagBitsNV` values
- VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypes-parameter
If `indexTypeCount` is not `0`, `pIndexTypes` **must** be a valid pointer to an array of `indexTypeCount` valid `VkIndexType` values
- VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypeValues-parameter
If `indexTypeCount` is not `0`, `pIndexTypeValues` **must** be a valid pointer to an array of `indexTypeCount` `uint32_t` values

The following code provides detailed information on how an individual sequence is processed. For valid usage, all restrictions from the regular commands apply.

```
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsStreams, s)
{
    for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++){
        token = indirectCommandsLayout.pTokens[t];

        uint32_t stride    = indirectCommandsLayout.pStreamStrides[token.stream];
        stream           = pIndirectCommandsStreams[token.stream];
        uint32_t offset    = stream.offset + stride * s + token.offset;
        const void* input = stream.buffer.pointer( offset )

        switch(input.type){
            VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV:
                VkBindShaderGroupIndirectCommandNV* bind = input;

                vkCmdBindPipelineShaderGroupNV(cmd, indirectCommandsLayout.pipelineBindPoint,
                    pipeline, bind->groupIndex);
            break;
        }
    }
}
```

VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV:

```
VkSetStateFlagsIndirectCommandNV* state = input;

if (token.indirectStateFlags & VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV){
    if (state.data & (1 << 0)){
        set VK_FRONT_FACE_CLOCKWISE;
    } else {
        set VK_FRONT_FACE_COUNTER_CLOCKWISE;
    }
}
break;
```

VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV:

```
uint32_t* data = input;

vkCmdPushConstants(cmd,
    token.pushconstantPipelineLayout
    token.pushconstantStageFlags,
    token.pushconstantOffset,
    token.pushconstantSize, data);
break;
```

VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV:

```
VkBindIndexBufferIndirectCommandNV* data = input;

// the indexType may optionally be remapped
// from a custom uint32_t value, via
// VkIndirectCommandsLayoutTokenNV::pIndexTypeValues

vkCmdBindIndexBuffer(cmd,
    deriveBuffer(data->bufferAddress),
    deriveOffset(data->bufferAddress),
    data->indexType);
break;
```

VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV:

```
VkBindVertexBufferIndirectCommandNV* data = input;

// if token.vertexDynamicStride is VK_TRUE
// then the stride for this binding is set
// using data->stride as well

vkCmdBindVertexBuffers(cmd,
    token.vertexBindingUnit, 1,
    &deriveBuffer(data->bufferAddress),
    &deriveOffset(data->bufferAddress));
break;
```

VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV:

```
vkCmdDrawIndexedIndirect(cmd,
    stream.buffer, offset, 1, 0);
```

```
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV:
vkCmdDrawIndirect(cmd,
    stream.buffer,
    offset, 1, 0);
break;

// only available if VK_NV_mesh_shader is supported
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV:
vkCmdDrawMeshTasksIndirectNV(cmd,
    stream.buffer, offset, 1, 0);
break;
}
}
```

31.2. Indirect Commands Generation And Execution

The generation of commands on the device requires a `preprocess` buffer. To retrieve the memory size and alignment requirements of a particular execution state call:

```
// Provided by VK_NV_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsNV(
    VkDevice device,
    const VkGeneratedCommandsMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
 - `pInfo` is a pointer to a `VkGeneratedCommandsMemoryRequirementsInfoNV` structure containing parameters required for the memory requirements query.
 - `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

Valid Usage

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-deviceGeneratedCommands-02906
The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-parameter
pInfo **must** be a valid pointer to a [VkGeneratedCommandsMemoryRequirementsInfoNV](#) structure
- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pMemoryRequirements-parameter
pMemoryRequirements **must** be a valid pointer to a [VkMemoryRequirements2](#) structure

```
// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsMemoryRequirementsInfoNV {
    VkStructureType          sType;
    const void*             pNext;
    VkPipelineBindPoint   pipelineBindPoint;
    VkPipeline            pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t                maxSequencesCount;
} VkGeneratedCommandsMemoryRequirementsInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pipelineBindPoint** is the [VkPipelineBindPoint](#) of the **pipeline** that this buffer memory is intended to be used with during the execution.
- **pipeline** is the [VkPipeline](#) that this buffer memory is intended to be used with during the execution.
- **indirectCommandsLayout** is the [VkIndirectCommandsLayoutNV](#) that this buffer memory is intended to be used with.
- **maxSequencesCount** is the maximum number of sequences that this buffer memory in combination with the other state provided **can** be used with.

Valid Usage

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-maxSequencesCount-02907
maxSequencesCount **must** be less or equal to [VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount](#)

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_NV`
- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pNext-pNext
pNext **must** be `NULL`
- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-parameter
pipelineBindPoint **must** be a valid `VkPipelineBindPoint` value
- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipeline-parameter
pipeline **must** be a valid `VkPipeline` handle
- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-indirectCommandsLayout-parameter
indirectCommandsLayout **must** be a valid `VkIndirectCommandsLayoutNV` handle
- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-commonparent
Both of **indirectCommandsLayout**, and **pipeline** **must** have been created, allocated, or retrieved from the same `VkDevice`

The actual generation of commands as well as their execution on the device is handled as single action with:

```
// Provided by VK_NV_device_generated_commands
void vkCmdExecuteGeneratedCommandsNV(
    VkCommandBuffer                                commandBuffer,
    VkBool32                                         isPreprocessed,
    const VkGeneratedCommandsInfoNV*               pGeneratedCommandsInfo);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **isPreprocessed** represents whether the input data has already been preprocessed on the device. If it is `VK_FALSE` this command will implicitly trigger the preprocessing step, otherwise not.
- **pGeneratedCommandsInfo** is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the generation of commands.

Valid Usage

- VUID-vkCmdExecuteGeneratedCommandsNV-magFilter-04555
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdExecuteGeneratedCommandsNV-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdExecuteGeneratedCommandsNV-None-06479
If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`
- VUID-vkCmdExecuteGeneratedCommandsNV-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdExecuteGeneratedCommandsNV-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdExecuteGeneratedCommandsNV-filterCubic-02694
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdExecuteGeneratedCommandsNV-filterCubicMinmax-02695
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with `minmax` filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdExecuteGeneratedCommandsNV-flags-02696
Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`
- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-06423
Any `VkImageView` or `VkBufferView` being written as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`
- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-06424
Any `VkImageView` or `VkBufferView` being read as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature

must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02697

For each set n that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to n at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set n , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdExecuteGeneratedCommandsNV-maintenance4-06425

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02699

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02700

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02701

If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02859

There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02702

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02703

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02704

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02705
If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdExecuteGeneratedCommandsNV-None-02706
If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02707
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by the **VkPipeline** object bound to the pipeline bind point used by this command **must** not be a protected resource
- VUID-vkCmdExecuteGeneratedCommandsNV-None-06550
If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** only be used with **OpImageSample*** or **OpImageSparseSample*** instructions
- VUID-vkCmdExecuteGeneratedCommandsNV-ConstOffset-06551
If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** not use the **ConstOffset** and **Offset** operands
- VUID-vkCmdExecuteGeneratedCommandsNV-None-04115
If a **VkImageView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-04469
If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04470
If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04471
If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32
- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04472
If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04473
If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is

accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-02684

The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdExecuteGeneratedCommandsNV-subpass-02685

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02686

Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06538

If any recorded command in the current subpass will write to an image subresource as an attachment, this command **must** not read from the memory backing that image subresource in any other way than as an attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06539

If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03417

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the

`VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-scissorCount-03418
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline
- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03419
If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`
- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04137
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScaleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`
- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04138
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScaleNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`
- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04139
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`
- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04140
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to

[vkCmdSetViewportWithCount](#)

- VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04141
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`
- VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04142
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`
- VUID-vkCmdExecuteGeneratedCommandsNV-None-04876
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` **must** have been called in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsNV-None-04877
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` **must** have been called in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsNV-logicOp-04878
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` **must** have been called in the current command buffer prior to this drawing command and the `logicOp` **must** be a valid `VkLogicOp` value
- VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-04552
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1
- VUID-vkCmdExecuteGeneratedCommandsNV-blendEnable-04727
If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` **must** be `VK_FALSE`
- VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-04740

If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` **must** be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06172

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06173

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06174

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06175

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06176

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06177

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-viewMask-06178

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`

- VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06179

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06180

If the current render pass instance was begun with `vkCmdBeginRendering` and

`VkRenderingInfo::colorAttachmentCount` greater than `0`, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-06181

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->pname:imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->pname:imageView`

- VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-06182

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->pname:imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->pname:imageView`

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06183

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06184

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06185

If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than `0`, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-06186

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->pname:imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->pname:imageView`

- VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-06187

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->pname:imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->pname:imageView`

- VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06188

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than `0`, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-06189

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->pname:imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->pname:imageView`

- VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-06190

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->pname:imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->pname:imageView`

- VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-06198

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04007

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers bound

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04008

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02721
For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- VUID-vkCmdExecuteGeneratedCommandsNV-primitiveTopology-03420
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same `topology` class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state
- VUID-vkCmdExecuteGeneratedCommandsNV-None-04912
If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command
- VUID-vkCmdExecuteGeneratedCommandsNV-pStrides-04913
If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`
- VUID-vkCmdExecuteGeneratedCommandsNV-None-04914
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command
- VUID-vkCmdExecuteGeneratedCommandsNV-None-04875
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` **must** have been called in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsNV-None-04879
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** have been called in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsNV-stage-06481
The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`
- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02970
`commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdExecuteGeneratedCommandsNV-isPreprocessed-02908

If `isPreprocessed` is `VK_TRUE` then `vkCmdPreprocessGeneratedCommandsNV` **must** have already been executed on the device, using the same `pGeneratedCommandsInfo` content as well as the content of the input buffers it references (all except `VkGeneratedCommandsInfoNV::preprocessBuffer`). Furthermore `pGeneratedCommandsInfo`'s `indirectCommandsLayout` **must** have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set

- VUID-vkCmdExecuteGeneratedCommandsNV-pipeline-02909
`VkGeneratedCommandsInfoNV::pipeline` **must** match the current bound pipeline at `VkGeneratedCommandsInfoNV::pipelineBindPoint`
- VUID-vkCmdExecuteGeneratedCommandsNV-None-02910
Transform feedback **must** not be active
- VUID-vkCmdExecuteGeneratedCommandsNV-deviceGeneratedCommands-02911
The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdExecuteGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
`pGeneratedCommandsInfo` **must** be a valid pointer to a valid `VkGeneratedCommandsInfoNV` structure
- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- VUID-vkCmdExecuteGeneratedCommandsNV-renderpass
This command **must** only be called inside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Inside	Graphics
Secondary		Compute

```
// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsInfoNV {
    VkStructureType           sType;
    const void*                pNext;
    VkPipelineBindPoint        pipelineBindPoint;
    VkPipeline                  pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t                   streamCount;
    const VkIndirectCommandsStreamNV* pStreams;
    uint32_t                   sequencesCount;
    VkBuffer                    preprocessBuffer;
    VkDeviceSize                preprocessOffset;
    VkDeviceSize                preprocessSize;
    VkBuffer                    sequencesCountBuffer;
    VkDeviceSize                sequencesCountOffset;
    VkBuffer                    sequencesIndexBuffer;
    VkDeviceSize                sequencesIndexOffset;
} VkGeneratedCommandsInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineBindPoint` is the `VkPipelineBindPoint` used for the `pipeline`.
- `pipeline` is the `VkPipeline` used in the generation and execution process.
- `indirectCommandsLayout` is the `VkIndirectCommandsLayoutNV` that provides the command sequence to generate.
- `streamCount` defines the number of input streams
- `pStreams` is a pointer to an array of `streamCount` `VkIndirectCommandsStreamNV` structures providing the input data for the tokens used in `indirectCommandsLayout`.
- `sequencesCount` is the maximum number of sequences to reserve. If `sequencesCountBuffer` is `VK_NULL_HANDLE`, this is also the actual number of sequences generated.
- `preprocessBuffer` is the `VkBuffer` that is used for preprocessing the input data for execution. If this structure is used with `vkCmdExecuteGeneratedCommandsNV` with its `isPreprocessed` set to `VK_TRUE`, then the preprocessing step is skipped and data is only read from this buffer.
- `preprocessOffset` is the byte offset into `preprocessBuffer` where the preprocessed data is stored.
- `preprocessSize` is the maximum byte size within the `preprocessBuffer` after the `preprocessOffset` that is available for preprocessing.

- `sequencesCountBuffer` is a `VkBuffer` in which the actual number of sequences is provided as single `uint32_t` value.
- `sequencesCountOffset` is the byte offset into `sequencesCountBuffer` where the count value is stored.
- `sequencesIndexBuffer` is a `VkBuffer` that encodes the used sequence indices as `uint32_t` array.
- `sequencesIndexOffset` is the byte offset into `sequencesIndexBuffer` where the index values start.

Valid Usage

- VUID-VkGeneratedCommandsInfoNV-pipeline-02912
The provided **pipeline** **must** match the pipeline bound at execution time
- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02913
If the **indirectCommandsLayout** uses a token of **VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV**, then the **pipeline** **must** have been created with multiple shader groups
- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02914
If the **indirectCommandsLayout** uses a token of **VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV**, then the **pipeline** **must** have been created with **VK_PIPELINE_CREATE INDIRECT BINDABLE BIT_NV** set in **VkGraphicsPipelineCreateInfo::flags**
- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02915
If the **indirectCommandsLayout** uses a token of **VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV**, then the **pipeline**'s **VkPipelineLayout** **must** match the **VkIndirectCommandsLayoutTokenNV::pushconstantPipelineLayout**
- VUID-VkGeneratedCommandsInfoNV-streamCount-02916
streamCount **must** match the **indirectCommandsLayout**'s **streamCount**
- VUID-VkGeneratedCommandsInfoNV-sequencesCount-02917
sequencesCount **must** be less or equal to **VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount** and **VkGeneratedCommandsMemoryRequirementsInfoNV::maxSequencesCount** that was used to determine the **preprocessSize**
- VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02918
preprocessBuffer **must** have the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set in its usage flag
- VUID-VkGeneratedCommandsInfoNV-preprocessOffset-02919
preprocessOffset **must** be aligned to **VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment**
- VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02971
If **preprocessBuffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-VkGeneratedCommandsInfoNV-preprocessSize-02920
preprocessSize **must** be at least equal to the memory requirement's size returned by **vkGetGeneratedCommandsMemoryRequirementsNV** using the matching inputs (**indirectCommandsLayout**, ...) as within this structure
- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02921
sequencesCountBuffer **can** be set if the actual used count of sequences is sourced from the provided buffer. In that case the **sequencesCount** serves as upper bound
- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02922
If **sequencesCountBuffer** is not **VK_NULL_HANDLE**, its usage flag **must** have the

VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02923
If `sequencesCountBuffer` is not `VK_NULL_HANDLE`, `sequencesCountOffset` **must** be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesCountBufferOffsetAlignment`
- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02972
If `sequencesCountBuffer` is not `VK_NULL_HANDLE` and is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02924
If `indirectCommandsLayout`'s `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV` is set, `sequencesIndexBuffer` **must** be set otherwise it **must** be `VK_NULL_HANDLE`
- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02925
If `sequencesIndexBuffer` is not `VK_NULL_HANDLE`, its usage flag **must** have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02926
If `sequencesIndexBuffer` is not `VK_NULL_HANDLE`, `sequencesIndexOffset` **must** be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesIndexBufferOffsetAlignment`
- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02973
If `sequencesIndexBuffer` is not `VK_NULL_HANDLE` and is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsInfoNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_NV`
- VUID-VkGeneratedCommandsInfoNV-pNext-pNext
pNext **must** be `NULL`
- VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-parameter
pipelineBindPoint **must** be a valid `VkPipelineBindPoint` value
- VUID-VkGeneratedCommandsInfoNV-pipeline-parameter
pipeline **must** be a valid `VkPipeline` handle
- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-parameter
indirectCommandsLayout **must** be a valid `VkIndirectCommandsLayoutNV` handle
- VUID-VkGeneratedCommandsInfoNV-pStreams-parameter
pStreams **must** be a valid pointer to an array of **streamCount** valid `VkIndirectCommandsStreamNV` structures
- VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-parameter
preprocessBuffer **must** be a valid `VkBuffer` handle
- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-parameter
If **sequencesCountBuffer** is not `VK_NULL_HANDLE`, **sequencesCountBuffer** **must** be a valid `VkBuffer` handle
- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-parameter
If **sequencesIndexBuffer** is not `VK_NULL_HANDLE`, **sequencesIndexBuffer** **must** be a valid `VkBuffer` handle
- VUID-VkGeneratedCommandsInfoNV-streamCount-arraylength
streamCount **must** be greater than `0`
- VUID-VkGeneratedCommandsInfoNV-commonparent
Each of **indirectCommandsLayout**, **pipeline**, **preprocessBuffer**, **sequencesCountBuffer**, and **sequencesIndexBuffer** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Referencing the functions defined in [Indirect Commands Layout](#), `vkCmdExecuteGeneratedCommandsNV` behaves as:

```

uint32_t sequencesCount = sequencesCountBuffer ?
    min(maxSequencesCount, sequencesCountBuffer.load_uint32(sequencesCountOffset)) :
    maxSequencesCount;

cmdProcessAllSequences(commandBuffer, pipeline,
    indirectCommandsLayout, pIndirectCommandsStreams,
    sequencesCount,
    sequencesIndexBuffer, sequencesIndexOffset);

// The stateful commands within indirectCommandsLayout will not
// affect the state of subsequent commands in the target
// command buffer (cmd)

```

Note

It is important to note that the values of all state related to the `pipelineBindPoint` used are undefined after this command.

Commands **can** be preprocessed prior execution using the following command:

```

// Provided by VK_NV_device_generated_commands
void vkCmdPreprocessGeneratedCommandsNV(
    VkCommandBuffer                                     commandBuffer,
    const VkGeneratedCommandsInfoNV*                  pGeneratedCommandsInfo);

```

- `commandBuffer` is the command buffer which does the preprocessing.
- `pGeneratedCommandsInfo` is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the preprocessing step.

Valid Usage

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-02974
`commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-02927
`pGeneratedCommandsInfo`'s `indirectCommandsLayout` **must** have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set
- VUID-vkCmdPreprocessGeneratedCommandsNV-deviceGeneratedCommands-02928
The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
pGeneratedCommandsInfo **must** be a valid pointer to a valid [VkGeneratedCommandsInfoNV](#) structure
- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support graphics, or compute operations
- VUID-vkCmdPreprocessGeneratedCommandsNV-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Graphics Compute

Chapter 32. Sparse Resources

As documented in [Resource Memory Association](#), `VkBuffer` and `VkImage` resources in Vulkan **must** be bound completely and contiguously to a single `VkDeviceMemory` object. This binding **must** be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources **can** be bound non-contiguously to one or more `VkDeviceMemory` allocations.
- Sparse resources **can** be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources **can** have descriptors generated and used orthogonally with memory binding commands.

32.1. Sparse Resource Features

Sparse resources have several features that **must** be enabled explicitly at resource creation time. The features are enabled by including bits in the `flags` parameter of `VkImageCreateInfo` or `VkBufferCreateInfo`. Each feature also has one or more corresponding feature enables specified in `VkPhysicalDeviceFeatures`.

- [Sparse binding](#) is the base feature, and provides the following capabilities:
 - Resources **can** be bound at some defined (sparse block) granularity.
 - The entire resource **must** be bound to memory before use regardless of regions actually accessed.
 - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
 - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
 - Requested via the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` and `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits.
 - A sparse image created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (but not `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) supports all formats that non-sparse usage supports, and supports both `VK_IMAGE_TILING_OPTIMAL` and `VK_IMAGE_TILING_LINEAR` tiling.
- [Sparse Residency](#) builds on (and requires) the `sparseBinding` feature. It includes the following capabilities:
 - Resources do not have to be completely bound to memory before use on the device.
 - Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
 - Consistency of access to unbound regions of the resource is defined by the absence or presence of `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict`. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the

data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.
- Sparse residency support is advertised on a finer grain via the following features:
 - `sparseResidencyBuffer`: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
 - `sparseResidencyImage2D`: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - `sparseResidencyImage3D`: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - `sparseResidency2Samples`: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - `sparseResidency4Samples`: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - `sparseResidency8Samples`: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - `sparseResidency16Samples`: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only **required** to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is **optional** and **can** be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats **may** also be supported and **can** be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.
- [Sparse aliasing](#) provides the following capability that **can** be enabled per resource:

Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

See [Sparse Memory Aliasing](#) for more information.

32.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits **can** be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely opaque, meaning that there is no application-visible mapping between texel location and memory

offset.

Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource **must** be bound to one or more `VkDeviceMemory` objects before use.

32.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment`. `alignment` represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

32.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

32.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the [mip tail](#)) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

Note

Applications **can** use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application **can** unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application **can** also use this functionality to access subregions of the image in a “megatexture” fashion. The application **can** create a large image and only populate the region of the image that is currently being used in the scene.

32.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered *safe* and will not affect other resources or populated regions of the image.

If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

Formatted accesses to unbound memory **may** still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked `VK_FORMAT_R8_UNORM` image will return a value of 1.0f.

See [Physical Device Enumeration](#) for instructions for retrieving physical device properties.

Implementor's Note

For implementations that **cannot** natively handle access to unbound regions of a resource, the implementation **may** allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations **may** use the same physical memory for all unbound regions of multiple resources within the same process.

32.4.2. Mip Tail Regions

Sparse images created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (without also using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) have no specific mapping of image region or image subresource to memory offset defined, so the entire image **can** be thought of as a linear opaque address region. However, images created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` do have a prescribed sparse image block layout, and hence each image subresource **must** start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a *mip tail region*.

If the `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` flag is present in the `flags` member of `VkSparseImageFormatProperties`, for the image's `format`, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` **may** affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. **must** be bound using a `VkSparseImageOpaqueMemoryBindInfo` structure) and **may** be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.

An implementation **may** choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` in `VkSparseImageMemoryRequirements::flags`.

The following diagrams depict how `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` alter memory usage and requirements.

Figure 19. Sparse Image

In the absence of `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions **can** be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks **must** still have their full sparse block size in bytes allocated in memory.

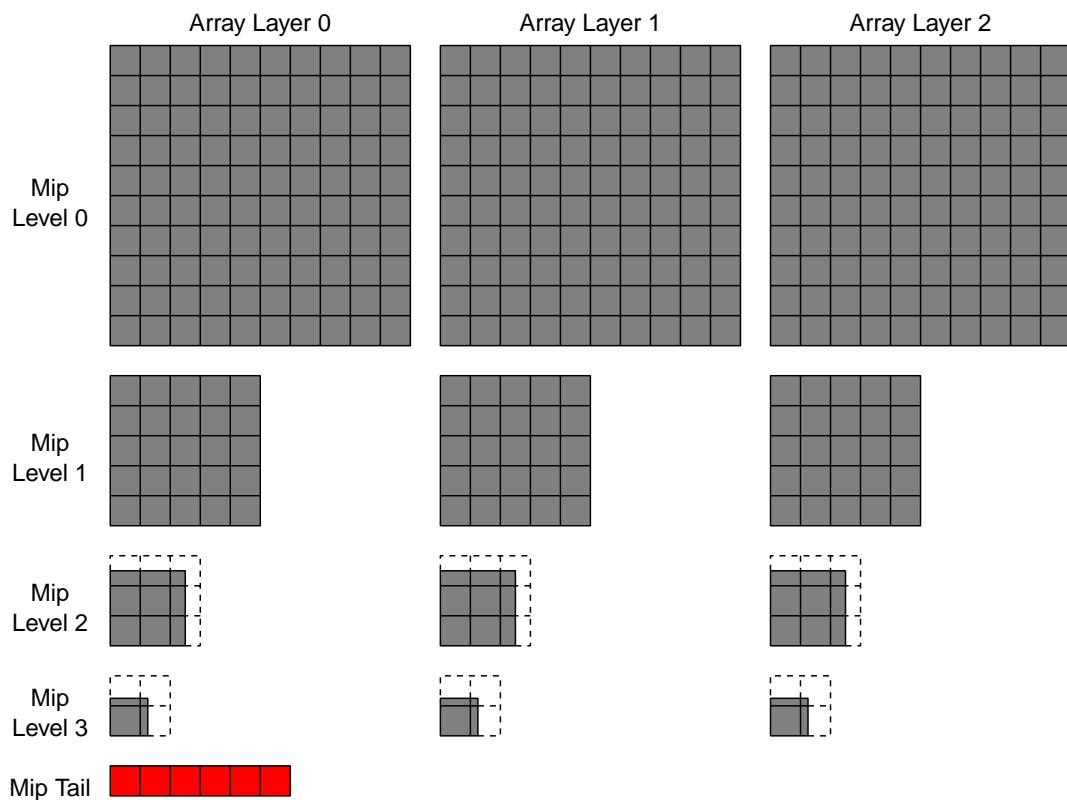

Figure 20. Sparse Image with Single Mip Tail

When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.

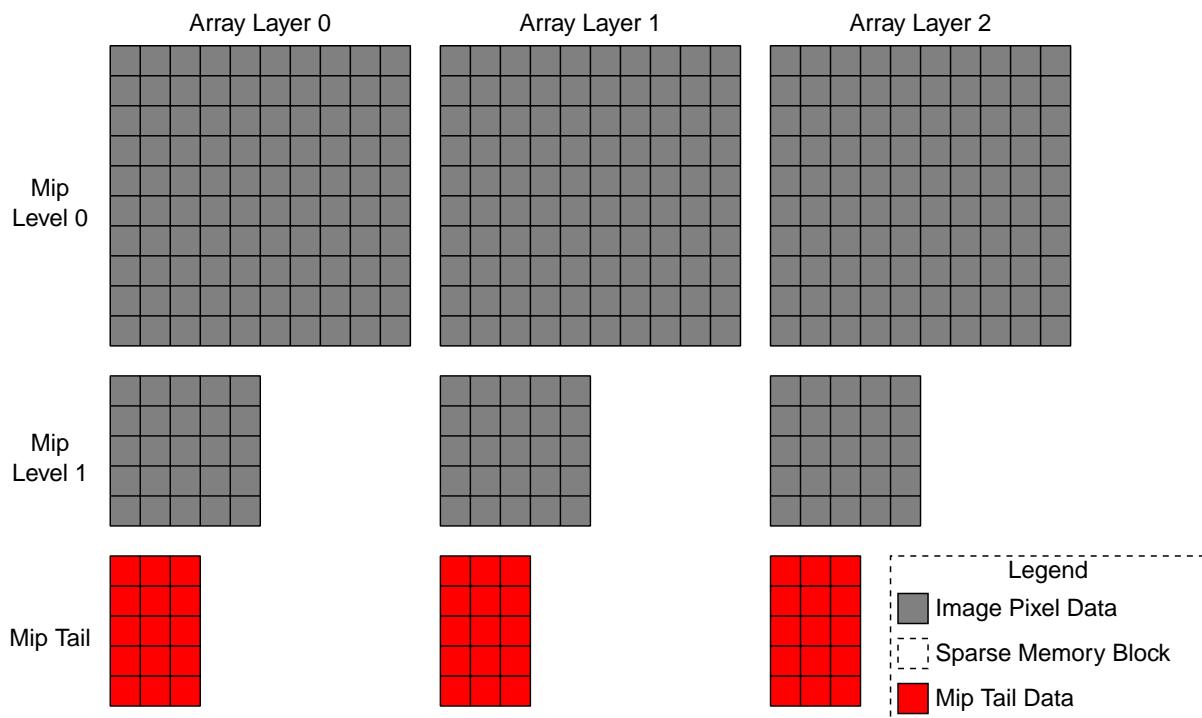

Figure 21. Sparse Image with Aligned Mip Size

Note

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first N mip levels whose dimensions are an exact multiple of the sparse image block dimensions **can** be bound and unbound on a sparse block basis.

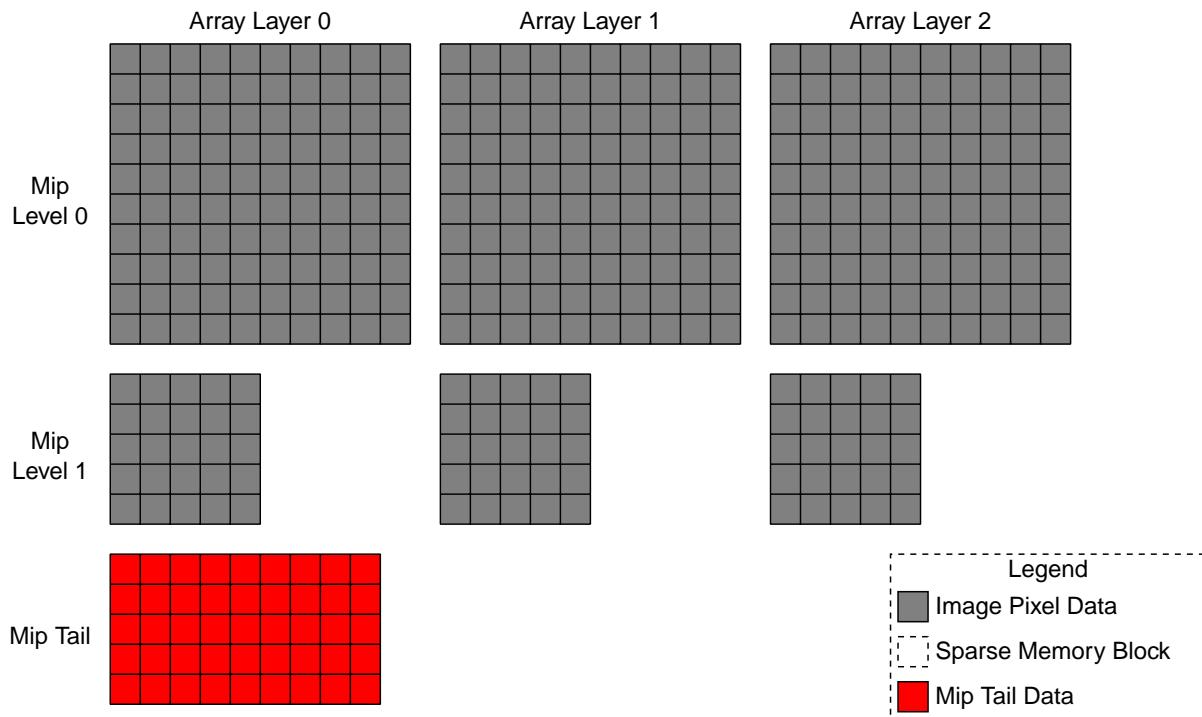

Figure 22. Sparse Image with Aligned Mip Size and Single Mip Tail

Note

The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` are present the constraints from each of these flags are in effect.

32.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. `VK_FORMAT_BC5_UNORM_BLOCK`), the texel size is the size of the compressed texel block (e.g. 128-bit for BC5) thus the dimensions of the standard sparse image block shapes apply in terms of compressed texel blocks.

Note

For block-compressed formats, the dimensions of a sparse image block in terms of texels **can** be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.

Table 45. Standard Sparse Image Block Shapes (Single Sample)

TEXEL SIZE (bits)	Block Shape (2D)	Block Shape (3D)
8-Bit	$256 \times 256 \times 1$	$64 \times 32 \times 32$
16-Bit	$256 \times 128 \times 1$	$32 \times 32 \times 32$
32-Bit	$128 \times 128 \times 1$	$32 \times 32 \times 16$
64-Bit	$128 \times 64 \times 1$	$32 \times 16 \times 16$
128-Bit	$64 \times 64 \times 1$	$16 \times 16 \times 16$

Table 46. Standard Sparse Image Block Shapes (MSAA)

TEXEL SIZE (bits)	Block Shape (2X)	Block Shape (4X)	Block Shape (8X)	Block Shape (16X)
8-Bit	$128 \times 256 \times 1$	$128 \times 128 \times 1$	$64 \times 128 \times 1$	$64 \times 64 \times 1$
16-Bit	$128 \times 128 \times 1$	$128 \times 64 \times 1$	$64 \times 64 \times 1$	$64 \times 32 \times 1$
32-Bit	$64 \times 128 \times 1$	$64 \times 64 \times 1$	$32 \times 64 \times 1$	$32 \times 32 \times 1$
64-Bit	$64 \times 64 \times 1$	$64 \times 32 \times 1$	$32 \times 32 \times 1$	$32 \times 16 \times 1$
128-Bit	$32 \times 64 \times 1$	$32 \times 32 \times 1$	$16 \times 32 \times 1$	$16 \times 16 \times 1$

Implementations that support the standard sparse image block shape for all formats listed in the [Standard Sparse Image Block Shapes \(Single Sample\)](#) and [Standard Sparse Image Block Shapes \(MSAA\)](#) tables **may** advertise the following `VkPhysicalDeviceSparseProperties`:

- `residencyStandard2DBlockShape`
- `residencyStandard2DMultisampleBlockShape`
- `residencyStandard3DBlockShape`

Reporting each of these features does *not* imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

32.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image **may** choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in `VkSparseImageFormatProperties::imageGranularity`. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in `VkMemoryRequirements::alignment`.

Custom sparse image block dimensions are reported through `vkGetPhysicalDeviceSparseImageFormatProperties` and `vkGetImageSparseMemoryRequirements`.

An implementation **must** not support both the standard sparse image block shape and a custom

sparse image block shape for the same image. The standard sparse image block shape **must** be used if it is supported.

32.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private *metadata* associated with the image. See the figure below:

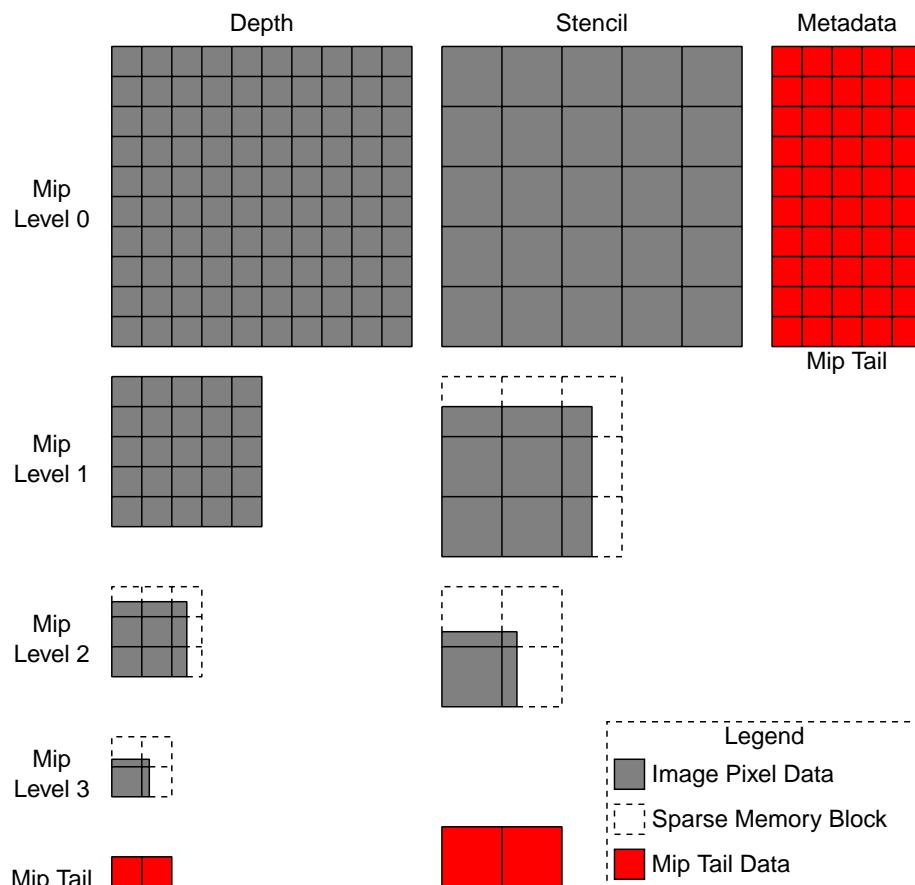

Figure 23. Multiple Aspect Sparse Image

Note

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The per-texel stencil data is $\frac{1}{4}$ the size of the depth data, hence the stencil sparse blocks include $4 \times$ the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by [VkMemoryRequirements::alignment](#).

Metadata

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata **must** be bound prior to device use of the sparse image.

32.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See [Memory Aliasing](#) for more information.

`VkDevice` objects that have the `sparseResidencyAliased` feature enabled are able to use the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care **must** be taken when performing a write operation to aliased physical memory. Memory dependencies **must** be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing **must** abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory **must** be created with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` / `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flag.
- All resources that access aliased physical memory **must** interpret the memory in the same way. This implies the following:
 - Buffers and images **cannot** alias the same physical memory in a data consistent fashion. The physical memory ranges **must** be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
 - Memory in sparse image mip tail regions **cannot** access aliased memory in a data consistent fashion.
 - Sparse images that alias the same physical memory **must** have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource [aliasing rules](#). In this case memory **cannot** be accessed in a data consistent fashion.

Note

Enabling sparse resource memory aliasing **can** be a way to lower physical memory use, but it **may** reduce performance on some implementations. An application developer **can** test on their target HW and balance the memory / performance trade-offs measured.

32.6. Sparse Resource Implementation Guidelines (Informative)

This section is Informative. It is included to aid in implementors' understanding of sparse resources.

Device Virtual Address

The basic `sparseBinding` feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages **must** be bound to physical memory before the device accesses the resource.

The `sparse residency` features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault **may** support `residencyNonResidentStrict`.

Not faulting on access to unbound pages is not enough to support `residencyNonResidentStrict`. An implementation **must** also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this **may** not always be possible.

Any implementation that does not fault, but does not guarantee correct read values **must** not support `residencyNonResidentStrict`.

Any implementation that **cannot** access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory **may** be bound to one (or more) "placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process **must** not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations **may** allocate more often (per instance, per device, or per resource).

Binding Memory

The byte size reported in `VkMemoryRequirements::size` **must** be greater than or equal to the amount of physical memory **required** to fully populate the resource. Some implementations require "holes" in the device virtual address range that are never accessed. These holes **may** be included in the `size` reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for `VkSparseImageOpaqueMemoryBindInfo`. This operation **must** be supported for all sparse images, even ones created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- If the holes are included in the size, this bind function becomes very easy. In most cases the `resourceOffset` is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application **may**

allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application **can** allocate less physical memory than otherwise for the resource. However, in this case the implementation **must** account for the holes when mapping `resourceOffset` to the actual device virtual address intended to be mapped.

Note

If the application always uses `VkSparseImageMemoryBindInfo` to bind memory for the non-tail mip levels, any holes that are present in the resource size **may** never be bound.

Since `VkSparseImageMemoryBindInfo` uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

Binding Metadata Memory

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the [Multiaspect](#) section for details.

Given that metadata is in a mip tail region, and the mip tail region **must** be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling `VkSparseImageOpaqueMemoryBindInfo`.

To make this easier on the implementation, the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` explicitly specifies when metadata is bound with `VkSparseImageOpaqueMemoryBindInfo`. When this flag is not present, the `resourceOffset` **may** be treated as a strict device virtual address offset.

When `VK_SPARSE_MEMORY_BIND_METADATA_BIT` is present, the `resourceOffset` **must** have been derived explicitly from the `imageMipTailOffset` in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for `imageMipTailOffset`, the `resourceOffset` does not have to correlate directly to a device virtual address offset, and **may** instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.

32.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- [Physical Device Features](#)
- [Physical Device Sparse Properties](#)
- [Sparse Image Format Properties](#)
- [Sparse Resource Creation](#)
- [Sparse Resource Memory Requirements](#)
- [Binding Resource Memory](#)

32.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in `VkPhysicalDeviceFeatures`. These features **must** be supported and enabled on the `VkDevice` object before applications **can** use them. See [Physical Device Features](#) for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- `sparseBinding`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flags, respectively.
- `sparseResidencyBuffer`: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag.
- `sparseResidencyImage2D`: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyImage3D`: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency2Samples`: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency4Samples`: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency8Samples`: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency16Samples`: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyAliased`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags, respectively.

32.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32    residencyStandard2DBlockShape;
    VkBool32    residencyStandard2DMultisampleBlockShape;
    VkBool32    residencyStandard3DBlockShape;
    VkBool32    residencyAlignedMipSize;
    VkBool32    residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- `residencyStandard2DBlockShape` is `VK_TRUE` if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the [Standard Sparse Image Block Shapes \(Single Sample\)](#) table. If this property is not supported the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.
- `residencyStandard2DMultisampleBlockShape` is `VK_TRUE` if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the [Standard Sparse Image Block Shapes \(MSAA\)](#) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.
- `residencyStandard3DBlockShape` is `VK_TRUE` if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the [Standard Sparse Image Block Shapes \(Single Sample\)](#) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not **required** to match the standard sparse image block dimensions listed in the table.
- `residencyAlignedMipSize` is `VK_TRUE` if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block **may** be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the `flags` member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.
- `residencyNonResidentStrict` specifies whether the physical device **can** consistently access non-resident regions of a resource. If this property is `VK_TRUE`, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.

32.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, **may** be implementation-dependent, `vkGetPhysicalDeviceSparseImageFormatProperties` **can** be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

Sparse Image Format Properties API

The `VkSparseImageFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;
```

- `aspectMask` is a bitmask `VkImageAspectFlagBits` specifying which aspects of the image the properties apply to.
- `imageGranularity` is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- `flags` is a bitmask of `VkSparseImageFormatFlagBits` specifying additional information about the sparse resource.

Bits which **may** be set in `VkSparseImageFormatProperties::flags`, specifying additional information about the sparse resource, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` specifies that the image uses a single mip tail region for all array layers.
- `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- `VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT` specifies that the image uses non-standard sparse image block dimensions, and the `imageGranularity` values do not match the standard sparse image block dimensions for the given format.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseImageFormatFlags;
```

`VkSparseImageFormatFlags` is a bitmask type for setting a mask of zero or more `VkSparseImageFormatFlagBits`.

`vkGetPhysicalDeviceSparseImageFormatProperties` returns an array of `VkSparseImageFormatProperties`. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

```

// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkSampleCountFlagBits samples,
    VkImageUsageFlags usage,
    VkImageTiling tiling,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties* pProperties);

```

- **physicalDevice** is the physical device from which to query the sparse image format properties.
- **format** is the image format.
- **type** is the dimensionality of image.
- **samples** is a **VkSampleCountFlagBits** value specifying the number of samples per texel.
- **usage** is a bitmask describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.
- **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkSparseImageFormatProperties** structures.

If **pProperties** is **NULL**, then the number of sparse format properties available is returned in **pPropertyCount**. Otherwise, **pPropertyCount** **must** point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If **pPropertyCount** is less than the number of sparse format properties available, at most **pPropertyCount** structures will be written.

If **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** is not supported for the given arguments, **pPropertyCount** will be set to zero upon return, and no data will be written to **pProperties**.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique **VkSparseImageFormatProperties** data.

Depth/stencil images with depth and stencil data interleaved into a single plane will return a single **VkSparseImageFormatProperties** structure with the **aspectMask** set to **VK_IMAGE_ASPECT_DEPTH_BIT** | **VK_IMAGE_ASPECT_STENCIL_BIT**.

Valid Usage

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094
`samples` **must** be a bit value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command and `flags` equal to the value that is set in `VkImageCreateInfo::flags` when the image is created

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter
`format` **must** be a valid `VkFormat` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter
`type` **must** be a valid `VkImageType` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter
`samples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter
`usage` **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitmask
`usage` **must** not be `0`
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter
`tiling` **must** be a valid `VkImageTiling` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pProperties-parameter
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties` structures

`vkGetPhysicalDeviceSparseImageFormatProperties2` returns an array of `VkSparseImageFormatProperties2`. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceSparseImageFormatProperties2(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);
```

or the equivalent command

```
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);
```

- **physicalDevice** is the physical device from which to query the sparse image format properties.
- **pFormatInfo** is a pointer to a [VkPhysicalDeviceSparseImageFormatInfo2](#) structure containing input parameters to the command.
- **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of [VkSparseImageFormatProperties2](#) structures.

[vkGetPhysicalDeviceSparseImageFormatProperties2](#) behaves identically to [vkGetPhysicalDeviceSparseImageFormatProperties](#), with the ability to return extended information by adding extending structures to the **pNext** chain of its **pProperties** parameter.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter
physicalDevice **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter
pFormatInfo **must** be a valid pointer to a valid [VkPhysicalDeviceSparseImageFormatInfo2](#) structure
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter
pPropertyCount **must** be a valid pointer to a [uint32_t](#) value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter
If the value referenced by **pPropertyCount** is not **0**, and **pProperties** is not **NULL**, **pProperties** **must** be a valid pointer to an array of **pPropertyCount** [VkSparseImageFormatProperties2](#) structures

The [VkPhysicalDeviceSparseImageFormatInfo2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType          sType;
    const void*             pNext;
    VkFormat                 format;
    VkImageType               type;
    VkSampleCountFlagBits     samples;
    VkImageUsageFlags         usage;
    VkImageTiling              tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceSparseImageFormatInfo2
VkPhysicalDeviceSparseImageFormatInfo2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **format** is the image format.
- **type** is the dimensionality of image.
- **samples** is a **VkSampleCountFlagBits** value specifying the number of samples per texel.
- **usage** is a bitmask describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.

Valid Usage

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095
samples **must** be a bit value that is set in **VkImageFormatProperties::sampleCounts** returned by **vkGetPhysicalDeviceImageFormatProperties** with **format**, **type**, **tiling**, and **usage** equal to those in this command and **flags** equal to the value that is set in **VkImageCreateInfo ::flags** when the image is created

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2`
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext
pNext **must** be `NULL`
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter
format **must** be a valid `VkFormat` value
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter
type **must** be a valid `VkImageType` value
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter
samples **must** be a valid `VkSampleCountFlagBits` value
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter
usage **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-requiredbitmask
usage **must** not be `0`
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter
tiling **must** be a valid `VkImageTiling` value

The `VkSparseImageFormatProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageFormatProperties2 {
    VkStructureType          sType;
    void*                  pNext;
    VkSparseImageFormatProperties properties;
} VkSparseImageFormatProperties2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **properties** is a `VkSparseImageFormatProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceSparseImageFormatProperties`.

Valid Usage (Implicit)

- `VUID-VkSparseImageFormatProperties2-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2`
- `VUID-VkSparseImageFormatProperties2-pNext-pNext`
`pNext` **must** be `NULL`

32.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the `VkPhysicalDeviceFeatures` structure described previously in the [Physical Device Features](#) section) when calling `vkCreateDevice`. When the appropriate device features are enabled, the `VK_BUFFER_CREATE_SPARSE_*` and `VK_IMAGE_CREATE_SPARSE_*` flags **can** be used. See `vkCreateBuffer` and `vkCreateImage` for details of the resource creation APIs.

Note

 Specifying `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` or `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` requires specifying `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` or `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, respectively, as well. This means that resources **must** be created with the appropriate `*_SPARSE_BINDING_BIT` to be used with the sparse binding command (`vkQueueBindSparse`).

32.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for `VkBuffer` objects and `VkImage` objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images **can** be bound to memory using only the data from `VkMemoryRequirements`. For all sparse resources the `VkMemoryRequirements::alignment` member specifies both the bindable sparse block size in bytes and **required** alignment of `VkDeviceMemory`.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the `VkMemoryRequirements::alignment` field specifies the bindable sparse block size in bytes for the image.

Requesting sparse memory requirements for `VkImage` objects using `vkGetImageSparseMemoryRequirements` will return an array of one or more `VkSparseImageMemoryRequirements` structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image **must** have been created using the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag to

retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The `VkSparseImageMemoryRequirements` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties      formatProperties;
    uint32_t                          imageMipTailFirstLod;
    VkDeviceSize                     imageMipTailSize;
    VkDeviceSize                     imageMipTailOffset;
    VkDeviceSize                     imageMipTailStride;
} VkSparseImageMemoryRequirements;
```

- `formatProperties` is a `VkSparseImageFormatProperties` structure specifying properties of the image format.
- `imageMipTailFirstLod` is the first mip level at which image subresources are included in the mip tail region.
- `imageMipTailSize` is the memory size (in bytes) of the mip tail region. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.
- `imageMipTailOffset` is the opaque memory offset used with `VkSparseImageOpaqueMemoryBindInfo` to bind the mip tail region(s).
- `imageMipTailStride` is the offset stride between each array-layer's mip tail, if `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(VkDevice           device,
                                         VkImage          image,
                                         uint32_t*        pSparseMemoryRequirementCount,
                                         VkSparseImageMemoryRequirements* pSparseMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `image` is the `VkImage` object to get the memory requirements for.
- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements` structures.

If `pSparseMemoryRequirements` is `NULL`, then the number of sparse memory requirements available is returned in `pSparseMemoryRequirementCount`. Otherwise, `pSparseMemoryRequirementCount` **must** point to a variable set by the user to the number of elements in the `pSparseMemoryRequirements` array, and on return the variable is overwritten with the number of structures actually written to `pSparseMemoryRequirements`. If `pSparseMemoryRequirementCount` is less than the number of sparse memory requirements available, at most `pSparseMemoryRequirementCount` structures will be written.

If the image was not created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` then `pSparseMemoryRequirementCount` will be set to zero and `pSparseMemoryRequirements` will not be written to.

Note

 It is legal for an implementation to report a larger value in `VkMemoryRequirements` `:size` than would be obtained by adding together memory sizes for all `VkSparseImageMemoryRequirements` returned by `vkGetImageSparseMemoryRequirements`. This **may** occur when the implementation requires unused padding in the address range describing the resource.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetImageSparseMemoryRequirements-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
`pSparseMemoryRequirementCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by `pSparseMemoryRequirementCount` is not `0`, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` **must** be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements` structures
- VUID-vkGetImageSparseMemoryRequirements-image-parent
`image` **must** have been created, allocated, or retrieved from `device`

To query sparse memory requirements for an image, call:

```
// Provided by VK_VERSION_1_1
void vkGetImageSparseMemoryRequirements2(
    VkDevice                               device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t*                                pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2*         pSparseMemoryRequirements);
```

or the equivalent command

```
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageSparseMemoryRequirements2KHR(
    VkDevice device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `pInfo` is a pointer to a `VkImageSparseMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.
- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements2-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkImageSparseMemoryRequirementsInfo2` structure
- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter
`pSparseMemoryRequirementCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter
If the value referenced by `pSparseMemoryRequirementCount` is not `0`, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` **must** be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements2` structures

To determine the sparse memory requirements for an image resource without creating an object, call:

```
// Provided by VK_VERSION_1_3
void vkGetDeviceImageSparseMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageSparseMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- `device` is the logical device intended to own the image.
- `pInfo` is a pointer to a `VkDeviceImageMemoryRequirements` structure containing parameters required for the memory requirements query.
- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

Valid Usage (Implicit)

- VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkDeviceImageMemoryRequirements` structure
- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
`pSparseMemoryRequirementCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by `pSparseMemoryRequirementCount` is not `0`, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` **must** be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements2` structures

The `VkImageSparseMemoryRequirementsInfo2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to query.

Valid Usage (Implicit)

- VUID-VkImageSparseMemoryRequirementsInfo2-sType-`sType`
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2`
- VUID-VkImageSparseMemoryRequirementsInfo2-pNext-`pNext`
`pNext` **must** be `NULL`
- VUID-VkImageSparseMemoryRequirementsInfo2-image-parameter
`image` **must** be a valid `VkImage` handle

The `VkSparseImageMemoryRequirements2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType           sType;
    void*                     pNext;
    VkSparseImageMemoryRequirements memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkSparseImageMemoryRequirements` structure describing the memory requirements of the sparse image.

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryRequirements2-sType-`sType`
`sType` **must** be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`
- VUID-VkSparseImageMemoryRequirements2-pNext-`pNext`
`pNext` **must** be `NULL`

32.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via

`vkBindImageMemory` or `vkBindBufferMemory`), and their backing **must** not be changed. On the other hand, sparse resources **can** be bound to memory non-contiguously and these bindings **can** be altered during the lifetime of the resource.

Note

It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications **must** not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit. Applications **must** use [synchronization primitives](#) to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

Note

Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations **may** include `VK_QUEUE_SPARSE_BINDING_BIT` support in queue families that also include graphics and compute support, other implementations **may** only expose a `VK_QUEUE_SPARSE_BINDING_BIT`-only queue family. In either case, applications **must** use [synchronization primitives](#) to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the `VK_IMAGE_ASPECT_METADATA_BIT` the application **must** use the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` in the `VkSparseMemoryBind::flags` field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` flag.

Binding the mip tail for any aspect **must** only be performed using `VkSparseImageOpaqueMemoryBindInfo`. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, then it **can** be bound with a single `VkSparseMemoryBind` structure, with `resourceOffset = imageMipTailOffset` and `size = imageMipTailSize`.

If `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` then the offset for the mip tail in each array layer is given as:

```
arrayMipTailOffset = imageMipTailOffset + arrayLayer * imageMipTailStride;
```

and the mip tail **can** be bound with `layerCount` `VkSparseMemoryBind` structures, each using `size = imageMipTailSize` and `resourceOffset = arrayMipTailOffset` as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

Sparse Memory Binding Functions

The `VkSparseMemoryBind` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize          resourceOffset;
    VkDeviceSize          size;
    VkDeviceMemory        memory;
    VkDeviceSize          memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseMemoryBind;
```

- `resourceOffset` is the offset into the resource.
- `size` is the size of the memory region to be bound.
- `memory` is the `VkDeviceMemory` object that the range of the resource is bound to. If `memory` is `VK_NULL_HANDLE`, the range is unbound.
- `memoryOffset` is the offset into the `VkDeviceMemory` object to bind the resource range to. If `memory` is `VK_NULL_HANDLE`, this value is ignored.
- `flags` is a bitmask of `VkSparseMemoryBindFlagBits` specifying usage of the binding operation.

The *binding range* [`resourceOffset`, `resourceOffset + size`] has different constraints based on `flags`. If `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range **must** be within the mip tail region of the metadata aspect. This metadata region is defined by:

$$\text{metadataRegion} = [\text{base}, \text{base} + \text{imageMipTailSize}]$$
$$\text{base} = \text{imageMipTailOffset} + \text{imageMipTailStride} \times n$$

and `imageMipTailOffset`, `imageMipTailSize`, and `imageMipTailStride` values are from the `VkSparseImageMemoryRequirements` corresponding to the metadata aspect of the image, and `n` is a valid array layer index for the image,

`imageMipTailStride` is considered to be zero for aspects where `VkSparseImageMemoryRequirements::formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`.

If `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range **must** be within the range [0, `VkMemoryRequirements::size`].

Valid Usage

- VUID-VkSparseMemoryBind-memory-01096
If `memory` is not `VK_NULL_HANDLE`, `memory` and `memoryOffset` **must** match the memory requirements of the resource, as described in section [Resource Memory Association](#)
- VUID-VkSparseMemoryBind-memory-01097
If `memory` is not `VK_NULL_HANDLE`, `memory` **must** not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set
- VUID-VkSparseMemoryBind-size-01098
`size` **must** be greater than `0`
- VUID-VkSparseMemoryBind-resourceOffset-01099
`resourceOffset` **must** be less than the size of the resource
- VUID-VkSparseMemoryBind-size-01100
`size` **must** be less than or equal to the size of the resource minus `resourceOffset`
- VUID-VkSparseMemoryBind-memoryOffset-01101
`memoryOffset` **must** be less than the size of `memory`
- VUID-VkSparseMemoryBind-size-01102
`size` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- VUID-VkSparseMemoryBind-memory-02730
If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to `0`, at least one handle type it contained **must** also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created
- VUID-VkSparseMemoryBind-memory-02731
If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created

Valid Usage (Implicit)

- VUID-VkSparseMemoryBind-parameter
If `memory` is not `VK_NULL_HANDLE`, `memory` **must** be a valid `VkDeviceMemory` handle
- VUID-VkSparseMemoryBind-flags-parameter
`flags` **must** be a valid combination of `VkSparseMemoryBindFlagBits` values

Bits which **can** be set in `VkSparseMemoryBind::flags`, specifying usage of a sparse memory binding operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;
```

- **VK_SPARSE_MEMORY_BIND_METADATA_BIT** specifies that the memory being bound is only for the metadata aspect.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseMemoryBindFlags;
```

VkSparseMemoryBindFlags is a bitmask type for setting a mask of zero or more **VkSparseMemoryBindFlagBits**.

Memory is bound to **VkBuffer** objects created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer                  buffer;
    uint32_t                bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;
```

- **buffer** is the **VkBuffer** object to be bound.
- **bindCount** is the number of **VkSparseMemoryBind** structures in the **pBinds** array.
- **pBinds** is a pointer to an array of **VkSparseMemoryBind** structures.

Valid Usage (Implicit)

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter
buffer **must** be a valid **VkBuffer** handle
- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter
pBinds **must** be a valid pointer to an array of **bindCount** valid **VkSparseMemoryBind** structures
- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength
bindCount **must** be greater than 0

Memory is bound to opaque regions of **VkImage** objects created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage                  image;
    uint32_t                bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;
```

- `image` is the `VkImage` object to be bound.
- `bindCount` is the number of `VkSparseMemoryBind` structures in the `pBinds` array.
- `pBinds` is a pointer to an array of `VkSparseMemoryBind` structures.

Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103
If the `flags` member of any element of `pBinds` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range defined **must** be within the mip tail region of the metadata aspect of `image`

Valid Usage (Implicit)

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
`pBinds` **must** be a valid pointer to an array of `bindCount` valid `VkSparseMemoryBind` structures
- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
`bindCount` **must** be greater than `0`

Note

This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it **can** also be used to bind memory for the entire binding range of partially resident images.

In case `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the `resourceOffset` is in the range [0, `VkMemoryRequirements::size`), This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the `resourceOffset` is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range specified **must** be within the mip tail region of the metadata aspect. In this case the `resourceOffset` is not **required** to be a simple device address offset within the resource. However, it *is* defined to be within [`imageMipTailOffset`, `imageMipTailOffset` + `imageMipTailSize`) for the metadata aspect. See `VkSparseMemoryBind` for the full constraints on binding region with this flag present.

Memory **can** be bound to sparse image blocks of `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBindInfo {
    VkImage                  image;
    uint32_t                bindCount;
    const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;
```

- `image` is the `VkImage` object to be bound
- `bindCount` is the number of `VkSparseImageMemoryBind` structures in `pBinds` array
- `pBinds` is a pointer to an array of `VkSparseImageMemoryBind` structures

Valid Usage

- VUID-VkSparseImageMemoryBindInfo-subresource-01722
The `subresource.mipLevel` member of each element of `pBinds` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkSparseImageMemoryBindInfo-subresource-01723
The `subresource.arrayLayer` member of each element of `pBinds` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkSparseImageMemoryBindInfo-image-02901
`image` **must** have been created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBindInfo-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-VkSparseImageMemoryBindInfo-pBinds-parameter
`pBinds` **must** be a valid pointer to an array of `bindCount` valid `VkSparseImageMemoryBind` structures
- VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength
`bindCount` **must** be greater than `0`

The `VkSparseImageMemoryBind` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource      subresource;
    VkOffset3D              offset;
    VkExtent3D              extent;
    VkDeviceMemory          memory;
    VkDeviceSize             memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;
```

- `subresource` is the image *aspect* and region of interest in the image.
- `offset` are the coordinates of the first texel within the image subresource to bind.
- `extent` is the size in texels of the region within the image subresource to bind. The extent **must** be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it **can** instead be such that any coordinate of `offset` + `extent` equals the corresponding dimensions of the image subresource.
- `memory` is the `VkDeviceMemory` object that the sparse image blocks of the image are bound to. If `memory` is `VK_NULL_HANDLE`, the sparse image blocks are unbound.
- `memoryOffset` is an offset into `VkDeviceMemory` object. If `memory` is `VK_NULL_HANDLE`, this value

is ignored.

- `flags` are sparse memory binding flags.

Valid Usage

- VUID-VkSparseImageMemoryBind-memory-01104

If the `sparse aliased residency` feature is not enabled, and if any other resources are bound to ranges of `memory`, the range of `memory` being bound **must** not overlap with those bound ranges

- VUID-VkSparseImageMemoryBind-memory-01105

`memory` and `memoryOffset` **must** match the memory requirements of the calling command's `image`, as described in section [Resource Memory Association](#)

- VUID-VkSparseImageMemoryBind-subresource-01106

`subresource` **must** be a valid image subresource for `image` (see [Image Views](#))

- VUID-VkSparseImageMemoryBind-offset-01107

`offset.x` **must** be a multiple of the sparse image block width (`VkSparseImageFormatProperties::imageGranularity.width`) of the image

- VUID-VkSparseImageMemoryBind-extent-01108

`extent.width` **must** either be a multiple of the sparse image block width of the image, or else (`extent.width + offset.x`) **must** equal the width of the image subresource

- VUID-VkSparseImageMemoryBind-offset-01109

`offset.y` **must** be a multiple of the sparse image block height (`VkSparseImageFormatProperties::imageGranularity.height`) of the image

- VUID-VkSparseImageMemoryBind-extent-01110

`extent.height` **must** either be a multiple of the sparse image block height of the image, or else (`extent.height + offset.y`) **must** equal the height of the image subresource

- VUID-VkSparseImageMemoryBind-offset-01111

`offset.z` **must** be a multiple of the sparse image block depth (`VkSparseImageFormatProperties::imageGranularity.depth`) of the image

- VUID-VkSparseImageMemoryBind-extent-01112

`extent.depth` **must** either be a multiple of the sparse image block depth of the image, or else (`extent.depth + offset.z`) **must** equal the depth of the image subresource

- VUID-VkSparseImageMemoryBind-memory-02732

If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to `0`, at least one handle type it contained **must** also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when the image was created

- VUID-VkSparseImageMemoryBind-memory-02733

If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBind-subresource-parameter
subresource must be a valid `VkImageSubresource` structure
- VUID-VkSparseImageMemoryBind-memory-parameter
If `memory` is not `VK_NULL_HANDLE`, `memory` must be a valid `VkDeviceMemory` handle
- VUID-VkSparseImageMemoryBind-flags-parameter
flags must be a valid combination of `VkSparseMemoryBindFlagBits` values

To submit sparse binding operations to a queue, call:

```
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue queue,
    uint32_t bindInfoCount,
    const VkBindSparseInfo* pBindInfo,
    VkFence fence);
```

- `queue` is the queue that the sparse binding operations will be submitted to.
- `bindInfoCount` is the number of elements in the `pBindInfo` array.
- `pBindInfo` is a pointer to an array of `VkBindSparseInfo` structures, each specifying a sparse binding submission batch.
- `fence` is an **optional** handle to a fence to be signaled. If `fence` is not `VK_NULL_HANDLE`, it defines a [fence signal operation](#).

`vkQueueBindSparse` is a [queue submission command](#), with each batch defined by an element of `pBindInfo` as a `VkBindSparseInfo` structure. Batches begin execution in the order they appear in `pBindInfo`, but **may** complete out of order.

Within a batch, a given range of a resource **must** not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application **must** guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to `vkQueueBindSparse` causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in [the synchronization chapter](#).

Valid Usage

- VUID-vkQueueBindSparse-fence-01113
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be unsignaled
- VUID-vkQueueBindSparse-fence-01114
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkQueueBindSparse-pSignalSemaphores-01115
Each element of the `pSignalSemaphores` member of each element of `pBindInfo` **must** be unsignaled when the semaphore signal operation it defines is executed on the device
- VUID-vkQueueBindSparse-pWaitSemaphores-01116
When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pBindInfo` executes on `queue`, there **must** be no other queues waiting on the same semaphore
- VUID-vkQueueBindSparse-pWaitSemaphores-01117
All elements of the `pWaitSemaphores` member of all elements of the `pBindInfo` parameter referring to a binary semaphore **must** be semaphores that are signaled, or have `semaphore signal operations` previously submitted for execution
- VUID-vkQueueBindSparse-pWaitSemaphores-03245
All elements of the `pWaitSemaphores` member of all elements of `pBindInfo` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution

Valid Usage (Implicit)

- VUID-vkQueueBindSparse-queue-parameter
`queue` **must** be a valid `VkQueue` handle
- VUID-vkQueueBindSparse-pBindInfo-parameter
If `bindInfoCount` is not `0`, `pBindInfo` **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindSparseInfo` structures
- VUID-vkQueueBindSparse-fence-parameter
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle
- VUID-vkQueueBindSparse-queuetype
The `queue` **must** support sparse binding operations
- VUID-vkQueueBindSparse-commonparent
Both of `fence`, and `queue` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `queue` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
-	-	SPARSE_BINDING

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkBindSparseInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBindSparseInfo {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  waitSemaphoreCount;
    const VkSemaphore*         pWaitSemaphores;
    uint32_t                  bufferBindCount;
    const VkSparseBufferMemoryBindInfo*   pBufferBinds;
    uint32_t                  imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo*  pImageOpaqueBinds;
    uint32_t                  imageBindCount;
    const VkSparseImageMemoryBindInfo*       pImageBinds;
    uint32_t                  signalSemaphoreCount;
    const VkSemaphore*         pSignalSemaphores;
} VkBindSparseInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.

- `pWaitSemaphores` is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a [semaphore wait operation](#).
- `bufferBindCount` is the number of sparse buffer bindings to perform in the batch.
- `pBufferBinds` is a pointer to an array of `VkSparseBufferMemoryBindInfo` structures.
- `imageOpaqueBindCount` is the number of opaque sparse image bindings to perform.
- `pImageOpaqueBinds` is a pointer to an array of `VkSparseImageOpaqueMemoryBindInfo` structures, indicating opaque sparse image bindings to perform.
- `imageBindCount` is the number of sparse image bindings to perform.
- `pImageBinds` is a pointer to an array of `VkSparseImageMemoryBindInfo` structures, indicating sparse image bindings to perform.
- `signalSemaphoreCount` is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.
- `pSignalSemaphores` is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a [semaphore signal operation](#).

Valid Usage

- VUID-VkBindSparseInfo-pWaitSemaphores-03246
If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then the `pNext` chain **must** include a `VkTimelineSemaphoreSubmitInfo` structure
- VUID-VkBindSparseInfo-pNext-03247
If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `waitSemaphoreValueCount` member **must** equal `waitSemaphoreCount`
- VUID-VkBindSparseInfo-pNext-03248
If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `signalSemaphoreValueCount` member **must** equal `signalSemaphoreCount`
- VUID-VkBindSparseInfo-pSignalSemaphores-03249
For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` **must** have a value greater than the current value of the semaphore when the `semaphore signal operation` is executed
- VUID-VkBindSparseInfo-pWaitSemaphores-03250
For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`
- VUID-VkBindSparseInfo-pSignalSemaphores-03251
For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

Valid Usage (Implicit)

- VUID-VkBindSparseInfo-sType-sType
The `sType` must be `VK_STRUCTURE_TYPE_BIND_SPARSE_INFO`
- VUID-VkBindSparseInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupBindSparseInfo` or `VkTimelineSemaphoreSubmitInfo`
- VUID-VkBindSparseInfo-sType-unique
The `sType` value of each struct in the `pNext` chain must be unique
- VUID-VkBindSparseInfo-pWaitSemaphores-parameter
If `waitSemaphoreCount` is not `0`, `pWaitSemaphores` must be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles
- VUID-VkBindSparseInfo-pBufferBinds-parameter
If `bufferBindCount` is not `0`, `pBufferBinds` must be a valid pointer to an array of `bufferBindCount` valid `VkSparseBufferMemoryBindInfo` structures
- VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter
If `imageOpaqueBindCount` is not `0`, `pImageOpaqueBinds` must be a valid pointer to an array of `imageOpaqueBindCount` valid `VkSparseImageOpaqueMemoryBindInfo` structures
- VUID-VkBindSparseInfo-pImageBinds-parameter
If `imageBindCount` is not `0`, `pImageBinds` must be a valid pointer to an array of `imageBindCount` valid `VkSparseImageMemoryBindInfo` structures
- VUID-VkBindSparseInfo-pSignalSemaphores-parameter
If `signalSemaphoreCount` is not `0`, `pSignalSemaphores` must be a valid pointer to an array of `signalSemaphoreCount` valid `VkSemaphore` handles
- VUID-VkBindSparseInfo-commonparent
Both of the elements of `pSignalSemaphores`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, add a `VkTimelineSemaphoreSubmitInfo` structure to the `pNext` chain of the `VkBindSparseInfo` structure.

If the `pNext` chain of `VkBindSparseInfo` includes a `VkDeviceGroupBindSparseInfo` structure, then that structure includes device indices specifying which instance of the resources and memory are bound.

The `VkDeviceGroupBindSparseInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType    sType;
    const void*      pNext;
    uint32_t         resourceDeviceIndex;
    uint32_t         memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **resourceDeviceIndex** is a device index indicating which instance of the resource is bound.
- **memoryDeviceIndex** is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the **resourceDeviceIndex**.

If this structure is not present, **resourceDeviceIndex** and **memoryDeviceIndex** are assumed to be zero.

Valid Usage

- VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118
resourceDeviceIndex and **memoryDeviceIndex** **must** both be valid device indices
- VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119
Each memory allocation bound in this batch **must** have allocated an instance for **memoryDeviceIndex**

Valid Usage (Implicit)

- VUID-VkDeviceGroupBindSparseInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO**

Chapter 33. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API **can** be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions **must** be enabled in order to use each of the functions described in this chapter.

33.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API **may** be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the [Window System-Specific Header Control](#) appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

- **#define** the appropriate preprocessor symbol prior to including the `vulkan.h` header file, or
- include `vulkan_core.h` and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the [Window System Extensions and Headers](#) table.

Each platform-specific extension is an instance extension. The application **must** enable instance extensions with `vkCreateInstance` before using them.

33.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by `VkSurfaceKHR` handles:

```
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The `VK_KHR_surface` extension declares the `VkSurfaceKHR` object, and provides a function for destroying `VkSurfaceKHR` objects. Separate platform-specific extensions each provide a function for creating a `VkSurfaceKHR` object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.

Note

On certain platforms, the Vulkan loader and ICDs **may** have conventions that treat the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers **may** wrap `VkSurfaceKHR` objects.

33.2.1. Android Platform

To create a `VkSurfaceKHR` object for an Android native window, call:

```
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkAndroidSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `ANativeWindow` handle any attempts to create another surface for the same `ANativeWindow` and any attempts to connect to the same `ANativeWindow` through other platform mechanisms will fail.

Note

In particular, only one `VkSurfaceKHR` **can** exist at a time for a given window. Similarly, a native window **cannot** be used by both a `VkSurfaceKHR` and `EGLSurface` simultaneously.

If successful, `vkCreateAndroidSurfaceKHR` increments the `ANativeWindow`'s reference count, and `vkDestroySurfaceKHR` will decrement it.

On Android, when a swapchain's `imageExtent` does not match the surface's `currentExtent`, the presentable images will be scaled to the surface's dimensions during presentation. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum image size supported by the consumer. For the system compositor, `currentExtent` is the window size (i.e. the consumer's preferred size).

Valid Usage (Implicit)

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkAndroidSurfaceCreateInfoKHR](#) structure
- VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_NATIVE_WINDOW_IN_USE_KHR](#)

The [VkAndroidSurfaceCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
    VkStructureType          sType;
    const void*             pNext;
    VkAndroidSurfaceCreateFlagsKHR flags;
    struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **window** is a pointer to the [ANativeWindow](#) to associate the surface with.

Valid Usage

- VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
window **must** point to a valid Android [ANativeWindow](#)

Valid Usage (Implicit)

- `VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR`
- `VUID-VkAndroidSurfaceCreateInfoKHR-pNext-pNext`
`pNext` **must** be `NULL`
- `VUID-VkAndroidSurfaceCreateInfoKHR-flags-zero bitmask`
`flags` **must** be `0`

To remove an unnecessary compile-time dependency, an incomplete type definition of `ANativeWindow` is provided in the Vulkan headers:

```
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual `ANativeWindow` type is defined in Android NDK headers.

```
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(  
    VkInstance                                instance,  
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo,  
    const VkAllocationCallbacks*      pAllocator,  
    VkSurfaceKHR*                            pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWaylandSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkWaylandSurfaceCreateInfoKHR](#) structure
- VUID-vkCreateWaylandSurfaceKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateWaylandSurfaceKHR-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

The [VkWaylandSurfaceCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWaylandSurfaceCreateFlagsKHR flags;
    struct wl_display* display;
    struct wl_surface* surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **display** and **surface** are pointers to the Wayland **wl_display** and **wl_surface** to associate the surface with.

Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304
display must point to a valid Wayland `wl_display`
- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305
surface must point to a valid Wayland `wl_surface`

Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
sType must be `VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR`
- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
pNext must be `NULL`
- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zero bitmask
flags must be `0`

On Wayland, `currentExtent` is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain's `imageExtent` to will be the size of the window, after the first image is presented. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum supported surface size. Any calls to `vkGetPhysicalDeviceSurfacePresentModesKHR` on a surface created with `vkCreateWaylandSurfaceKHR` are required to return `VK_PRESENT_MODE_MAILBOX_KHR` as one of the valid present modes.

Some Vulkan functions may send protocol over the specified `wl_display` connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to a `wl_surface`. Applications must therefore ensure that both the `wl_display` and the `wl_surface` remain valid for the lifetime of any `VkSwapchainKHR` objects created from a particular `wl_display` and `wl_surface`. Also, calling `vkQueuePresentKHR` will result in Vulkan sending `wl_surface.commit` requests to the underlying `wl_surface` of each `VkSwapchainKHR` objects referenced by `pPresentInfo`. If the swapchain is created with a present mode of `VK_PRESENT_MODE_MAILBOX_KHR` or `VK_PRESENT_MODE_IMMEDIATE_KHR`, then the corresponding `wl_surface.attach`, `wl_surface.damage`, and `wl_surface.commit` request must be issued by the implementation during the call to `vkQueuePresentKHR` and must not be issued by the implementation outside of `vkQueuePresentKHR`. This ensures that any Wayland requests sent by the client after the call to `vkQueuePresentKHR` returns will be received by the compositor after the `wl_surface.commit`. Regardless of the mode of swapchain creation, a new `wl_event_queue` must be created for each successful `vkCreateWaylandSurfaceKHR` call, and every Wayland object created by the implementation must be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this must be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests must be sent to the Wayland display server prior to calling `vkQueuePresentKHR`. For full control over interactions between Vulkan rendering and other Wayland protocol requests and events, a present mode of `VK_PRESENT_MODE_MAILBOX_KHR` should be used.

```
// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;
```

`VkWaylandSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.3. Win32 Platform

To create a `VkSurfaceKHR` object for a Win32 window, call:

```
// Provided by VK_KHR_win32_surface
VkResult vkCreateWin32SurfaceKHR(  
    VkInstance                                     instance,  
    const VkWin32SurfaceCreateInfoKHR*          pCreateInfo,  
    const VkAllocationCallbacks*                 pAllocator,  
    VkSurfaceKHR*                            pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWin32SurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkWin32SurfaceCreateInfoKHR` structure
- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkWin32SurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE                 hinstance;
    HWND                      hwnd;
} VkWin32SurfaceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `hinstance` is the Win32 `HINSTANCE` for the window to associate the surface with.
- `hwnd` is the Win32 `HWND` for the window to associate the surface with.

Valid Usage

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
`hinstance` **must** be a valid Win32 `HINSTANCE`
- VUID-VkWin32SurfaceCreateInfoKHR-hwnd-01308
`hwnd` **must** be a valid Win32 `HWND`

Valid Usage (Implicit)

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`
- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkWin32SurfaceCreateInfoKHR-flags-zero bitmask
`flags` **must** be `0`

With Win32, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of a Win32 surface **must** have both `width` and `height` greater than 0, or both of them 0.

Note

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

```
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
```

`VkWin32SurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.4. XCB Platform

To create a `VkSurfaceKHR` object for an X11 window, using the XCB client-side library, call:

```
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance                                     instance,
    const VkXcbSurfaceCreateInfoKHR*                pCreateInfo,
    const VkAllocationCallbacks*                    pAllocator,
    VkSurfaceKHR*                                  pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkXcbSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateXcbSurfaceKHR-instance-parameter
instance **must** be a valid `VkInstance` handle
- VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid `VkXcbSurfaceCreateInfoKHR` structure
- VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter
If **pAllocator** is not `NULL`, **pAllocator** **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateXcbSurfaceKHR-pSurface-parameter
pSurface **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXcbSurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType          sType;
    const void*               pNext;
    VkXcbSurfaceCreateFlagsKHR flags;
    xcb_connection_t*       connection;
    xcb_window_t           window;
} VkXcbSurfaceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **connection** is a pointer to an `xcb_connection_t` to the X server.
- **window** is the `xcb_window_t` for the X11 window to associate the surface with.

Valid Usage

- VUID-VkXcbSurfaceCreateInfoKHR-connection-01310
`connection` **must** point to a valid X11 `xcb_connection_t`
- VUID-VkXcbSurfaceCreateInfoKHR-window-01311
`window` **must** be a valid X11 `xcb_window_t`

Valid Usage (Implicit)

- VUID-VkXcbSurfaceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR`
- VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkXcbSurfaceCreateInfoKHR-flags-zero bitmask
`flags` **must** be `0`

With Xcb, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of an Xcb surface **must** have both `width` and `height` greater than 0, or both of them 0.

Note

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

Some Vulkan functions **may** send protocol over the specified xcb connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an xcb window. Applications **must** therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains **must**

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so **may** result in deadlock.

```
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
```

`VkXcbSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.5. Xlib Platform

To create a [VkSurfaceKHR](#) object for an X11 window, using the Xlib client-side library, call:

```
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance                                     instance,
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a [VkXlibSurfaceCreateInfoKHR](#) structure containing the parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pSurface** is a pointer to a [VkSurfaceKHR](#) handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateXlibSurfaceKHR-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkXlibSurfaceCreateInfoKHR](#) structure
- VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateXlibSurfaceKHR-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

The [VkXlibSurfaceCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_xlib_surface
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display* dpy;
    Window window;
} VkXlibSurfaceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `dpy` is a pointer to an Xlib `Display` connection to the X server.
- `window` is an Xlib `Window` to associate the surface with.

Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
`dpy` **must** point to a valid Xlib `Display`
- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
`window` **must** be a valid Xlib `Window`

Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR`
- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkXlibSurfaceCreateInfoKHR-flags-zeroBitmask
`flags` **must** be `0`

With Xlib, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of an Xlib surface **must** have both `width` and `height` greater than 0, or both of them 0.

Note

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

Some Vulkan functions **may** send protocol over the specified Xlib `Display` connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an Xlib window. Applications **must** therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains **must**

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so **may** result in deadlock.

Some implementations may require threads to implement some presentation modes so applications **must** call `XInitThreads()` before calling any other Xlib functions.

```
// Provided by VK_KHR_xlib_surface
typedef VkFlags VkXlibSurfaceCreateFlagsKHR;
```

`VkXlibSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.6. DirectFB Platform

To create a `VkSurfaceKHR` object for a DirectFB surface, call:

```
// Provided by VK_EXT_directfb_surface
VkResult vkCreateDirectFBSurfaceEXT(
    VkInstance                                     instance,
    const VkDirectFBSurfaceCreateInfoEXT*          pCreateInfo,
    const VkAllocationCallbacks*                   pAllocator,
    VkSurfaceKHR*                                pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkDirectFBSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDirectFBSurfaceEXT-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateDirectFBSurfaceEXT-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkDirectFBSurfaceCreateInfoEXT](#) structure
- VUID-vkCreateDirectFBSurfaceEXT-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateDirectFBSurfaceEXT-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

The [VkDirectFBSurfaceCreateInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_directfb_surface
typedef struct VkDirectFBSurfaceCreateInfoEXT {
    VkStructureType                      sType;
    const void*                           pNext;
    VkDirectFBSurfaceCreateFlagsEXT   flags;
    IDirectFB\*                         dfb;
    IDirectFBSurface\*                 surface;
} VkDirectFBSurfaceCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dfb** is a pointer to the [IDirectFB](#) main interface of DirectFB.
- **surface** is a pointer to a [IDirectFBSurface](#) surface interface.

Valid Usage

- VUID-VkDirectFBSurfaceCreateInfoEXT-dfb-04117
dfb must point to a valid DirectFB **IDirectFB**
- VUID-VkDirectFBSurfaceCreateInfoEXT-surface-04118
surface must point to a valid DirectFB **IDirectFBSurface**

Valid Usage (Implicit)

- VUID-VkDirectFBSurfaceCreateInfoEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT`
- VUID-VkDirectFBSurfaceCreateInfoEXT-pNext-pNext
pNext must be `NULL`
- VUID-VkDirectFBSurfaceCreateInfoEXT-flags-zero bitmask
flags must be `0`

With DirectFB, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the surface size.

```
// Provided by VK_EXT_directfb_surface
typedef VkFlags VkDirectFBSurfaceCreateFlagsEXT;
```

`VkDirectFBSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.7. Fuchsia Platform

To create a `VkSurfaceKHR` object for a Fuchsia ImagePipe, call:

```
// Provided by VK_FUCHSIA_imagepipe_surface
VkResult vkCreateImagePipeSurfaceFUCHSIA(
    VkInstance                                     instance,
    const VkImagePipeSurfaceCreateInfoFUCHSIA*   pCreateInfo,
    const VkAllocationCallbacks*                  pAllocator,
    VkSurfaceKHR*                                pSurface);
```

- **instance** is the instance to associate with the surface.
- **pCreateInfo** is a pointer to a `VkImagePipeSurfaceCreateInfoFUCHSIA` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateImagePipeSurfaceFUCHSIA-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateImagePipeSurfaceFUCHSIA-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkImagePipeSurfaceCreateInfoFUCHSIA](#) structure
- VUID-vkCreateImagePipeSurfaceFUCHSIA-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateImagePipeSurfaceFUCHSIA-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

The [VkImagePipeSurfaceCreateInfoFUCHSIA](#) structure is defined as:

```
// Provided by VK_FUCHSIA_imagepipe_surface
typedef struct VkImagePipeSurfaceCreateInfoFUCHSIA {
    VkStructureType                     sType;
    const void*                         pNext;
    VkImagePipeSurfaceCreateFlagsFUCHSIA flags;
    zx_handle_t                         imagePipeHandle;
} VkImagePipeSurfaceCreateInfoFUCHSIA;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **imagePipeHandle** is a **zx_handle_t** referring to the ImagePipe to associate with the surface.

Valid Usage

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-imagePipeHandle-04863
imagePipeHandle **must** be a valid **zx_handle_t**

Valid Usage (Implicit)

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-sType-sType
sType must be `VK_STRUCTURE_TYPE_IMAGEPIPE_SURFACE_CREATE_INFO_FUCHSIA`
- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-pNext-pNext
pNext must be `NULL`
- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-flags-zero bitmask
flags must be `0`

On Fuchsia, the surface `currentExtent` is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

```
// Provided by VK_FUCHSIA_imagepipe_surface
typedef VkFlags VkImagePipeSurfaceCreateFlagsFUCHSIA;
```

`VkImagePipeSurfaceCreateFlagsFUCHSIA` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.8. Google Games Platform

To create a `VkSurfaceKHR` object for a Google Games Platform stream descriptor, call:

```
// Provided by VK_GGP_stream_descriptor_surface
VkResult vkCreateStreamDescriptorSurfaceGGP(
    VkInstance                                     instance,
    const VkStreamDescriptorSurfaceCreateInfoGGP* pCreateInfo,
    const VkAllocationCallbacks*                  pAllocator,
    VkSurfaceKHR*                                pSurface);
```

- **instance** is the instance to associate with the surface.
- **pCreateInfo** is a pointer to a `VkStreamDescriptorSurfaceCreateInfoGGP` structure containing parameters that affect the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateStreamDescriptorSurfaceGGP-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateStreamDescriptorSurfaceGGP-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkStreamDescriptorSurfaceCreateInfoGGP](#) structure
- VUID-vkCreateStreamDescriptorSurfaceGGP-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateStreamDescriptorSurfaceGGP-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_NATIVE_WINDOW_IN_USE_KHR](#)

The [VkStreamDescriptorSurfaceCreateInfoGGP](#) structure is defined as:

```
// Provided by VK_GGP_stream_descriptor_surface
typedef struct VkStreamDescriptorSurfaceCreateInfoGGP {
    VkStructureType sType;
    const void* pNext;
    VkStreamDescriptorSurfaceCreateFlagsGGP flags;
    GgpStreamDescriptor streamDescriptor;
} VkStreamDescriptorSurfaceCreateInfoGGP;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **streamDescriptor** is a [GgpStreamDescriptor](#) referring to the GGP stream descriptor to associate with the surface.

Valid Usage

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-streamDescriptor-02681
streamDescriptor must be a valid `GgpStreamDescriptor`

Valid Usage (Implicit)

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-sType-sType
sType must be `VK_STRUCTURE_TYPE_STREAM_DESCRIPTOR_SURFACE_CREATE_INFO_GGP`
- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-pNext-pNext
pNext must be `NULL`
- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-flags-zero bitmask
flags must be `0`

On Google Games Platform, the surface extents are dynamic. The `minImageExtent` will never be greater than 1080p and the `maxImageExtent` will never be less than 1080p. The `currentExtent` will reflect the current optimal resolution.

Applications are expected to choose an appropriate size for the swapchain's `imageExtent`, within the bounds of the surface. Using the surface's `currentExtent` will offer the best performance and quality. When a swapchain's `imageExtent` does not match the surface's `currentExtent`, the presentable images are scaled to the surface's dimensions during presentation if possible and `VK_SUBOPTIMAL_KHR` is returned, otherwise presentation fails with `VK_ERROR_OUT_OF_DATE_KHR`.

```
// Provided by VK_GGP_stream_descriptor_surface
typedef VkFlags VkStreamDescriptorSurfaceCreateFlagsGGP;
```

`VkStreamDescriptorSurfaceCreateFlagsGGP` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.9. iOS Platform

To create a `VkSurfaceKHR` object for an iOS `UIView` or `CAMetalLayer`, call:

```
// Provided by VK_MVK_ios_surface
VkResult vkCreateIOSSurfaceMVK(  
    VkInstance instance,  
    const VkIOSSurfaceCreateInfoMVK* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkSurfaceKHR* pSurface);
```

Note

The `vkCreateIOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkIOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateIOSSurfaceMVK-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateIOSSurfaceMVK-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkIOSSurfaceCreateInfoMVK` structure
- VUID-vkCreateIOSSurfaceMVK-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateIOSSurfaceMVK-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`

The `VkIOSSurfaceCreateInfoMVK` structure is defined as:

```
// Provided by VK_MVK_ios_surface
typedef struct VkIOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkIOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkIOSSurfaceCreateInfoMVK;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pView** is a reference to either a **CAMetalLayer** object or a **UIView** object.

Valid Usage

- VUID-VkIOSSurfaceCreateInfoMVK-pView-04143
If **pView** is a **CAMetalLayer** object, it **must** be a valid **CAMetalLayer**
- VUID-VkIOSSurfaceCreateInfoMVK-pView-01316
If **pView** is a **UIView** object, it **must** be a valid **UIView**, **must** be backed by a **CALayer** object of type **CAMetalLayer**, and **vkCreateIOSSurfaceMVK** **must** be called on the main thread

Valid Usage (Implicit)

- VUID-VkIOSSurfaceCreateInfoMVK-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_IOS_SURFACE_CREATE_INFO_MVK**
- VUID-VkIOSSurfaceCreateInfoMVK-pNext-pNext
pNext **must** be **NULL**
- VUID-VkIOSSurfaceCreateInfoMVK-flags-zero bitmask
flags **must** be **0**

```
// Provided by VK_MVK_ios_surface
typedef VkFlags VkIOSSurfaceCreateFlagsMVK;
```

VkIOSSurfaceCreateFlagsMVK is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.10. macOS Platform

To create a **VkSurfaceKHR** object for a macOS **NSView** or **CAMetalLayer**, call:

```
// Provided by VK_MVK_macos_surface
VkResult vkCreateMacOSSurfaceMVK(
    VkInstance instance,
    const VkMacOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

Note

The `vkCreateMacOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkMacOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateMacOSSurfaceMVK-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateMacOSSurfaceMVK-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkMacOSSurfaceCreateInfoMVK` structure
- VUID-vkCreateMacOSSurfaceMVK-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateMacOSSurfaceMVK-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`

The `VkMacOSSurfaceCreateInfoMVK` structure is defined as:

```
// Provided by VK_MVK_macos_surface
typedef struct VkMacOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkMacOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkMacOSSurfaceCreateInfoMVK;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pView** is a reference to either a **CAMetalLayer** object or an **NSView** object.

Valid Usage

- VUID-VkMacOSSurfaceCreateInfoMVK-pView-04144
If **pView** is a **CAMetalLayer** object, it **must** be a valid **CAMetalLayer**
- VUID-VkMacOSSurfaceCreateInfoMVK-pView-01317
If **pView** is an **NSView** object, it **must** be a valid **NSView**, **must** be backed by a **CALayer** object of type **CAMetalLayer**, and **vkCreateMacOSSurfaceMVK** **must** be called on the main thread

Valid Usage (Implicit)

- VUID-VkMacOSSurfaceCreateInfoMVK-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_MACOS_SURFACE_CREATE_INFO_MVK**
- VUID-VkMacOSSurfaceCreateInfoMVK-pNext-pNext
pNext **must** be **NULL**
- VUID-VkMacOSSurfaceCreateInfoMVK-flags-zero bitmask
flags **must** be **0**

```
// Provided by VK_MVK_macos_surface
typedef VkFlags VkMacOSSurfaceCreateFlagsMVK;
```

VkMacOSSurfaceCreateFlagsMVK is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.11. VI Platform

To create a **VkSurfaceKHR** object for an **nn::vi::Layer**, query the layer's native handle using **nn::vi::GetNativeWindow**, and then call:

```
// Provided by VK_NN_vi_surface
VkResult vkCreateViSurfaceNN(
    VkInstance instance,
    const VkViSurfaceCreateInfoNN* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance with which to associate the surface.
- **pCreateInfo** is a pointer to a `VkViSurfaceCreateInfoNN` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `nn::vi::NativeWindowHandle`, applications **must** not attempt to create another surface for the same `nn::vi::Layer` or attempt to connect to the same `nn::vi::Layer` through other platform mechanisms.

If the native window is created with a specified size, `currentExtent` will reflect that size. In this case, applications should use the same size for the swapchain's `imageExtent`. Otherwise, the `currentExtent` will have the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that applications are expected to choose an appropriate size for the swapchain's `imageExtent` (e.g., by matching the result of a call to `nn::vi::GetDisplayResolution`).

Valid Usage (Implicit)

- VUID-vkCreateViSurfaceNN-instance-parameter
instance **must** be a valid `VkInstance` handle
- VUID-vkCreateViSurfaceNN-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid `VkViSurfaceCreateInfoNN` structure
- VUID-vkCreateViSurfaceNN-pAllocator-parameter
If **pAllocator** is not `NULL`, **pAllocator** **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateViSurfaceNN-pSurface-parameter
pSurface **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`

The `VkViSurfaceCreateInfoNN` structure is defined as:

```
// Provided by VK_NN_vi_surface
typedef struct VkViSurfaceCreateInfoNN {
    VkStructureType           sType;
    const void*               pNext;
    VkViSurfaceCreateFlagsNN   flags;
    void*                     window;
} VkViSurfaceCreateInfoNN;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `window` is the `nn::vi::NativeWindowHandle` for the `nn::vi::Layer` with which to associate the surface.

Valid Usage

- VUID-VkViSurfaceCreateInfoNN-window-01318
`window` **must** be a valid `nn::vi::NativeWindowHandle`

Valid Usage (Implicit)

- VUID-VkViSurfaceCreateInfoNN-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN`
- VUID-VkViSurfaceCreateInfoNN-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkViSurfaceCreateInfoNN-flags-zero bitmask
`flags` **must** be `0`

```
// Provided by VK_NN_vi_surface
typedef VkFlags VkViSurfaceCreateFlagsNN;
```

`VkViSurfaceCreateFlagsNN` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.12. Metal Platform

To create a `VkSurfaceKHR` object for a `CAMetalLayer`, call:

```
// Provided by VK_EXT_metal_surface
VkResult vkCreateMetalSurfaceEXT(  
    VkInstance instance,  
    const VkMetalSurfaceCreateInfoEXT* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkMetalSurfaceCreateInfoEXT` structure specifying parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateMetalSurfaceEXT-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateMetalSurfaceEXT-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkMetalSurfaceCreateInfoEXT` structure
- VUID-vkCreateMetalSurfaceEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateMetalSurfaceEXT-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`

The `VkMetalSurfaceCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_metal_surface
typedef struct VkMetalSurfaceCreateInfoEXT {
    VkStructureType          sType;
    const void*            pNext;
    VkMetalSurfaceCreateFlagsEXT flags;
    const CAMetalLayer*      pLayer;
} VkMetalSurfaceCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pLayer` is a reference to a `CAMetalLayer` object representing a renderable surface.

Valid Usage (Implicit)

- VUID-VkMetalSurfaceCreateInfoEXT-sType-sType
`sType` **must be** `VK_STRUCTURE_TYPE_METAL_SURFACE_CREATE_INFO_EXT`
- VUID-VkMetalSurfaceCreateInfoEXT-pNext-pNext
`pNext` **must be** `NULL`
- VUID-VkMetalSurfaceCreateInfoEXT-flags-zero bitmask
`flags` **must be** `0`

To remove an unnecessary compile-time dependency, an incomplete type definition of `CAMetalLayer` is provided in the Vulkan headers:

```
// Provided by VK_EXT_metal_surface

#ifndef __OBJC__
@class CAMetalLayer;
#else
typedef void CAMetalLayer;
#endif
```

The actual `CAMetalLayer` type is defined in the QuartzCore framework.

```
// Provided by VK_EXT_metal_surface
typedef VkFlags VkMetalSurfaceCreateFlagsEXT;
```

`VkMetalSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.13. QNX Screen Platform

To create a `VkSurfaceKHR` object for a QNX Screen surface, call:

```
// Provided by VK_QNX_screen_surface
VkResult vkCreateScreenSurfaceQNX(
    VkInstance                                     instance,
    const VkScreenSurfaceCreateInfoQNX*           pCreateInfo,
    const VkAllocationCallbacks*                  pAllocator,
    VkSurfaceKHR*                                pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkScreenSurfaceCreateInfoQNX` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateScreenSurfaceQNX-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateScreenSurfaceQNX-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkScreenSurfaceCreateInfoQNX](#) structure
- VUID-vkCreateScreenSurfaceQNX-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateScreenSurfaceQNX-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

The [VkScreenSurfaceCreateInfoQNX](#) structure is defined as:

```
// Provided by VK_QNX_screen_surface
typedef struct VkScreenSurfaceCreateInfoQNX {
    VkStructureType           sType;
    const void*               pNext;
    VkScreenSurfaceCreateFlagsQNX flags;
    struct _screen_context*   context;
    struct _screen_window*    window;
} VkScreenSurfaceCreateInfoQNX;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **context** and **window** are QNX Screen **context** and **window** to associate the surface with.

Valid Usage

- VUID-VkScreenSurfaceCreateInfoQNX-context-04741
context must point to a valid QNX Screen **struct _screen_context**
- VUID-VkScreenSurfaceCreateInfoQNX-window-04742
window must point to a valid QNX Screen **struct _screen_window**

Valid Usage (Implicit)

- VUID-VkScreenSurfaceCreateInfoQNX-sType-sType
sType must be **VK_STRUCTURE_TYPE_SCREEN_SURFACE_CREATE_INFO_QNX**
- VUID-VkScreenSurfaceCreateInfoQNX-pNext-pNext
pNext must be **NULL**
- VUID-VkScreenSurfaceCreateInfoQNX-flags-zero bitmask
flags must be **0**

```
// Provided by VK_QNX_screen_surface
typedef VkFlags VkScreenSurfaceCreateFlagsQNX;
```

VkScreenSurfaceCreateFlagsQNX is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.14. Platform-Independent Information

Once created, **VkSurfaceKHR** objects **can** be used in this and other extensions, in particular the [VK_KHR_swapchain](#) extension.

Several WSI functions return **VK_ERROR_SURFACE_LOST_KHR** if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) **should** be destroyed, as there is no way to restore them to a not-lost state. Applications **may** attempt to create a new **VkSurfaceKHR** using the same native platform window object, but whether such re-creation will succeed is platform-dependent and **may** depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be [lost](#).

To destroy a **VkSurfaceKHR** object, call:

```
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(
    VkInstance                                     instance,
    VkSurfaceKHR                                    surface,
    const VkAllocationCallbacks*                  pAllocator);
```

- **instance** is the instance used to create the surface.

- `surface` is the surface to destroy.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).

Destroying a `VkSurfaceKHR` merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

Valid Usage

- VUID-vkDestroySurfaceKHR-surface-01266
All `VkSwapchainKHR` objects created for `surface` **must** have been destroyed prior to destroying `surface`
- VUID-vkDestroySurfaceKHR-surface-01267
If `VkAllocationCallbacks` were provided when `surface` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroySurfaceKHR-surface-01268
If no `VkAllocationCallbacks` were provided when `surface` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkDestroySurfaceKHR-surface-parameter
If `surface` is not `VK_NULL_HANDLE`, `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkDestroySurfaceKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroySurfaceKHR-surface-parent
If `surface` is a valid handle, it **must** have been created, allocated, or retrieved from `instance`

Host Synchronization

- Host access to `surface` **must** be externally synchronized

33.3. Presenting Directly to Display Devices

In some environments applications **can** also present Vulkan rendering directly to display devices without using an intermediate windowing system. This **can** be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The `VK_KHR_display` extension provides the functionality necessary to enumerate display devices and create `VkSurfaceKHR` objects that target displays.

33.3.1. Display Enumeration

Displays are represented by `VkDisplayKHR` handles:

```
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice                         physicalDevice,
    uint32_t*                                pPropertyCount,
    VkDisplayPropertiesKHR*                   pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayPropertiesKHR` structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```

- `display` is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.
- `displayName` is `NULL` or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If `NULL`, no suitable name is available. If not `NULL`, the string pointed to **must** remain accessible and unmodified as long as `display` is valid.
- `physicalDimensions` describes the physical width and height of the visible portion of the display, in millimeters.
- `physicalResolution` describes the physical, native, or preferred resolution of the display.

Note

For devices which have no natural value to return here, implementations **should** return the maximum resolution supported.

- `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` describing which transforms are supported by this display.
- `planeReorderPossible` tells whether the planes on this display **can** have their z order changed. If this is `VK_TRUE`, the application **can** re-arrange the planes on this display in any order relative to each other.
- `persistentContent` tells whether the display supports self-refresh/internal buffering. If this is

true, the application **can** submit persistent present operations on swapchains created against this display.

Note

 Persistent presents **may** have higher latency, and **may** use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayProperties2KHR* pProperties);
```

- **physicalDevice** is a physical device.
- **pPropertyCount** is a pointer to an integer related to the number of display devices available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkDisplayProperties2KHR** structures.

vkGetPhysicalDeviceDisplayProperties2KHR behaves similarly to **vkGetPhysicalDeviceDisplayPropertiesKHR**, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter
pPropertyCount **must** be a valid pointer to a **uint32_t** value
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter
If the value referenced by **pPropertyCount** is not **0**, and **pProperties** is not **NULL**, **pProperties** **must** be a valid pointer to an array of **pPropertyCount** **VkDisplayProperties2KHR** structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType          sType;
    void*                   pNext;
    VkDisplayPropertiesKHR   displayProperties;
} VkDisplayProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayProperties` is a `VkDisplayPropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR`
- VUID-VkDisplayProperties2KHR-pNext-pNext
`pNext` **must** be `NULL`

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan from an X11 server, call:

```
// Provided by VK_EXT_acquire_xlib_display
VkResult vkAcquireXlibDisplayEXT(
    VkPhysicalDevice           physicalDevice,
    Display*                  dpy,
    VkDisplayKHR               display);
```

- **physicalDevice** The physical device the display is on.
- **dpy** A connection to the X11 server that currently owns **display**.
- **display** The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with **physicalDevice** until the display is released or the X11 connection specified by **dpy** is terminated. Permission to access the display **may** be temporarily revoked during periods when the X11 server from which control was acquired itself loses access to **display**. During such periods, operations which require access to the display **must** fail with an appropriate error code. If the X11 server associated with **dpy** does not own **display**, or if permission to access it has already been acquired by another entity, the call **must** return the error code **VK_ERROR_INITIALIZATION_FAILED**.

Note

One example of when an X11 server loses access to a display is when it loses ownership of its virtual terminal.

Valid Usage (Implicit)

- VUID-vkAcquireXlibDisplayEXT-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkAcquireXlibDisplayEXT-dpy-parameter
dpy **must** be a valid pointer to a **Display** value
- VUID-vkAcquireXlibDisplayEXT-display-parameter
display **must** be a valid **VkDisplayKHR** handle
- VUID-vkAcquireXlibDisplayEXT-display-parent
display **must** have been created, allocated, or retrieved from **physicalDevice**

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**

When acquiring displays from an X11 server, an application may also wish to enumerate and identify them using a native handle rather than a **VkDisplayKHR** handle. To determine the **VkDisplayKHR** handle corresponding to an X11 RandR Output, call:

```
// Provided by VK_EXT_acquire_xlib_display
VkResult vkGetRandROutputDisplayEXT(
    VkPhysicalDevice physicalDevice,
    Display* dpy,
    RROutput rrOutput,
    VkDisplayKHR* pDisplay);
```

- **physicalDevice** The physical device to query the display handle on.
- **dpy** A connection to the X11 server from which **rrOutput** was queried.
- **rrOutput** An X11 RandR output ID.
- **pDisplay** The corresponding **VkDisplayKHR** handle will be returned here.

If there is no **VkDisplayKHR** corresponding to **rrOutput** on **physicalDevice**, **VK_NULL_HANDLE** **must** be returned in **pDisplay**.

Valid Usage (Implicit)

- VUID-vkGetRandROutputDisplayEXT-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetRandROutputDisplayEXT-dpy-parameter
dpy **must** be a valid pointer to a **Display** value
- VUID-vkGetRandROutputDisplayEXT-pDisplay-parameter
pDisplay **must** be a valid pointer to a **VkDisplayKHR** handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**

To acquire permission to directly access a display in Vulkan on Windows 10, call:

```
// Provided by VK_NV_acquire_winrt_display
VkResult vkAcquireWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- **physicalDevice** The physical device the display is on.
- **display** The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with **physicalDevice** until the display is released or the application is terminated. Permission to access the display **may** be revoked by events that cause Windows 10 itself to lose access to **display**. If this has happened, operations which require access to the display **must** fail with an appropriate error code. If permission to access **display** has already been acquired by another entity, the call **must** return the error code **VK_ERROR_INITIALIZATION_FAILED**.

Note

 The Vulkan instance acquires control of a “`winrt::Windows::Devices::Display::Core::DisplayTarget`” by performing an operation equivalent to “`winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()`” on the “`DisplayTarget`”.

Note

 One example of when Windows 10 loses access to a display is when the display is hot-unplugged.

Note

 One example of when a display has already been acquired by another entity is when the Windows desktop compositor (DWM) is in control of the display. Beginning with Windows 10 version 2004 it is possible to cause DWM to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. `vkAcquireWinrtDisplayNV` does not itself cause DWM to release a display; this action must be performed outside of Vulkan.

Valid Usage (Implicit)

- VUID-vkAcquireWinrtDisplayNV-physicalDevice-parameter
physicalDevice **must** be a valid `VkPhysicalDevice` handle
- VUID-vkAcquireWinrtDisplayNV-display-parameter
display **must** be a valid `VkDisplayKHR` handle
- VUID-vkAcquireWinrtDisplayNV-display-parent
display **must** have been created, allocated, or retrieved from **physicalDevice**

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

When acquiring displays on Windows 10, an application may also wish to enumerate and identify them using a native handle rather than a `VkDisplayKHR` handle.

To determine the `VkDisplayKHR` handle corresponding to a “`winrt::Windows::Devices::Display::Core::DisplayTarget`”, call:

```
// Provided by VK_NV_acquire_winrt_display
VkResult vkGetWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    uint32_t deviceRelativeId,
    VkDisplayKHR* pDisplay);
```

- `physicalDevice` The physical device on which to query the display handle.
- `deviceRelativeId` The value of the “`AdapterRelativeId`” property of a “`DisplayTarget`” that is enumerated by a “`DisplayAdapter`” with an “`Id`” property matching the `deviceLUID` property of a `VkPhysicalDeviceIDProperties` for `physicalDevice`.
- `pDisplay` The corresponding `VkDisplayKHR` handle will be returned here.

If there is no `VkDisplayKHR` corresponding to `deviceRelativeId` on `physicalDevice`, `VK_NULL_HANDLE` must be returned in `pDisplay`.

Valid Usage (Implicit)

- VUID-vkGetWinrtDisplayNV-physicalDevice-parameter
`physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetWinrtDisplayNV-pDisplay-parameter
`pDisplay` must be a valid pointer to a `VkDisplayKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_INITIALIZATION_FAILED`

To acquire permission to directly control a display in Vulkan from the Direct Rendering Manager (DRM) interface, call:

```
// Provided by VK_EXT_acquire_drm_display
VkResult vkAcquireDrmDisplayEXT(
    VkPhysicalDevice           physicalDevice,
    int32_t                    drmFd,
    VkDisplayKHR               display);
```

- `physicalDevice` The physical device the display is on.
- `drmFd` DRM primary file descriptor.
- `display` The display the caller wishes Vulkan to control.

All permissions necessary to control the display are granted to the Vulkan instance associated with the provided `physicalDevice` until the display is either released or the connector is unplugged. The provided `drmFd` must correspond to the one owned by the `physicalDevice`. If not, the error code `VK_ERROR_UNKNOWN` must be returned. The DRM FD must have DRM master permissions. If any error is encountered during the acquisition of the display, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

The provided DRM fd should not be closed before the display is released, attempting to do it may result in undefined behaviour.

Valid Usage (Implicit)

- VUID-vkAcquireDrmDisplayEXT-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkAcquireDrmDisplayEXT-display-parameter
`display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkAcquireDrmDisplayEXT-display-parent
`display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`

Before acquiring a display from the DRM interface, the caller may want to select a specific `VkDisplayKHR` handle by identifying it using a `connectorId`. To do so, call:

```
// Provided by VK_EXT_acquire_drm_display
VkResult vkGetDrmDisplayEXT(
    VkPhysicalDevice                         physicalDevice,
    int32_t                                  drmFd,
    uint32_t                                 connectorId,
    VkDisplayKHR*                            display);
```

- `physicalDevice` The physical device to query the display from.
- `drmFd` DRM primary file descriptor.
- `connectorId` Identifier of the specified DRM connector.
- `display` The corresponding `VkDisplayKHR` handle will be returned here.

If there is no `VkDisplayKHR` corresponding to the `connectorId` on the `physicalDevice`, the returning `display` must be set to `VK_NULL_HANDLE`. The provided `drmFd` must correspond to the one owned by the `physicalDevice`. If not, the error code `VK_ERROR_UNKNOWN` must be returned. Master permissions are not required, because the file descriptor is just used for information gathering purposes. The given `connectorId` must be a resource owned by the provided `drmFd`. If not, the error code `VK_ERROR_UNKNOWN` must be returned. If any error is encountered during the identification of the display, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

Valid Usage (Implicit)

- VUID-vkGetDrmDisplayEXT-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDrmDisplayEXT-display-parameter
`display` **must** be a valid pointer to a `VkDisplayKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To release a previously acquired display, call:

```
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice           physicalDevice,
    VkDisplayKHR               display);
```

- **physicalDevice** The physical device the display is on.
- **display** The display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter
physicalDevice **must** be a valid `VkPhysicalDevice` handle
- VUID-vkReleaseDisplayEXT-display-parameter
display **must** be a valid `VkDisplayKHR` handle
- VUID-vkReleaseDisplayEXT-display-parent
display **must** have been created, allocated, or retrieved from **physicalDevice**

Return Codes

Success

- `VK_SUCCESS`

Display Planes

Images are presented to individual planes on a display. Devices **must** support at least one plane on each display. Planes **can** be stacked and blended to composite multiple images on one display. Devices **may** support only a fixed stacking order and fixed mapping between planes and displays, or they **may** allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlanePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display planes available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display planes for `physicalDevice`, at most `pPropertyCount` structures will be written.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayPlanePropertiesKHR` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlanePropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR currentDisplay;
    uint32_t currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```

- **currentDisplay** is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be **VK_NULL_HANDLE**.
- **currentStackIndex** is the current z-order of the plane. This will be between 0 and the value returned by **vkGetPhysicalDeviceDisplayPlanePropertiesKHR** in **pPropertyCount**.

To query the properties of a device's display planes, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(  

    VkPhysicalDevice physicalDevice,  

    uint32_t* pPropertyCount,  

    VkDisplayPlaneProperties2KHR** pProperties);
```

- **physicalDevice** is a physical device.
- **pPropertyCount** is a pointer to an integer related to the number of display planes available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkDisplayPlaneProperties2KHR** structures.

vkGetPhysicalDeviceDisplayPlaneProperties2KHR behaves similarly to **vkGetPhysicalDeviceDisplayPlanePropertiesKHR**, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter
pPropertyCount **must** be a valid pointer to a **uint32_t** value
- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter
If the value referenced by **pPropertyCount** is not **0**, and **pProperties** is not **NULL**, **pProperties** **must** be a valid pointer to an array of **pPropertyCount** **VkDisplayPlaneProperties2KHR** structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType           sType;
    void*                     pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPlaneProperties` is a `VkDisplayPlanePropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneProperties2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- VUID-VkDisplayPlaneProperties2KHR-pNext-pNext
`pNext` **must** be `NULL`

To determine which displays a plane is usable with, call

```
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice           physicalDevice,
    uint32_t                   planeIndex,
    uint32_t*                  pDisplayCount,
    VkDisplayKHR*              pDisplays);
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and **must** be in the range [0, physical device plane count - 1].

- `pDisplayCount` is a pointer to an integer related to the number of displays available or queried, as described below.
- `pDisplays` is either `NULL` or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is `NULL`, then the number of displays usable with the specified `planeIndex` for `physicalDevice` is returned in `pDisplayCount`. Otherwise, `pDisplayCount` **must** point to a variable set by the user to the number of elements in the `pDisplays` array, and on return the variable is overwritten with the number of handles actually written to `pDisplays`. If the value of `pDisplayCount` is less than the number of usable display-plane pairs for `physicalDevice`, at most `pDisplayCount` handles will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available pairs were returned.

Valid Usage

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249
`planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter
`pDisplayCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter
If the value referenced by `pDisplayCount` is not `0`, and `pDisplays` is not `NULL`, `pDisplays` **must** be a valid pointer to an array of `pDisplayCount` `VkDisplayKHR` handles

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Additional properties of displays are queried using specialized query functions.

Display Modes

Display modes are represented by `VkDisplayModeKHR` handles:

```
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```
// Provided by VK_KHR_display
VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModePropertiesKHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display modes available on the specified `display` for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display modes for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available display modes were returned.

Valid Usage (Implicit)

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter
`display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayModePropertiesKHR` structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent
`display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayModePropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR           displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device's built-in display modes, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(  

    VkPhysicalDevice           physicalDevice,  

    VkDisplayKHR               display,  

    uint32_t*                 pPropertyCount,  

    VkDisplayModeProperties2KHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.

- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.

`vkGetDisplayModeProperties2KHR` behaves similarly to `vkGetDisplayModePropertiesKHR`, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModeProperties2KHR-display-parameter
`display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayModeProperties2KHR` structures
- VUID-vkGetDisplayModeProperties2KHR-display-parent
`display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayModeProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType          sType;
    void*                  pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayModeProperties` is a `VkDisplayModePropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
sType must be `VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR`
- VUID-VkDisplayModeProperties2KHR-pNext-pNext
pNext must be `NULL`

The `VkDisplayModeParametersKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D    visibleRegion;
    uint32_t      refreshRate;
} VkDisplayModeParametersKHR;
```

- **visibleRegion** is the 2D extents of the visible region.
- **refreshRate** is a `uint32_t` that is the number of times the display is refreshed each second multiplied by 1000.

Note

For example, a 60Hz display mode would report a **refreshRate** of 60,000.

Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
The **width** member of **visibleRegion** must be greater than **0**
- VUID-VkDisplayModeParametersKHR-height-01991
The **height** member of **visibleRegion** must be greater than **0**
- VUID-VkDisplayModeParametersKHR-refreshRate-01992
refreshRate must be greater than **0**

Additional modes **may** also be created by calling:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(  
    VkPhysicalDevice                                physicalDevice,  
    VkDisplayKHR                                 display,  
    const VkDisplayModeCreateInfoKHR*          pCreateInfo,  
    const VkAllocationCallbacks*                  pAllocator,  
    VkDisplayModeKHR*                            pMode);
```

- **physicalDevice** is the physical device associated with **display**.

- `display` is the display to create an additional mode for.
- `pCreateInfo` is a pointer to a `VkDisplayModeCreateInfoKHR` structure describing the new mode to create.
- `pAllocator` is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pMode` is a pointer to a `VkDisplayModeKHR` handle in which the mode created is returned.

Valid Usage (Implicit)

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkCreateDisplayModeKHR-display-parameter
`display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkDisplayModeCreateInfoKHR` structure
- VUID-vkCreateDisplayModeKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDisplayModeKHR-pMode-parameter
`pMode` **must** be a valid pointer to a `VkDisplayModeKHR` handle
- VUID-vkCreateDisplayModeKHR-display-parent
`display` **must** have been created, allocated, or retrieved from `physicalDevice`

Host Synchronization

- Host access to `display` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkDisplayModeCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType           sType;
    const void*              pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use, and **must** be zero.
- **parameters** is a [VkDisplayModeParametersKHR](#) structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation **must** return [VK_ERROR_INITIALIZATION_FAILED](#).

Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR](#)
- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
pNext **must** be **NULL**
- VUID-VkDisplayModeCreateInfoKHR-flags-zero bitmask
flags **must** be **0**
- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
parameters **must** be a valid [VkDisplayModeParametersKHR](#) structure

Applications that wish to present directly to a display **must** select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(  
    VkPhysicalDevice           physicalDevice,  
    VkDisplayModeKHR          mode,  
    uint32_t                  planeIndex,  
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- **physicalDevice** is the physical device associated with the display specified by **mode**
- **mode** is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- **planeIndex** is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.

- `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilitiesKHR` structure in which the capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-parameter `mode` **must** be a valid `VkDisplayModeKHR` handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-parameter `pCapabilities` **must** be a valid pointer to a `VkDisplayPlaneCapabilitiesKHR` structure

Host Synchronization

- Host access to `mode` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR    supportedAlpha;
    VkOffset2D                    minSrcPosition;
    VkOffset2D                    maxSrcPosition;
    VkExtent2D                   minSrcExtent;
    VkExtent2D                   maxSrcExtent;
    VkOffset2D                    minDstPosition;
    VkOffset2D                    maxDstPosition;
    VkExtent2D                   minDstExtent;
    VkExtent2D                   maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

- `supportedAlpha` is a bitmask of `VkDisplayPlaneAlphaFlagBitsKHR` describing the supported alpha blending modes.
- `minSrcPosition` is the minimum source rectangle offset supported by this plane using the

specified mode.

- `maxSrcPosition` is the maximum source rectangle offset supported by this plane using the specified mode. The `x` and `y` components of `maxSrcPosition` **must** each be greater than or equal to the `x` and `y` components of `minSrcPosition`, respectively.
- `minSrcExtent` is the minimum source rectangle size supported by this plane using the specified mode.
- `maxSrcExtent` is the maximum source rectangle size supported by this plane using the specified mode.
- `minDstPosition`, `maxDstPosition`, `minDstExtent`, `maxDstExtent` all have similar semantics to their corresponding `*Src*` equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the `*Src*` offsets, `minDstPosition` and `maxDstPosition` **may** contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors **may** support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning `minSrcPosition`, `maxSrcPosition`, `minSrcExtent`, and `maxSrcExtent` values that indicate a range of possible positions and sizes which **may** be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors **may** also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning `minDstPosition`, `maxDstPosition`, `minDstExtent` and `maxDstExtent` values that indicate a range of possible positions and sizes which **may** be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors **may** support only a 1-1 mapping between pixels in the presentable images and the display mode. This **may** be indicated by returning (0,0) for `minSrcPosition`, `maxSrcPosition`, `minDstPosition`, and `maxDstPosition`, and (display mode width, display mode height) for `minSrcExtent`, `maxSrcExtent`, `minDstExtent`, and `maxDstExtent`.

The value `supportedAlpha` **must** contain at least one valid `VkDisplayPlaneAlphaFlagBitsKHR` bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in `VkDisplayPlaneCapabilitiesKHR` are guaranteed to be supported. Presentation requests specifying unsupported combinations **may** fail.

To query the capabilities of a given mode and plane combination, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
```

- `physicalDevice` is the physical device associated with `pDisplayPlaneInfo`.

- `pDisplayPlaneInfo` is a pointer to a `VkDisplayPlaneInfo2KHR` structure describing the plane and mode.
- `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilities2KHR` structure in which the capabilities are returned.

`vkGetDisplayPlaneCapabilities2KHR` behaves similarly to `vkGetDisplayPlaneCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter
`pDisplayPlaneInfo` **must** be a valid pointer to a valid `VkDisplayPlaneInfo2KHR` structure
- VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter
`pCapabilities` **must** be a valid pointer to a `VkDisplayPlaneCapabilities2KHR` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneInfo2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType    sType;
    const void*        pNext;
    VkDisplayModeKHR   mode;
    uint32_t           planeIndex;
} VkDisplayPlaneInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mode` is the display mode the application intends to program when using the specified plane.

Note

This parameter also implicitly specifies a display.

- `planeIndex` is the plane which the application intends to use with the display.

The members of `VkDisplayPlaneCreateInfo2KHR` correspond to the arguments to `vkGetDisplayPlaneCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneCreateInfo2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR`
- VUID-VkDisplayPlaneCreateInfo2KHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDisplayPlaneCreateInfo2KHR-mode-parameter
`mode` **must** be a valid `VkDisplayModeKHR` handle

Host Synchronization

- Host access to `mode` **must** be externally synchronized

The `VkDisplayPlaneCapabilities2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType           sType;
    void*                     pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `capabilities` is a `VkDisplayPlaneCapabilitiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneCapabilities2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR`
- VUID-VkDisplayPlaneCapabilities2KHR-pNext-pNext
`pNext` **must** be `NULL`

33.3.2. Display Control

To set the power state of a display, call:

```
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice                                     device,
    VkDisplayKHR                                display,
    const VkDisplayPowerInfoEXT*                pDisplayPowerInfo);
```

- `device` is a logical device associated with `display`.
- `display` is the display whose power state is modified.
- `pDisplayPowerInfo` is a pointer to a `VkDisplayPowerInfoEXT` structure specifying the new power state of `display`.

Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDisplayPowerControlEXT-display-parameter
`display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
`pDisplayPowerInfo` **must** be a valid pointer to a valid `VkDisplayPowerInfoEXT` structure
- VUID-vkDisplayPowerControlEXT-commonparent
Both of `device`, and `display` **must** have been created, allocated, or retrieved from the same `VkPhysicalDevice`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkDisplayPowerInfoEXT` structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType          sType;
    const void*             pNext;
    VkDisplayPowerStateEXT   powerState;
} VkDisplayPowerInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `powerState` is a `VkDisplayPowerStateEXT` value specifying the new power state of the display.

Valid Usage (Implicit)

- VUID-VkDisplayPowerInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT`
- VUID-VkDisplayPowerInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDisplayPowerInfoEXT-powerState-parameter
`powerState` **must** be a valid `VkDisplayPowerStateEXT` value

Possible values of `VkDisplayPowerInfoEXT::powerState`, specifying the new power state of a display, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- `VK_DISPLAY_POWER_STATE_OFF_EXT` specifies that the display is powered down.
- `VK_DISPLAY_POWER_STATE_SUSPEND_EXT` specifies that the display is put into a low power mode, from which it **may** be able to transition back to `VK_DISPLAY_POWER_STATE_ON_EXT` more quickly than if it were in `VK_DISPLAY_POWER_STATE_OFF_EXT`. This state **may** be the same as `VK_DISPLAY_POWER_STATE_OFF_EXT`.
- `VK_DISPLAY_POWER_STATE_ON_EXT` specifies that the display is powered on.

33.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a `VkSurfaceKHR` object for a display plane, call:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance instance,
    const VkDisplaySurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance corresponding to the physical device the targeted display is on.
- **pCreateInfo** is a pointer to a [VkDisplaySurfaceCreateInfoKHR](#) structure specifying which mode, plane, and other parameters to use, as described below.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pSurface** is a pointer to a [VkSurfaceKHR](#) handle in which the created surface is returned.

Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkDisplaySurfaceCreateInfoKHR](#) structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

The [VkDisplaySurfaceCreateInfoKHR](#) structure is defined as:

```

// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR displayMode;
    uint32_t planeIndex;
    uint32_t planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D imageExtent;
} VkDisplaySurfaceCreateInfoKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use, and **must** be zero.
- **displayMode** is a **VkDisplayModeKHR** handle specifying the mode to use when displaying this surface.
- **planeIndex** is the plane on which this surface appears.
- **planeStackIndex** is the z-order of the plane.
- **transform** is a **VkSurfaceTransformFlagBitsKHR** value specifying the transformation to apply to images as part of the scanout operation.
- **globalAlpha** is the global alpha value. This value is ignored if **alphaMode** is not **VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR**.
- **alphaMode** is a **VkDisplayPlaneAlphaFlagBitsKHR** value specifying the type of alpha blending to use.
- **imageExtent** is the size of the presentable images to use with the surface.

Note

Creating a display surface **must** not modify the state of the displays, planes, or other resources it names. For example, it **must** not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

Valid Usage

- VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252
`planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`
- VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253
If the `planeReorderPossible` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to `displayMode` is `VK_TRUE` then `planeStackIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`; otherwise `planeStackIndex` **must** equal the `currentStackIndex` member of `VkDisplayPlanePropertiesKHR` returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` for the display plane corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254
If `alphaMode` is `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` then `globalAlpha` **must** be between `0` and `1`, inclusive
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255
`alphaMode` **must** be one of the bits present in the `supportedAlpha` member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256
The `width` and `height` members of `imageExtent` **must** be less than or equal to `VkPhysicalDeviceLimits::maxImageDimension2D`

Valid Usage (Implicit)

- VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR`
- VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDisplaySurfaceCreateInfoKHR-flags-zero bitmask
`flags` **must** be `0`
- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
`displayMode` **must** be a valid `VkDisplayModeKHR` handle
- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
`transform` **must** be a valid `VkSurfaceTransformFlagBitsKHR` value
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
`alphaMode` **must** be a valid `VkDisplayPlaneAlphaFlagBitsKHR` value

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;
```

`VkDisplaySurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which **can** be set in `VkDisplaySurfaceCreateInfoKHR::alphaMode`, specifying the type of alpha blending to use on a display, are:

```
// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;
```

- `VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR` specifies that the source image will be treated as opaque.
- `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` specifies that a global alpha value **must** be specified that will be applied to all pixels in the source image.
- `VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR` specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.
- `VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR` is equivalent to `VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR`, except the source alpha values are assumed to be premultiplied into the source image's other color components.

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;
```

`VkDisplayPlaneAlphaFlagsKHR` is a bitmask type for setting a mask of zero or more `VkDisplayPlaneAlphaFlagBitsKHR`.

33.3.4. Presenting to headless surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

Note

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customisable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless `VkSurfaceKHR` object, call:

```
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance instance,
    const VkHeadlessSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkHeadlessSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateHeadlessSurfaceEXT-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkHeadlessSurfaceCreateInfoEXT` structure
- VUID-vkCreateHeadlessSurfaceEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkHeadlessSurfaceCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType             sType;
    const void*                 pNext;
    VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage (Implicit)

- VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`
- VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zero bitmask
`flags` **must** be `0`

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain's `imageExtent` to will be the size of the surface, after the first image is presented.

```
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

33.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility **can** be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally **may** be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(  
    VkPhysicalDevice physicalDevice,  
    uint32_t queueFamilyIndex,  
    VkSurfaceKHR surface,  
    VkBool32* pSupported);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family.
- **surface** is the surface.
- **pSupported** is a pointer to a **VkBool32**, which is set to **VK_TRUE** to indicate support, and **VK_FALSE** otherwise.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269
queueFamilyIndex **must** be less than **pQueueFamilyPropertyCount** returned by **vkGetPhysicalDeviceQueueFamilyProperties** for the given **physicalDevice**

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter
surface **must** be a valid **VkSurfaceKHR** handle
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter
pSupported **must** be a valid pointer to a **VkBool32** value
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent
Both of **physicalDevice**, and **surface** **must** have been created, allocated, or retrieved from the same **VkInstance**

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

33.4.1. Android Platform

On Android, all physical devices and queue families **must** be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

33.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice           physicalDevice,
    uint32_t                   queueFamilyIndex,
    struct wl_display*         display);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by
`vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter
physicalDevice **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter
display **must** be a valid pointer to a `wl_display` value

33.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice           physicalDevice,
    uint32_t                   queueFamilyIndex);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family index.

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309
queueFamilyIndex **must** be less than **pQueueFamilyPropertyCount** returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given **physicalDevice**

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter
physicalDevice **must** be a valid `VkPhysicalDevice` handle

33.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:

```
// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(  

    VkPhysicalDevice physicalDevice,  

    uint32_t queueFamilyIndex,  

    xcb_connection_t* connection,  

    xcb_visualid_t visual_id);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an `xcb_connection_t` to the X server.
- `visual_id` is an X11 visual (`xcb_visualid_t`).

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter
`connection` **must** be a valid pointer to an `xcb_connection_t` value

33.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```
// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(  

    VkPhysicalDevice physicalDevice,  

    uint32_t queueFamilyIndex,  

    Display* dpy,  

    VisualID visualID);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dpy` is a pointer to an Xlib `Display` connection to the server.

- `visualId` is an X11 visual (`VisualID`).

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter
`dpy` **must** be a valid pointer to a `Display` value

33.4.6. DirectFB Platform

To determine whether a queue family of a physical device supports presentation with DirectFB library, call:

```
// Provided by VK_EXT_directfb_surface
VkBool32 vkGetPhysicalDeviceDirectFBPresentationSupportEXT(
    VkPhysicalDevice           physicalDevice,
    uint32_t                   queueFamilyIndex,
    IDirectFB*                 dfb);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dfb` is a pointer to the `IDirectFB` main interface of DirectFB.

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-queueFamilyIndex-04119
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-physicalDevice-parameter
physicalDevice **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-dfb-parameter
dfb **must** be a valid pointer to an `IDirectFB` value

33.4.7. Fuchsia Platform

On Fuchsia, all physical devices and queue families **must** be capable of presentation with any `ImagePipe`. As a result there is no Fuchsia-specific query for these capabilities.

33.4.8. Google Games Platform

On Google Games Platform, all physical devices and queue families with the `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT` capabilities **must** be capable of presentation with any Google Games Platform stream descriptor. As a result, there is no query specific to Google Games Platform for these capabilities.

33.4.9. iOS Platform

On iOS, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no iOS-specific query for these capabilities.

33.4.10. macOS Platform

On macOS, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no macOS-specific query for these capabilities.

33.4.11. VI Platform

On VI, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no VI-specific query for these capabilities.

33.4.12. QNX Screen Platform

To determine whether a queue family of a physical device supports presentation to a QNX Screen compositor, call:

```
// Provided by VK_QNX_screen_surface
VkBool32 vkGetPhysicalDeviceScreenPresentationSupportQNX(
    VkPhysicalDevice                                physicalDevice,
    uint32_t                                         queueFamilyIndex,
    struct _screen_window*                         window);
```

- **physicalDevice** is the physical device.

- `queueFamilyIndex` is the queue family index.
- `window` is the QNX Screen `window` object.

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-queueFamilyIndex-04743
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-window-parameter
`window` **must** be a valid pointer to a `_screen_window` value

33.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities **can** be obtained with the queries listed below in this section.

Note

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by `vkGetPhysicalDeviceImageFormatProperties`. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

33.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice           physicalDevice,
    VkSurfaceKHR                surface,
    VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilitiesKHR` structure in which the capabilities are returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523
`surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211
`surface` **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter
`surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter
`pSurfaceCapabilities` **must** be a valid pointer to a `VkSurfaceCapabilitiesKHR` structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent
Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceCapabilitiesKHR` structure is defined as:

```

// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;

```

- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to **minImageCount**. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.
- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The **width** and **height** of the extent will each be less than or equal to the corresponding **width** and **height** of **currentExtent**, unless **currentExtent** has the special value described above.
- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The **width** and **height** of the extent will each be greater than or equal to the corresponding **width** and **height** of **minImageExtent**. The **width** and **height** of the extent will each be greater than or equal to the corresponding **width** and **height** of **currentExtent**, unless **currentExtent** has the special value described above.
- **maxImageArrayLayers** is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.
- **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- **currentTransform** is **VkSurfaceTransformFlagBitsKHR** value indicating the surface's current transform relative to the presentation engine's natural orientation.
- **supportedCompositeAlpha** is a bitmask of **VkCompositeAlphaFlagBitsKHR**, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.
- **supportedUsageFlags** is a bitmask of **VkImageUsageFlagBits** representing the ways the

application **can** use the presentable images of a swapchain created with [VkPresentModeKHR](#) set to [VK_PRESENT_MODE_IMMEDIATE_KHR](#), [VK_PRESENT_MODE_MAILBOX_KHR](#), [VK_PRESENT_MODE_FIFO_KHR](#) or [VK_PRESENT_MODE_FIFO_RELAXED_KHR](#) for the surface on the specified device. [VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT](#) must be included in the set. Implementations **may** support additional usages.

Note

Supported usage flags of a presentable image when using [VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR](#) or [VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR](#) presentation mode are provided by [VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags](#).

Note

Formulas such as $\min(N, \text{maxImageCount})$ are not correct, since [maxImageCount](#) **may** be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(  
    VkPhysicalDevice           physicalDevice,  
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,  
    VkSurfaceCapabilities2KHR*   pSurfaceCapabilities);
```

- [physicalDevice](#) is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).
- [pSurfaceInfo](#) is a pointer to a [VkPhysicalDeviceSurfaceInfo2KHR](#) structure describing the surface and other fixed parameters that would be consumed by [vkCreateSwapchainKHR](#).
- [pSurfaceCapabilities](#) is a pointer to a [VkSurfaceCapabilities2KHR](#) structure in which the capabilities are returned.

[vkGetPhysicalDeviceSurfaceCapabilities2KHR](#) behaves similarly to [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#), with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06520
`pSurfaceInfo->surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06210
`pSurfaceInfo->surface` **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671
If a `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **must** be included in the `pNext` chain of `pSurfaceInfo`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter
`pSurfaceInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSurfaceCreateInfo2KHR` structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter
`pSurfaceCapabilities` **must** be a valid pointer to a `VkSurfaceCapabilities2KHR` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkPhysicalDeviceSurfaceCreateInfo2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceCreateInfo2KHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSurfaceKHR       surface;
} VkPhysicalDeviceSurfaceCreateInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surface` is the surface that will be associated with the swapchain.

The members of `VkPhysicalDeviceSurfaceInfo2KHR` correspond to the arguments to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Additional capabilities of a surface **may** be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities **can** be queried by adding a `VkSurfaceFullScreenExclusiveInfoEXT` structure to the `pNext` chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **may** also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same parameters included in the `pNext` chain of `VkSwapchainCreateInfoKHR`.

Valid Usage

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672
If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **must** be included in the `pNext` chain
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pSurfaceInfo-06526
When passed as the `pSurfaceInfo` parameter of `vkGetPhysicalDeviceSurfaceCapabilities2KHR`, if the `VK_GOOGLE_surfaceless_query` extension is enabled and the `pNext` chain of the `pSurfaceCapabilities` parameter includes `VkSurfaceProtectedCapabilitiesKHR`, then `surface` **can** be `VK_NULL_HANDLE`. Otherwise, `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pSurfaceInfo-06527
When passed as the `pSurfaceInfo` parameter of `vkGetPhysicalDeviceSurfaceFormats2KHR`, if the `VK_GOOGLE_surfaceless_query` extension is enabled, then `surface` **can** be `VK_NULL_HANDLE`. Otherwise, `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pSurfaceInfo-06528
When passed as the `pSurfaceInfo` parameter of `vkGetPhysicalDeviceSurfacePresentModes2EXT`, if the `VK_GOOGLE_surfaceless_query` extension is enabled, then `surface` **can** be `VK_NULL_HANDLE`. Otherwise, `surface` **must** be a valid `VkSurfaceKHR` handle

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR`
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain **must** be either `NULL` or a pointer to a valid instance of `VkSurfaceFullScreenExclusiveInfoEXT` or `VkSurfaceFullScreenExclusiveWin32InfoEXT`
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique
The sType value of each struct in the pNext chain **must** be unique
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-parameter
If surface is not `VK_NULL_HANDLE`, surface **must** be a valid `VkSurfaceKHR` handle

If the pNext chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application's preferred full-screen transition behavior.

The `VkSurfaceFullScreenExclusiveInfoEXT` structure is defined as:

```
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType          sType;
    void*                   pNext;
    VkFullScreenExclusiveEXT   fullScreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- sType is the type of this structure.
- pNext is `NULL` or a pointer to a structure extending this structure.
- fullScreenExclusive is a `VkFullScreenExclusiveEXT` value specifying the preferred full-screen transition behavior.

If this structure is not present, fullScreenExclusive is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_INFO_EXT`
- VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter
fullScreenExclusive **must** be a valid `VkFullScreenExclusiveEXT` value

Possible values of `VkSurfaceFullScreenExclusiveInfoEXT::fullScreenExclusive` are:

```
// Provided by VK_EXT_full_screen_exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULLSCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULLSCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULLSCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULLSCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- `VK_FULLSCREEN_EXCLUSIVE_DEFAULT_EXT` indicates the implementation **should** determine the appropriate full-screen method by whatever means it deems appropriate.
- `VK_FULLSCREEN_EXCLUSIVE_ALLOWED_EXT` indicates the implementation **may** use full-screen exclusive mechanisms when available. Such mechanisms **may** result in better performance and/or the availability of different presentation capabilities, but **may** require a more disruptive transition during swapchain initialization, first presentation and/or destruction.
- `VK_FULLSCREEN_EXCLUSIVE_DISALLOWED_EXT` indicates the implementation **should** avoid using full-screen mechanisms which rely on disruptive transitions.
- `VK_FULLSCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` indicates the application will manage full-screen exclusive mode by using the `vkAcquireFullScreenExclusiveModeEXT` and `vkReleaseFullScreenExclusiveModeEXT` commands.

The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure is defined as:

```
// Provided by VK_KHR_win32_surface with VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType sType;
    const void* pNext;
    HMONITOR hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hmonitor` is the Win32 `HMONITOR` handle identifying the display to create the surface with.

Note

If `hmonitor` is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return `VK_ERROR_OUT_OF_DATE_KHR`.

Note

It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes **may** alter the surface capabilities reported for the created surface.

Valid Usage

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673
hmonitor must be a valid **HMONITOR**

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType
sType must be **VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_WIN32_INFO_EXT**

The **VkSurfaceCapabilities2KHR** structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType          sType;
    void*                  pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **surfaceCapabilities** is a **VkSurfaceCapabilitiesKHR** structure describing the capabilities of the specified surface.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2KHR-sType-sType
sType must be **VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR**
- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of **VkDisplayNativeHdrSurfaceCapabilitiesAMD**, **VkSharedPresentSurfaceCapabilitiesKHR**, **VkSurfaceCapabilitiesFullScreenExclusiveEXT**, or **VkSurfaceProtectedCapabilitiesKHR**
- VUID-VkSurfaceCapabilities2KHR-sType-unique
The **sType** value of each struct in the **pNext** chain must be unique

An application queries if a protected **VkSurfaceKHR** is displayable on a specific windowing system using **VkSurfaceProtectedCapabilitiesKHR**, which can be passed in **pNext** parameter of **VkSurfaceCapabilities2KHR**.

The **VkSurfaceProtectedCapabilitiesKHR** structure is defined as:

```
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType    sType;
    const void*      pNext;
    VkBool32           supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **supportsProtected** specifies whether a protected swapchain created from [VkPhysicalDeviceSurfaceInfo2KHR::surface](#) for a particular windowing system **can** be displayed on screen or not. If **supportsProtected** is **VK_TRUE**, then creation of swapchains with the **VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR** flag set **must** be supported for **surface**.

If the [VK_GOOGLE_surfaceless_query](#) extension is enabled, the value returned in **supportsProtected** will be identical for every valid surface created on this physical device, and so in the [vkGetPhysicalDeviceSurfaceCapabilities2KHR](#) call, [VkPhysicalDeviceSurfaceInfo2KHR::surface](#) **can** be **VK_NULL_HANDLE**. In that case, the contents of [VkSurfaceCapabilities2KHR::surfaceCapabilities](#) as well as any other struct chained to it will be undefined.

Valid Usage (Implicit)

- VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR**

The [VkSharedPresentSurfaceCapabilitiesKHR](#) structure is defined as:

```
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType    sType;
    void*            pNext;
    VkImageUsageFlags sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **sharedPresentSupportedUsageFlags** is a bitmask of [VkImageUsageFlagBits](#) representing the ways the application **can** use the shared presentable image from a swapchain created with [VkPresentModeKHR](#) set to **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** for the surface on the specified device. **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** **must** be included in the set but implementations **may** support additional usages.

Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

The `VkDisplayNativeHdrSurfaceCapabilitiesAMD` structure is defined as:

```
// Provided by VK_AMD_display_native_hdr
typedef struct VkDisplayNativeHdrSurfaceCapabilitiesAMD {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             localDimmingSupport;
} VkDisplayNativeHdrSurfaceCapabilitiesAMD;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `localDimmingSupport` specifies whether the surface supports local dimming. If this is `VK_TRUE`, `VkSwapchainDisplayNativeHdrCreateInfoAMD` **can** be used to explicitly enable or disable local dimming for the surface. Local dimming may also be overridden by `vkSetLocalDimmingAMD` during the lifetime of the swapchain.

Valid Usage (Implicit)

- VUID-VkDisplayNativeHdrSurfaceCapabilitiesAMD-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_DISPLAY_NATIVE_HDR_SURFACE_CAPABILITIES_AMD`

The `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is defined as:

```
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fullScreenExclusiveControlSupported` is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure **can** be included in the `pNext` chain of `VkSurfaceCapabilities2KHR` to determine support for exclusive full-screen access. If `fullScreenExclusiveSupported` is `VK_FALSE`, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications **must** not attempt to create swapchains with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` set if `fullScreenExclusiveSupported` is `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULLSCREEN_EXCLUSIVE_EXT`

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice                                physicalDevice,
    VkSurfaceKHR                                     surface,
    VkSurfaceCapabilities2EXT*                      pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilities2EXT` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2EXT` behaves similarly to [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#), with the ability to return extended information by adding extending structures to the `pNext` chain of its `pSurfaceCapabilities` parameter.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-surface-06523
`surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-surface-06211
`surface` **must** be supported by `physicalDevice`, as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter
physicalDevice **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter
surface **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter
pSurfaceCapabilities **must** be a valid pointer to a [VkSurfaceCapabilities2EXT](#) structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent
Both of **physicalDevice**, and **surface** **must** have been created, allocated, or retrieved from the same [VkInstance](#)

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)

The [VkSurfaceCapabilities2EXT](#) structure is defined as:

```
// Provided by VK_EXT_display_surface_counter
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType sType;
    void* pNext;
    uint32\_t minImageCount;
    uint32\_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32\_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
    VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `minImageCount` is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- `maxImageCount` is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.
- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- `minImageExtent` contains the smallest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be less than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageExtent` contains the largest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `minImageExtent`. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageArrayLayers` is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.
- `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- `currentTransform` is `VkSurfaceTransformFlagBitsKHR` value indicating the surface's current transform relative to the presentation engine's natural orientation.
- `supportedCompositeAlpha` is a bitmask of `VkCompositeAlphaFlagBitsKHR`, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.
- `supportedUsageFlags` is a bitmask of `VkImageUsageFlagBits` representing the ways the application **can** use the presentable images of a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` **must** be included in the set. Implementations **may** support additional usages.
- `supportedSurfaceCounters` is a bitmask of `VkSurfaceCounterFlagBitsEXT` indicating the supported surface counter types.

Valid Usage

- VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246
`supportedSurfaceCounters` **must** not include `VK_SURFACE_COUNTER_VBLANK_BIT_EXT` unless the surface queried is a `display surface`

Valid Usage (Implicit)

- `VUID-VkSurfaceCapabilities2EXT-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT`
- `VUID-VkSurfaceCapabilities2EXT-pNext-pNext`
`pNext` must be `NULL`

Bits which **can** be set in `VkSurfaceCapabilities2EXT::supportedSurfaceCounters`, indicating supported surface counter types, are:

```
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- `VK_SURFACE_COUNTER_VBLANK_BIT_EXT` specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

`VkSurfaceCounterFlagsEXT` is a bitmask type for setting a mask of zero or more `VkSurfaceCounterFlagBitsEXT`.

Bits which **may** be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface's current transform relative to the presentation engine's natural orientation, are:

```
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR` specifies that image content is presented without being transformed.

- `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR` specifies that image content is rotated 90 degrees clockwise.
- `VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR` specifies that image content is rotated 180 degrees clockwise.
- `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR` specifies that image content is rotated 270 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR` specifies that image content is mirrored horizontally.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR` specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR` specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR` specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- `VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR` specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```
// Provided by VK_KHR_display
typedef VkFlags VkSurfaceTransformFlagsKHR;
```

`VkSurfaceTransformFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSurfaceTransformFlagBitsKHR`.

The `supportedCompositeAlpha` member is of type `VkCompositeAlphaFlagBitsKHR`, containing the following values:

```
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

- `VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR`: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.
- `VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR`: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.
- `VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR`: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected

to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.

- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

```
// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;
```

`VkCompositeAlphaFlagsKHR` is a bitmask type for setting a mask of zero or more `VkCompositeAlphaFlagBitsKHR`.

33.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice           physicalDevice,
    VkSurfaceKHR                surface,
    uint32_t*                  pSurfaceFormatCount,
    VkSurfaceFormatKHR*         pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format pairs available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormatKHR` structures.

If `pSurfaceFormats` is `NULL`, then the number of format pairs supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` **must** point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format pairs supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available format pairs were returned.

The number of format pairs supported **must** be greater than or equal to 1. `pSurfaceFormats` **must** not contain an entry whose value for `format` is `VK_FORMAT_UNDEFINED`.

If `pSurfaceFormats` includes an entry whose value for `colorSpace` is `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` and whose value for `format` is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for

`VK_IMAGE_TILING_OPTIMAL`, then `pSurfaceFormats` **must** also contain an entry with the same value for `colorSpace` and `format` equal to the corresponding SRGB (or UNORM) format.

If the `VK_GOOGLE_surfaceless_query` extension is enabled, the values returned in `pSurfaceFormats` will be identical for every valid surface created on this physical device, and so `surface` **can** be `VK_NULL_HANDLE`.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524
If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525
If `surface` is not `VK_NULL_HANDLE`, it **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter
If `surface` is not `VK_NULL_HANDLE`, `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter
`pSurfaceFormatCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter
If the value referenced by `pSurfaceFormatCount` is not `0`, and `pSurfaceFormats` is not `NULL`, `pSurfaceFormats` **must** be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormatKHR` structures
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent
Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceFormatKHR` structure is defined as:

```
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
    VkFormat          format;
    VkColorSpaceKHR colorSpace;
} VkSurfaceFormatKHR;
```

- `format` is a `VkFormat` that is compatible with the specified surface.
- `colorSpace` is a presentation `VkColorSpaceKHR` that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(  

    VkPhysicalDevice           physicalDevice,  

    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,  

    uint32_t*                pSurfaceFormatCount,  

    VkSurfaceFormat2KHR*      pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by [vkCreateSwapchainKHR](#).
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format tuples available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormat2KHR` structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If `pSurfaceFormats` is `NULL`, then the number of format tuples supported for the given `surface` is

returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` **must** point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format tuples supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521
If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522
If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, it **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter
`pSurfaceInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSurfaceCreateInfo2KHR` structure
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter
`pSurfaceFormatCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter
If the value referenced by `pSurfaceFormatCount` is not `0`, and `pSurfaceFormats` is not `NULL`, `pSurfaceFormats` **must** be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormat2KHR` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceFormat2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType      sType;
    void*              pNext;
    VkSurfaceFormatKHR   surfaceFormat;
} VkSurfaceFormat2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceFormat` is a `VkSurfaceFormatKHR` structure describing a format-color space pair that is compatible with the specified surface.

Valid Usage (Implicit)

- VUID-VkSurfaceFormat2KHR-sType-sType
`sType` **must be** `VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR`
- VUID-VkSurfaceFormat2KHR-pNext-pNext
`pNext` **must be** `NULL`

While the `format` of a presentable image refers to the encoding of each pixel, the `colorSpace` determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and a transfer function that is applied before storing or transmitting color data in the given color space.

Possible values of `VkSurfaceFormatKHR::colorSpace`, specifying supported color spaces of a presentation engine, are:

```

// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
    // Provided by VK_AMD_display_native_hdr
    VK_COLOR_SPACE_DISPLAY_NATIVE_AMD = 1000213000,
    VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_LINEAR_EXT = VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT,
} VkColorSpaceKHR;

```

- **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** specifies support for the sRGB color space.
- **VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT** specifies support for the Display-P3 color space to be displayed using an sRGB-like EOTF (defined below).
- **VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT** specifies support for the extended sRGB color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT** specifies support for the extended sRGB color space to be displayed using an sRGB EOTF.
- **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** specifies support for the Display-P3 color space to be displayed using a linear EOTF.

- `VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT` specifies support for the DCI-P3 color space to be displayed using the DCI-P3 EOTF. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.
- `VK_COLOR_SPACE_BT709_LINEAR_EXT` specifies support for the BT709 color space to be displayed using a linear EOTF.
- `VK_COLOR_SPACE_BT709_NONLINEAR_EXT` specifies support for the BT709 color space to be displayed using the SMPTE 170M EOTF.
- `VK_COLOR_SPACE_BT2020_LINEAR_EXT` specifies support for the BT2020 color space to be displayed using a linear EOTF.
- `VK_COLOR_SPACE_HDR10_ST2084_EXT` specifies support for the HDR10 (BT2020 color) space to be displayed using the SMPTE ST2084 Perceptual Quantizer (PQ) EOTF.
- `VK_COLOR_SPACE_DOLBYVISION_EXT` specifies support for the Dolby Vision (BT2020 color space), proprietary encoding, to be displayed using the SMPTE ST2084 EOTF.
- `VK_COLOR_SPACE_HDR10_HLG_EXT` specifies support for the HDR10 (BT2020 color space) to be displayed using the Hybrid Log Gamma (HLG) EOTF.
- `VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT` specifies support for the AdobeRGB color space to be displayed using a linear EOTF.
- `VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT` specifies support for the AdobeRGB color space to be displayed using the Gamma 2.2 EOTF.
- `VK_COLOR_SPACE_PASS_THROUGH_EXT` specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.
- `VK_COLOR_SPACE_DISPLAY_NATIVE_AMD` specifies support for the display’s native color space. This matches the color space expectations of AMD’s FreeSync2 standard, for displays supporting it.

Note

In the initial release of the `VK_KHR_surface` and `VK_KHR_swapchain` extensions, the token `VK_COLORSPACE_SRGB_NONLINEAR_KHR` was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

Note

In older versions of this extension `VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT` was misnamed `VK_COLOR_SPACE_DCI_P3_LINEAR_EXT`. This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is deprecated but is maintained for backwards compatibility.

The color components of non-linear color space swap chain images **must** have had the appropriate transfer function applied. The color space selected for the swap chain image will not affect the processing of data written into the image by the implementation. Vulkan requires that all implementations support the sRGB transfer function by use of an SRGB pixel format. Other transfer functions, such as SMPTE 170M or SMPTE2084, **can** be performed by the application shader. This

extension defines enums for [VkColorSpaceKHR](#) that correspond to the following color spaces:

Table 47. Color Spaces and Attributes

Name	Red Primary	Green Primary	Blue Primary	White-point	Transfer function
DCI-P3	1.000, 0.000	0.000, 1.000	0.000, 0.000	0.3333, 0.3333	DCI P3
Display-P3	0.680, 0.320	0.265, 0.690	0.150, 0.060	0.3127, 0.3290 (D65)	Display-P3
BT709	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	ITU (SMPTE 170M)
sRGB	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	sRGB
extended sRGB	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	extended sRGB
HDR10_ST2084	0.708, 0.292	0.170, 0.797	0.131, 0.046	0.3127, 0.3290 (D65)	ST2084 PQ
DOLBYVISION	0.708, 0.292	0.170, 0.797	0.131, 0.046	0.3127, 0.3290 (D65)	ST2084 PQ
HDR10_HLG	0.708, 0.292	0.170, 0.797	0.131, 0.046	0.3127, 0.3290 (D65)	HLG
AdobeRGB	0.640, 0.330	0.210, 0.710	0.150, 0.060	0.3127, 0.3290 (D65)	AdobeRGB

The transfer functions are described in the “Transfer Functions” chapter of the [Khronos Data Format Specification](#).

Except Display-P3 OETF, which is:

$$E = \begin{cases} 1.055 \times L^{\frac{1}{2.4}} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\ 12.92 \times L & \text{for } 0 \leq L < 0.0030186 \end{cases}$$

where L is the linear value of a color component and E is the encoded value (as stored in the image in memory).

Note

For most uses, the sRGB OETF is equivalent.

33.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).
- `surface` is the surface that will be associated with the swapchain.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of [VkPresentModeKHR](#) values, indicating the supported presentation modes.

If `pPresentModes` is `NULL`, then the number of presentation modes supported for the given `surface` is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount` **must** point to a variable set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available modes were returned.

If the [VK_GOOGLE_surfaceless_query](#) extension is enabled, the values returned in `pPresentModes` will be identical for every valid surface created on this physical device, and so `surface` **can** be [VK_NULL_HANDLE](#).

Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524

If the [VK_GOOGLE_surfaceless_query](#) extension is not enabled, `surface` **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525

If `surface` is not [VK_NULL_HANDLE](#), it **must** be supported by `physicalDevice`, as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter
If `surface` is not `VK_NULL_HANDLE`, `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter
`pPresentModeCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter
If the value referenced by `pPresentModeCount` is not `0`, and `pPresentModes` is not `NULL`, `pPresentModes` **must** be a valid pointer to an array of `pPresentModeCount` `VkPresentModeKHR` values
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent
Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

Alternatively, to query the supported presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```
// Provided by VK_EXT_full_screen_exclusive
VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice           physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pCreateInfo,
    uint32_t*                   pPresentModeCount,
    VkPresentModeKHR*          pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pCreateInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

`vkGetPhysicalDeviceSurfacePresentModes2EXT` behaves similarly to `vkGetPhysicalDeviceSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06521
If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06522
If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, it **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter
`pSurfaceInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter
`pPresentModeCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter
If the value referenced by `pPresentModeCount` is not `0`, and `pPresentModes` is not `NULL`, `pPresentModes` **must** be a valid pointer to an array of `pPresentModeCount` `VkPresentModeKHR` values

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

Possible values of elements of the `vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes` array, indicating the supported presentation modes for a surface, are:

```
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;
```

- `VK_PRESENT_MODE_IMMEDIATE_KHR` specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode **may** result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.
- `VK_PRESENT_MODE_MAILBOX_KHR` specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for re-use by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.
- `VK_PRESENT_MODE_FIFO_KHR` specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of `presentMode` that is **required** to be supported.
- `VK_PRESENT_MODE_FIFO_RELAXED_KHR` specifies that the presentation engine generally waits for the

next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode **may** result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

- `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application **must** make a presentation request whenever an update is required. However, the presentation engine **may** update the current image at any point, meaning this mode **may** result in visible tearing.
- `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine **must** update the current image without any need for further presentation requests. The application **can** indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode **may** result in visible tearing if rendering to the image is not timed correctly.

The supported `VkImageUsageFlagBits` of the presentable images of a swapchain created for a surface **may** differ depending on the presentation mode, and can be determined as per the table below:

Table 48. Presentable image usage queries

Presentation mode	Image usage flags
<code>VK_PRESENT_MODE_IMMEDIATE_KHR</code>	<code>VkSurfaceCapabilitiesKHR::supportedUsageFlags</code>
<code>VK_PRESENT_MODE_MAILBOX_KHR</code>	<code>VkSurfaceCapabilitiesKHR::supportedUsageFlags</code>
<code>VK_PRESENT_MODE_FIFO_KHR</code>	<code>VkSurfaceCapabilitiesKHR::supportedUsageFlags</code>
<code>VK_PRESENT_MODE_FIFO_RELAXED_KHR</code>	<code>VkSurfaceCapabilitiesKHR::supportedUsageFlags</code>
<code>VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR</code>	<code>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</code>
<code>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</code>	<code>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</code>

Note

For reference, the mode indicated by `VK_PRESENT_MODE_FIFO_KHR` is equivalent to the behavior of `{wgl|glX|egl}SwapBuffers` with a swap interval of 1, while the mode indicated by `VK_PRESENT_MODE_FIFO_RELAXED_KHR` is equivalent to the behavior of `{wgl|glX}SwapBuffers` with a swap interval of -1 (from the `{WGL|GLX}_EXT_swap_control_tear` extensions).

33.6. Full Screen Exclusive Control

Swapchains created with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` **must** acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:

```
// Provided by VK_EXT_full_screen_exclusive
VkResult vkAcquireFullScreenExclusiveModeEXT(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to acquire exclusive full-screen access for.

Valid Usage

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674
`swapchain` **must** not be in the retired state
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675
`swapchain` **must** be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676
`swapchain` **must** not currently have exclusive full-screen access

A return value of `VK_SUCCESS` indicates that the `swapchain` successfully acquired exclusive full-screen access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with `vkReleaseFullScreenExclusiveModeEXT`, destroys the swapchain, or if any of the swapchain commands return `VK_ERROR_FULLSCREEN_EXCLUSIVE_MODE_LOST_EXT` indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then `VK_ERROR_INITIALIZATION_FAILED` is returned. An application **can** attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if `VK_ERROR_FULLSCREEN_EXCLUSIVE_MODE_LOST_EXT` has been returned by a swapchain command.

Valid Usage (Implicit)

- VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter
swapchain **must** be a valid [VkSwapchainKHR](#) handle
- VUID-vkAcquireFullScreenExclusiveModeEXT-commonparent
Both of **device**, and **swapchain** **must** have been created, allocated, or retrieved from the same [VkInstance](#)

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_INITIALIZATION_FAILED](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)

To release exclusive full-screen access from a swapchain, call:

```
// Provided by VK_EXT_full_screen_exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(  
    VkDevice device,  
    VkSwapchainKHR swapchain);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to release exclusive full-screen access from.

Note

Applications will not be able to present to **swapchain** after this call until exclusive full-screen access is reacquired. This is usually useful to handle when an application is minimised or otherwise intends to stop presenting for a time.

Valid Usage

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677
swapchain **must** not be in the retired state
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678
swapchain **must** be a swapchain created with a [VkSurfaceFullScreenExclusiveInfoEXT](#) structure, with **fullScreenExclusive** set to **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT**

33.7. Device Group Queries

A logical device that represents multiple physical devices **may** support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice                                     device,
    VkDeviceGroupPresentCapabilitiesKHR*        pDeviceGroupPresentCapabilities);
```

- **device** is the logical device.
- **pDeviceGroupPresentCapabilities** is a pointer to a [VkDeviceGroupPresentCapabilitiesKHR](#) structure in which the device's capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter
pDeviceGroupPresentCapabilities **must** be a valid pointer to a [VkDeviceGroupPresentCapabilitiesKHR](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

The `VkDeviceGroupPresentCapabilitiesKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
// VK_KHR_surface
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType           sType;
    void*                    pNext;
    uint32_t                 presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentMask` is an array of `VK_MAX_DEVICE_GROUP_SIZE uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if physical device `i` **can** present swapchain images from physical device `j`. If element `i` is non-zero, then bit `i` **must** be set.
- `modes` is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

`modes` always has `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` set.

The present mode flags are also used when presenting an image, in `VkDeviceGroupPresentInfoKHR::mode`.

If a device group only includes a single physical device, then `modes` **must** equal `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`
- VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext
`pNext` **must** be `NULL`

Bits which **may** be set in `VkDeviceGroupPresentCapabilitiesKHR::modes`, indicating which device group presentation modes are supported, are:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
    VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;
```

- **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR** specifies that any physical device with a presentation engine **can** present its own swapchain images.
- **VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR** specifies that any physical device with a presentation engine **can** present swapchain images from any physical device in its **presentMask**.
- **VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR** specifies that any physical device with a presentation engine **can** present the sum of swapchain images from any physical devices in its **presentMask**.
- **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR** specifies that multiple physical devices with a presentation engine **can** each present their own swapchain images.

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;
```

VkDeviceGroupPresentModeFlagsKHR is a bitmask type for setting a mask of zero or more **VkDeviceGroupPresentModeFlagBitsKHR**.

Some surfaces **may** not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetDeviceGroupSurfacePresentModesKHR(  

    VkDevice device,  

    VkSurfaceKHR surface,  

    VkDeviceGroupPresentModeFlagsKHR* pModes);
```

- **device** is the logical device.
- **surface** is the surface.
- **pModes** is a pointer to a **VkDeviceGroupPresentModeFlagsKHR** in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded. These modes **must** be a subset of the modes returned by **vkGetDeviceGroupPresentCapabilitiesKHR**.

Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
surface must be supported by all physical devices associated with **device**, as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
surface must be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
pModes must be a valid pointer to a [VkDeviceGroupPresentModeFlagsKHR](#) value
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
Both of **device**, and **surface must** have been created, allocated, or retrieved from the same [VkInstance](#)

Host Synchronization

- Host access to **surface must** be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)

Alternatively, to query the supported device group presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```
// Provided by VK_VERSION_1_1 with VK_EXT_full_screen_exclusive, VK_KHR_device_group
// with VK_EXT_full_screen_exclusive
VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice device,
    const VkPhysicalDeviceSurfaceInfo2KHR* pCreateInfo,
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```

- `device` is the logical device.
- `pCreateInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pModes` is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to `vkGetDeviceGroupSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pCreateInfo-06213
`pCreateInfo->surface` **must** be supported by all physical devices associated with `device`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure
- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter
`pModes` **must** be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

When using `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, the application **may** need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice                         physicalDevice,
    VkSurfaceKHR                            surface,
    uint32_t*                                pRectCount,
    VkRect2D*                                pRects);
```

- `physicalDevice` is the physical device.
- `surface` is the surface.
- `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
- `pRects` is either `NULL` or a pointer to an array of `VkRect2D` structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` **must** point to a variable set by the user to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command **must** not overlap.

Valid Usage

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06523
surface must be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
surface must be supported by [physicalDevice](#), as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
physicalDevice must be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
surface must be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter
pRectCount must be a valid pointer to a [uint32_t](#) value
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter
If the value referenced by [pRectCount](#) is not `0`, and [pRects](#) is not `NULL`, [pRects must](#) be a valid pointer to an array of [pRectCount](#) [VkRect2D](#) structures
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent
Both of [physicalDevice](#), and [surface must](#) have been created, allocated, or retrieved from the same [VkInstance](#)

Host Synchronization

- Host access to [surface must](#) be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)
- [VK_INCOMPLETE](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

33.8. Display Timing Queries

Traditional game and real-time-animation applications frequently use [VK_PRESENT_MODE_FIFO_KHR](#) so

that presentable images are updated during the vertical blanking period of a given refresh cycle (RC) of the presentation engine's display. This avoids the visual anomaly known as tearing.

However, synchronizing the presentation of images with the RC does not prevent all forms of visual anomalies. Stuttering occurs when the geometry for each presentable image is not accurately positioned for when that image will be displayed. The geometry may appear to move too little some RCs, and too much for others. Sometimes the animation appears to freeze, when the same image is used for more than one RC.

In order to minimize stuttering, an application needs to correctly position their geometry for when the presentable image will be displayed to the user. To accomplish this, applications need various timing information about the presentation engine's display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This can allow the application's animation to look smooth to the user, with no stuttering. The `VK_GOOGLE_display_timing` extension allows an application to satisfy these needs.

The presentation engine's display typically refreshes the pixels that are displayed to the user on a periodic basis. The period may be fixed or variable. In many cases, the presentation engine is associated with fixed refresh rate (FRR) display technology, with a fixed refresh rate (RR, e.g. 60Hz). In some cases, the presentation engine is associated with variable refresh rate (VRR) display technology, where each refresh cycle (RC) can vary in length. This extension treats VRR displays as if they are FRR.

To query the duration of a refresh cycle (RC) for the presentation engine's display, call:

```
// Provided by VK_GOOGLE_display_timing
VkResult vkGetRefreshCycleDurationGOOGLE(
    VkDevice                                     device,
    VkSwapchainKHR                               swapchain,
    VkRefreshCycleDurationGOOGLE*                pDisplayTimingProperties);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to obtain the refresh duration for.
- `pDisplayTimingProperties` is a pointer to a `VkRefreshCycleDurationGOOGLE` structure.

Valid Usage (Implicit)

- VUID-vkGetRefreshCycleDurationGOOGLE-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkGetRefreshCycleDurationGOOGLE-pDisplayTimingProperties-parameter
`pDisplayTimingProperties` **must** be a valid pointer to a `VkRefreshCycleDurationGOOGLE` structure
- VUID-vkGetRefreshCycleDurationGOOGLE-commonparent
Both of `device`, and `swapchain` **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkRefreshCycleDurationGOOGLE` structure is defined as:

```
// Provided by VK_GOOGLE_display_timing
typedef struct VkRefreshCycleDurationGOOGLE {
    uint64_t refreshDuration;
} VkRefreshCycleDurationGOOGLE;
```

- `refreshDuration` is the number of nanoseconds from the start of one refresh cycle to the next.

Note

The rate at which an application renders and presents new images is known as the image present rate (IPR, aka frame rate). The inverse of IPR, or the duration between each image present, is the image present duration (IPD). In order to provide a smooth, stutter-free animation, an application will want its IPD to be a multiple of `refreshDuration`. For example, if a display has a 60Hz refresh rate, `refreshDuration` will be a value in nanoseconds that is approximately equal to 16.67ms. In such a case, an application will want an IPD of 16.67ms (1X multiplier of `refreshDuration`), or 33.33ms (2X multiplier of `refreshDuration`), or 50.0ms (3X multiplier of `refreshDuration`), etc.

In order to determine a target IPD for a display (i.e. a multiple of `refreshDuration`), an application needs to determine when its images are actually displayed. Suppose an application has an initial target IPD of 16.67ms (1X multiplier of `refreshDuration`). It will therefore position the geometry of a new image 16.67ms later than the previous image. But suppose this application is running on slower hardware, so that it actually takes 20ms to render each new image. This will create visual anomalies, because the images will not be displayed to the user every 16.67ms, nor every 20ms. In this case, it is better for the application to adjust its target IPD to 33.33ms (i.e. a 2X multiplier of `refreshDuration`), and tell the presentation engine to not present images any sooner than every 33.33ms. This will allow the geometry to be correctly positioned for each presentable image.

Adjustments to an application's IPD may be needed because different views of an application's geometry can take different amounts of time to render. For example, looking at the sky may take less time to render than looking at multiple, complex items in a room. In general, it is good to not frequently change IPD, as that can cause visual anomalies. Adjustments to a larger IPD because of late images should happen quickly, but adjustments to a smaller IPD should only happen if the `actualPresentTime` and `earliestPresentTime` members of the `VkPastPresentationTimingGOOGLE` structure are consistently different, and if `presentMargin` is consistently large, over multiple images.

The implementation will maintain a limited amount of history of timing information about previous presents. Because of the asynchronous nature of the presentation engine, the timing information for a given `vkQueuePresentKHR` command will become available some time later. These time values can be asynchronously queried, and will be returned if available. All time values are in nanoseconds, relative to a monotonically-increasing clock (e.g. `CLOCK_MONOTONIC` (see `clock_gettime(2)`) on Android and Linux).

To asynchronously query the presentation engine, for newly-available timing information about one or more previous presents to a given swapchain, call:

```

// Provided by VK_GOOGLE_display_timing
VkResult vkGetPastPresentationTimingGOOGLE(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pPresentationTimingCount,
    VkPastPresentationTimingGOOGLE* pPresentationTimings);

```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to obtain presentation timing information duration for.
- `pPresentationTimingCount` is a pointer to an integer related to the number of `VkPastPresentationTimingGOOGLE` structures to query, as described below.
- `pPresentationTimings` is either `NULL` or a pointer to an array of `VkPastPresentationTimingGOOGLE` structures.

If `pPresentationTimings` is `NULL`, then the number of newly-available timing records for the given `swapchain` is returned in `pPresentationTimingCount`. Otherwise, `pPresentationTimingCount` **must** point to a variable set by the user to the number of elements in the `pPresentationTimings` array, and on return the variable is overwritten with the number of structures actually written to `pPresentationTimings`. If the value of `pPresentationTimingCount` is less than the number of newly-available timing records, at most `pPresentationTimingCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available timing records were returned.

Valid Usage (Implicit)

- VUID-vkGetPastPresentationTimingGOOGLE-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimingCount-parameter
`pPresentationTimingCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimings-parameter
If the value referenced by `pPresentationTimingCount` is not `0`, and `pPresentationTimings` is not `NULL`, `pPresentationTimings` **must** be a valid pointer to an array of `pPresentationTimingCount` `VkPastPresentationTimingGOOGLE` structures
- VUID-vkGetPastPresentationTimingGOOGLE-commonparent
Both of `device`, and `swapchain` **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The `VkPastPresentationTimingGOOGLE` structure is defined as:

```
// Provided by VK_GOOGLE_display_timing
typedef struct VkPastPresentationTimingGOOGLE {
    uint32_t    presentID;
    uint64_t    desiredPresentTime;
    uint64_t    actualPresentTime;
    uint64_t    earliestPresentTime;
    uint64_t    presentMargin;
} VkPastPresentationTimingGOOGLE;
```

- `presentID` is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::presentID` (see below). It **can** be used to uniquely identify a previous present with the `vkQueuePresentKHR` command.
- `desiredPresentTime` is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::desiredPresentTime`. If non-zero, it was used by the application to indicate that an image not be presented any sooner than `desiredPresentTime`.
- `actualPresentTime` is the time when the image of the `swapchain` was actually displayed.
- `earliestPresentTime` is the time when the image of the `swapchain` could have been displayed. This **may** differ from `actualPresentTime` if the application requested that the image be presented no sooner than `VkPresentTimeGOOGLE::desiredPresentTime`.
- `presentMargin` is an indication of how early the `vkQueuePresentKHR` command was processed compared to how soon it needed to be processed, and still be presented at `earliestPresentTime`.

The results for a given `swapchain` and `presentID` are only returned once from `vkGetPastPresentationTimingGOOGLE`.

The application **can** use the `VkPastPresentationTimingGOOGLE` values to occasionally adjust its timing. For example, if `actualPresentTime` is later than expected (e.g. one `refreshDuration` late), the application may increase its target IPD to a higher multiple of `refreshDuration` (e.g. decrease its

frame rate from 60Hz to 30Hz). If `actualPresentTime` and `earliestPresentTime` are consistently different, and if `presentMargin` is consistently large enough, the application may decrease its target IPD to a smaller multiple of `refreshDuration` (e.g. increase its frame rate from 30Hz to 60Hz). If `actualPresentTime` and `earliestPresentTime` are same, and if `presentMargin` is consistently high, the application may delay the start of its input-render-present loop in order to decrease the latency between user input and the corresponding present (always leaving some margin in case a new image takes longer to render than the previous image). An application that desires its target IPD to always be the same as `refreshDuration`, can also adjust features until `actualPresentTime` is never late and `presentMargin` is satisfactory.

The full `VK_GOOGLE_display_timing` extension semantics are described for swapchains created with `VK_PRESENT_MODE_FIFO_KHR`. For example, non-zero values of `VkPresentTimeGOOGLE::desiredPresentTime` **must** be honored, and `vkGetPastPresentationTimingGOOGLE` **should** return a `VkPastPresentationTimingGOOGLE` structure with valid values for all images presented with `vkQueuePresentKHR`. The semantics for other present modes are as follows:

- **`VK_PRESENT_MODE_IMMEDIATE_KHR`**. The presentation engine **may** ignore non-zero values of `VkPresentTimeGOOGLE::desiredPresentTime` in favor of presenting immediately. The value of `VkPastPresentationTimingGOOGLE::earliestPresentTime` **must** be the same as `VkPastPresentationTimingGOOGLE::actualPresentTime`, which **should** be when the presentation engine displayed the image.
- **`VK_PRESENT_MODE_MAILBOX_KHR`**. The intention of using this present mode with this extension is to handle cases where an image is presented late, and the next image is presented soon enough to replace it at the next vertical blanking period. For images that are displayed to the user, the value of `VkPastPresentationTimingGOOGLE::actualPresentTime` **must** be when the image was displayed. For images that are not displayed to the user, `vkGetPastPresentationTimingGOOGLE` **may** not return a `VkPastPresentationTimingGOOGLE` structure, or it **may** return a `VkPastPresentationTimingGOOGLE` structure with the value of zero for both `VkPastPresentationTimingGOOGLE::actualPresentTime` and `VkPastPresentationTimingGOOGLE::earliestPresentTime`. It is possible that an application **can** submit images with `VkPresentTimeGOOGLE::desiredPresentTime` values such that new images **may** not be displayed. For example, if `VkPresentTimeGOOGLE::desiredPresentTime` is far enough in the future that an image is not presented before `vkQueuePresentKHR` is called to present another image, the first image will not be displayed to the user. If the application continues to do that, the presentation **may** not display new images.
- **`VK_PRESENT_MODE_FIFO_RELAXED_KHR`**. For images that are presented in time to be displayed at the next vertical blanking period, the semantics are identical as for `VK_PRESENT_MODE_FIFO_RELAXED_KHR`. For images that are presented late, and are displayed after the start of the vertical blanking period (i.e. with tearing), the values of `VkPastPresentationTimingGOOGLE` **may** be treated as if the image was displayed at the start of the vertical blanking period, or **may** be treated the same as for `VK_PRESENT_MODE_IMMEDIATE_KHR`.

33.9. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.

Using the `VK_GOOGLE_display_timing` extension applications can discover when images were presented, but only asynchronously.

Providing a mechanism which allows applications to block, waiting for a specific step of the presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The `VK_KHR_present_wait` extension allows applications to tell the presentation engine at the `vkQueuePresentKHR` call that it plans on waiting for presentation by passing a `VkPresentIdKHR` structure. The `presentId` passed in that structure may then be passed to a future `vkWaitForPresentKHR` call to cause the application to block until that presentation is finished.

33.10. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by `VkSwapchainKHR` handles:

```
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface. The presentable images are represented by `VkImage` objects created by the platform. One image (which **can** be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images **can** be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window **cannot** be associated with more than one non-retired swapchain at a time. Further, swapchains **cannot** be created for native windows that have a non-Vulkan graphics API surface associated with them.

Note

The presentation engine is an abstraction for the platform's compositor or display engine.

The presentation engine **may** be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations **may** use the device's graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application **can** acquire use of a presentable image from the presentation engine. Use of a presentable image **must** occur only after the image is returned by `vkAcquireNextImageKHR`, and before it is released by `vkQueuePresentKHR`. This includes transitioning the image layout and rendering commands.

An application **can** acquire use of a presentable image with `vkAcquireNextImageKHR`. After acquiring a presentable image and before modifying it, the application **must** use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application **can**

then transition the image's layout, queue rendering commands to it, etc. Finally, the application presents the image with `vkQueuePresentKHR`, which releases the acquisition of the image.

The presentation engine controls the order in which presentable images are acquired for use by the application.

Note

This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

How this all works is described below.

If a swapchain is created with `presentMode` set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, a single presentable image **can** be acquired, referred to as a shared presentable image. A shared presentable image **may** be concurrently accessed by the application and the presentation engine, without transitioning the image's layout after it is initially presented.

- With `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application **must** call `vkQueuePresentKHR` to guarantee an update. However, the presentation engine **may** update from it at any time.
- With `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to `vkQueuePresentKHR`, after which the presentation engine will update from it without any need for further present calls. The application **can** indicate the image contents have been updated by calling `vkQueuePresentKHR`, but this does not guarantee the timing of when updates will occur.

The presentation engine **may** access a shared presentable image at any time after it is first presented. To avoid tearing, an application **should** coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine's refresh cycle they are intended for.

Note

The `VK_KHR_shared_presentable_image` extension does not provide functionality for determining the timing of the presentation engine's refresh cycles.

In order to query a swapchain's status when rendering to a shared presentable image, call:

```
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice                                     device,
    VkSwapchainKHR                                swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.

Valid Usage (Implicit)

- VUID-vkGetSwapchainStatusKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkGetSwapchainStatusKHR-commonparent
Both of `device`, and `swapchain` **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`
- `VK_SUBOPTIMAL_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULLSCREEN_EXCLUSIVE_MODE_LOST_EXT`

The possible return values for `vkGetSwapchainStatusKHR` **should** be interpreted as follows:

- `VK_SUCCESS` specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.
- `VK_SUBOPTIMAL_KHR` the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.
- `VK_ERROR_OUT_OF_DATE_KHR` the surface has changed in such a way that it is no longer compatible with the swapchain.

- **VK_ERROR_SURFACE_LOST_KHR** the surface is no longer available.

Note

The swapchain state **may** be cached by implementations, so applications **should** regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

To create a swapchain, call:

```
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice                                     device,
    const VkSwapchainCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks*     pAllocator,
    VkSwapchainKHR*                  pSwapchain);
```

- **device** is the device to create the swapchain for.
- **pCreateInfo** is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.
- **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pSwapchain** is a pointer to a `VkSwapchainKHR` handle in which the created swapchain object will be returned.

As mentioned above, if `vkCreateSwapchainKHR` succeeds, it will return a handle to a swapchain containing an array of at least `pCreateInfo->minImageCount` presentable images.

While acquired by the application, presentable images **can** be used in any way that equivalent non-presentable images **can** be used. A presentable image is equivalent to a non-presentable image created with the following `VkImageCreateInfo` parameters:

VkImageCreateInfo Field	Value
flags	<p><code>VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT</code> is set if <code>VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR</code> is set</p> <p><code>VK_IMAGE_CREATE_PROTECTED_BIT</code> is set if <code>VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR</code> is set</p> <p><code>VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT</code> and <code>VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR</code> are both set if <code>VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR</code> is set</p> <p>all other bits are unset</p>
imageType	<code>VK_IMAGE_TYPE_2D</code>
format	<code>pCreateInfo->imageFormat</code>
extent	<code>{pCreateInfo->imageExtent.width, pCreateInfo->imageExtent.height, 1}</code>
mipLevels	1
arrayLayers	<code>pCreateInfo->imageArrayLayers</code>
samples	<code>VK_SAMPLE_COUNT_1_BIT</code>
tiling	<code>VK_IMAGE_TILING_OPTIMAL</code>
usage	<code>pCreateInfo->imageUsage</code>
sharingMode	<code>pCreateInfo->imageSharingMode</code>
queueFamilyIndexCount	<code>pCreateInfo->queueFamilyIndexCount</code>
pQueueFamilyIndices	<code>pCreateInfo->pQueueFamilyIndices</code>
initialLayout	<code>VK_IMAGE_LAYOUT_UNDEFINED</code>

The `pCreateInfo->surface` **must** not be destroyed until after the swapchain is destroyed.

If `pCreateInfo->oldSwapchain` is `VK_NULL_HANDLE`, and the native window referred to by `pCreateInfo->surface` is already associated with a Vulkan swapchain, `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR` **must** be returned.

If the native window referred to by `pCreateInfo->surface` is already associated with a non-Vulkan graphics API surface, `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR` **must** be returned.

The native window referred to by `pCreateInfo->surface` **must** not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

`vkCreateSwapchainKHR` will return `VK_ERROR_DEVICE_LOST` if the logical device was lost. The `VkSwapchainKHR` is a child of the `device`, and **must** not be destroyed before the `device`. However, `VkSurfaceKHR` is not a child of any `VkDevice` and is not affected by the lost device. After successfully recreating a `VkDevice`, the same `VkSurfaceKHR` **can** be used to create a new `VkSwapchainKHR`, provided

the previous one was destroyed.

If the `oldSwapchain` parameter of `pCreateInfo` is a valid swapchain, which has exclusive full-screen access, that access is released from `pCreateInfo->oldSwapchain`. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from `pCreateInfo->oldSwapchain`.

Note

This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation **may** fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, `VK_ERROR_INITIALIZATION_FAILED` will be returned.

Note

In particular, it will fail if the `imageExtent` member of `pCreateInfo` does not match the extents of the monitor. Other reasons for failure may include the app not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

When the `VkSurfaceKHR` in `VkSwapchainCreateInfoKHR` is a display surface, then the `VkDisplayModeKHR` in display surface's `VkDisplaySurfaceCreateInfoKHR` is associated with a particular `VkDisplayKHR`. Swapchain creation **may** fail if that `VkDisplayKHR` is not acquired by the application. In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

Valid Usage (Implicit)

- VUID-vkCreateSwapchainKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkSwapchainCreateInfoKHR` structure
- VUID-vkCreateSwapchainKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
`pSwapchain` **must** be a valid pointer to a `VkSwapchainKHR` handle

Host Synchronization

- Host access to `pCreateInfo->surface` **must** be externally synchronized
- Host access to `pCreateInfo->oldSwapchain` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkSwapchainCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_swapchain
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkSwapchainCreateFlagsKHR       flags;
    VkSurfaceKHR                    surface;
    uint32_t                        minImageCount;
    VkFormat                         imageFormat;
    VkColorSpaceKHR                 imageColorSpace;
    VkExtent2D                       imageExtent;
    uint32_t                        imageArrayLayers;
    VkImageUsageFlags               imageUsage;
    VkSharingMode                   imageSharingMode;
    uint32_t                        queueFamilyIndexCount;
    const uint32_t*                  pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR   preTransform;
    VkCompositeAlphaFlagBitsKHR     compositeAlpha;
    VkPresentModeKHR                presentMode;
    VkBool32                         clipped;
    VkSwapchainKHR                  oldSwapchain;
} VkSwapchainCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSwapchainCreateFlagBitsKHR` indicating parameters of the swapchain creation.
- `surface` is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with `surface`.

- `minImageCount` is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.
- `imageFormat` is a [VkFormat](#) value specifying the format the swapchain image(s) will be created with.
- `imageColorSpace` is a [VkColorSpaceKHR](#) value specifying the way the swapchain interprets image data.
- `imageExtent` is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface's `currentExtent` as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

Note

On some platforms, it is normal that `maxImageExtent` **may** become `(0, 0)`, for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements.

- `imageArrayLayers` is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.
- `imageUsage` is a bitmask of [VkImageUsageFlagBits](#) describing the intended usage of the (acquired) swapchain images.
- `imageSharingMode` is the sharing mode used for the image(s) of the swapchain.
- `queueFamilyIndexCount` is the number of queue families having access to the image(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.
- `pQueueFamilyIndices` is a pointer to an array of queue family indices having access to the images(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.
- `preTransform` is a [VkSurfaceTransformFlagBitsKHR](#) value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the `currentTransform` value returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, the presentation engine will transform the image content as part of the presentation operation.
- `compositeAlpha` is a [VkCompositeAlphaFlagBitsKHR](#) value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.
- `presentMode` is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.
- `clipped` specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
 - If set to `VK_TRUE`, the presentable images associated with the swapchain **may** not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders **may** not execute for these pixels, and thus any side effects they would have had will not occur. Setting `VK_TRUE` does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.

- If set to `VK_FALSE`, presentable images associated with the swapchain will own all of the pixels they contain.

Note

Applications **should** set this value to `VK_TRUE` if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- `oldSwapchain` is `VK_NULL_HANDLE`, or the existing non-retired swapchain currently associated with `surface`. Providing a valid `oldSwapchain` **may** aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling `vkCreateSwapchainKHR` with an `oldSwapchain` that is not `VK_NULL_HANDLE`, `oldSwapchain` is retired—even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not `oldSwapchain` is `VK_NULL_HANDLE`.

Upon calling `vkCreateSwapchainKHR` with an `oldSwapchain` that is not `VK_NULL_HANDLE`, any images from `oldSwapchain` that are not acquired by the application **may** be freed by the implementation, which **may** occur even if creation of the new swapchain fails. The application **can** destroy `oldSwapchain` to free all memory associated with `oldSwapchain`.

Note

Multiple retired swapchains **can** be associated with the same `VkSurfaceKHR` through multiple uses of `oldSwapchain` that outnumber calls to `vkDestroySwapchainKHR`.

After `oldSwapchain` is retired, the application **can** pass to `vkQueuePresentKHR` any images it had already acquired from `oldSwapchain`. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, `vkQueuePresentKHR` **may** fail if `oldSwapchain` has entered a state that causes `VK_ERROR_OUT_OF_DATE_KHR` to be returned.

The application **can** continue to use a shared presentable image obtained from `oldSwapchain` until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return `VK_ERROR_OUT_OF_DATE_KHR`.

Valid Usage

- VUID-VkSwapchainCreateInfoKHR-surface-01270
 - surface must** be a surface that is supported by the device as determined using [vkGetPhysicalDeviceSurfaceSupportKHR](#)
- VUID-VkSwapchainCreateInfoKHR-minImageCount-01272
 - minImageCount must** be less than or equal to the value returned in the **maxImageCount** member of the **VkSurfaceCapabilitiesKHR** structure returned by [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#) for the surface if the returned **maxImageCount** is not zero
- VUID-VkSwapchainCreateInfoKHR-presentMode-02839
 - If **presentMode** is not **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** nor **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**, then **minImageCount must** be greater than or equal to the value returned in the **minImageCount** member of the **VkSurfaceCapabilitiesKHR** structure returned by [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#) for the surface
- VUID-VkSwapchainCreateInfoKHR-minImageCount-01383
 - minImageCount must** be 1 if **presentMode** is either **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**
- VUID-VkSwapchainCreateInfoKHR-imageFormat-01273
 - imageFormat** and **imageColorSpace must** match the **format** and **colorSpace** members, respectively, of one of the **VkSurfaceFormatKHR** structures returned by [vkGetPhysicalDeviceSurfaceFormatsKHR](#) for the surface
- VUID-VkSwapchainCreateInfoKHR-imageExtent-01274
 - imageExtent must** be between **minImageExtent** and **maxImageExtent**, inclusive, where **minImageExtent** and **maxImageExtent** are members of the **VkSurfaceCapabilitiesKHR** structure returned by [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#) for the surface
- VUID-VkSwapchainCreateInfoKHR-imageExtent-01689
 - imageExtent** members **width** and **height must** both be non-zero
- VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275
 - imageArrayLayers must** be greater than 0 and less than or equal to the **maxImageArrayLayers** member of the **VkSurfaceCapabilitiesKHR** structure returned by [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#) for the surface
- VUID-VkSwapchainCreateInfoKHR-presentMode-01427
 - If **presentMode** is **VK_PRESENT_MODE_IMMEDIATE_KHR**, **VK_PRESENT_MODE_MAILBOX_KHR**, **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR**, **imageUsage must** be a subset of the supported usage flags present in the **supportedUsageFlags** member of the **VkSurfaceCapabilitiesKHR** structure returned by [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#) for **surface**
- VUID-VkSwapchainCreateInfoKHR-imageUsage-01384
 - If **presentMode** is **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**, **imageUsage must** be a subset of the supported usage flags present in the **sharedPresentSupportedUsageFlags** member of the

`VkSharedPresentSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for `surface`

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277
If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` **must** be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278
If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` **must** be greater than 1
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428
If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` **must** be unique and **must** be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create `device`
- VUID-VkSwapchainCreateInfoKHR-preTransform-01279
`preTransform` **must** be one of the bits present in the `supportedTransforms` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280
`compositeAlpha` **must** be one of the bits present in the `supportedCompositeAlpha` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-presentMode-01281
`presentMode` **must** be one of the `VkPresentModeKHR` values returned by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-physicalDeviceCount-01429
If the logical device was created with `VkDeviceGroupDeviceCreateInfo::physicalDeviceCount` equal to 1, `flags` **must** not contain `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`
- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-01933
If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` **must** be a non-retired swapchain associated with native window referred to by `surface`
- VUID-VkSwapchainCreateInfoKHR-imageFormat-01778
The `implied image creation parameters` of the swapchain **must** be supported as reported by `vkGetPhysicalDeviceImageFormatProperties`
- VUID-VkSwapchainCreateInfoKHR-flags-03168
If `flags` contains `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` then the `pNext` chain **must** include a `VkImageFormatListCreateInfo` structure with a `viewFormatCount` greater than zero and `pViewFormats` **must** have an element equal to `imageFormat`
- VUID-VkSwapchainCreateInfoKHR-pNext-04099
If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and `VkImageFormatListCreateInfo::viewFormatCount` is not zero then all of the formats in `VkImageFormatListCreateInfo::pViewFormats` **must** be compatible with the `format` as described in the `compatibility table`

- VUID-VkSwapchainCreateInfoKHR-flags-04100
If `flags` does not contain `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` and the `pNext` chain include a `VkImageFormatListCreateInfo` structure then `VkImageFormatListCreateInfo` `::viewFormatCount` **must** be 0 or 1
- VUID-VkSwapchainCreateInfoKHR-flags-03187
If `flags` contains `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR`, then `VkSurfaceProtectedCapabilitiesKHR::supportsProtected` **must** be `VK_TRUE` in the `VkSurfaceProtectedCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for `surface`
- VUID-VkSwapchainCreateInfoKHR-pNext-02679
If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **must** be included in the `pNext` chain

Valid Usage (Implicit)

- VUID-VkSwapchainCreateInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkSwapchainCreateInfoKHR-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupSwapchainCreateInfoKHR`, `VkImageFormatListCreateInfo`, `VkSurfaceFullScreenExclusiveInfoEXT`, `VkSurfaceFullScreenExclusiveWin32InfoEXT`, `VkSwapchainCounterCreateInfoEXT`, or `VkSwapchainDisplayNativeHdrCreateInfoAMD`
- VUID-VkSwapchainCreateInfoKHR-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique
- VUID-VkSwapchainCreateInfoKHR-flags-parameter
flags **must** be a valid combination of `VkSwapchainCreateFlagBitsKHR` values
- VUID-VkSwapchainCreateInfoKHR-surface-parameter
surface **must** be a valid `VkSurfaceKHR` handle
- VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter
imageFormat **must** be a valid `VkFormat` value
- VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter
imageColorSpace **must** be a valid `VkColorSpaceKHR` value
- VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter
imageUsage **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask
imageUsage **must** not be `0`
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter
imageSharingMode **must** be a valid `VkSharingMode` value
- VUID-VkSwapchainCreateInfoKHR-preTransform-parameter
preTransform **must** be a valid `VkSurfaceTransformFlagBitsKHR` value
- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter
compositeAlpha **must** be a valid `VkCompositeAlphaFlagBitsKHR` value
- VUID-VkSwapchainCreateInfoKHR-presentMode-parameter
presentMode **must** be a valid `VkPresentModeKHR` value
- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter
If **oldSwapchain** is not `VK_NULL_HANDLE`, **oldSwapchain** **must** be a valid `VkSwapchainKHR` handle
- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parent
If **oldSwapchain** is a valid handle, it **must** have been created, allocated, or retrieved from **surface**
- VUID-VkSwapchainCreateInfoKHR-commonparent
Both of **oldSwapchain**, and **surface** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Bits which **can** be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
    // VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_swapchain mutable format
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
} VkSwapchainCreateFlagBitsKHR;
```

- `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR` specifies that images created from the swapchain (i.e. with the `swapchain` member of `VkImageSwapchainCreateInfoKHR` set to this swapchain's handle) **must** use `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT`.
- `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` specifies that images created from the swapchain are protected images.
- `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` specifies that the images of the swapchain **can** be used to create a `VkImageView` with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a `VkImageFormatListCreateInfo` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. In addition, this flag also specifies that the swapchain **can** be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.

```
// Provided by VK_KHR_swapchain
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

`VkSwapchainCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSwapchainCreateFlagBitsKHR`.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkDeviceGroupSwapchainCreateInfoKHR` structure, then that structure includes a set of device group present modes that the swapchain **can** be used with.

The `VkDeviceGroupSwapchainCreateInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
// VK_KHR_swapchain
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType           sType;
    const void*             pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `modes` is a bitfield of modes that the swapchain **can** be used with.

If this structure is not present, `modes` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage (Implicit)

- VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter
`modes` **must** be a valid combination of `VkDeviceGroupPresentModeFlagBitsKHR` values
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-requiredbitmask
`modes` **must** not be `0`

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure, then that structure includes additional swapchain creation parameters specific to display native HDR support.

The `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure is defined as:

```
// Provided by VK_AMD_display_native_hdr
typedef struct VkSwapchainDisplayNativeHdrCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkBool32 localDimmingEnable;
} VkSwapchainDisplayNativeHdrCreateInfoAMD;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, the default value for `localDimmingEnable` is `VK_TRUE`, meaning local dimming is initially enabled for the swapchain.

Valid Usage (Implicit)

- VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_DISPLAY_NATIVE_HDR_CREATE_INFO_AMD`

Valid Usage

- VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-localDimmingEnable-04449
It is only valid to set `localDimmingEnable` to `VK_TRUE` if `VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` is supported

The local dimming HDR setting may also be changed over the life of a swapchain by calling:

```
// Provided by VK_AMD_display_native_hdr
void vkSetLocalDimmingAMD(
    VkDevice                                     device,
    VkSwapchainKHR                               swapChain,
    VkBool32                                     localDimmingEnable);
```

- `device` is the device associated with `swapChain`.
- `swapChain` handle to enable local dimming.
- `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

Valid Usage (Implicit)

- VUID-vkSetLocalDimmingAMD-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkSetLocalDimmingAMD-swapChain-parameter
`swapChain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkSetLocalDimmingAMD-commonparent
Both of `device`, and `swapChain` **must** have been created, allocated, or retrieved from the same `VkInstance`

Valid Usage

- VUID-vkSetLocalDimmingAMD-localDimmingSupport-04618
`VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` **must** be supported

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application's preferred full-screen presentation behavior. If this structure is not present, `fullScreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

To enable surface counters when creating a swapchain, add a `VkSwapchainCounterCreateInfoEXT` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. `VkSwapchainCounterCreateInfoEXT` is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType          sType;
    const void*             pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCounters` is a bitmask of `VkSurfaceCounterFlagBitsEXT` specifying surface counters to enable for the swapchain.

Valid Usage

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244

The bits in `surfaceCounters` **must** be supported by `VkSwapchainCreateInfoKHR::surface`, as reported by `vkGetPhysicalDeviceSurfaceCapabilities2EXT`

Valid Usage (Implicit)

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT`
- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
`surfaceCounters` **must** be a valid combination of `VkSurfaceCounterFlagBitsEXT` values

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:

```
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice                      device,
    VkSwapchainKHR                 swapchain,
    VkSurfaceCounterFlagBitsEXT    counter,
    uint64_t*                    pCounterValue);
```

- `device` is the `VkDevice` associated with `swapchain`.
- `swapchain` is the swapchain from which to query the counter value.
- `counter` is a `VkSurfaceCounterFlagBitsEXT` value specifying the counter to query.
- `pCounterValue` will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation **may** return `VK_ERROR_OUT_OF_DATE_KHR`.

Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245

One or more present commands on `swapchain` **must** have been processed by the presentation engine

Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter

`device` **must** be a valid `VkDevice` handle

- VUID-vkGetSwapchainCounterEXT-swapchain-parameter

`swapchain` **must** be a valid `VkSwapchainKHR` handle

- VUID-vkGetSwapchainCounterEXT-counter-parameter

`counter` **must** be a valid `VkSurfaceCounterFlagBitsEXT` value

- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter

`pCounterValue` **must** be a valid pointer to a `uint64_t` value

- VUID-vkGetSwapchainCounterEXT-commonparent

Both of `device`, and `swapchain` **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`

To destroy a swapchain object call:

```
// Provided by VK_KHR_swapchain
void vkDestroySwapchainKHR(
    VkDevice                                     device,
    VkSwapchainKHR                               swapchain,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the `VkDevice` associated with `swapchain`.
- `swapchain` is the swapchain to destroy.
- `pAllocator` is the allocator used for host memory allocated for the swapchain object when there

is no more specific allocator available (see [Memory Allocation](#)).

The application **must** not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. `swapchain` and all associated `VkImage` handles are destroyed, and **must** not be acquired or used any more by the application. The memory of each `VkImage` will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image **may** not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent `VkSurfaceKHR`, and a new swapchain **can** be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently presented to the display surface is from the swapchain being destroyed, then either any display resources modified by presenting images from any swapchain associated with the display surface **must** be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources **must** be left in their current state.

If `swapchain` has exclusive full-screen access, it is released before the swapchain is destroyed.

Valid Usage

- VUID-vkDestroySwapchainKHR-swapchain-01282
All uses of presentable images acquired from `swapchain` **must** have completed execution
- VUID-vkDestroySwapchainKHR-swapchain-01283
If `VkAllocationCallbacks` were provided when `swapchain` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroySwapchainKHR-swapchain-01284
If no `VkAllocationCallbacks` were provided when `swapchain` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroySwapchainKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroySwapchainKHR-swapchain-parameter
If `swapchain` is not `VK_NULL_HANDLE`, `swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkDestroySwapchainKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroySwapchainKHR-commonparent
Both of `device`, and `swapchain` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

When the `VK_KHR_display_swapchain` extension is enabled, multiple swapchains that share presentable images are created by calling:

```
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice device,
    uint32_t swapchainCount,
    const VkSwapchainCreateInfoKHR* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkSwapchainKHR* pSwapchains);
```

- `device` is the device to create the swapchains for.
- `swapchainCount` is the number of swapchains to create.
- `pCreateInfos` is a pointer to an array of `VkSwapchainCreateInfoKHR` structures specifying the parameters of the created swapchains.
- `pAllocator` is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` handles in which the created swapchain objects will be returned.

`vkCreateSharedSwapchainsKHR` is similar to `vkCreateSwapchainKHR`, except that it takes an array of `VkSwapchainCreateInfoKHR` structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images **must** match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`. If any error occurs, no swapchains will be created. Images presented to multiple swapchains **must** be re-acquired from all of them before transitioning away from `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`. After destroying one or more of the swapchains, the remaining swapchains and the presentable images **can** continue to be used.

Valid Usage (Implicit)

- VUID-vkCreateSharedSwapchainsKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateSharedSwapchainsKHR-pCreateInfo-parameter
`pCreateInfos` **must** be a valid pointer to an array of `swapchainCount` valid `VkSwapchainCreateInfoKHR` structures
- VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter
`pSwapchains` **must** be a valid pointer to an array of `swapchainCount` `VkSwapchainKHR` handles
- VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength
`swapchainCount` **must** be greater than `0`

Host Synchronization

- Host access to `pCreateInfos[]`.`surface` **must** be externally synchronized
- Host access to `pCreateInfos[]`.`oldSwapchain` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_SURFACE_LOST_KHR`

To obtain the array of presentable images associated with a swapchain, call:

```

// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pSwapchainImageCount,
    VkImage* pSwapchainImages);

```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.
- `pSwapchainImageCount` is a pointer to an integer related to the number of presentable images available or queried, as described below.
- `pSwapchainImages` is either `NULL` or a pointer to an array of `VkImage` handles.

If `pSwapchainImages` is `NULL`, then the number of presentable images for `swapchain` is returned in `pSwapchainImageCount`. Otherwise, `pSwapchainImageCount` **must** point to a variable set by the user to the number of elements in the `pSwapchainImages` array, and on return the variable is overwritten with the number of structures actually written to `pSwapchainImages`. If the value of `pSwapchainImageCount` is less than the number of presentable images for `swapchain`, at most `pSwapchainImageCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available presentable images were returned.

Valid Usage (Implicit)

- VUID-vkGetSwapchainImagesKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetSwapchainImagesKHR-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter
`pSwapchainImageCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter
If the value referenced by `pSwapchainImageCount` is not `0`, and `pSwapchainImages` is not `NULL`, `pSwapchainImages` **must** be a valid pointer to an array of `pSwapchainImageCount` `VkImage` handles
- VUID-vkGetSwapchainImagesKHR-commonparent
Both of `device`, and `swapchain` **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Note

By knowing all presentable images used in the swapchain, the application **can** create command buffers that reference these images prior to entering its main rendering loop.

Images returned by `vkGetSwapchainImagesKHR` are fully backed by memory before they are passed to the application. All presentable images are initially in the `VK_IMAGE_LAYOUT_UNDEFINED` layout, thus before using presentable images, the application **must** transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications **must** not destroy a presentable image. See `vkDestroySwapchainKHR` for further details on the lifetime of presentable images.

Images **can** also be created by using `vkCreateImage` with `VkImageSwapchainCreateInfoKHR` and bound to swapchain memory using `vkBindImageMemory2` with `VkBindImageMemorySwapchainInfoKHR`. These images **can** be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images **must** be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice                               device,
    VkSwapchainKHR                         swapchain,
    uint64_t                                timeout,
    VkSemaphore                            semaphore,
    VkFence                                 fence,
    uint32_t*                               pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain from which an image is being acquired.

- `timeout` specifies how long the function waits, in nanoseconds, if no image is available.
- `semaphore` is `VK_NULL_HANDLE` or a semaphore to signal.
- `fence` is `VK_NULL_HANDLE` or a fence to signal.
- `pImageIndex` is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.

Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
`swapchain` **must** not be in the retired state
- VUID-vkAcquireNextImageKHR-semaphore-01286
 If `semaphore` is not `VK_NULL_HANDLE` it **must** be unsignaled
- VUID-vkAcquireNextImageKHR-semaphore-01779
 If `semaphore` is not `VK_NULL_HANDLE` it **must** not have any uncompleted signal or wait operations pending
- VUID-vkAcquireNextImageKHR-fence-01287
 If `fence` is not `VK_NULL_HANDLE` it **must** be unsignaled and **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkAcquireNextImageKHR-semaphore-01780
`semaphore` and `fence` **must** not both be equal to `VK_NULL_HANDLE`
- VUID-vkAcquireNextImageKHR-swapchain-01802
 If the number of currently acquired images is greater than the difference between the number of images in `swapchain` and the value of `VkSurfaceCapabilitiesKHR::minImageCount` as returned by a call to `vkGetPhysicalDeviceSurfaceCapabilities2KHR` with the `surface` used to create `swapchain`, `timeout` **must** not be `UINT64_MAX`
- VUID-vkAcquireNextImageKHR-semaphore-03265
`semaphore` **must** have a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

Valid Usage (Implicit)

- VUID-vkAcquireNextImageKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkAcquireNextImageKHR-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkAcquireNextImageKHR-semaphore-parameter
If `semaphore` is not `VK_NULL_HANDLE`, `semaphore` **must** be a valid `VkSemaphore` handle
- VUID-vkAcquireNextImageKHR-fence-parameter
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle
- VUID-vkAcquireNextImageKHR-pImageIndex-parameter
`pImageIndex` **must** be a valid pointer to a `uint32_t` value
- VUID-vkAcquireNextImageKHR-semaphore-parent
If `semaphore` is a valid handle, it **must** have been created, allocated, or retrieved from `device`
- VUID-vkAcquireNextImageKHR-fence-parent
If `fence` is a valid handle, it **must** have been created, allocated, or retrieved from `device`
- VUID-vkAcquireNextImageKHR-commonparent
Both of `device`, and `swapchain` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized
- Host access to `semaphore` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`
- `VK_TIMEOUT`
- `VK_NOT_READY`
- `VK_SUBOPTIMAL_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULLSCREEN_EXCLUSIVE_MODE_LOST_EXT`

When successful, `vkAcquireNextImageKHR` acquires a presentable image from `swapchain` that an application **can** use, and sets `pImageIndex` to the index of that image within the swapchain. The presentation engine **may** not have finished reading from the image at the time it is acquired, so the application **must** use `semaphore` and/or `fence` to ensure that the image layout and contents are not modified until the presentation engine reads have completed. If `semaphore` is not `VK_NULL_HANDLE`, the application may assume that, once `vkAcquireNextImageKHR` returns, the semaphore signal operation referenced by `semaphore` has been submitted for execution. The order in which images are acquired is implementation-dependent, and **may** be different than the order the images were presented.

If `timeout` is zero, then `vkAcquireNextImageKHR` does not wait, and will either successfully acquire an image, or fail and return `VK_NOT_READY` if no image is available.

If the specified timeout period expires before an image is acquired, `vkAcquireNextImageKHR` returns `VK_TIMEOUT`. If `timeout` is `UINT64_MAX`, the timeout period is treated as infinite, and `vkAcquireNextImageKHR` will block until an image is acquired or an error occurs.

`vkAcquireNextImageKHR` **should** not be called if the number of images that the application has currently acquired is greater than the difference between the number of images in `swapchain` and the value of `VkSurfaceCapabilitiesKHR::minImageCount`. If `vkAcquireNextImageKHR` is called when the number of images that the application has currently acquired is less or equal than the difference between the number of images in `swapchain` and the value of `VkSurfaceCapabilitiesKHR ::minImageCount`, `vkAcquireNextImageKHR` **must** return in finite time with an allowed `VkResult` code.

Note

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use `UINT64_MAX`. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

If an image is acquired successfully, `vkAcquireNextImageKHR` **must** either return `VK_SUCCESS` or `VK_SUBOPTIMAL_KHR`. The implementation **may** return `VK_SUBOPTIMAL_KHR` if the swapchain no longer matches the surface properties exactly, but **can** still be used for presentation.

Note

`VK_SUBOPTIMAL_KHR` **may** happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If the swapchain images no longer match native surface properties, either `VK_SUBOPTIMAL_KHR` or `VK_ERROR_OUT_OF_DATE_KHR` **must** be returned. If `VK_ERROR_OUT_OF_DATE_KHR` is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with `VK_ERROR_OUT_OF_DATE_KHR`. Applications need to create a new swapchain for the surface to continue presenting if `VK_ERROR_OUT_OF_DATE_KHR` is returned.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, `vkAcquireNextImageKHR` **must** return in finite time with either one of the allowed success codes, or `VK_ERROR_DEVICE_LOST`.

If `semaphore` is not `VK_NULL_HANDLE`, the semaphore **must** be unsignaled, with no signal or wait operations pending. It will become signaled when the application **can** use the image.

Note

Use of `semaphore` allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If `fence` is not equal to `VK_NULL_HANDLE`, the fence **must** be unsignaled, with no signal operations pending. It will become signaled when the application **can** use the image.

Note

Applications **should** not rely on `vkAcquireNextImageKHR` blocking in order to meter their rendering speed. The implementation **may** return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications **can** use `fence` to meter their frame generation work to match the presentation rate.

An application **must** wait until either the `semaphore` or `fence` is signaled before accessing the image's

data.

Note

When the presentable image will be accessed by some stage S, the recommended idiom for ensuring correct synchronization is:

- The `VkSubmitInfo` used to submit the image layout transition for execution includes `vkAcquireNextImageKHR::semaphore` in its `pWaitSemaphores` member, with the corresponding element of `pWaitDstStageMask` including S.
- The `synchronization command` that performs any necessary image layout transition includes S in both the `srcStageMask` and `dstStageMask`.

After a successful return, the image indicated by `pImageIndex` and its data will be unmodified compared to when it was presented.

Note

Exclusive ownership of presentable images corresponding to a swapchain created with `VK_SHARING_MODE_EXCLUSIVE` as defined in [Resource Sharing](#) is not altered by a call to `vkAcquireNextImageKHR`. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for `vkAcquireNextImageKHR` depend on the `timeout` provided:

- `VK_SUCCESS` is returned if an image became available.
- `VK_ERROR_SURFACE_LOST_KHR` is returned if the surface becomes no longer available.
- `VK_NOT_READY` is returned if `timeout` is zero and no image was available.
- `VK_TIMEOUT` is returned if `timeout` is greater than zero and less than `UINT64_MAX`, and no image became available within the time allowed.
- `VK_SUBOPTIMAL_KHR` is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but `can` still be used to present to the surface successfully.

Note

This **may** happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to re-create the swapchain to better match the platform surface properties.

- `VK_ERROR_OUT_OF_DATE_KHR` is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation **may** fail. If presentation does succeed, the mapping from the presented image to the native surface is implementation-defined. It is the application's responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a `VK_ERROR_OUT_OF_DATE_KHR` error will be returned.

Note

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems **may** squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice                                     device,
    const VkAcquireNextImageInfoKHR*            pAcquireInfo,
    uint32_t*                                    pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `pAcquireInfo` is a pointer to a `VkAcquireNextImageInfoKHR` structure containing parameters of the acquire.
- `pImageIndex` is a pointer to a `uint32_t` that is set to the index of the next image to use.

Valid Usage

- VUID-vkAcquireNextImage2KHR-swapchain-01803

If the number of currently acquired images is greater than the difference between the number of images in the `swapchain` member of `pAcquireInfo` and the value of `VkSurfaceCapabilitiesKHR::minImageCount` as returned by a call to `vkGetPhysicalDeviceSurfaceCapabilities2KHR` with the `surface` used to create `swapchain`, the `timeout` member of `pAcquireInfo` must not be `UINT64_MAX`

Valid Usage (Implicit)

- VUID-vkAcquireNextImage2KHR-device-parameter
device must be a valid `VkDevice` handle
- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
pAcquireInfo must be a valid pointer to a valid `VkAcquireNextImageInfoKHR` structure
- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
pImageIndex must be a valid pointer to a `uint32_t` value

Return Codes

Success

- `VK_SUCCESS`
- `VK_TIMEOUT`
- `VK_NOT_READY`
- `VK_SUBOPTIMAL_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

The `VkAcquireNextImageInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint64_t timeout;
    VkSemaphore semaphore;
    VkFence fence;
    uint32_t deviceMask;
} VkAcquireNextImageInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.

- `swapchain` is a non-retired swapchain from which an image is acquired.
- `timeout` specifies how long the function waits, in nanoseconds, if no image is available.
- `semaphore` is `VK_NULL_HANDLE` or a semaphore to signal.
- `fence` is `VK_NULL_HANDLE` or a fence to signal.
- `deviceMask` is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If `vkAcquireNextImageKHR` is used, the device mask is considered to include all physical devices in the logical device.

Note

`vkAcquireNextImage2KHR` signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the `deviceMask`. However, only a single physical device **can** wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) **can** wait upon.

Valid Usage

- VUID-VkAcquireNextImageInfoKHR-swapchain-01675
`swapchain` **must** not be in the retired state
- VUID-VkAcquireNextImageInfoKHR-semaphore-01288
If `semaphore` is not `VK_NULL_HANDLE` it **must** be unsignaled
- VUID-VkAcquireNextImageInfoKHR-semaphore-01781
If `semaphore` is not `VK_NULL_HANDLE` it **must** not have any uncompleted signal or wait operations pending
- VUID-VkAcquireNextImageInfoKHR-fence-01289
If `fence` is not `VK_NULL_HANDLE` it **must** be unsignaled and **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-VkAcquireNextImageInfoKHR-semaphore-01782
`semaphore` and `fence` **must** not both be equal to `VK_NULL_HANDLE`
- VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
`deviceMask` **must** be a valid device mask
- VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
`deviceMask` **must** not be zero
- VUID-VkAcquireNextImageInfoKHR-semaphore-03266
`semaphore` **must** have a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

Valid Usage (Implicit)

- VUID-VkAcquireNextImageInfoKHR-sType-sType
sType must be `VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR`
- VUID-VkAcquireNextImageInfoKHR-pNext-pNext
pNext must be `NULL`
- VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
swapchain must be a valid `VkSwapchainKHR` handle
- VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
If **semaphore** is not `VK_NULL_HANDLE`, **semaphore** must be a valid `VkSemaphore` handle
- VUID-VkAcquireNextImageInfoKHR-fence-parameter
If **fence** is not `VK_NULL_HANDLE`, **fence** must be a valid `VkFence` handle
- VUID-VkAcquireNextImageInfoKHR-commonparent
Each of **fence**, **semaphore**, and **swapchain** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to **swapchain** must be externally synchronized
- Host access to **semaphore** must be externally synchronized
- Host access to **fence** must be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue queue,
    const VkPresentInfoKHR* pPresentInfo);
```

- **queue** is a queue that is capable of presentation to the target surface's platform on the same device as the image's swapchain.
- **pPresentInfo** is a pointer to a `VkPresentInfoKHR` structure specifying parameters of the presentation.

Note

There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.

Valid Usage

- VUID-vkQueuePresentKHR-pSwapchains-01292

Each element of `pSwapchains` member of `pPresentInfo` **must** be a swapchain that is created for a surface for which presentation is supported from `queue` as determined using a call to `vkGetPhysicalDeviceSurfaceSupportKHR`

- VUID-vkQueuePresentKHR-pSwapchains-01293

If more than one member of `pSwapchains` was created from a display surface, all display surfaces referenced that refer to the same display **must** use the same display mode

- VUID-vkQueuePresentKHR-pWaitSemaphores-01294

When a semaphore wait operation referring to a binary semaphore defined by the elements of the `pWaitSemaphores` member of `pPresentInfo` executes on `queue`, there **must** be no other queues waiting on the same semaphore

- VUID-vkQueuePresentKHR-pWaitSemaphores-01295

All elements of the `pWaitSemaphores` member of `pPresentInfo` **must** be semaphores that are signaled, or have `semaphore signal operations` previously submitted for execution

- VUID-vkQueuePresentKHR-pWaitSemaphores-03267

All elements of the `pWaitSemaphores` member of `pPresentInfo` **must** be created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

- VUID-vkQueuePresentKHR-pWaitSemaphores-03268

All elements of the `pWaitSemaphores` member of `pPresentInfo` **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Queueing an image for presentation defines a set of *queue operations*, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the presentation engine.

Note

The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented `VkImage` at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, and the display standing the right way up).

If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must**

ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error `VK_ERROR_OUT_OF_DATE_KHR`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`, or `VK_ERROR_SURFACE_LOST_KHR`, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in `VkPresentInfoKHR` will execute when the corresponding queue operation is complete.

Calls to `vkQueuePresentKHR` **may** block, but **must** return in finite time.

If any swapchain member of `pPresentInfo` was created with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` will be returned if that swapchain does not have exclusive full-screen access, possibly for implementation-specific reasons outside of the application's control.

Valid Usage (Implicit)

- VUID-vkQueuePresentKHR-queue-parameter
`queue` **must** be a valid `VkQueue` handle
- VUID-vkQueuePresentKHR-pPresentInfo-parameter
`pPresentInfo` **must** be a valid pointer to a valid `VkPresentInfoKHR` structure

Host Synchronization

- Host access to `queue` **must** be externally synchronized
- Host access to `pPresentInfo->pWaitSemaphores[]` **must** be externally synchronized
- Host access to `pPresentInfo->pSwapchains[]` **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
-	-	Any

Return Codes

Success

- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The `VkPresentInfoKHR` structure is defined as:

```
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType          sType;
    const void*               pNext;
    uint32_t                  waitSemaphoreCount;
    const VkSemaphore*        pWaitSemaphores;
    uint32_t                  swapchainCount;
    const VkSwapchainKHR*    pSwapchains;
    const uint32_t*           pImageIndices;
    VkResult*                 pResults;
} VkPresentInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number **may** be zero.
- `pWaitSemaphores` is `NULL` or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries. A given swapchain **must** not appear in this list more than once.
- `pImageIndices` is a pointer to an array of indices into the array of each swapchain's presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- `pResults` is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries.

Applications that do not need per-swapchain results **can** use `NULL` for `pResults`. If non-`NULL`, each entry in `pResults` will be set to the `VkResult` for presenting the swapchain corresponding to the same index in `pSwapchains`.

Before an application **can** present an image, the image's layout **must** be transitioned to the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, or for a shared presentable image the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout.

Note

 When transitioning the image to `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`, there is no need to delay subsequent processing, or perform any visibility operations (as `vkQueuePresentKHR` performs automatic visibility operations). To achieve this, the `dstAccessMask` member of the `VkImageMemoryBarrier` **should** be set to `0`, and the `dstStageMask` parameter **should** be set to `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`.

Valid Usage

- VUID-VkPresentInfoKHR-pImageIndices-01430

Each element of `pImageIndices` **must** be the index of a presentable image acquired from the swapchain specified by the corresponding element of the `pSwapchains` array, and the presented image subresource **must** be in the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout at the time the operation is executed on a `VkDevice`

- VUID-VkPresentInfoKHR-pNext-06235

If a `VkPresentIdKHR` structure is included in the `pNext` chain, and the `presentId` feature is not enabled, each `presentIds` entry in that structure **must** be `NULL`

Valid Usage (Implicit)

- VUID-VkPresentInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PRESENT_INFO_KHR`
- VUID-VkPresentInfoKHR-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupPresentInfoKHR`, `VkDisplayPresentInfoKHR`, `VkPresentFrameTokenGGP`, `VkPresentIdKHR`, `VkPresentRegionsKHR`, or `VkPresentTimesInfoGOOGLE`
- VUID-VkPresentInfoKHR-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique
- VUID-VkPresentInfoKHR-pWaitSemaphores-parameter
If `waitSemaphoreCount` is not `0`, `pWaitSemaphores` **must** be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles
- VUID-VkPresentInfoKHR-pSwapchains-parameter
`pSwapchains` **must** be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles
- VUID-VkPresentInfoKHR-pImageIndices-parameter
`pImageIndices` **must** be a valid pointer to an array of `swapchainCount uint32_t` values
- VUID-VkPresentInfoKHR-pResults-parameter
If `pResults` is not `NULL`, `pResults` **must** be a valid pointer to an array of `swapchainCount VkResult` values
- VUID-VkPresentInfoKHR-swapchainCount-arraylength
`swapchainCount` **must** be greater than `0`
- VUID-VkPresentInfoKHR-commonparent
Both of the elements of `pSwapchains`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

When the `VK_KHR_incremental_present` extension is enabled, additional fields **can** be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine **may** use to only update the region of a surface that is actually changing. The application still **must** ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application **can** provide this hint by adding a `VkPresentRegionsKHR` structure to the **pNext** chain of the `VkPresentInfoKHR` structure.

The `VkPresentRegionsKHR` structure is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionsKHR {
    VkStructureType           sType;
    const void*             pNext;
    uint32_t                swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pRegions** is **NULL** or a pointer to an array of **VkPresentRegionKHR** elements with **swapchainCount** entries. If not **NULL**, each element of **pRegions** contains the region that has changed since the last present to the swapchain in the corresponding entry in the **VkPresentInfoKHR::pSwapchains** array.

Valid Usage

- VUID-VkPresentRegionsKHR-swapchainCount-01260
swapchainCount **must** be the same value as **VkPresentInfoKHR::swapchainCount**, where **VkPresentInfoKHR** is included in the **pNext** chain of this **VkPresentRegionsKHR** structure

Valid Usage (Implicit)

- VUID-VkPresentRegionsKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR**
- VUID-VkPresentRegionsKHR-pRegions-parameter
If **pRegions** is not **NULL**, **pRegions** **must** be a valid pointer to an array of **swapchainCount** valid **VkPresentRegionKHR** structures
- VUID-VkPresentRegionsKHR-swapchainCount-arraylength
swapchainCount **must** be greater than **0**

For a given image and swapchain, the region to present is specified by the **VkPresentRegionKHR** structure, which is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionKHR {
    uint32_t          rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;
```

- **rectangleCount** is the number of rectangles in **pRectangles**, or zero if the entire image has changed and should be presented.

- `pRectangles` is either `NULL` or a pointer to an array of `VkRectLayerKHR` structures. The `VkRectLayerKHR` structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and **must** be presented. If non-`NULL`, each entry in `pRectangles` is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles **must** be specified relative to `VkSurfaceCapabilitiesKHR ::currentTransform`, regardless of the swapchain's `preTransform`. The presentation engine will apply the `preTransform` transformation to the rectangles, along with any further transformation it applies to the image content.

Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter
If `rectangleCount` is not `0`, and `pRectangles` is not `NULL`, `pRectangles` **must** be a valid pointer to an array of `rectangleCount` valid `VkRectLayerKHR` structures

The `VkRectLayerKHR` structure is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
    VkOffset2D    offset;
    VkExtent2D    extent;
    uint32_t      layer;
} VkRectLayerKHR;
```

- `offset` is the origin of the rectangle, in pixels.
- `extent` is the size of the rectangle, in pixels.
- `layer` is the layer of the image. For images with only one layer, the value of `layer` **must** be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. `VkRectLayerKHR` specifies pixels of the swapchain's image(s), which will be constant for the life of the swapchain.

Valid Usage

- VUID-VkRectLayerKHR-offset-04864
The sum of `offset` and `extent`, after being transformed according to the `preTransform` member of the `VkSwapchainCreateInfoKHR` structure, **must** be no greater than the `imageExtent` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`
- VUID-VkRectLayerKHR-layer-01262
`layer` **must** be less than the `imageArrayLayers` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`

When the `VK_KHR_display_swapchain` extension is enabled additional fields **can** be specified when

presenting an image to a swapchain by setting `VkPresentInfoKHR::pNext` to point to a `VkDisplayPresentInfoKHR` structure.

The `VkDisplayPresentInfoKHR` structure is defined as:

```
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRect2D srcRect;
    VkRect2D dstRect;
    VkBool32 persistent;
} VkDisplayPresentInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcRect` is a rectangular region of pixels to present. It **must** be a subset of the image being presented. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire presentable image.
- `dstRect` is a rectangular region within the visible region of the swapchain's display mode. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.
- `persistent`: If this is `VK_TRUE`, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but **may** increase presentation latency. If `VkDisplayPresentInfoKHR` is not specified, persistent mode will not be used.

If the extent of the `srcRect` and `dstRect` are not equal, the presented pixels will be scaled accordingly.

Valid Usage

- VUID-VkDisplayPresentInfoKHR-srcRect-01257
srcRect **must** specify a rectangular region that is a subset of the image being presented
- VUID-VkDisplayPresentInfoKHR-dstRect-01258
dstRect **must** specify a rectangular region that is a subset of the **visibleRegion** parameter of the display mode the swapchain being presented uses
- VUID-VkDisplayPresentInfoKHR-persistentContent-01259
If the **persistentContent** member of the **VkDisplayPropertiesKHR** structure returned by **vkGetPhysicalDeviceDisplayPropertiesKHR** for the display the present operation targets is **VK_FALSE**, then **persistent** **must** be **VK_FALSE**

Valid Usage (Implicit)

- VUID-VkDisplayPresentInfoKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR**

If the **pNext** chain of **VkPresentInfoKHR** includes a **VkDeviceGroupPresentInfoKHR** structure, then that structure includes an array of device masks and a device group present mode.

The **VkDeviceGroupPresentInfoKHR** structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType                      sType;
    const void*                         pNext;
    uint32_t                           swapchainCount;
    const uint32_t*                     pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR   mode;
} VkDeviceGroupPresentInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **swapchainCount** is zero or the number of elements in **pDeviceMasks**.
- **pDeviceMasks** is a pointer to an array of device masks, one for each element of **VkPresentInfoKHR::pSwapchains**.
- **mode** is a **VkDeviceGroupPresentModeFlagBitsKHR** value specifying the device group present mode that will be used for this present.

If **mode** is **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR**, then each element of **pDeviceMasks** selects which instance of the swapchain image is presented. Each element of **pDeviceMasks** **must** have exactly one bit set, and the corresponding physical device **must** have a presentation engine as

reported by [VkDeviceGroupPresentCapabilitiesKHR](#).

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` **must** have exactly one bit set, and some physical device in the logical device **must** include that bit in its [VkDeviceGroupPresentCapabilitiesKHR::presentMask](#).

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of `pDeviceMasks` **must** have a value for which all set bits are set in one of the elements of [VkDeviceGroupPresentCapabilitiesKHR::presentMask](#).

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance(s) of the swapchain images are presented. For each bit set in each element of `pDeviceMasks`, the corresponding physical device **must** have a presentation engine as reported by [VkDeviceGroupPresentCapabilitiesKHR](#).

If `VkDeviceGroupPresentInfoKHR` is not provided or `swapchainCount` is zero then the masks are considered to be 1. If `VkDeviceGroupPresentInfoKHR` is not provided, `mode` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage

- VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
`swapchainCount` **must** equal `0` or `VkPresentInfoKHR::swapchainCount`
- VUID-VkDeviceGroupPresentInfoKHR-mode-01298
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` **must** have exactly one bit set, and the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` **must** be non-zero
- VUID-VkDeviceGroupPresentInfoKHR-mode-01299
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` **must** have exactly one bit set, and some physical device in the logical device **must** include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`
- VUID-VkDeviceGroupPresentInfoKHR-mode-01300
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` **must** have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`
- VUID-VkDeviceGroupPresentInfoKHR-mode-01301
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then for each bit set in each element of `pDeviceMasks`, the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` **must** be non-zero
- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
The value of each element of `pDeviceMasks` **must** be equal to the device mask passed in `VkAcquireNextImageInfoKHR::deviceMask` when the image index was last acquired
- VUID-VkDeviceGroupPresentInfoKHR-mode-01303
`mode` **must** have exactly one bit set, and that bit **must** have been included in `VkDeviceGroupSwapchainCreateInfoKHR::modes`

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`
- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
If `swapchainCount` is not `0`, `pDeviceMasks` **must** be a valid pointer to an array of `swapchainCount uint32_t` values
- VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
`mode` **must** be a valid `VkDeviceGroupPresentModeFlagBitsKHR` value

When the `VK_GOOGLE_display_timing` extension is enabled, additional fields **can** be specified that allow an application to specify the earliest time that an image should be displayed. This allows an application to avoid stutter that is caused by an image being displayed earlier than planned. Such stuttering can occur with both fixed and variable-refresh-rate displays, because stuttering occurs when the geometry is not correctly positioned for when the image is displayed. An application **can**

instruct the presentation engine that an image should not be displayed earlier than a specified time by adding a `VkPresentTimesInfoGOOGLE` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentTimesInfoGOOGLE` structure is defined as:

```
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimesInfoGOOGLE {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  swapchainCount;
    const VkPresentTimeGOOGLE* pTimes;
} VkPresentTimesInfoGOOGLE;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pTimes` is `NULL` or a pointer to an array of `VkPresentTimeGOOGLE` elements with `swapchainCount` entries. If not `NULL`, each element of `pTimes` contains the earliest time to present the image corresponding to the entry in the `VkPresentInfoKHR::pImageIndices` array.

Valid Usage

- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-01247
`swapchainCount` **must** be the same value as `VkPresentInfoKHR::swapchainCount`, where `VkPresentInfoKHR` is included in the `pNext` chain of this `VkPresentTimesInfoGOOGLE` structure

Valid Usage (Implicit)

- VUID-VkPresentTimesInfoGOOGLE-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_TIMES_INFO_GOOGLE`
- VUID-VkPresentTimesInfoGOOGLE-pTimes-parameter
If `pTimes` is not `NULL`, `pTimes` **must** be a valid pointer to an array of `swapchainCount` `VkPresentTimeGOOGLE` structures
- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-arraylength
`swapchainCount` **must** be greater than `0`

The `VkPresentTimeGOOGLE` structure is defined as:

```
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimeGOOGLE {
    uint32_t      presentID;
    uint64_t      desiredPresentTime;
} VkPresentTimeGOOGLE;
```

- `presentID` is an application-provided identification value, that **can** be used with the results of `vkGetPastPresentationTimingGOOGLE`, in order to uniquely identify this present. In order to be useful to the application, it **should** be unique within some period of time that is meaningful to the application.
- `desiredPresentTime` specifies that the image given **should** not be displayed to the user any earlier than this time. `desiredPresentTime` is a time in nanoseconds, relative to a monotonically-increasing clock (e.g. `CLOCK_MONOTONIC` (see `clock_gettime(2)`) on Android and Linux). A value of zero specifies that the presentation engine **may** display the image at any time. This is useful when the application desires to provide `presentID`, but does not need a specific `desiredPresentTime`.

The `VkPresentIdKHR` structure is defined as:

```
// Provided by VK_KHR_present_id
typedef struct VkPresentIdKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           swapchainCount;
    const uint64_t*    pPresentIds;
} VkPresentIdKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to the `vkQueuePresentKHR` command.
- `pPresentIds` is `NULL` or a pointer to an array of `uint64_t` with `swapchainCount` entries. If not `NULL`, each non-zero value in `pPresentIds` specifies the present id to be associated with the presentation of the swapchain with the same index in the `vkQueuePresentKHR` call.

For applications to be able to reference specific presentation events queued by a call to `vkQueuePresentKHR`, an identifier needs to be associated with them. When the `presentId` feature is enabled, applications **can** include the `VkPresentIdKHR` structure in the `pNext` chain of the `VkPresentInfoKHR` structure to supply identifiers.

Each `VkSwapchainKHR` has a `presentId` associated with it. This value is initially set to zero when the `VkSwapchainKHR` is created.

When a `VkPresentIdKHR` structure with a non-`NULL` `pPresentIds` is included in the `pNext` chain of a `VkPresentInfoKHR` structure, each `pSwapchains` entry has a `presentId` associated in the `pPresentIds` array at the same index as the swapchain in the `pSwapchains` array. If this `presentId` is non-zero, then the application **can** later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated `presentId`. A non-zero `presentId` **must** be greater than any non-zero `presentId` passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the `presentId` value, but implementations **should** make this as close as possible to the presentation of the first pixel in the new image to the user.

Valid Usage

- VUID-VkPresentIdKHR-swapchainCount-04998
`swapchainCount` **must** be the same value as `VkPresentInfoKHR::swapchainCount`, where this `VkPresentIdKHR` is in the `pNext` chain of the `VkPresentInfoKHR` structure
- VUID-VkPresentIdKHR-presentIds-04999
Each `presentIds` entry **must** be greater than any previous `presentIds` entry passed for the associated `pSwapchains` entry

Valid Usage (Implicit)

- VUID-VkPresentIdKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_ID_KHR`
- VUID-VkPresentIdKHR-pPresentIds-parameter
If `pPresentIds` is not `NULL`, `pPresentIds` **must** be a valid pointer to an array of `swapchainCount uint64_t` values
- VUID-VkPresentIdKHR-swapchainCount-arraylength
`swapchainCount` **must** be greater than `0`

When the `presentWait` feature is enabled, an application **can** wait for an image to be presented to the user by first specifying a `presentId` for the target presentation by adding a `VkPresentIdKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure and then waiting for that presentation to complete by calling:

```
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(
    VkDevice                                     device,
    VkSwapchainKHR                               swapchain,
    uint64_t                                     presentId,
    uint64_t                                     timeout);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain on which an image was queued for presentation.
- `presentId` is the presentation `presentId` to wait for.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

`vkWaitForPresentKHR` waits for the `presentId` associated with `swapchain` to be increased in value so that it is at least equal to `presentId`.

For `VK_PRESENT_MODE_MAILBOX_KHR` (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image **must** be signaled no later

than a wait associated with the replacing image would be signaled.

When the presentation has completed, the `presentId` associated with the related `pSwapchains` entry will be increased in value so that it is at least equal to the value provided in the `VkPresentIdKHR` structure.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the `presentId` value, but implementations **should** make this as close as possible to the presentation of the first pixel in the new image to the user.

The call to `vkWaitForPresentKHR` will block until either the `presentId` associated with `swapchain` is greater than or equal to `presentId`, or `timeout` nanoseconds passes. When the swapchain becomes `OUT_OF_DATE`, the call will either return `VK_SUCCESS` (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status `VK_ERROR_OUT_OF_DATE_KHR` (if the image was not presented to the user).

As an exception to the normal rules for objects which are externally synchronized, the `swapchain` passed to `vkWaitForPresentKHR` **may** be simultaneously used by other threads in calls to functions other than `vkDestroySwapchainKHR`. Access to the swapchain data associated with this extension **must** be atomic within the implementation.

Valid Usage

- VUID-vkWaitForPresentKHR-swapchain-04997
`swapchain` **must** not be in the retired state
- VUID-vkWaitForPresentKHR-presentWait-06234
The `presentWait` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkWaitForPresentKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkWaitForPresentKHR-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkWaitForPresentKHR-commonparent
Both of `device`, and `swapchain` **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS
- VK_TIMEOUT

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

When the `VK_GGP_frame_token` extension is enabled, a Google Games Platform frame token **can** be specified when presenting an image to a swapchain by adding a `VkPresentFrameTokenGGP` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentFrameTokenGGP` structure is defined as:

```
// Provided by VK_GGP_frame_token
typedef struct VkPresentFrameTokenGGP {
    VkStructureType    sType;
    const void*        pNext;
    GgpFrameToken     frameToken;
} VkPresentFrameTokenGGP;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `frameToken` is the Google Games Platform frame token.

Valid Usage

- VUID-VkPresentFrameTokenGGP-frameToken-02680
`frameToken` **must** be a valid `GgpFrameToken`

Valid Usage (Implicit)

- VUID-VkPresentFrameTokenGGP-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_FRAME_TOKEN_GGP`

`vkQueuePresentKHR`, releases the acquisition of the images referenced by `imageIndices`. The queue family corresponding to the queue `vkQueuePresentKHR` is executed on **must** have ownership of the presented images as defined in [Resource Sharing](#). `vkQueuePresentKHR` does not alter the queue family ownership, but the presented images **must** not be used again before they have been reacquired

using `vkAcquireNextImageKHR`.

The processing of the presentation happens in issue order with other queue operations, but semaphores have to be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue, however, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

The result codes `VK_ERROR_OUT_OF_DATE_KHR` and `VK_SUBOPTIMAL_KHR` have the same meaning when returned by `vkQueuePresentKHR` as they do when returned by `vkAcquireNextImageKHR`. If multiple swapchains are presented, the result code is determined applying the following rules in order:

- If the device is lost, `VK_ERROR_DEVICE_LOST` is returned.
- If any of the target surfaces are no longer available the error `VK_ERROR_SURFACE_LOST_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_FULLSCREEN_EXCLUSIVE_MODE_LOST_EXT` if issued separately then `VK_ERROR_FULLSCREEN_EXCLUSIVE_MODE_LOST_EXT` is returned.
- If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.
- Otherwise `VK_SUCCESS` is returned.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Note

The application **can** continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes `vkQueuePresentKHR` to return `VK_ERROR_OUT_OF_DATE_KHR`.

33.11. Hdr Metadata

This section describes how to improve color reproduction of content to better reproduce colors as seen on the reference monitor. Definitions below are from the associated SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications.

To provide Hdr metadata to an implementation, call:

```
// Provided by VK_EXT_hdr_metadata
void vkSetHdrMetadataEXT(
    VkDevice                                device,
    uint32_t                               swapchainCount,
    const VkSwapchainKHR*                  pSwapchains,
    const VkHdrMetadataEXT*                pMetadata);
```

- **device** is the logical device where the swapchain(s) were created.
- **swapchainCount** is the number of swapchains included in **pSwapchains**.
- **pSwapchains** is a pointer to an array of **swapchainCount** **VkSwapchainKHR** handles.
- **pMetadata** is a pointer to an array of **swapchainCount** **VkHdrMetadataEXT** structures.

The metadata will be applied to the specified **VkSwapchainKHR** objects at the next **vkQueuePresentKHR** call using that **VkSwapchainKHR** object. The metadata will persist until a subsequent **vkSetHdrMetadataEXT** changes it.

Valid Usage (Implicit)

- VUID-vkSetHdrMetadataEXT-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkSetHdrMetadataEXT-pSwapchains-parameter
pSwapchains **must** be a valid pointer to an array of **swapchainCount** valid **VkSwapchainKHR** handles
- VUID-vkSetHdrMetadataEXT-pMetadata-parameter
pMetadata **must** be a valid pointer to an array of **swapchainCount** valid **VkHdrMetadataEXT** structures
- VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength
swapchainCount **must** be greater than **0**
- VUID-vkSetHdrMetadataEXT-commonparent
Both of **device**, and the elements of **pSwapchains** **must** have been created, allocated, or retrieved from the same **VkInstance**

The **VkHdrMetadataEXT** structure is defined as:

```

// Provided by VK_EXT_hdr_metadata
typedef struct VkHdrMetadataEXT {
    VkStructureType sType;
    const void* pNext;
    VkXYColorEXT displayPrimaryRed;
    VkXYColorEXT displayPrimaryGreen;
    VkXYColorEXT displayPrimaryBlue;
    VkXYColorEXT whitePoint;
    float maxLuminance;
    float minLuminance;
    float maxContentLightLevel;
    float maxFrameAverageLightLevel;
} VkHdrMetadataEXT;

```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPrimaryRed` is a `VkXYColorEXT` structure specifying the reference monitor's red primary in chromaticity coordinates
- `displayPrimaryGreen` is a `VkXYColorEXT` structure specifying the reference monitor's green primary in chromaticity coordinates
- `displayPrimaryBlue` is a `VkXYColorEXT` structure specifying the reference monitor's blue primary in chromaticity coordinates
- `whitePoint` is a `VkXYColorEXT` structure specifying the reference monitor's white-point in chromaticity coordinates
- `maxLuminance` is the maximum luminance of the reference monitor in nits
- `minLuminance` is the minimum luminance of the reference monitor in nits
- `maxContentLightLevel` is content's maximum luminance in nits
- `maxFrameAverageLightLevel` is the maximum frame average light level in nits

Valid Usage (Implicit)

- VUID-VkHdrMetadataEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`
- VUID-VkHdrMetadataEXT-pNext-pNext
`pNext` **must** be `NULL`

Note

The validity and use of this data is outside the scope of Vulkan.

The `VkXYColorEXT` structure is defined as:

```
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
    float    x;
    float    y;
} VkXYColorEXT;
```

- **x** is the x chromaticity coordinate.
- **y** is the y chromaticity coordinate.

Chromaticity coordinates are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors for the reference monitor.

Chapter 34. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of *deferred operations* allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The [VK_KHR_deferred_host_operations](#) extension defines the infrastructure and usage patterns for *deferrable commands*, but does not specify any commands as deferrable. This is left to additional dependant extensions. Commands **must** not be deferred unless the deferral is specifically allowed by another extension which depends on [VK_KHR_deferred_host_operations](#). This specification will refer to such extensions as *deferral extensions*.

34.1. Requesting Deferral

When an application requests an operation deferral, the implementation **may** defer the operation. When deferral is requested and the implementation defers any operation, the implementation **must** return [VK_OPERATION_DEFERRED_KHR](#) as the success code if no errors occurred. When deferral is requested, the implementation **should** defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation **must** return [VK_OPERATION_NOT_DEFERRED_KHR](#) as the success code if no errors occurred.

A deferred operation is created *complete* with an initial result value of [VK_SUCCESS](#). The deferred operation becomes *pending* when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes *complete* when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are *joined* by an application thread, using [vkDeferredOperationJoinKHR](#). Applications **can** join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application **can** query the status of a [VkDeferredOperationKHR](#) using the [vkGetDeferredOperationMaxConcurrencyKHR](#) or [vkGetDeferredOperationResultKHR](#) commands.

Parameters to the command requesting a deferred operation **may** be accessed at any time until the deferred operation enters the pending state. While a deferred operation is pending:

- Externally synchronized parameters **must** not be accessed.
- Pointer parameters **must** not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which **may** be read by the command **must** not be modified.
- The contents of pointer parameters which **may** be written by the command **must** not be read.
- Vulkan object parameters **must** not be passed as externally synchronized parameters to any other command.

When the deferred operation is complete, the application **should** call

`vkGetDeferredOperationResultKHR` to obtain the `VkResult` indicating success or failure of the operation. The `VkResult` value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

34.2. Deferred Host Operations API

The `VkDeferredOperationKHR` handle is defined as:

```
// Provided by VK_KHR_deferred_host_operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```
// Provided by VK_KHR_deferred_host_operations
VkResult vkCreateDeferredOperationKHR(
    VkDevice                                     device,
    const VkAllocationCallbacks*                pAllocator,
    VkDeferredOperationKHR*                     pDeferredOperation);
```

- `device` is the device which owns `operation`.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pDeferredOperation` is a pointer to a handle in which the created `VkDeferredOperationKHR` is returned.

Valid Usage (Implicit)

- VUID-vkCreateDeferredOperationKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateDeferredOperationKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter
`pDeferredOperation` **must** be a valid pointer to a `VkDeferredOperationKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

To assign a thread to a deferred operation, call:

```
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- `device` is the device which owns `operation`.
- `operation` is the deferred operation that the calling thread should work on.

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of `VK_SUCCESS` indicates that `operation` is complete. The application **should** use `vkGetDeferredOperationResultKHR` to retrieve the result of `operation`.
- A return value of `VK_THREAD_DONE_KHR` indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to `vkDeferredOperationJoinKHR` are not necessary and will simply harm performance. This situation **may** occur when other threads executing `vkDeferredOperationJoinKHR` are about to complete `operation`, and the implementation is unable to partition the workload any further.
- A return value of `VK_THREAD_IDLE_KHR` indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation **may** occur if the operation encounters a temporary reduction in parallelism. By returning `VK_THREAD_IDLE_KHR`, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to `vkDeferredOperationJoinKHR` **can** be beneficial. In the meantime, the application **can** perform other work on the calling thread.

Implementations **must** guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked `vkDeferredOperationJoinKHR` on a given operation, that thread **must** execute the operation to completion and return `VK_SUCCESS`.
2. If multiple threads have concurrently invoked `vkDeferredOperationJoinKHR` on the same operation, then at least one of them **must** complete the operation and return `VK_SUCCESS`.

Valid Usage (Implicit)

- VUID-vkDeferredOperationJoinKHR-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkDeferredOperationJoinKHR-operation-parameter
operation **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkDeferredOperationJoinKHR-operation-parent
operation **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- `VK_SUCCESS`
- `VK_THREAD_DONE_KHR`
- `VK_THREAD_IDLE_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

When a deferred operation is completed, the application **can** destroy the tracking object by calling:

```
// Provided by VK_KHR_deferred_host_operations
void vkDestroyDeferredOperationKHR(
    VkDevice                                     device,
    VkDeferredOperationKHR                      operation,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the device which owns **operation**.
- **operation** is the completed operation to be destroyed.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyDeferredOperationKHR-operation-03434
If `VkAllocationCallbacks` were provided when `operation` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDeferredOperationKHR-operation-03435
If no `VkAllocationCallbacks` were provided when `operation` was created, `pAllocator` **must** be `NULL`
- VUID-vkDestroyDeferredOperationKHR-operation-03436
`operation` **must** be completed

Valid Usage (Implicit)

- VUID-vkDestroyDeferredOperationKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyDeferredOperationKHR-operation-parameter
If `operation` is not `VK_NULL_HANDLE`, `operation` **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkDestroyDeferredOperationKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyDeferredOperationKHR-operation-parent
If `operation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `operation` **must** be externally synchronized

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice                                     device,
    VkDeferredOperationKHR                      operation);
```

- `device` is the device which owns `operation`.
- `operation` is the deferred operation to be queried.

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads.

Applications **can** join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins **may** return `VK_THREAD_DONE_KHR` immediately, performing no useful work.

If `operation` is complete, `vkGetDeferredOperationMaxConcurrencyKHR` returns zero.

If `operation` is currently joined to any threads, the value returned by this command **may** immediately be out of date.

If `operation` is pending, implementations **must** not return zero unless at least one thread is currently executing `vkDeferredOperationJoinKHR` on `operation`. If there are such threads, the implementation **should** return an estimate of the number of additional threads which it could profitably use.

Implementations **may** return $2^{32}-1$ to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations **may** return values larger than the maximum concurrency available on the host CPU. In these situations, an application **should** clamp the return value rather than oversubscribing the machine.

Note

The recommended usage pattern for applications is to query this value once, after deferral, and schedule no more than the specified number of threads to join the operation. Each time a joined thread receives `VK_THREAD_IDLE_KHR`, the application should schedule an additional join at some point in the future, but is not required to do so.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter
`operation` **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent
`operation` **must** have been created, allocated, or retrieved from `device`

The `vkGetDeferredOperationResultKHR` function is defined as:

```
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(  
    VkDevice                                     device,  
    VkDeferredOperationKHR                      operation);
```

- `device` is the device which owns `operation`.
- `operation` is the operation whose deferred result is being queried.

If no command has been deferred on `operation`, `vkGetDeferredOperationResultKHR` returns

`VK_SUCCESS`.

If the deferred operation is pending, `vkGetDeferredOperationResultKHR` returns `VK_NOT_READY`.

If the deferred operation is complete, it returns the appropriate return value from the original command. This value **must** be one of the `VkResult` values which could have been returned by the original command if the operation had not been deferred.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationResultKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeferredOperationResultKHR-operation-parameter
`operation` **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkGetDeferredOperationResultKHR-operation-parent
`operation` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_NOT_READY`

Chapter 35. Private Data

The private data extension provides a way for users to associate arbitrary user defined data with Vulkan objects. This association is accomplished by storing 64-bit unsigned integers of user defined data in private data slots.

An application **can** reserve private data slots at device creation. To reserve private data slots, insert a `VkDevicePrivateDataCreateInfo` in the `pNext` chain in `VkDeviceCreateInfo` before device creation. Multiple `VkDevicePrivateDataCreateInfo` structures **can** be chained together, and the sum of the requested slots will be reserved. This is an exception to the specified valid usage for **structure pointer chains**. Reserving slots in this manner is not strictly necessary but it **may** improve performance.

Private data slots are represented by `VkPrivateDataSlot` handles:

```
// Provided by VK_VERSION_1_3
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPrivateDataSlot)
```

or the equivalent

```
// Provided by VK_EXT_private_data
typedef VkPrivateDataSlot VkPrivateDataSlotEXT;
```

To create a private data slot, call:

```
// Provided by VK_VERSION_1_3
VkResult vkCreatePrivateDataSlot(
    VkDevice                                     device,
    const VkPrivateDataSlotCreateInfo*           pCreateInfo,
    const VkAllocationCallbacks*                 pAllocator,
    VkPrivateDataSlot*                         pPrivateDataSlot);
```

or the equivalent command

```
// Provided by VK_EXT_private_data
VkResult vkCreatePrivateDataSlotEXT(
    VkDevice                                     device,
    const VkPrivateDataSlotCreateInfo*           pCreateInfo,
    const VkAllocationCallbacks*                 pAllocator,
    VkPrivateDataSlot*                         pPrivateDataSlot);
```

- `device` is the logical device associated with the creation of the object(s) holding the private data slot.
- `pCreateInfo` is a pointer to a `VkPrivateDataSlotCreateInfo`

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pPrivateDataSlot` is a pointer to a `VkPrivateDataSlot` handle in which the resulting private data slot is returned

Valid Usage

- VUID-vkCreatePrivateDataSlot-privateData-04564
The `privateData` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreatePrivateDataSlot-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreatePrivateDataSlot-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkPrivateDataSlotCreateInfo` structure
- VUID-vkCreatePrivateDataSlot-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreatePrivateDataSlot-pPrivateDataSlot-parameter
`pPrivateDataSlot` **must** be a valid pointer to a `VkPrivateDataSlot` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPrivateDataSlotCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPrivateDataSlotCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkPrivateDataSlotCreateFlags flags;
} VkPrivateDataSlotCreateInfo;
```

or the equivalent

```
// Provided by VK_EXT_private_data
typedef VkPrivateDataSlotCreateInfo VkPrivateDataSlotCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

Valid Usage (Implicit)

- VUID-VkPrivateDataSlotCreateInfo-sType-sType
sType **must be** `VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO`
- VUID-VkPrivateDataSlotCreateInfo-pNext-pNext
pNext **must be** `NULL`
- VUID-VkPrivateDataSlotCreateInfo-flags-zero bitmask
flags **must be** `0`

```
// Provided by VK_VERSION_1_3
typedef VkFlags VkPrivateDataSlotCreateFlags;
```

or the equivalent

```
// Provided by VK_EXT_private_data
typedef VkPrivateDataSlotCreateFlags VkPrivateDataSlotCreateFlagsEXT;
```

`VkPrivateDataSlotCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a private data slot, call:

```
// Provided by VK_VERSION_1_3
void vkDestroyPrivateDataSlot(
    VkDevice                                     device,
    VkPrivateDataSlot                            privateDataSlot,
    const VkAllocationCallbacks*                pAllocator);
```

or the equivalent command

```
// Provided by VK_EXT_private_data
void vkDestroyPrivateDataSlotEXT(
    VkDevice device,
    VkPrivateDataSlot privateDataSlot,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device associated with the creation of the object(s) holding the private data slot.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **privateDataSlot** is the private data slot to destroy.

Valid Usage

- VUID-vkDestroyPrivateDataSlot-privateDataSlot-04062
If **VkAllocationCallbacks** were provided when **privateDataSlot** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyPrivateDataSlot-privateDataSlot-04063
If no **VkAllocationCallbacks** were provided when **privateDataSlot** was created, **pAllocator must be NULL**

Valid Usage (Implicit)

- VUID-vkDestroyPrivateDataSlot-device-parameter
device must be a valid **VkDevice** handle
- VUID-vkDestroyPrivateDataSlot-privateDataSlot-parameter
If **privateDataSlot** is not **VK_NULL_HANDLE**, **privateDataSlot must** be a valid **VkPrivateDataSlot** handle
- VUID-vkDestroyPrivateDataSlot-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroyPrivateDataSlot-privateDataSlot-parent
If **privateDataSlot** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **privateDataSlot** **must** be externally synchronized

To store user defined data in a slot associated with a Vulkan object, call:

```
// Provided by VK_VERSION_1_3
VkResult vkSetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```

or the equivalent command

```
// Provided by VK_EXT_private_data
VkResult vkSetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```

- **device** is the device that created the object.
- **objectType** is a [VkObjectType](#) specifying the type of object to associate data with.
- **objectHandle** is a handle to the object to associate data with.
- **privateDataSlot** is a handle to a [VkPrivateDataSlot](#) specifying location of private data storage.
- **data** is user defined data to associate the object with. This data will be stored at **privateDataSlot**.

Valid Usage

- VUID-vkSetPrivateData-objectHandle-04016
objectHandle **must** be **device** or a child of **device**
- VUID-vkSetPrivateData-objectHandle-04017
objectHandle **must** be a valid handle to an object of type **objectType**

Valid Usage (Implicit)

- VUID-vkSetPrivateData-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkSetPrivateData-objectType-parameter
objectType **must** be a valid [VkObjectType](#) value
- VUID-vkSetPrivateData-privateDataSlot-parameter
privateDataSlot **must** be a valid [VkPrivateDataSlot](#) handle
- VUID-vkSetPrivateData-privateDataSlot-parent
privateDataSlot **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY

To retrieve user defined data from a slot associated with a Vulkan object, call:

```
// Provided by VK_VERSION_1_3
void vkGetPrivateData(
    VkDevice
    VkObjectType
    uint64_t
    VkPrivateDataSlot
    uint64_t*
                                device,
                                objectType,
                                objectHandle,
                                privateDataSlot,
                                pData);
```

or the equivalent command

```
// Provided by VK_EXT_private_data
void vkGetPrivateDataEXT(
    VkDevice
    VkObjectType
    uint64_t
    VkPrivateDataSlot
    uint64_t*
                                device,
                                objectType,
                                objectHandle,
                                privateDataSlot,
                                pData);
```

- **device** is the device that created the object
- **objectType** is a [VkObjectType](#) specifying the type of object data is associated with.
- **objectHandle** is a handle to the object data is associated with.
- **privateDataSlot** is a handle to a [VkPrivateDataSlot](#) specifying location of private data pointer storage.
- **pData** is a pointer to specify where user data is returned. **0** will be written in the absence of a previous call to [vkSetPrivateData](#) using the object specified by **objectHandle**.

Note

 Due to platform details on Android, implementations might not be able to reliably return **0** from calls to [vkGetPrivateData](#) for [VkSwapchainKHR](#) objects on which [vkSetPrivateData](#) has not previously been called. This erratum is exclusive to the Android platform and objects of type [VkSwapchainKHR](#).

Valid Usage

- VUID-vkGetPrivateData-objectType-04018
objectType **must** be `VK_OBJECT_TYPE_DEVICE`, or an object type whose parent is `VkDevice`

Valid Usage (Implicit)

- VUID-vkGetPrivateData-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkGetPrivateData-objectType-parameter
objectType **must** be a valid `VkObjectType` value
- VUID-vkGetPrivateData-privateDataSlot-parameter
privateDataSlot **must** be a valid `VkPrivateDataSlot` handle
- VUID-vkGetPrivateData-pData-parameter
pData **must** be a valid pointer to a `uint64_t` value
- VUID-vkGetPrivateData-privateDataSlot-parent
privateDataSlot **must** have been created, allocated, or retrieved from **device**

Chapter 36. Acceleration Structures

36.1. Acceleration Structures

Acceleration structures are data structures used by the implementation to efficiently manage scene geometry as it is [traversed during a ray tracing query](#). The application is responsible for managing acceleration structure objects (see [Acceleration Structures](#)), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, *top level acceleration structures* and *bottom level acceleration structures*.

An acceleration structure is considered to be constructed if an [acceleration structure build command](#) or [copy command](#) has been executed with the given acceleration structure as the destination.

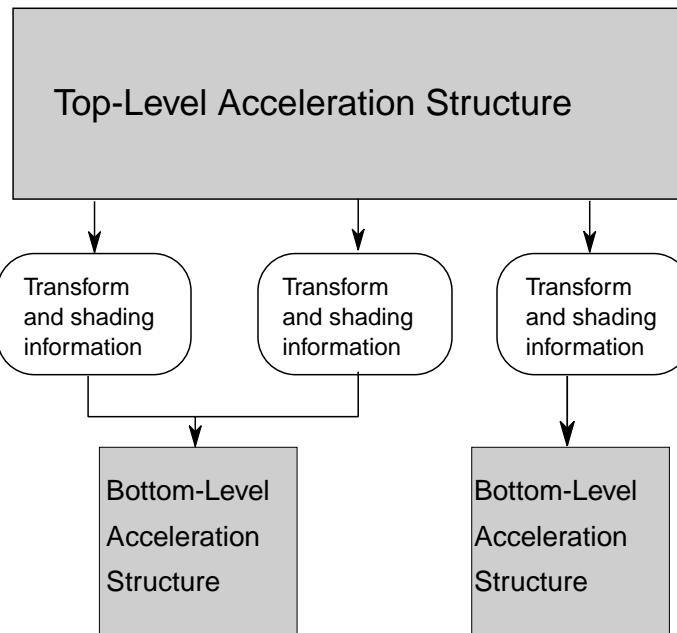

Figure 24. Acceleration Structure

Caption

The diagram shows the relationship between top and bottom level acceleration structures.

36.1.1. Geometry

Geometries refer to a triangle or axis-aligned bounding box.

36.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.

The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects **must** be valid when the top level acceleration structure is accessed.

36.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

36.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A *build* operation is used to construct an acceleration structure.
- An *update* operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description **must** exactly match the one from the original build.

More precisely, the application **must** not use an update operation to do any of the following:

- Change primitives or instances from *active* to *inactive*, or vice versa (as defined in [Inactive Primitives and Instances](#)).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

36.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal *inactive* primitives or instances.

An *inactive* triangle is one for which the first (X) component of each vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An *inactive* instance is one whose acceleration structure handle is [VK_NULL_HANDLE](#).

An *inactive* AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, "NaN" refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.

An inactive object is considered invisible to all rays, and **should** not be represented in the acceleration structure. Implementations **should** ensure that the presence of inactive objects does not seriously degrade traversal performance.

Inactive objects are counted in the auto-generated index sequences which are provided to shaders via `InstanceId` and `PrimitiveId` SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications **must** not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.

36.1.6. Building Acceleration Structures

To build an acceleration structure call:

```
// Provided by VK_NV_ray_tracing
void vkCmdBuildAccelerationStructureNV(
    VkCommandBuffer
    const VkAccelerationStructureInfoNV*
    VkBuffer
    VkDeviceSize
    VkBool32
    VkAccelerationStructureNV
    VkAccelerationStructureNV
    VkBuffer
    VkDeviceSize
    commandBuffer,
    pInfo,
    instanceData,
    instanceOffset,
    update,
    dst,
    src,
    scratch,
    scratchOffset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` contains the shared information for the acceleration structure's structure.
- `instanceData` is the buffer containing an array of `VkAccelerationStructureInstanceKHR` structures defining acceleration structures. This parameter **must** be `NULL` for bottom level acceleration structures.
- `instanceOffset` is the offset in bytes (relative to the start of `instanceData`) at which the instance data is located.
- `update` specifies whether to update the `dst` acceleration structure with the data in `src`.
- `dst` is a pointer to the target acceleration structure for the build.
- `src` is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure.
- `scratch` is the `VkBuffer` that will be used as scratch memory for the build.
- `scratchOffset` is the offset in bytes relative to the start of `scratch` that will be used as a scratch memory.

Accesses to `dst`, `src`, and `scratch` **must** be `synchronized` with the

`VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`.

Valid Usage

- VUID-vkCmdBuildAccelerationStructureNV-geometryCount-02241
`geometryCount` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`
- VUID-vkCmdBuildAccelerationStructureNV-dst-02488
`dst` **must** have been created with compatible `VkAccelerationStructureInfoNV` where `VkAccelerationStructureInfoNV::type` and `VkAccelerationStructureInfoNV::flags` are identical, `VkAccelerationStructureInfoNV::instanceCount` and `VkAccelerationStructureInfoNV::geometryCount` for `dst` are greater than or equal to the build size and each geometry in `VkAccelerationStructureInfoNV::pGeometries` for `dst` has greater than or equal to the number of vertices, indices, and AABBs
- VUID-vkCmdBuildAccelerationStructureNV-update-02489
If `update` is `VK_TRUE`, `src` **must** not be `VK_NULL_HANDLE`
- VUID-vkCmdBuildAccelerationStructureNV-update-02490
If `update` is `VK_TRUE`, `src` **must** have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV` set in `VkAccelerationStructureInfoNV::flags` in the original build
- VUID-vkCmdBuildAccelerationStructureNV-update-02491
If `update` is `VK_FALSE`, the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure` set to `dst` and `VkAccelerationStructureMemoryRequirementsInfoNV::type` set to `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` **must** be less than or equal to the size of `scratch` minus `scratchOffset`
- VUID-vkCmdBuildAccelerationStructureNV-update-02492
If `update` is `VK_TRUE`, the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure` set to `dst` and `VkAccelerationStructureMemoryRequirementsInfoNV::type` set to `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` **must** be less than or equal to the size of `scratch` minus `scratchOffset`
- VUID-vkCmdBuildAccelerationStructureNV-scratch-03522
`scratch` **must** have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag
- VUID-vkCmdBuildAccelerationStructureNV-instanceData-03523
If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` **must** have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag
- VUID-vkCmdBuildAccelerationStructureNV-accelerationStructureReference-03786
Each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `instanceData` **must** be a valid device address containing a value obtained from `vkGetAccelerationStructureHandleNV`
- VUID-vkCmdBuildAccelerationStructureNV-update-03524
If `update` is `VK_TRUE`, then objects that were previously active **must** not be made inactive as per [Inactive Primitives and Instances](#)

- VUID-vkCmdBuildAccelerationStructureNV-update-03525
If `update` is `VK_TRUE`, then objects that were previously inactive **must** not be made active as per [Inactive Primitives and Instances](#)
- VUID-vkCmdBuildAccelerationStructureNV-update-03526
If `update` is `VK_TRUE`, the `src` and `dst` objects **must** either be the same object or not have any memory aliasing

Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBuildAccelerationStructureNV-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkAccelerationStructureInfoNV` structure
- VUID-vkCmdBuildAccelerationStructureNV-instanceData-parameter
If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` **must** be a valid `VkBuffer` handle
- VUID-vkCmdBuildAccelerationStructureNV-dst-parameter
`dst` **must** be a valid `VkAccelerationStructureNV` handle
- VUID-vkCmdBuildAccelerationStructureNV-src-parameter
If `src` is not `VK_NULL_HANDLE`, `src` **must** be a valid `VkAccelerationStructureNV` handle
- VUID-vkCmdBuildAccelerationStructureNV-scratch-parameter
`scratch` **must** be a valid `VkBuffer` handle
- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdBuildAccelerationStructureNV-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBuildAccelerationStructureNV-commonparent
Each of `commandBuffer`, `dst`, `instanceData`, `scratch`, and `src` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

To build acceleration structures call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresKHR(
    VkCommandBuffer                                commandBuffer,
    uint32_t                                     infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that **must** be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

The `vkCmdBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

Note

This means that an application **cannot** build a top-level acceleration structure in the same `vkCmdBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also **cannot** be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the `VkAccelerationStructureBuildGeometryInfoKHR::scratchData` buffer device addresses **must** be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`. Similarly for accesses to each `VkAccelerationStructureBuildGeometryInfoKHR::srcAccelerationStructure` and `VkAccelerationStructureBuildGeometryInfoKHR::dstAccelerationStructure`.

Accesses to other input buffers as identified by any used values of `VkAccelerationStructureGeometryMotionTrianglesDataNV::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, `VkAccelerationStructureGeometryAabbsDataKHR::data`, and `VkAccelerationStructureGeometryInstancesDataKHR::data` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_SHADER_READ_BIT`.

Valid Usage

- VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628
The `mode` member of each element of `pInfos` **must** be a valid `VkBuildAccelerationStructureModeKHR` value
- VUID-vkCmdBuildAccelerationStructuresKHR-srcAccelerationStructure-04629
If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-04630
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** not be `VK_NULL_HANDLE`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03403
The `srcAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`
- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03698
The `dstAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`
- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03800
The `dstAccelerationStructure` member of any element of `pInfos` **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03699
For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03700
For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03663
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, `inactive` primitives in its `srcAccelerationStructure` member **must** not be made active
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03664
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member **must** not be made `inactive`

- VUID-vkCmdBuildAccelerationStructuresKHR-None-03407

The `dstAccelerationStructure` member of any element of `pInfos` **must** not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03701

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03702

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03703

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03704

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03705

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `srcAccelerationStructure` member of any element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` (including the same element), which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03706

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03667

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03668

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members **must** either be the same

[VkAccelerationStructureKHR](#), or not have any [memory aliasing](#)

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03758
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03759
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03760
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03761
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03762
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03763
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03764
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03765
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified

when `srcAccelerationStructure` was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03766
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was `NULL` when `srcAccelerationStructure` was last built, then it **must** be `NULL`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03767
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not `NULL` when `srcAccelerationStructure` was last built, then it **must** not be `NULL`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03768
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-primitiveCount-03769
 - For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-firstVertex-03770
 - For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03801
 - For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppBuildRangeInfos[i][j].primitiveCount` **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03707
 - For each element of `pInfos`, the `buffer` used to create its `dstAccelerationStructure` member **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03708
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the `buffer` used to create its `srcAccelerationStructure` member **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03709

For each element of `pInfos`, the `buffer` used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03671
If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` **must** be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03672
If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` **must** be in the buffer device address range of the same buffer, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count
- VUID-vkCmdBuildAccelerationStructuresKHR-geometry-03673
The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried **must** have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03674
The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried **must** have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03800
For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a valid device address obtained from `vkGetBufferDeviceAddress`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03800
For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03710
For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03804
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03805

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.vertexData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03711

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` **must** be aligned to the size in bytes of the smallest component of the format in `vertexFormat`

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03806

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03807

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, if `geometry.triangles.indexData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03712

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and with `geometry.triangles.indexType` not equal to `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` **must** be aligned to the size in bytes of the type in `indexType`

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03808

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not `0`, it **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03809

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not `0`, it **must** be aligned to `16` bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, if `geometry.aabbs.data.deviceAddress` is the address of a non-

sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03714
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` **must** be aligned to 8 bytes
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03715
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03716
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, `geometry.instances.data.deviceAddress` **must** be aligned to 8 bytes
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03717
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03813
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `geometry.instances.data.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03814
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.instances.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03815
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.deviceAddress` **must** be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03675
For each `pInfos[i]`, `dstAccelerationStructure` **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in $[0, pInfos[i].geometryCount)$
- VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676
Each element of `ppBuildRangeInfos[i]` **must** be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures

Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-parameter
pInfos **must** be a valid pointer to an array of **infoCount** valid [VkAccelerationStructureBuildGeometryInfoKHR](#) structures
- VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter
ppBuildRangeInfos **must** be a valid pointer to an array of **infoCount** [VkAccelerationStructureBuildRangeInfoKHR](#) structures
- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support compute operations
- VUID-vkCmdBuildAccelerationStructuresKHR-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBuildAccelerationStructuresKHR-infoCount-arraylength
infoCount **must** be greater than **0**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Outside	Compute
Secondary		

To build acceleration structures with some parameters sourced on the device call:

```

// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer                                commandBuffer,
    uint32_t                                     infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress*                         pIndirectDeviceAddresses,
    const uint32_t*                            pIndirectStrides,
    const uint32_t* const*
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **infoCount** is the number of acceleration structures to build.
- **pInfos** is a pointer to an array of **infoCount** **VkAccelerationStructureBuildGeometryInfoKHR** structures defining the geometry used to build each acceleration structure.
- **pIndirectDeviceAddresses** is a pointer to an array of **infoCount** buffer device addresses which point to **pInfos[i].geometryCount** **VkAccelerationStructureBuildRangeInfoKHR** structures defining dynamic offsets to the addresses where geometry data is stored, as defined by **pInfos[i]**.
- **pIndirectStrides** is a pointer to an array of **infoCount** byte strides between elements of **pIndirectDeviceAddresses**.
- **ppMaxPrimitiveCounts** is a pointer to an array of **infoCount** pointers to arrays of **pInfos[i].geometryCount** values indicating the maximum number of primitives that will be built by this command for each geometry.

Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers must be synchronized as with [vkCmdBuildAccelerationStructuresKHR](#).

Accesses to any element of **pIndirectDeviceAddresses** **must** be [synchronized](#) with the **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stage and an access type of **VK_ACCESS_INDIRECT_COMMAND_READ_BIT**.

Valid Usage

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-mode-04628
The `mode` member of each element of `pInfos` **must** be a valid `VkBuildAccelerationStructureModeKHR` value
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-srcAccelerationStructure-04629
If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-04630
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** not be `VK_NULL_HANDLE`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03403
The `srcAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03698
The `dstAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03800
The `dstAccelerationStructure` member of any element of `pInfos` **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03699
For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03700
For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03663
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, `inactive` primitives in its `srcAccelerationStructure` member **must** not be made active
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03664
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member **must** not be made `inactive`

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-None-03407
 The `dstAccelerationStructure` member of any element of `pInfos` **must** not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03701
 The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03702
 The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03703
 The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03704
 The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03705
 The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `srcAccelerationStructure` member of any element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` (including the same element), which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03706
 The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03667
 For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03668
 For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members **must** either be the same

VkAccelerationStructureKHR, or not have any memory aliasing

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03758
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03759
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03760
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03761
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03762
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03763
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03764
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03765
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified

when `srcAccelerationStructure` was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03766
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was `NULL` when `srcAccelerationStructure` was last built, then it **must** be `NULL`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03767
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not `NULL` when `srcAccelerationStructure` was last built, then it **must** not be `NULL`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03768
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-primitiveCount-03769
 - For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-firstVertex-03770
 - For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03801
 - For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppMaxPrimitiveCounts[i][j]` **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03707
 - For each element of `pInfos`, the `buffer` used to create its `dstAccelerationStructure` member **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03708
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the `buffer` used to create its `srcAccelerationStructure` member **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03709
 - For each element of `pInfos`, the `buffer` used to create each acceleration structure

referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03671
If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` **must** be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03672
If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` **must** be in the buffer device address range of the same buffer, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-geometry-03673
The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried **must** have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03674
The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried **must** have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03802
For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a valid device address obtained from `vkGetBufferDeviceAddress`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03803
For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03710
For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03804
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03805
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of

`VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.vertexData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03711
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` **must** be aligned to the size in bytes of the smallest component of the format in `vertexFormat`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03806
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03807
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, if `geometry.triangles.indexData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03712
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and with `geometry.triangles.indexType` not equal to `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` **must** be aligned to the size in bytes of the type in `indexType`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03808
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not `0`, it **must** be a valid device address obtained from `vkGetBufferDeviceAddress`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03809
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03810
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not `0`, it **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03811
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03812
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, if `geometry.aabbs.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single

VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03714
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` **must** be aligned to 8 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03715
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03716
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, `geometry.instances.data.deviceAddress` **must** be aligned to 8 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03717
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03813
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `geometry.instances.data.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03814
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.instances.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03815
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.deviceAddress` **must** be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03645
For any element of `pIndirectDeviceAddresses`, if the buffer from which it was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03646
For any element of `pIndirectDeviceAddresses[i]`, all device addresses between `pIndirectDeviceAddresses[i]` and `pIndirectDeviceAddresses[i] + (pInfos[i].geometryCount × pIndirectStrides[i]) - 1` **must** be in the buffer device address range of the same buffer
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03647
For any element of `pIndirectDeviceAddresses`, the buffer from which it was queried **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03648

Each element of `pIndirectDeviceAddresses` **must** be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-03787

Each element of `pIndirectStrides` **must** be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-03649

`commandBuffer` **must** not be a protected command buffer

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650

The `VkPhysicalDeviceAccelerationStructureFeaturesKHR`
`::accelerationStructureIndirectBuild` feature **must** be enabled

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03651

Each `VkAccelerationStructureBuildRangeInfoKHR` structure referenced by any element of `pIndirectDeviceAddresses` **must** be a valid `VkAccelerationStructureBuildRangeInfoKHR` structure

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03652

`pInfos[i].dstAccelerationStructure` **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and `pMaxPrimitiveCounts = ppMaxPrimitiveCounts[i]`

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-03653

Each `ppMaxPrimitiveCounts[i][j]` **must** be greater than or equal to the `primitiveCount` value specified by the `VkAccelerationStructureBuildRangeInfoKHR` structure located at `pIndirectDeviceAddresses[i] + (j × pIndirectStrides[i])`

Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-parameter
pInfos **must** be a valid pointer to an array of **infoCount** valid [VkAccelerationStructureBuildGeometryInfoKHR](#) structures
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
pIndirectDeviceAddresses **must** be a valid pointer to an array of **infoCount** [VkDeviceAddress](#) values
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
pIndirectStrides **must** be a valid pointer to an array of **infoCount** [uint32_t](#) values
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
ppMaxPrimitiveCounts **must** be a valid pointer to an array of **infoCount** [uint32_t](#) values
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support compute operations
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-infoCount-arraylength
infoCount **must** be greater than **0**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

The [VkAccelerationStructureBuildGeometryInfoKHR](#) structure is defined as:

```

// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType                                     sType;
    const void*                                       pNext;
    VkAccelerationStructureTypeKHR                   type;
    VkBuildAccelerationStructureFlagsKHR           flags;
    VkBuildAccelerationStructureModeKHR            mode;
    VkAccelerationStructureKHR                      srcAccelerationStructure;
    VkAccelerationStructureKHR                      dstAccelerationStructure;
    uint32_t                                         geometryCount;
    const VkAccelerationStructureGeometryKHR*      pGeometries;
    const VkAccelerationStructureGeometryKHR* const* ppGeometries;
    VkDeviceOrHostAddressKHR                         scratchData;
} VkAccelerationStructureBuildGeometryInfoKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **type** is a **VkAccelerationStructureTypeKHR** value specifying the type of acceleration structure being built.
- **flags** is a bitmask of **VkBuildAccelerationStructureFlagBitsKHR** specifying additional parameters of the acceleration structure.
- **mode** is a **VkBuildAccelerationStructureModeKHR** value specifying the type of operation to perform.
- **srcAccelerationStructure** is a pointer to an existing acceleration structure that is to be used to update the **dst** acceleration structure when **mode** is **VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR**.
- **dstAccelerationStructure** is a pointer to the target acceleration structure for the build.
- **geometryCount** specifies the number of geometries that will be built into **dstAccelerationStructure**.
- **pGeometries** is a pointer to an array of **VkAccelerationStructureGeometryKHR** structures.
- **ppGeometries** is a pointer to an array of pointers to **VkAccelerationStructureGeometryKHR** structures.
- **scratchData** is the device or host address to memory that will be used as scratch memory for the build.

Only one of **pGeometries** or **ppGeometries** **can** be a valid pointer, the other **must** be **NULL**. Each element of the non-**NULL** array describes the data used to build each acceleration structure geometry.

The index of each element of the **pGeometries** or **ppGeometries** members of **VkAccelerationStructureBuildGeometryInfoKHR** is used as the *geometry index* during ray traversal. The geometry index is available in ray shaders via the **RayGeometryIndexKHR** **built-in**, and is **used to determine hit and intersection shaders executed during traversal**. The geometry index is available to ray queries via the **OpRayQueryGetIntersectionGeometryIndexKHR** instruction.

Setting `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags` indicates that this build is a motion top level acceleration structure. A motion top level uses instances of format `VkAccelerationStructureMotionInstanceNV` if `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_FALSE`.

If `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_TRUE`, the pointer for any given element of the array of instance pointers consists of 4 bits of `VkAccelerationStructureMotionInstanceTypeNV` in the low 4 bits of the pointer identifying the type of structure at the pointer. The device address accessed is the value in the array with the low 4 bits set to zero. The structure at the pointer is one of `VkAccelerationStructureInstanceKHR`, `VkAccelerationStructureMatrixMotionInstanceNV` or `VkAccelerationStructureSRTMotionInstanceNV`, depending on the type value encoded in the low 4 bits.

A top level acceleration structure with either motion instances or vertex motion in its instances **must** set `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags`.

Members `srcAccelerationStructure` and `dstAccelerationStructure` **may** be the same or different for an update operation (when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`). If they are the same, the update happens in-place. Otherwise, the target acceleration structure is updated and the source is not modified.

Valid Usage

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654
type **must** not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788
Only one of `pGeometries` or `ppGeometries` **can** be a valid pointer, the other **must** be `NULL`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789
If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, the `geometryType` member of elements of either `pGeometries` or `ppGeometries` **must** be `VK_GEOMETRY_TYPE_INSTANCES_KHR`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790
If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, `geometryCount` **must** be `1`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791
If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` the `geometryType` member of elements of either `pGeometries` or `ppGeometries` **must** not be `VK_GEOMETRY_TYPE_INSTANCES_KHR`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792
If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then the `geometryType` member of each geometry in either `pGeometries` or `ppGeometries` **must** be the same
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793
If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then `geometryCount` **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxGeometryCount`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03794
If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` and the `geometryType` member of either `pGeometries` or `ppGeometries` is `VK_GEOMETRY_TYPE_AABBS_KHR`, the total number of AABBs in all geometries **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03795
If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` and the `geometryType` member of either `pGeometries` or `ppGeometries` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the total number of triangles in all geometries **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-03796
If `flags` has the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR` bit set, then it **must** not have the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR` bit set
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-dstAccelerationStructure-04927
If `dstAccelerationStructure` was created with `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` set in `VkAccelerationStructureCreateInfoKHR::flags`, `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` **must** be set in `flags`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-04928
If `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` is set in `flags`, `dstAccelerationStructure` **must** have been created with `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` set in

VkAccelerationStructureCreateInfoKHR::flags

- VUID-VkAccelerationStructureCreateInfoKHR-flags-04929
If `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` is set in `flags`, `type` **must** not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-parameter
`type` **must** be a valid `VkAccelerationStructureTypeKHR` value
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-parameter
`flags` **must** be a valid combination of `VkBuildAccelerationStructureFlagBitsKHR` values
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-parameter
If `geometryCount` is not `0`, and `pGeometries` is not `NULL`, `pGeometries` **must** be a valid pointer to an array of `geometryCount` valid `VkAccelerationStructureGeometryKHR` structures
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-ppGeometries-parameter
If `geometryCount` is not `0`, and `ppGeometries` is not `NULL`, `ppGeometries` **must** be a valid pointer to an array of `geometryCount` valid pointers to valid `VkAccelerationStructureGeometryKHR` structures
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-commonparent
Both of `dstAccelerationStructure`, and `srcAccelerationStructure` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkBuildAccelerationStructureModeKHR` enumeration is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```

- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR` specifies that the destination acceleration structure will be built using the specified geometries.
- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The `VkDeviceOrHostAddressKHR` union is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress    deviceAddress;
    void*            hostAddress;
} VkDeviceOrHostAddressKHR;
```

- `deviceAddress` is a buffer device address as returned by the [vkGetBufferDeviceAddressKHR](#) command.
- `hostAddress` is a host memory address.

The `VkDeviceOrHostAddressConstKHR` union is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress    deviceAddress;
    const void*      hostAddress;
} VkDeviceOrHostAddressConstKHR;
```

- `deviceAddress` is a buffer device address as returned by the [vkGetBufferDeviceAddressKHR](#) command.
- `hostAddress` is a const host memory address.

The `VkAccelerationStructureGeometryKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType          sType;
    const void*            pNext;
    VkGeometryTypeKHR        geometryType;
    VkAccelerationStructureGeometryDataKHR geometry;
    VkGeometryFlagsKHR       flags;
} VkAccelerationStructureGeometryKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `geometryType` describes which type of geometry this `VkAccelerationStructureGeometryKHR` refers to.
- `geometry` is a `VkAccelerationStructureGeometryDataKHR` union describing the geometry data for the relevant geometry type.
- `flags` is a bitmask of `VkGeometryFlagBitsKHR` values describing additional properties of how the geometry should be built.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR`
- VUID-VkAccelerationStructureGeometryKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter
geometryType **must** be a valid `VkGeometryTypeKHR` value
- VUID-VkAccelerationStructureGeometryKHR-triangles-parameter
If geometryType is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the triangles member of geometry **must** be a valid `VkAccelerationStructureGeometryTrianglesDataKHR` structure
- VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter
If geometryType is `VK_GEOMETRY_TYPE_AABBS_KHR`, the aabbs member of geometry **must** be a valid `VkAccelerationStructureGeometryAabbsDataKHR` structure
- VUID-VkAccelerationStructureGeometryKHR-instances-parameter
If geometryType is `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the instances member of geometry **must** be a valid `VkAccelerationStructureGeometryInstancesDataKHR` structure
- VUID-VkAccelerationStructureGeometryKHR-flags-parameter
flags **must** be a valid combination of `VkGeometryFlagBitsKHR` values

The `VkAccelerationStructureGeometryDataKHR` union is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef union VkAccelerationStructureGeometryDataKHR {
    VkAccelerationStructureGeometryTrianglesDataKHR    triangles;
    VkAccelerationStructureGeometryAabbsDataKHR        aabbs;
    VkAccelerationStructureGeometryInstancesDataKHR    instances;
} VkAccelerationStructureGeometryDataKHR;
```

- `triangles` is a `VkAccelerationStructureGeometryTrianglesDataKHR` structure.
- `aabbs` is a `VkAccelerationStructureGeometryAabbsDataKHR` structure.
- `instances` is a `VkAccelerationStructureGeometryInstancesDataKHR` structure.

The `VkAccelerationStructureGeometryTrianglesDataKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryTrianglesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkFormat vertexFormat;
    VkDeviceOrHostAddressConstKHR vertexData;
    VkDeviceSize vertexStride;
    uint32_t maxVertex;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexData;
    VkDeviceOrHostAddressConstKHR transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **vertexFormat** is the **VkFormat** of each vertex element.
- **vertexData** is a device or host address to memory containing vertex data for this geometry.
- **maxVertex** is the highest index of a vertex that will be addressed by a build command using this structure.
- **vertexStride** is the stride in bytes between each vertex.
- **indexType** is the **VkIndexType** of each index element.
- **indexData** is a device or host address to memory containing index data for this geometry.
- **transformData** is a device or host address to memory containing an optional reference to a **VkTransformMatrixKHR** structure describing a transformation from the space in which the vertices in this geometry are described to the space in which the acceleration structure is defined.

Note

Unlike the stride for vertex buffers in **VkVertexInputBindingDescription** for graphics pipelines which must not exceed **maxVertexInputBindingStride**, **vertexStride** for acceleration structure geometry is instead restricted to being a 32-bit value.

Valid Usage

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735
`vertexStride` **must** be a multiple of the size in bytes of the smallest component of `vertexFormat`
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819
`vertexStride` **must** be less than or equal to $2^{32}-1$
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797
`vertexFormat` **must** support the `VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR` in `VkFormatProperties` `::bufferFeatures` as returned by `vkGetPhysicalDeviceFormatProperties2`
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03798
`indexType` **must** be `VK_INDEX_TYPE_UINT16`, `VK_INDEX_TYPE_UINT32`, or `VK_INDEX_TYPE_NONE_KHR`

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR`
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkAccelerationStructureGeometryMotionTrianglesDataNV`
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter
`vertexFormat` **must** be a valid `VkFormat` value
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter
`indexType` **must** be a valid `VkIndexType` value

The `VkAccelerationStructureGeometryMotionTrianglesDataNV` structure is defined as:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureGeometryMotionTrianglesDataNV {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceOrHostAddressConstKHR vertexData;
} VkAccelerationStructureGeometryMotionTrianglesDataNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexData` is a pointer to vertex data for this geometry at time 1.0

If `VkAccelerationStructureGeometryMotionTrianglesDataNV` is included in the `pNext` chain of a

`VkAccelerationStructureGeometryTrianglesDataKHR` structure, the basic vertex positions are used for the position of the triangles in the geometry at time 0.0 and the `vertexData` in `VkAccelerationStructureGeometryMotionTrianglesDataNV` is used for the vertex positions at time 1.0, with positions linearly interpolated at intermediate times.

Indexing for `VkAccelerationStructureGeometryMotionTrianglesDataNV` `vertexData` is equivalent to the basic vertex position data.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryMotionTrianglesDataNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_MOTION_TRIANGLES_DATA_NV`

The `VkTransformMatrixKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkTransformMatrixKHR {
    float matrix[3][4];
} VkTransformMatrixKHR;
```

or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkTransformMatrixKHR VkTransformMatrixNV;
```

- `matrix` is a 3x4 row-major affine transformation matrix.

Valid Usage

- VUID-VkTransformMatrixKHR-matrix-03799
The first three columns of `matrix` **must** define an invertible 3x3 matrix

The `VkAccelerationStructureGeometryAabbsDataKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryAabbsDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceSize stride;
} VkAccelerationStructureGeometryAabbsDataKHR;
```

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `data` is a device or host address to memory containing `VkAabbPositionsKHR` structures containing position data for each axis-aligned bounding box in the geometry.
- `stride` is the stride in bytes between each entry in `data`. The stride **must** be a multiple of 8.

Valid Usage

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545
`stride` **must** be a multiple of 8
- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820
`stride` **must** be less than or equal to $2^{32}-1$

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR`
- VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext
`pNext` **must** be `NULL`

The `VkAabbPositionsKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAabbPositionsKHR {
    float    minX;
    float    minY;
    float    minZ;
    float    maxX;
    float    maxY;
    float    maxZ;
} VkAabbPositionsKHR;
```

or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkAabbPositionsKHR VkAabbPositionsNV;
```

- `minX` is the x position of one opposing corner of a bounding box.
- `minY` is the y position of one opposing corner of a bounding box.
- `minZ` is the z position of one opposing corner of a bounding box.
- `maxX` is the x position of the other opposing corner of a bounding box.
- `maxY` is the y position of the other opposing corner of a bounding box.

- `maxZ` is the z position of the other opposing corner of a bounding box.

Valid Usage

- VUID-VkAabbPositionsKHR-minX-03546
`minX` **must** be less than or equal to `maxX`
- VUID-VkAabbPositionsKHR-minY-03547
`minY` **must** be less than or equal to `maxY`
- VUID-VkAabbPositionsKHR-minZ-03548
`minZ` **must** be less than or equal to `maxZ`

The `VkAccelerationStructureGeometryInstancesDataKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkBool32                  arrayOfPointers;
    VkDeviceOrHostAddressConstKHR data;
} VkAccelerationStructureGeometryInstancesDataKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `arrayOfPointers` specifies whether `data` is used as an array of addresses or just an array.
- `data` is either the address of an array of device or host addresses referencing individual `VkAccelerationStructureInstanceKHR` structures or packed motion instance information as described in `motion instances` if `arrayOfPointers` is `VK_TRUE`, or the address of an array of `VkAccelerationStructureInstanceKHR` or `VkAccelerationStructureMotionInstanceNV` structures. Addresses and `VkAccelerationStructureInstanceKHR` structures are tightly packed. `VkAccelerationStructureMotionInstanceNV` structures have a stride of 160 bytes.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryInstancesDataKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR`
- VUID-VkAccelerationStructureGeometryInstancesDataKHR-pNext-pNext
`pNext` **must** be `NULL`

Acceleration structure instances **can** be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances **can** point to the same bottom level acceleration structure.

An acceleration structure instance is defined by the structure:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR transform;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;
```

or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureInstanceKHR VkAccelerationStructureInstanceNV;
```

- **transform** is a **VkTransformMatrixKHR** structure describing a transformation to be applied to the acceleration structure.
- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the **InstanceCustomIndexKHR** built-in.
- **mask** is an 8-bit visibility mask for the geometry. The instance **may** only be hit if **Cull Mask & instance.mask != 0**
- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.
- **flags** is an 8-bit mask of **VkGeometryInstanceFlagBitsKHR** values to apply to this instance.
- **accelerationStructureReference** is either:
 - a device address containing the value obtained from **vkGetAccelerationStructureDeviceAddressKHR** or **vkGetAccelerationStructureHandleNV** (used by device operations which reference acceleration structures) or,
 - a **VkAccelerationStructureKHR** object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single **uint32_t** was specified in their place
 - **instanceCustomIndex** occupies the 24 least significant bits of that memory
 - **mask** occupies the 8 most significant bits of that memory
- **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single **uint32_t** was specified in their place
 - **instanceShaderBindingTableRecordOffset** occupies the 24 least significant bits of that memory

- **flags** occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureInstanceKHR-flags-parameter
flags must be a valid combination of [VkGeometryInstanceFlagBitsKHR](#) values

Possible values of **flags** in the instance modifying the behavior of that instance are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR =
VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_CULL_DISABLE_BIT_NV =
VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_NV =
VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_NV =
VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_NV =
VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR,
} VkGeometryInstanceFlagBitsKHR;
```

or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagBitsKHR VkGeometryInstanceFlagBitsNV;
```

- **VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR** disables face culling for this instance.
- **VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR** indicates that the **facing determination** for geometry in this instance is inverted. Because the facing is determined in object space, an instance transform does not change the winding, but a geometry transform does.
- **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were specified on all geometries referenced by this instance. This

behavior **can** be overridden by the SPIR-V **NoOpaqueKHR** ray flag.

- **VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were not specified on all geometries referenced by this instance. This behavior **can** be overridden by the SPIR-V **OpaqueKHR** ray flag.

VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR and **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** **must** not be used in the same flag.

```
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryInstanceFlagsKHR;
```

or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagsKHR VkGeometryInstanceFlagsNV;
```

VkGeometryInstanceFlagsKHR is a bitmask type for setting a mask of zero or more **VkGeometryInstanceFlagBitsKHR**.

Acceleration structure motion instances **can** be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location including a type of motion and parameters to determine the motion of the instance over time.

An acceleration structure motion instance is defined by the structure:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMotionInstanceNV {
    VkAccelerationStructureMotionInstanceTypeNV      type;
    VkAccelerationStructureMotionInstanceFlagsNV     flags;
    VkAccelerationStructureMotionInstanceDataNV      data;
} VkAccelerationStructureMotionInstanceNV;
```

- **type** is a **VkAccelerationStructureMotionInstanceTypeNV** enumerant identifying which type of motion instance this is and which type of the union is valid.
- **flags** is currently unused, but is required to keep natural alignment of **data**.
- **data** is a **VkAccelerationStructureMotionInstanceDataNV** containing motion instance data for this instance.

Note

If writing this other than with a standard C compiler, note that the final structure should be 152 bytes in size.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMotionInstanceNV-type-parameter
type **must** be a valid [VkAccelerationStructureMotionInstanceTypeNV](#) value
- VUID-VkAccelerationStructureMotionInstanceNV-flags-zero bitmask
flags **must** be **0**
- VUID-VkAccelerationStructureMotionInstanceNV-staticInstance-parameter
If **type** is **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV**, the **staticInstance** member of **data** **must** be a valid [VkAccelerationStructureInstanceKHR](#) structure
- VUID-VkAccelerationStructureMotionInstanceNV-matrixMotionInstance-parameter
If **type** is **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV**, the **matrixMotionInstance** member of **data** **must** be a valid [VkAccelerationStructureMatrixMotionInstanceNV](#) structure
- VUID-VkAccelerationStructureMotionInstanceNV-srtMotionInstance-parameter
If **type** is **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV**, the **srtMotionInstance** member of **data** **must** be a valid [VkAccelerationStructureSRTMotionInstanceNV](#) structure

Acceleration structure motion instance is defined by the union:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef union VkAccelerationStructureMotionInstanceDataNV {
    VkAccelerationStructureInstanceKHR           staticInstance;
    VkAccelerationStructureMatrixMotionInstanceNV matrixMotionInstance;
    VkAccelerationStructureSRTMotionInstanceNV   srtMotionInstance;
} VkAccelerationStructureMotionInstanceDataNV;
```

- **staticInstance** is a [VkAccelerationStructureInstanceKHR](#) structure containing data for a static instance.
- **matrixMotionInstance** is a [VkAccelerationStructureMatrixMotionInstanceNV](#) structure containing data for a matrix motion instance.
- **srtMotionInstance** is a [VkAccelerationStructureSRTMotionInstanceNV](#) structure containing data for an SRT motion instance.

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef VkFlags VkAccelerationStructureMotionInstanceFlagsNV;
```

[VkAccelerationStructureMotionInstanceFlagsNV](#) is a bitmask type for setting a mask, but is currently reserved for future use.

The [VkAccelerationStructureMotionInstanceTypeNV](#) enumeration is defined as:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef enum VkAccelerationStructureMotionInstanceTypeNV {
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV = 0,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV = 1,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV = 2,
} VkAccelerationStructureMotionInstanceTypeNV;
```

- `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV` specifies that the instance is a static instance with no instance motion.
- `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV` specifies that the instance is a motion instance with motion specified by interpolation between two matrices.
- `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV` specifies that the instance is a motion instance with motion specified by interpolation in the SRT decomposition.

An acceleration structure matrix motion instance is defined by the structure:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMatrixMotionInstanceNV {
    VkTransformMatrixKHR          transformT0;
    VkTransformMatrixKHR          transformT1;
    uint32_t                   instanceCustomIndex:24;
    uint32_t                   mask:8;
    uint32_t                   instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR   flags:8;
    uint64_t                   accelerationStructureReference;
} VkAccelerationStructureMatrixMotionInstanceNV;
```

- `transformT0` is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure at time 0.
- `transformT1` is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure at time 1.
- `instanceCustomIndex` is a 24-bit user-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.
- `mask` is an 8-bit visibility mask for the geometry. The instance **may** only be hit if `Cull Mask & instance.mask != 0`
- `instanceShaderBindingTableRecordOffset` is a 24-bit offset used in calculating the hit shader binding table index.
- `flags` is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.
- `accelerationStructureReference` is either:
 - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
 - a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration

structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
 - `instanceCustomIndex` occupies the 24 least significant bits of that memory
 - `mask` occupies the 8 most significant bits of that memory
- `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single `uint32_t` was specified in their place
 - `instanceShaderBindingTableRecordOffset` occupies the 24 least significant bits of that memory
 - `flags` occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

The transform for a matrix motion instance at a point in time is derived by component-wise linear interpolation of the two transforms. That is, for a `time` in [0,1] the resulting transform is

`transformT0 × (1 - time) + transformT1 × time`

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMatrixMotionInstanceNV-flags-parameter
`flags` **must** be a valid combination of `VkGeometryInstanceFlagBitsKHR` values

An acceleration structure SRT motion instance is defined by the structure:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureSRTMotionInstanceNV {
    VkSRTDataNV          transformT0;
    VkSRTDataNV          transformT1;
    uint32_t              instanceCustomIndex:24;
    uint32_t              mask:8;
    uint32_t              instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t              accelerationStructureReference;
} VkAccelerationStructureSRTMotionInstanceNV;
```

- `transformT0` is a `VkSRTDataNV` structure describing a transformation to be applied to the acceleration structure at time 0.
- `transformT1` is a `VkSRTDataNV` structure describing a transformation to be applied to the acceleration structure at time 1.

- `instanceCustomIndex` is a 24-bit user-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.
- `mask` is an 8-bit visibility mask for the geometry. The instance **may** only be hit if `Cull Mask & instance.mask != 0`
- `instanceShaderBindingTableRecordOffset` is a 24-bit offset used in calculating the hit shader binding table index.
- `flags` is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.
- `accelerationStructureReference` is either:
 - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
 - a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
 - `instanceCustomIndex` occupies the 24 least significant bits of that memory
 - `mask` occupies the 8 most significant bits of that memory
- `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single `uint32_t` was specified in their place
 - `instanceShaderBindingTableRecordOffset` occupies the 24 least significant bits of that memory
 - `flags` occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

The transform for a SRT motion instance at a point in time is derived from component-wise linear interpolation of the two SRT transforms. That is, for a `time` in [0,1] the resulting transform is

$$\text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time}$$

Valid Usage (Implicit)

- VUID-VkAccelerationStructureSRTMotionInstanceNV-flags-parameter
`flags` **must** be a valid combination of `VkGeometryInstanceFlagBitsKHR` values

An acceleration structure SRT transform is defined by the structure:

```

// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkSRTDataNV {
    float     sx;
    float     a;
    float     b;
    float     pvx;
    float     sy;
    float     c;
    float     pvy;
    float     sz;
    float     pvz;
    float     qx;
    float     qy;
    float     qz;
    float     qw;
    float     tx;
    float     ty;
    float     tz;
} VkSRTDataNV;

```

- **sx** is the x component of the scale of the transform
- **a** is one component of the shear for the transform
- **b** is one component of the shear for the transform
- **pxx** is the x component of the pivot point of the transform
- **sy** is the y component of the scale of the transform
- **c** is one component of the shear for the transform
- **pvy** is the y component of the pivot point of the transform
- **sz** is the z component of the scale of the transform
- **pvz** is the z component of the pivot point of the transform
- **qx** is the x component of the rotation quaternion
- **qy** is the y component of the rotation quaternion
- **qz** is the z component of the rotation quaternion
- **qw** is the w component of the rotation quaternion
- **tx** is the x component of the post-rotation translation
- **ty** is the y component of the post-rotation translation
- **tz** is the z component of the post-rotation translation

This transform decomposition consists of three elements. The first is a matrix S, consisting of a scale, shear, and translation, usually used to define the pivot point of the following rotation. This matrix is constructed from the parameters above by:

$$S = \begin{pmatrix} sx & a & b & p_{vx} \\ 0 & sy & c & p_{vy} \\ 0 & 0 & sz & p_{vz} \end{pmatrix}$$

The rotation quaternion is defined as:

$$R = [qx, qy, qz, qw]$$

This is a rotation around a conceptual normalized axis [ax, ay, az] of amount `theta` such that:

$$[qx, qy, qz] = \sin(\text{theta}/2) \times [ax, ay, az]$$

and

$$qw = \cos(\text{theta}/2)$$

Finally, the transform has a translation T constructed from the parameters above by:

$$T = \begin{pmatrix} 1 & 0 & 0 & tx \\ 0 & 1 & 0 & ty \\ 0 & 0 & 1 & tz \end{pmatrix}$$

The effective derived transform is then given by

$$T \times R \times S$$

`VkAccelerationStructureBuildRangeInfoKHR` is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
    uint32_t primitiveCount;
    uint32_t primitiveOffset;
    uint32_t firstVertex;
    uint32_t transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- `primitiveCount` defines the number of primitives for a corresponding acceleration structure geometry.
- `primitiveOffset` defines an offset in bytes into the memory where primitive data is defined.
- `firstVertex` is the index of the first vertex to build from for triangle geometry.
- `transformOffset` defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the `VkGeometryTypeKHR` used:

- For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `primitiveCount` is the number of

triangles to be built, where each triangle is treated as 3 vertices.

- If the geometry uses indices, `primitiveCount` × 3 indices are consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, starting at an offset of `primitiveOffset`. The value of `firstVertex` is added to the index values before fetching vertices.
 - If the geometry does not use indices, `primitiveCount` × 3 vertices are consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, starting at an offset of `primitiveOffset` + `VkAccelerationStructureGeometryTrianglesDataKHR::vertexStride` × `firstVertex`.
 - If `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` is not `NULL`, a single `VkTransformMatrixKHR` structure is consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, at an offset of `transformOffset`. This matrix describes a transformation from the space in which the vertices for all triangles in this geometry are described to the space in which the acceleration structure is defined.
- For geometries of type `VK_GEOMETRY_TYPE_AABBS_KHR`, `primitiveCount` is the number of axis-aligned bounding boxes. `primitiveCount` `VkAabbPositionsKHR` structures are consumed from `VkAccelerationStructureGeometryAabbsDataKHR::data`, starting at an offset of `primitiveOffset`.
 - For geometries of type `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `primitiveCount` is the number of acceleration structures. `primitiveCount` `VkAccelerationStructureInstanceKHR` or `VkAccelerationStructureMotionInstanceNV` structures are consumed from `VkAccelerationStructureGeometryInstancesDataKHR::data`, starting at an offset of `primitiveOffset`.

Valid Usage

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03656
For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the geometry uses indices, the offset `primitiveOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::indexData` **must** be a multiple of the element size of `VkAccelerationStructureGeometryTrianglesDataKHR::indexType`
- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03657
For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the geometry does not use indices, the offset `primitiveOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData` **must** be a multiple of the component size of `VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat`
- VUID-VkAccelerationStructureBuildRangeInfoKHR-transformOffset-03658
For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the offset `transformOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` **must** be a multiple of 16
- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659
For geometries of type `VK_GEOMETRY_TYPE_AABBS_KHR`, the offset `primitiveOffset` from `VkAccelerationStructureGeometryAabbsDataKHR::data` **must** be a multiple of 8
- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03660
For geometries of type `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the offset `primitiveOffset` from `VkAccelerationStructureGeometryInstancesDataKHR::data` **must** be a multiple of 16

36.1.7. Copying Acceleration Structures

An additional command exists for copying acceleration structures without updating their contents. The acceleration structure object **can** be compacted in order to improve performance. Before copying, an application **must** query the size of the resulting acceleration structure.

To query acceleration structure size parameters call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdWriteAccelerationStructuresPropertiesKHR(
    VkCommandBuffer                                     commandBuffer,
    uint32_t                                            accelerationStructureCount,
    const VkAccelerationStructureKHR*                  pAccelerationStructures,
    VkQueryType                                         queryType,
    VkQueryPool                                         queryPool,
    uint32_t                                            firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration

structures.

- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `accelerationStructureCount` number of results.

Accesses to any of the acceleration structures listed in `pAccelerationStructures` **must** be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

- If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then the value written out is the number of bytes required by a compacted acceleration structure.
- If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then the value written out is the number of bytes required by a serialized acceleration structure.

Valid Usage

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02493
`queryPool` **must** have been created with a `queryType` matching `queryType`
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02494
The queries identified by `queryPool` and `firstQuery` **must** be *unavailable*
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-buffer-03736
The `buffer` used to create each acceleration structure in `pAccelerationStructures` **must** be bound to device memory
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-query-04880
The sum of `query` plus `accelerationStructureCount` **must** be less than or equal to the number of queries in `queryPool`
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964
All acceleration structures in `pAccelerationStructures` **must** have been built prior to the execution of this command
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431
All acceleration structures in `pAccelerationStructures` **must** have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-03432
`queryType` **must** be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

Valid Usage (Implicit)

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter
pAccelerationStructures **must** be a valid pointer to an array of **accelerationStructureCount** valid [VkAccelerationStructureKHR](#) handles
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-parameter
queryType **must** be a valid [VkQueryType](#) value
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-parameter
queryPool **must** be a valid [VkQueryPool](#) handle
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-recording
commandBuffer **must** be in the [recording](#) state
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support compute operations
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
accelerationStructureCount **must** be greater than **0**
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commonparent
Each of **commandBuffer**, **queryPool**, and the elements of **pAccelerationStructures** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

To query acceleration structure size parameters call:

```

// Provided by VK_NV_ray_tracing
void vkCmdWriteAccelerationStructuresPropertiesNV(
    VkCommandBuffer
    uint32_t
    const VkAccelerationStructureNV*
    VkQueryType
    VkQueryPool
    uint32_t
                                commandBuffer,
                                accelerationStructureCount,
                                pAccelerationStructures,
                                queryType,
                                queryPool,
                                firstQuery);

```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `accelerationStructureCount` number of results.

Accesses to any of the acceleration structures listed in `pAccelerationStructures` **must** be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

Valid Usage

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03755
`queryPool` **must** have been created with a `queryType` matching `queryType`
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03756
The queries identified by `queryPool` and `firstQuery` **must** be *unavailable*
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructure-03757
`accelerationStructure` **must** be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-04958
All acceleration structures in `pAccelerationStructures` **must** have been built prior to the execution of this command
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-06215
All acceleration structures in `pAccelerationStructures` **must** have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-06216
`queryType` **must** be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

Valid Usage (Implicit)

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-parameter
pAccelerationStructures **must** be a valid pointer to an array of **accelerationStructureCount** valid [VkAccelerationStructureNV](#) handles
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-parameter
queryType **must** be a valid [VkQueryType](#) value
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-parameter
queryPool **must** be a valid [VkQueryPool](#) handle
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support compute operations
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructureCount-arraylength
accelerationStructureCount **must** be greater than **0**
- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commonparent
Each of **commandBuffer**, **queryPool**, and the elements of **pAccelerationStructures** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

To copy an acceleration structure call:

```
// Provided by VK_NV_ray_tracing
void vkCmdCopyAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkCopyAccelerationStructureModeKHR mode);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **dst** is the target acceleration structure for the copy.
- **src** is the source acceleration structure for the copy.
- **mode** is a [VkCopyAccelerationStructureModeKHR](#) value specifying additional operations to perform during the copy.

Accesses to **src** and **dst** **must** be synchronized with the [VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR](#) pipeline stage and an access type of [VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR](#) or [VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR](#) as appropriate.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureNV-mode-03410
mode **must** be [VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR](#) or [VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR](#)
- VUID-vkCmdCopyAccelerationStructureNV-src-04963
The source acceleration structure **src** **must** have been constructed prior to the execution of this command
- VUID-vkCmdCopyAccelerationStructureNV-src-03411
If **mode** is [VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR](#), **src** **must** have been constructed with [VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR](#) in the build
- VUID-vkCmdCopyAccelerationStructureNV-buffer-03718
The **buffer** used to create **src** **must** be bound to device memory
- VUID-vkCmdCopyAccelerationStructureNV-buffer-03719
The **buffer** used to create **dst** **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdCopyAccelerationStructureNV-dst-parameter
dst **must** be a valid [VkAccelerationStructureNV](#) handle
- VUID-vkCmdCopyAccelerationStructureNV-src-parameter
src **must** be a valid [VkAccelerationStructureNV](#) handle
- VUID-vkCmdCopyAccelerationStructureNV-mode-parameter
mode **must** be a valid [VkCopyAccelerationStructureModeKHR](#) value
- VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support compute operations
- VUID-vkCmdCopyAccelerationStructureNV-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyAccelerationStructureNV-commonparent
Each of **commandBuffer**, **dst**, and **src** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

To copy an acceleration structure call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

This command copies the `pInfo->src` acceleration structure to the `pInfo->dst` acceleration structure in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` **must** be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03737
The `buffer` used to create `pInfo->src` **must** be bound to device memory
- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03738
The `buffer` used to create `pInfo->dst` **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyAccelerationStructureKHR-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkCopyAccelerationStructureInfoKHR` structure
- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdCopyAccelerationStructureKHR-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

The `VkCopyAccelerationStructureInfoKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureInfoKHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkAccelerationStructureKHR  src;
    VkAccelerationStructureKHR  dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyAccelerationStructureInfoKHR-mode-03410
 - mode must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` or `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR`
- VUID-VkCopyAccelerationStructureInfoKHR-src-04963
 - The source acceleration structure `src` must have been constructed prior to the execution of this command
- VUID-VkCopyAccelerationStructureInfoKHR-src-03411
 - If mode is `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR`, `src` must have been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` in the build
- VUID-VkCopyAccelerationStructureInfoKHR-buffer-03718
 - The buffer used to create `src` must be bound to device memory
- VUID-VkCopyAccelerationStructureInfoKHR-buffer-03719
 - The buffer used to create `dst` must be bound to device memory

Valid Usage (Implicit)

- VUID-VkCopyAccelerationStructureInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_INFO_KHR`
- VUID-VkCopyAccelerationStructureInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkCopyAccelerationStructureInfoKHR-src-parameter
src **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-VkCopyAccelerationStructureInfoKHR-dst-parameter
dst **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-VkCopyAccelerationStructureInfoKHR-mode-parameter
mode **must** be a valid `VkCopyAccelerationStructureModeKHR` value
- VUID-VkCopyAccelerationStructureInfoKHR-commonparent
Both of **dst**, and **src** **must** have been created, allocated, or retrieved from the same `VkDevice`

Possible values of **mode** specifying additional operations to perform during the copy, are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkCopyAccelerationStructureModeKHR {
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR = 0,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR = 1,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR = 2,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR = 3,
    // Provided by VK_NV_ray_tracing
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_NV =
VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR,
    // Provided by VK_NV_ray_tracing
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_NV =
VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR,
} VkCopyAccelerationStructureModeKHR;
```

or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkCopyAccelerationStructureModeKHR VkCopyAccelerationStructureModeNV;
```

- `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR` creates a direct copy of the acceleration structure specified in **src** into the one specified by **dst**. The **dst** acceleration structure **must** have been created with the same parameters as **src**. If **src** contains references to other acceleration structures, **dst** will reference the same acceleration structures.
- `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` creates a more compact version of an acceleration structure **src** into **dst**. The acceleration structure **dst** **must** have been created with

a size at least as large as that returned by [vkCmdWriteAccelerationStructuresPropertiesKHR](#) or [vkWriteAccelerationStructuresPropertiesKHR](#) after the build of the acceleration structure specified by `src`. If `src` contains references to other acceleration structures, `dst` will reference the same acceleration structures.

- `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR` serializes the acceleration structure to a semi-opaque format which can be reloaded on a compatible implementation.
- `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR` deserializes the semi-opaque serialization format in the buffer to the acceleration structure.

To copy an acceleration structure to device memory call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureToMemoryKHR(
    VkCommandBuffer                                     commandBuffer,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is an a pointer to a [VkCopyAccelerationStructureToMemoryInfoKHR](#) structure defining the copy operation.

Accesses to `pInfo->src` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`. Accesses to the buffer indicated by `pInfo->dst.deviceAddress` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_TRANSFER_WRITE_BIT`.

This command produces the same results as [vkCopyAccelerationStructureToMemoryKHR](#), but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either [vkCmdCopyMemoryToAccelerationStructureKHR](#) or [vkCopyMemoryToAccelerationStructureKHR](#).

The defined header structure for the serialized data consists of:

- `VK_UUID_SIZE` bytes of data matching `VkPhysicalDeviceIDProperties::driverUUID`
- `VK_UUID_SIZE` bytes of data identifying the compatibility for comparison using [vkGetDeviceAccelerationStructureCompatibilityKHR](#)
- A 64-bit integer of the total size matching the value queried using `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`
- A 64-bit integer of the serialized size to be passed in to `VkAccelerationStructureCreateInfoKHR ::size`
- A 64-bit integer of the count of the number of acceleration structure handles following. This will be zero for a bottom-level acceleration structure. For top-level acceleration structures this number is implementation-dependent; the number of and ordering of the handles may not match the instance descriptions which were used to build the acceleration structure.

The corresponding handles matching the values returned by [vkGetAccelerationStructureDeviceAddressKHR](#) or [vkGetAccelerationStructureHandleNV](#) are tightly packed in the buffer following the count. The application is expected to store a mapping between those handles and the original application-generated bottom-level acceleration structures to provide when deserializing. The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03739
`pInfo->dst.deviceAddress` **must** be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03740
`pInfo->dst.deviceAddress` **must** be aligned to 256 bytes
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03741
If the buffer pointed to by `pInfo->dst.deviceAddress` is non-sparse then it **must** be bound completely and contiguously to a single [VkDeviceMemory](#) object
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-None-03559
The `buffer` used to create `pInfo->src` **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-parameter
`commandBuffer` **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid [VkCopyAccelerationStructureToMemoryInfoKHR](#) structure
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the [VkCommandPool](#) that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureToMemoryInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkAccelerationStructureKHR src;
    VkDeviceOrHostAddressKHR  dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureToMemoryInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy
- `dst` is the device or host address to memory which is the target for the copy
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-04959

The source acceleration structure `src` **must** have been constructed prior to the execution of this command

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-dst-03561

The memory pointed to by `dst` **must** be at least as large as the serialization size of `src`, as reported by `vkWriteAccelerationStructuresPropertiesKHR` or `vkCmdWriteAccelerationStructuresPropertiesKHR` with a query type of `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-03412

`mode` **must** be `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`

Valid Usage (Implicit)

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR`
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-parameter
src **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-parameter
mode **must** be a valid `VkCopyAccelerationStructureModeKHR` value

To copy device memory to an acceleration structure call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyMemoryToAccelerationStructureKHR(
    VkCommandBuffer                                     commandBuffer,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pInfo** is a pointer to a `VkCopyMemoryToAccelerationStructureInfoKHR` structure defining the copy operation.

Accesses to `pInfo->dst` **must** be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`. Accesses to the buffer indicated by `pInfo->src.deviceAddress` **must** be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_TRANSFER_READ_BIT`.

This command can accept acceleration structures produced by either `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`.

The structure provided as input to deserialize is as described in `vkCmdCopyAccelerationStructureToMemoryKHR`, with any acceleration structure handles filled in with the newly-queried handles to bottom level acceleration structures created before deserialization. These do not need to be built at deserialize time, but **must** be created.

Valid Usage

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03742
`pInfo->src.deviceAddress` **must** be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03743
`pInfo->src.deviceAddress` **must** be aligned to 256 bytes
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03744
If the buffer pointed to by `pInfo->src.deviceAddress` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-buffer-03745
The `buffer` used to create `pInfo->dst` **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkCopyMemoryToAccelerationStructureInfoKHR` structure
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

The `VkCopyMemoryToAccelerationStructureInfoKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyMemoryToAccelerationStructureInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyMemoryToAccelerationStructureInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the device or host address to memory containing the source data for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-src-04960
The source memory pointed to by `src` **must** contain data previously serialized using `vkCmdCopyAccelerationStructureToMemoryKHR`, potentially modified to relocate acceleration structure references as described in that command
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-03413
`mode` **must** be `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR`
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pInfo-03414
The data in `src` **must** have a format compatible with the destination physical device as returned by `vkGetDeviceAccelerationStructureCompatibilityKHR`
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-03746
`dst` **must** have been created with a `size` greater than or equal to that used to serialize the data in `src`

Valid Usage (Implicit)

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_COPY_MEMORY_TO_ACCELERATION_STRUCTURE_INFO_KHR`
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-parameter
dst **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-parameter
mode **must** be a valid `VkCopyAccelerationStructureModeKHR` value

To check if a serialized acceleration structure is compatible with the current device call:

```
// Provided by VK_KHR_acceleration_structure
void vkGetDeviceAccelerationStructureCompatibilityKHR(
    VkDevice device,
    const VkAccelerationStructureVersionInfoKHR* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- **device** is the device to check the version against.
- **pVersionInfo** is a pointer to a `VkAccelerationStructureVersionInfoKHR` structure specifying version information to check against the device.
- **pCompatibility** is a pointer to a `VkAccelerationStructureCompatibilityKHR` value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-rayTracingPipeline-03661
The `rayTracingPipeline` or `rayQuery` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pVersionInfo-parameter
pVersionInfo **must** be a valid pointer to a valid `VkAccelerationStructureVersionInfoKHR` structure
- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pCompatibility-parameter
pCompatibility **must** be a valid pointer to a `VkAccelerationStructureCompatibilityKHR` value

The `VkAccelerationStructureVersionInfoKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureVersionInfoKHR {
    VkStructureType      sType;
    const void*         pNext;
    const uint8_t*       pVersionData;
} VkAccelerationStructureVersionInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pVersionData` is a pointer to the version header of an acceleration structure as defined in [vkCmdCopyAccelerationStructureToMemoryKHR](#)

Note

`pVersionData` is a *pointer* to an array of $2 * \text{VK_UUID_SIZE}$ `uint8_t` values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of an previously serialized acceleration structure (via [vkCmdCopyAccelerationStructureToMemoryKHR](#) or [vkCopyAccelerationStructureToMemoryKHR](#)) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureVersionInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR`
- VUID-VkAccelerationStructureVersionInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkAccelerationStructureVersionInfoKHR-pVersionData-parameter
`pVersionData` **must** be a valid pointer to an array of $2 \times \text{VK_UUID_SIZE}$ `uint8_t` values

Possible values of `pCompatibility` returned by [vkGetDeviceAccelerationStructureCompatibilityKHR](#) are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCompatibilityKHR {
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR = 0,
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR = 1,
} VkAccelerationStructureCompatibilityKHR;
```

- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR` if the `pVersionData` version acceleration structure is compatible with `device`.
- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR` if the `pVersionData` version

acceleration structure is not compatible with `device`.

36.2. Host Acceleration Structure Operations

Implementations are also required to provide host implementations of the acceleration structure operations if the `accelerationStructureHostCommands` feature is enabled:

- `vkBuildAccelerationStructuresKHR` corresponding to `vkCmdBuildAccelerationStructuresKHR`
- `vkCopyAccelerationStructureKHR` corresponding to `vkCmdCopyAccelerationStructureKHR`
- `vkCopyAccelerationStructureToMemoryKHR` corresponding to `vkCmdCopyAccelerationStructureToMemoryKHR`
- `vkCopyMemoryToAccelerationStructureKHR` corresponding to `vkCmdCopyMemoryToAccelerationStructureKHR`
- `vkWriteAccelerationStructuresPropertiesKHR` corresponding to `vkCmdWriteAccelerationStructuresPropertiesKHR`

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All acceleration structures used by the host commands **must** be bound to host-visible memory, and all input data for acceleration structure builds **must** be referenced using host addresses instead of device addresses. Applications are not required to map acceleration structure memory when using the host commands.

Note

The `vkBuildAccelerationStructuresKHR` and `vkCmdBuildAccelerationStructuresKHR` **may** use different algorithms, and thus are not required to produce identical structures. The structures produced by these two commands **may** exhibit different memory footprints or traversal performance, but should strive to be similar where possible.

Apart from these details, the host and device operations are interchangeable. For example, an application **can** use `vkBuildAccelerationStructuresKHR` to build a structure, compact it on the device using `vkCmdCopyAccelerationStructureKHR`, and serialize the result using `vkCopyAccelerationStructureToMemoryKHR`.

Note

For efficient execution, acceleration structures manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build acceleration structures on the host, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkBuildAccelerationStructuresKHR(
    VkDevice                                     device,
    VkDeferredOperationKHR                      deferredOperation,
    uint32_t                                      infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `device` is the `VkDevice` for which the acceleration structures are being built.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that **must** be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

This command fulfills the same task as `vkCmdBuildAccelerationStructuresKHR` but is executed by the host.

The `vkBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

Note

This means that an application **cannot** build a top-level acceleration structure in the same `vkBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also **cannot** be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Valid Usage

- VUID-vkBuildAccelerationStructuresKHR-mode-04628
The `mode` member of each element of `pInfos` **must** be a valid `VkBuildAccelerationStructureModeKHR` value
- VUID-vkBuildAccelerationStructuresKHR-srcAccelerationStructure-04629
If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-vkBuildAccelerationStructuresKHR-pInfos-04630
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** not be `VK_NULL_HANDLE`
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03403
The `srcAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03698
The `dstAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03800
The `dstAccelerationStructure` member of any element of `pInfos` **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03699
For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03700
For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03663
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, `inactive` primitives in its `srcAccelerationStructure` member **must** not be made active
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03664
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member **must** not be made `inactive`

- VUID-vkBuildAccelerationStructuresKHR-None-03407

The `dstAccelerationStructure` member of any element of `pInfos` **must** not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03701

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03702

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03703

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-scratchData-03704

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-scratchData-03705

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `srcAccelerationStructure` member of any element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` (including the same element), which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03706

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03667

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03668

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members **must** either be the same

[VkAccelerationStructureKHR](#), or not have any [memory aliasing](#)

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03758
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03759
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03760
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03761
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03762
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03763
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03764
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03765
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified

when `srcAccelerationStructure` was last built

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03766
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was `NULL` when `srcAccelerationStructure` was last built, then it **must** be `NULL`
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03767
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not `NULL` when `srcAccelerationStructure` was last built, then it **must** not be `NULL`
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03768
 - For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-primitiveCount-03769
 - For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-firstVertex-03770
 - For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03801
 - For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppBuildRangeInfos[i][j].primitiveCount` **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03675
 - For each `pInfos[i]`, `dstAccelerationStructure` **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in $[0, pInfos[i].geometryCount)$
- VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676

Each element of `ppBuildRangeInfos[i]` **must** be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures

- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-03677
If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object
- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-03678
Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03722
For each element of `pInfos`, the `buffer` used to create its `dstAccelerationStructure` member **must** be bound to host-visible device memory
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03723
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the `buffer` used to create its `srcAccelerationStructure` member **must** be bound to host-visible device memory
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03724
For each element of `pInfos`, the `buffer` used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to host-visible device memory
- VUID-vkBuildAccelerationStructuresKHR-accelerationStructureHostCommands-03581
The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03725
If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` **must** be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03726
If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` **must** be valid host memory, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03771
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.hostAddress` **must** be a valid host address
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03772
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of

`VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.hostAddress` **must** be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03773

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.hostAddress` is not `0`, it **must** be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03774

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.hostAddress` **must** be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03775

For each element of `pInfos`, the `buffer` used to create its `dstAccelerationStructure` member **must** be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03776

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the `buffer` used to create its `srcAccelerationStructure` member **must** be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03777

For each element of `pInfos`, the `buffer` used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03778

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `geometry.instances.data.hostAddress` **must** be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03779

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.hostAddress` must be a valid `VkAccelerationStructureKHR` object

- VUID-vkBuildAccelerationStructuresKHR-pInfos-04930

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` with `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` set, each `accelerationStructureReference` in any structure in `VkAccelerationStructureMotionInstanceNV` value in `geometry.instances.data.hostAddress` must be a valid `VkAccelerationStructureKHR` object

Valid Usage (Implicit)

- VUID-vkBuildAccelerationStructuresKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parameter
If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkBuildAccelerationStructuresKHR-pInfos-parameter
`pInfos` **must** be a valid pointer to an array of `infoCount` valid `VkAccelerationStructureBuildGeometryInfoKHR` structures
- VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter
`ppBuildRangeInfos` **must** be a valid pointer to an array of `infoCount` `VkAccelerationStructureBuildRangeInfoKHR` structures
- VUID-vkBuildAccelerationStructuresKHR-infoCount-arraylength
`infoCount` **must** be greater than `0`
- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parent
If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy or compact an acceleration structure on the host, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureKHR(
    VkDevice                                     device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- `device` is the device which owns the acceleration structures.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.

- `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureKHR` but is executed by the host.

Valid Usage

- VUID-vkCopyAccelerationStructureKHR-deferredOperation-03677
If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object
- VUID-vkCopyAccelerationStructureKHR-deferredOperation-03678
Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkCopyAccelerationStructureKHR-buffer-03727
The `buffer` used to create `pInfo->src` **must** be bound to host-visible device memory
- VUID-vkCopyAccelerationStructureKHR-buffer-03728
The `buffer` used to create `pInfo->dst` **must** be bound to host-visible device memory
- VUID-vkCopyAccelerationStructureKHR-accelerationStructureHostCommands-03582
The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled
- VUID-vkCopyAccelerationStructureKHR-buffer-03780
The `buffer` used to create `pInfo->src` **must** be bound to memory that was not allocated with multiple instances
- VUID-vkCopyAccelerationStructureKHR-buffer-03781
The `buffer` used to create `pInfo->dst` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyAccelerationStructureKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCopyAccelerationStructureKHR-deferredOperation-parameter
If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkCopyAccelerationStructureKHR-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkCopyAccelerationStructureInfoKHR` structure
- VUID-vkCopyAccelerationStructureKHR-deferredOperation-parent
If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to an acceleration structure, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyMemoryToAccelerationStructureKHR(
    VkDevice                                     device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- **device** is the device which owns **pInfo->dst**.
- **deferredOperation** is an optional **VkDeferredOperationKHR** to request deferral for this command.
- **pInfo** is a pointer to a **VkCopyMemoryToAccelerationStructureInfoKHR** structure defining the copy operation.

This command fulfills the same task as [vkCmdCopyMemoryToAccelerationStructureKHR](#) but is executed by the host.

This command can accept acceleration structures produced by either [vkCmdCopyAccelerationStructureToMemoryKHR](#) or [vkCopyAccelerationStructureToMemoryKHR](#).

Valid Usage

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03677
If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object
- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03678
Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03729
`pInfo->src.hostAddress` **must** be a valid host pointer
- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03750
`pInfo->src.hostAddress` **must** be aligned to 16 bytes
- VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03730
The `buffer` used to create `pInfo->dst` **must** be bound to host-visible device memory
- VUID-vkCopyMemoryToAccelerationStructureKHR-accelerationStructureHostCommands-03583
The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled
- VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03782
The `buffer` used to create `pInfo->dst` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyMemoryToAccelerationStructureKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parameter
If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkCopyMemoryToAccelerationStructureInfoKHR` structure
- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parent
If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy an acceleration structure to host accessible memory, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureToMemoryKHR(
    VkDevice                                     device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- **device** is the device which owns `pInfo->src`.
- **deferredOperation** is an optional `VkDeferredOperationKHR` to request deferral for this command.
- **pInfo** is a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureToMemoryKHR` but is executed by the host.

This command produces the same results as `vkCmdCopyAccelerationStructureToMemoryKHR`, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output **may** not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToAccelerationStructureKHR` or `vkCopyMemoryToAccelerationStructureKHR`.

Valid Usage

- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03677
If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object
- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03678
Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03731
The `buffer` used to create `pInfo->src` **must** be bound to host-visible device memory
- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03732
`pInfo->dst.hostAddress` **must** be a valid host pointer
- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03751
`pInfo->dst.hostAddress` **must** be aligned to 16 bytes
- VUID-vkCopyAccelerationStructureToMemoryKHR-accelerationStructureHostCommands-03584
The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled
- VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03783
The `buffer` used to create `pInfo->src` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyAccelerationStructureToMemoryKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parameter
If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkCopyAccelerationStructureToMemoryInfoKHR` structure
- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parent
If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query acceleration structure size parameters on the host, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkWriteAccelerationStructuresPropertiesKHR(
    VkDevice device,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    size_t dataSize,
    void* pData,
    size_t stride);
```

- **device** is the device which owns the acceleration structures in **pAccelerationStructures**.
- **accelerationStructureCount** is the count of acceleration structures for which to query the property.
- **pAccelerationStructures** is a pointer to an array of existing previously built acceleration structures.
- **queryType** is a [VkQueryType](#) value specifying the property to be queried.
- **dataSize** is the size in bytes of the buffer pointed to by **pData**.
- **pData** is a pointer to a user-allocated buffer where the results will be written.
- **stride** is the stride in bytes between results for individual queries within **pData**.

This command fulfills the same task as [vkCmdWriteAccelerationStructuresPropertiesKHR](#) but is executed by the host.

Valid Usage

- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964
All acceleration structures in `pAccelerationStructures` **must** have been built prior to the execution of this command
- VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431
All acceleration structures in `pAccelerationStructures` **must** have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03432
`queryType` **must** be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03448
If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `stride` **must** be a multiple of the size of `VkDeviceSize`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03449
If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `data` **must** point to a `VkDeviceSize`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03450
If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then `stride` **must** be a multiple of the size of `VkDeviceSize`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03451
If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then `data` **must** point to a `VkDeviceSize`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-03452
`dataSize` **must** be greater than or equal to `accelerationStructureCount*stride`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03733
The `buffer` used to create each acceleration structure in `pAccelerationStructures` **must** be bound to host-visible device memory
- VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureHostCommands-03585
The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled
- VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03784
The `buffer` used to create each acceleration structure in `pAccelerationStructures` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkWriteAccelerationStructuresPropertiesKHR-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter
pAccelerationStructures **must** be a valid pointer to an array of **accelerationStructureCount** valid `VkAccelerationStructureKHR` handles
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-parameter
queryType **must** be a valid `VkQueryType` value

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Chapter 37. Ray Traversal

The ray traversal process identifies and handles intersections between a ray and geometries in an acceleration structure.

Ray traversal cannot be started by a Vulkan API command directly - a shader must execute `OpRayQueryProceedKHR` or `OpTraceRayKHR`. When the `rayTracingPipeline` feature is enabled, `OpTraceRayKHR` can be used for `ray tracing` in a `ray tracing pipeline`. When the `rayQuery` feature is enabled, `OpRayQueryProceedKHR` can be used in any shader stage.

37.1. Ray Intersection Candidate Determination

Once tracing begins, rays are first tested against instances in a top-level acceleration structure. A ray that intersects an instance will be transformed into the space of the instance to continue traversal within that instance; therefore the transform matrix stored in the instance must be invertible.

Next, rays are tested against geometries in an bottom-level acceleration structure to determine if a hit occurred between them, initially based only on their geometric properties (i.e. their vertices). The implementation performs similar operations to that of rasterization, but with the effective viewport determined by the parameters of the ray, and the geometry transformed into a space determined by that viewport.

The vertices of each primitive are transformed from acceleration structure space `as` to ray space `r` according to the ray origin and direction as follows:

$$\begin{pmatrix} x_r \\ y_r \\ z_r \end{pmatrix} = \begin{pmatrix} a_x^2(1-c) + c & a_x a_y(1-c) - s a_z & a_x a_z(1-c) + s a_y \\ a_x a_y(1-c) + s a_z & a_y^2(1-c) + c & a_y a_z(1-c) - s a_x \\ a_x a_z(1-c) - s a_y & a_y a_z(1-c) + s a_x & a_z^2(1-c) + c \end{pmatrix} \begin{pmatrix} x_{as} - o_x \\ y_{as} - o_y \\ z_{as} - o_z \end{pmatrix}$$

a is the axis of rotation from the unnormalized ray direction vector **d** to the axis vector **k**:

$$\mathbf{a} = \begin{cases} \frac{\mathbf{d} \times \mathbf{k}}{\|\mathbf{d} \times \mathbf{k}\|} & \text{if } \|\mathbf{d} \times \mathbf{k}\| \neq 0 \\ \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} & \text{if } \|\mathbf{d} \times \mathbf{k}\| = 0 \end{cases}$$

s and *c* are the sine and cosine of the angle of rotation about **a** from **d** to **k**:

$$c = \frac{\mathbf{d} \cdot \mathbf{k}}{\|\mathbf{d}\|}$$
$$s = \sqrt{1 - c^2}$$

k is the unit vector:

$$\mathbf{k} = \begin{pmatrix} 0 \\ 0 \\ -1 \end{pmatrix}$$

o and **d** are the ray origin and unnormalized direction, respectively; the vector described by x_{as} , y_{as} ,

and \mathbf{z}_{as} is any position in acceleration structure space; and the vector described by \mathbf{x}_r , \mathbf{y}_r , and \mathbf{z}_r is the same position in ray space.

An *intersection candidate* is a unique point of intersection between a ray and a geometric primitive. For any primitive that has within its bounds a position \mathbf{xyz}_{as} such that

$$\begin{aligned} \mathbf{x}_r &= 0 \\ \mathbf{y}_r &= 0 \\ t_{min} < -\frac{z_r}{\|\mathbf{d}\|} &< t_{max} \quad \text{if the primitive is a triangle,} \\ t_{min} \leq -\frac{z_r}{\|\mathbf{d}\|} &\leq t_{max} \quad \text{otherwise} \end{aligned}$$

(where $t = -\frac{z_r}{\|\mathbf{d}\|}$), an intersection candidate exists.

Triangle primitive bounds consist of all points on the plane formed by the three vertices and within the bounds of the edges between the vertices, subject to the watertightness constraints below. AABB primitive bounds consist of all points within an implementation-defined bound which includes the specified box.

Note

The bounds of the AABB including all points internal to the bound implies that a ray started within the AABB will hit that AABB.

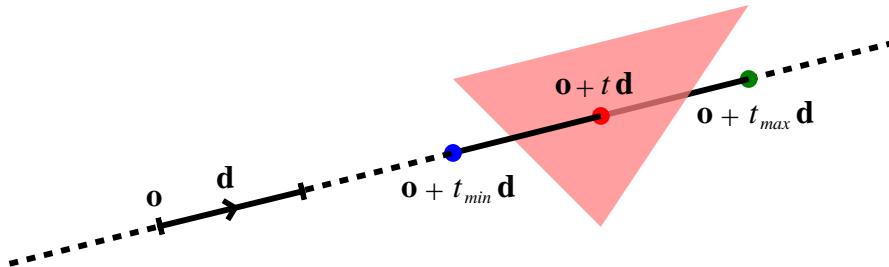

Figure 25. Ray intersection candidate

The determination of this condition is performed in an implementation specific manner, and **may** be performed with floating point operations. Due to the complexity and number of operations involved, inaccuracies are expected, particularly as the scale of values involved begins to diverge. Implementations **should** take efforts to maintain as much precision as possible.

Note

One very common case is when geometries are close to each other at some distance from the origin in acceleration structure space, where an effect similar to “z-fighting” is likely to be observed. Applications can mitigate this by ensuring their detailed geometries remain close to the origin.

Another likely case is when the origin of a ray is set to a position on a previously intersected surface, and its t_{min} is zero or near zero; an intersection may be detected on the emitting surface. This case can usually be mitigated by offsetting t_{min} slightly.

For a motion primitive or a motion instance, the positions for intersection are evaluated at the time

specified in the `time` parameter to `OpTraceRayMotionNV` by interpolating between the two endpoints as specified for the given motion type. If a motion acceleration structure is traced with `OpTraceRayKHR`, it behaves as a `OpTraceRayMotionNV` with `time` of 0.0.

In the case of AABB geometries, implementations **may** increase their size in an acceleration structure in order to mitigate precision issues. This **may** result in false positive intersections being reported to the application.

For triangle intersection candidates, the `b` and `c` barycentric coordinates on the triangle where the above condition is met are made available to future shading. If the ray was traced with `OpTraceRayKHR`, these values are available as a vector of 2 32-bit floating point values in the `HitAttributeKHR` storage class.

Once an intersection candidate is determined, it proceeds through the following operations, in order:

1. [Ray Intersection Culling](#)
2. [Ray Intersection Confirmation](#)
3. [Ray Closest Hit Determination](#)
4. [Ray Result Determination](#)

The sections below describe the exact details of these tests. There is no ordering guarantee between operations performed on different intersection candidates.

37.1.1. Watertightness

For a set of triangles with identical transforms, within a single instance:

- Any set of two or more triangles where all triangles have one vertex with an identical position value, that vertex is a *shared vertex*.
- Any set of two triangles with two shared vertices that were specified in the same [winding order](#) in each triangle have a *shared edge* defined by those vertices.

A *closed fan* is a set of three or more triangles where:

- All triangles in the set have the same shared vertex as one of their vertices.
- All edges that include the above vertex are shared edges.
- All above shared edges are shared by exactly two triangles from the set.
- No two triangles in the set intersect, except at shared edges.
- Every triangle in the set is joined to every other triangle in the set by a series of the above shared edges.

Implementations **should** not double-hit or miss when a ray intersects a shared edge, or a shared vertex of a closed fan.

37.2. Ray Intersection Culling

Candidate intersections go through several phases of culling before confirmation as an actual hit. There is no particular ordering dependency between the different culling operations.

37.2.1. Ray Primitive Culling

If the `rayTraversalPrimitiveCulling` or `rayQuery` features are enabled, the `SkipTrianglesKHR` and `SkipAABBSKHR` ray flags **can** be specified when tracing a ray. `SkipTrianglesKHR` and `SkipAABBSKHR` are mutually exclusive.

If `SkipTrianglesKHR` was included in the `Ray Flags` operand of the ray trace instruction, and the intersection is with a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs. If `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` was included in the pipeline, traversal with `OpTraceRayKHR` calls will all behave as if `SkipTrianglesKHR` was included in its `Ray Flags` operand.

If `SkipAABBSKHR` was included in the `Ray Flags` operand of the ray trace instruction, and the intersection is with an AABB primitive, the intersection is dropped, and no further processing of this intersection occurs. If `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` was included in the pipeline, traversal with `OpTraceRayKHR` calls will all behave as if `SkipAABBSKHR` was included in its `Ray Flags` operand.

37.2.2. Ray Mask Culling

Instances **can** be made invisible to particular rays based on the value of `VkAccelerationStructureInstanceKHR::mask` used to add that instance to a top-level acceleration structure, and the `Cull Mask` parameter used to trace the ray.

For the instance which is intersected, if `mask & Cull Mask == 0`, the intersection is dropped, and no further processing occurs.

37.2.3. Ray Face Culling

As in [polygon rasterization](#), one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives **can** be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

Determination

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for [rasterization](#), based on the sign of the polygon's area but using the ray space coordinates instead of framebuffer coordinates. One way to compute this area is:

$$a = -\frac{1}{2} \sum_{i=0}^{n-1} x_r^i y_r^{i+1} - x_r^{i+1} y_r^i$$

where x_r^i and y_r^i are the x and y [ray space coordinates](#) of the ith vertex of the n-vertex polygon

(vertices are numbered starting at zero for the purposes of this computation) and $i \oplus 1$ is $(i + 1) \bmod n$.

By default, if a is negative then the intersection is with the front face of the triangle, otherwise it is with the back face. If `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` is included in `VkAccelerationStructureInstanceKHR::flags` for the instance containing the intersected triangle, this determination is reversed. Additionally, if a is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

Note

In a left-handed coordinate system, an intersection will be with the front face of a triangle if the vertices of the triangle, as defined in index order, appear from the ray's perspective in a clockwise rotation order.

`VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` was previously annotated as `VK_GEOMETRY_INSTANCE_TRIANGLE_COUNTERCLOCKWISE_BIT_KHR` because of this.

If the ray was traced with `OpTraceRayKHR`, the `HitKindKHR` built-in is set to `HitKindFrontFacingTriangleKHR` if the intersection is with front-facing geometry, and `HitKindBackFacingTriangleKHR` if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with `OpRayQueryProceedKHR`, `OpRayQueryGetIntersectionFrontFaceKHR` will return true for intersection candidates with front faces, or false for back faces.

Culling

If `CullBackFacingTrianglesKHR` was included in the `Ray Flags` parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If `CullFrontFacingTrianglesKHR` was included in the `Ray Flags` parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if `VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR` was included in `VkAccelerationStructureInstanceKHR::flags` for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face ($a == 0$) are unconditionally culled, irrespective of ray flags and geometry instance flags.

37.2.4. Ray Opacity Culling

Each geometry in the acceleration structure **may** be considered either opaque or not. Opaque geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates **can** also be culled based on their opacity.

Determination

Each individual intersection candidate is initially determined as opaque if

`VK_GEOMETRY_OPAQUE_BIT_KHR` was included in the `VkAccelerationStructureGeometryKHR::flags` when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the intersection candidate was generated by an [intersection shader](#), the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` in `VkAccelerationStructureInstanceKHR::flags` will force all geometries in the instance to be considered opaque. Similarly, setting `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including `OpaqueKHR` or `NoOpaqueKHR` in the `Ray Flags` parameter when tracing a ray. `OpaqueKHR` forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, `NoOpaqueKHR` forces all geometries to behave as if they are non-opaque.

If the ray was traced with `OpRayQueryProceedKHR`, to determine the opacity of AABB intersection candidates, `OpRayQueryGetIntersectionCandidateAABBOpaqueKHR` **can** be used. This instruction will return `true` for opaque intersection candidates, and `false` for non-opaque intersection candidates.

Culling

If `CullOpaqueKHR` is included in the `Ray Flags` parameter when tracing a ray, an intersection with a geometry that is considered opaque is dropped, and no further processing occurs.

If `CullNoOpaqueKHR` is included in the `Ray Flags` parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

37.3. Ray Intersection Confirmation

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB, candidate intersections are further processed to determine the eventual hit result. Candidates generated from AABB intersections run through the same confirmation process as triangle hits.

37.3.1. AABB Intersection Candidates

For an intersection candidate with an AABB geometry generated by [Ray Intersection Candidate Determination](#), shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs. The occurrence of an AABB intersection candidate does not guarantee the ray intersects the primitive bounds. To avoid propagating false intersections the application **should** verify the intersection candidate before reporting any hits.

If the ray was traced with `OpTraceRayKHR`, an [intersection shader](#) is invoked from the [Shader Binding Table](#) according to the [specified indexing](#) for the intersected geometry. If this shader calls `OpReportIntersectionKHR`, a new intersection candidate is generated as described [below](#). If the intersection shader is `VK_SHADER_UNUSED_KHR` (which is only allowed for a zero shader group) then no further processing of the intersection candidate occurs.

Each new candidate generated as a result of this processing is a generated intersection candidate that intersects the AABB geometry, with a `t` value equal to the `Hit` parameter of the `OpReportIntersectionKHR` instruction. The new generated candidate is then independently run through [Ray Intersection Confirmation](#) as a [generated intersection](#).

If the ray was traced with `OpRayQueryProceedKHR`, control is returned to the shader which executed `OpRayQueryProceedKHR`, returning `true`. The resulting ray query has a candidate intersection type of `RayQueryCandidateIntersectionAABBKHR`. `OpRayQueryGenerateIntersectionKHR` **can** be called to commit a new intersection candidate with committed intersection type of `RayQueryCommittedIntersectionGeneratedKHR`. Further ray query processing **can** be continued by executing `OpRayQueryProceedKHR` with the same ray query, or intersection **can** be terminated with `OpRayQueryTerminateKHR`. Unlike rays traced with `OpTraceRayKHR`, candidates generated in this way skip generated intersection candidate confirmation; applications **should** make this determination before generating the intersection.

This operation **may** be executed multiple times for the same intersection candidate.

37.3.2. Triangle and Generated Intersection Candidates

For triangle and [generated intersection candidates](#), additional shader code **may** be executed based on the intersection's opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit occurred or not.

If the ray was traced with `OpTraceRayKHR`, an [any-hit shader](#) is invoked from the [Shader Binding Table](#) according to the specified indexing. If this shader calls `OpIgnoreIntersectionKHR`, the candidate is dropped and no further processing of the candidate occurs. If the [any-hit shader](#) identified is `VK_SHADER_UNUSED_KHR`, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with `OpRayQueryProceedKHR`, control is returned to the shader which executed `OpRayQueryProceedKHR`, returning `true`. As only triangle candidates participate in this operation with ray queries, the resulting candidate intersection type is always `RayQueryCandidateIntersectionTriangleKHR`. `OpRayQueryConfirmIntersectionKHR` **can** be called on the ray query to confirm the candidate as a hit with committed intersection type of `RayQueryCommittedIntersectionTriangleKHR`. Further ray query processing **can** be continued by executing `OpRayQueryProceedKHR` with the same ray query, or intersection **can** be terminated with `OpRayQueryTerminateKHR`. If `OpRayQueryConfirmIntersectionKHR` has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation **may** be executed multiple times for the same intersection candidate unless `VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR` was specified for the intersected geometry.

37.4. Ray Closest Hit Determination

Unless the ray was traced with the `TerminateOnFirstHitKHR` ray flag, the implementation **must** track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its t value is compared to t_{max} to determine which intersection is closer, where t is the parametric distance along the ray at which the intersection occurred.

- If $t < t_{max}$, t_{max} is set to t and the candidate is set as the current closest hit.
- If $t > t_{max}$, the candidate is dropped and no further processing of that candidate occurs.
- If $t = t_{max}$, the candidate **may** be set as the current closest hit or dropped.

If `TerminateOnFirstHitKHR` was included in the `Ray Flags` used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

37.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by [Ray Closest Hit Determination](#), a closest hit has occurred, otherwise the final result is a miss.

For rays traced with `OpTraceRayKHR`, if a closest hit result was identified, a [closest hit shader](#) is invoked from the [Shader Binding Table](#) according to the [specified indexing](#) for the intersected geometry. Control returns to the shader that executed `OpTraceRayKHR` once this shader returns. This shader is skipped if either the ray flags included `SkipClosestHitShaderKHR`, or if the [closest hit shader](#) identified is `VK_SHADER_UNUSED_KHR`.

For rays traced with `OpTraceRayKHR` where no hit result was identified, the [miss shader](#) identified by the [Miss Index](#) parameter of `OpTraceRayKHR` is invoked. Control returns to the shader that executed `OpTraceRayKHR` once this shader returns. This shader is skipped if the miss shader identified is `VK_SHADER_UNUSED_KHR`.

If the ray was traced with `OpRayQueryProceedKHR`, control is returned to the shader which executed `OpRayQueryProceedKHR`, returning `false`. If a closest hit was identified by [Ray Closest Hit Determination](#), the ray query will now have a committed intersection type of `RayQueryCommittedIntersectionGeneratedKHR` or `RayQueryCommittedIntersectionTriangleKHR`. If no closest hit was identified, the committed intersection type will be `RayQueryCommittedIntersectionNoneKHR`.

No further processing of a ray query occurs after this result is determined.

Chapter 38. Ray Tracing

Ray tracing uses a separate rendering pipeline from both the graphics and compute pipelines (see [Ray Tracing Pipeline](#)).

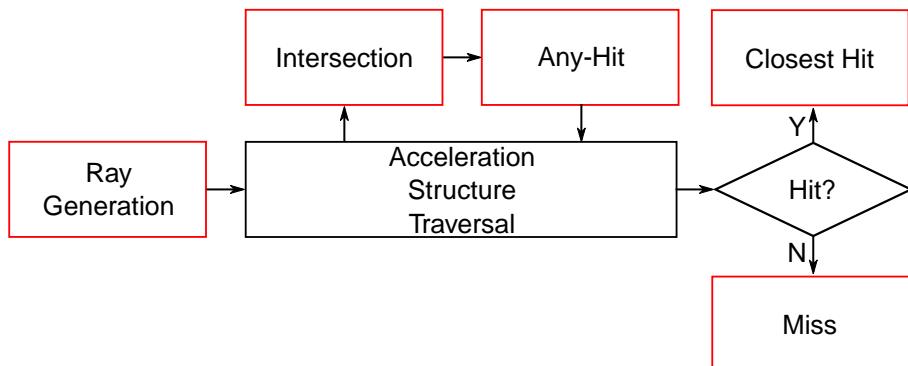

Figure 26. Ray tracing pipeline execution

Caption

Interaction between the different shader stages in the ray tracing pipeline

Within the ray tracing pipeline, `OpTraceRayKHR` or `OpTraceRayMotionNV` can be called to perform a [ray traversal](#) that invokes the various ray tracing shader stages during its execution. The relationship between the ray tracing pipeline object and the geometries present in the acceleration structure traversed is passed into the ray tracing command in a `VkBuffer` object known as a *shader binding table*. `OpExecuteCallableKHR` can also be used in ray tracing pipelines to invoke a [callable shader](#).

During execution, control alternates between scheduling and other operations. The scheduling functionality is implementation-specific and is responsible for workload execution. The shader stages are programmable. [Traversal](#), which refers to the process of traversing acceleration structures to find potential intersections of rays with geometry, is fixed function.

The programmable portions of the pipeline are exposed in a single-ray programming model, with each invocation handling one ray at a time. Memory operations can be synchronized using standard memory barriers. The [Workgroup](#) scope and variables with a storage class of [Workgroup](#) must not be used in the ray tracing pipeline.

38.1. Shader Call Instructions

A *shader call* is an instruction which may cause execution to continue elsewhere by creating one or more invocations that execute a different shader stage.

The shader call instructions are:

- `OpTraceRayKHR` which may invoke intersection, any-hit, closest hit, or miss shaders,
- `OpTraceRayMotionNV` which may invoke intersection, any-hit, closest hit, or miss shaders,
- `OpReportIntersectionKHR` which may invoke any-hit shaders, and

- `OpExecuteCallableKHR` which will invoke a callable shader.

The invocations created by shader call instructions are grouped into subgroups by the implementation. Those subgroups **may** be unrelated to the subgroup of the parent invocation.

Pipeline trace ray instructions **can** be used recursively; invoked shaders **can** themselves execute pipeline trace ray instructions, to a maximum depth defined by the `maxRecursionDepth` or `maxRayRecursionDepth` limit.

Shaders directly invoked from the API always have a recursion depth of 0; each shader executed by a pipeline trace ray instruction has a recursion depth one higher than the recursion depth of the shader which invoked it. Applications **must** not invoke a shader with a recursion depth greater than the value of `maxRecursionDepth` or `maxPipelineRayRecursionDepth` specified in the pipeline.

There is no explicit recursion limit for other shader call instructions which may recurse (e.g. `OpExecuteCallableKHR`) but there is an upper bound determined by the **stack size**.

An *invocation repack instruction* is a ray tracing shader call instruction where the implementation **may** change the set of invocations that are executing. When a repack instruction is encountered, the invocation is suspended and a new invocation begins and executes the instruction. After executing the repack instruction (which **may** result in other ray tracing shader stages executing) the new invocation ends and the original invocation is resumed, but it **may** be resumed in a different subgroup or at a different `SubgroupLocalInvocationId` within the same subgroup. When a subset of invocations in a subgroup execute the invocation repack instruction, those that do not execute it remain in the same subgroup at the same `SubgroupLocalInvocationId`.

The `OpTraceRayKHR`, `OpTraceRayMotionNV`, `OpReportIntersectionKHR`, and `OpExecuteCallableKHR` instructions are invocation repack instructions.

The invocations that are executing before an invocation repack instruction, after the instruction, or are created by the instruction, are **shader-call-related**.

If the implementation changes the composition of subgroups, the values of `SubgroupSize`, `SubgroupLocalInvocationId`, `SMIDNV`, `WarpIDNV`, and builtin variables that are derived from them (`SubgroupEqMask`, `SubgroupGeMask`, `SubgroupGtMask`, `SubgroupLeMask`, `SubgroupLtMask`) **must** be changed accordingly by the invocation repack instruction. The application **must** use **Volatile semantics** on these `BuiltIn` variables when used in the ray generation, closest hit, miss, intersection, and callable shaders. Similarly, the application **must** use **Volatile** semantics on any `RayTmaxKHR` decorated `Builtin` used in an intersection shader.

Note

[Subgroup operations](#) are permitted in the programmable ray tracing shader stages. However, shader call instructions place a bound on where results of subgroup instructions or subgroup-scoped instructions that execute the dynamic instance of that instruction are potentially valid. For example, care **must** be taken when using the result of a ballot operation that was computed before an invocation repack instruction, after that repack instruction. The ballot **may** be incorrect as the set of invocations could have changed.

While the `SubgroupSize` built-in is required to be declared `Volatile`, its value will never change unless `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` is set on pipeline creation, as without that bit set, its value is required to match that of `VkPhysicalDeviceSubgroupProperties::subgroupSize`.

For clock operations, the value of a `Subgroup` scoped `OpReadClockKHR` read before the dynamic instance of a repack instruction **should** not be compared to the result of that clock instruction after the repack instruction.

When a ray tracing shader executes a dynamic instance of an invocation repack instruction which results in another ray tracing shader being invoked, their instructions are related by [shader-call-order](#).

For ray tracing invocations that are [shader-call-related](#):

- memory operations on `StorageBuffer`, `Image`, and `ShaderRecordBufferKHR` storage classes **can** be synchronized using the `ShaderCallKHR` scope.
- the `CallableDataKHR`, `IncomingCallableDataKHR`, `RayPayloadKHR`, `HitAttributeKHR`, and `IncomingRayPayloadKHR` storage classes are [system-synchronized](#) and no application availability and visibility operations are required.
- memory operations within a single invocation before and after the invocation repack instruction are ordered by [program-order](#) and do not require explicit synchronization.

38.2. Ray Tracing Commands

Ray tracing commands provoke work in the ray tracing pipeline. Ray tracing commands are recorded into a command buffer and when executed by a queue will produce work that executes according to the currently bound ray tracing pipeline. A ray tracing pipeline **must** be bound to a command buffer before any ray tracing commands are recorded in that command buffer.

To dispatch ray tracing use:

```

// Provided by VK_NV_ray_tracing
void vkCmdTraceRaysNV(
    VkCommandBuffer
    VkBuffer
    VkDeviceSize
    VkBuffer
    VkDeviceSize
    VkDeviceSize
    VkBuffer
    VkDeviceSize
    VkDeviceSize
    VkBuffer
    VkDeviceSize
    VkDeviceSize
    uint32_t
    uint32_t
    uint32_t
        commandBuffer,
        raygenShaderBindingTableBuffer,
        raygenShaderBindingOffset,
        missShaderBindingTableBuffer,
        missShaderBindingOffset,
        missShaderBindingStride,
        hitShaderBindingTableBuffer,
        hitShaderBindingOffset,
        hitShaderBindingStride,
        callableShaderBindingTableBuffer,
        callableShaderBindingOffset,
        callableShaderBindingStride,
        width,
        height,
        depth);

```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **raygenShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the ray generation shader stage.
- **raygenShaderBindingOffset** is the offset in bytes (relative to **raygenShaderBindingTableBuffer**) of the ray generation shader being used for the trace.
- **missShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the miss shader stage.
- **missShaderBindingOffset** is the offset in bytes (relative to **missShaderBindingTableBuffer**) of the miss shader being used for the trace.
- **missShaderBindingStride** is the size in bytes of each shader binding table record in **missShaderBindingTableBuffer**.
- **hitShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the hit shader stages.
- **hitShaderBindingOffset** is the offset in bytes (relative to **hitShaderBindingTableBuffer**) of the hit shader group being used for the trace.
- **hitShaderBindingStride** is the size in bytes of each shader binding table record in **hitShaderBindingTableBuffer**.
- **callableShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the callable shader stage.
- **callableShaderBindingOffset** is the offset in bytes (relative to **callableShaderBindingTableBuffer**) of the callable shader being used for the trace.
- **callableShaderBindingStride** is the size in bytes of each shader binding table record in **callableShaderBindingTableBuffer**.
- **width** is the width of the ray trace query dimensions.
- **height** is height of the ray trace query dimensions.

- `depth` is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of `width × height × depth` rays is assembled.

Valid Usage

- VUID-vkCmdTraceRaysNV-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysNV-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysNV-None-06479
If a `VkImageView` is sampled with `depth comparison`, the image view's format features **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`
- VUID-vkCmdTraceRaysNV-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdTraceRaysNV-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdTraceRaysNV-filterCubic-02694
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdTraceRaysNV-filterCubicMinmax-02695
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdTraceRaysNV-flags-02696
Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`
- VUID-vkCmdTraceRaysNV-OpTypeImage-06423
Any `VkImageView` or `VkBufferView` being written as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`
- VUID-vkCmdTraceRaysNV-OpTypeImage-06424
Any `VkImageView` or `VkBufferView` being read as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature

must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdTraceRaysNV-None-02697

For each set n that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to n at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set n , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdTraceRaysNV-maintenance4-06425

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdTraceRaysNV-None-02699

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysNV-None-02700

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysNV-commandBuffer-02701

If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdTraceRaysNV-None-02859

There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdTraceRaysNV-None-02702

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- VUID-vkCmdTraceRaysNV-None-02703

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- VUID-vkCmdTraceRaysNV-None-02704

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdTraceRaysNV-None-02705
 If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysNV-None-02706
 If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysNV-commandBuffer-02707
 If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by the **VkPipeline** object bound to the pipeline bind point used by this command **must** not be a protected resource
- VUID-vkCmdTraceRaysNV-None-06550
 If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** only be used with **OpImageSample*** or **OpImageSparseSample*** instructions
- VUID-vkCmdTraceRaysNV-ConstOffset-06551
 If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** not use the **ConstOffset** and **Offset** operands
- VUID-vkCmdTraceRaysNV-None-04115
 If a **VkImageView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdTraceRaysNV-OpImageWrite-04469
 If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdTraceRaysNV-SampledType-04470
 If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdTraceRaysNV-SampledType-04471
 If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32
- VUID-vkCmdTraceRaysNV-SampledType-04472
 If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdTraceRaysNV-SampledType-04473
 If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is

accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdTraceRaysNV-None-03429

Any shader group handle referenced by this call **must** have been queried from the currently bound ray tracing pipeline

- VUID-vkCmdTraceRaysNV-commandBuffer-04624

`commandBuffer` **must** not be a protected command buffer

- VUID-vkCmdTraceRaysNV-maxRecursionDepth-03625

This command **must** not cause a pipeline trace ray instruction to be executed from a shader invocation with a `recursion depth` greater than the value of `maxRecursionDepth` used to create the bound ray tracing pipeline

- VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-04042

If `raygenShaderBindingTableBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02455

`raygenShaderBindingOffset` **must** be less than the size of `raygenShaderBindingTableBuffer`

- VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02456

`raygenShaderBindingOffset` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-04043

If `missShaderBindingTableBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02457

`missShaderBindingOffset` **must** be less than the size of `missShaderBindingTableBuffer`

- VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02458

`missShaderBindingOffset` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-04044

If `hitShaderBindingTableBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02459

`hitShaderBindingOffset` **must** be less than the size of `hitShaderBindingTableBuffer`

- VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02460

`hitShaderBindingOffset` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`

`::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-04045
If `callableShaderBindingTableBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02461
`callableShaderBindingOffset` **must** be less than the size of `callableShaderBindingTableBuffer`
- VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02462
`callableShaderBindingOffset` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`
- VUID-vkCmdTraceRaysNV-missShaderBindingStride-02463
`missShaderBindingStride` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize`
- VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02464
`hitShaderBindingStride` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize`
- VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02465
`callableShaderBindingStride` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize`
- VUID-vkCmdTraceRaysNV-missShaderBindingStride-02466
`missShaderBindingStride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride`
- VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02467
`hitShaderBindingStride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride`
- VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02468
`callableShaderBindingStride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride`
- VUID-vkCmdTraceRaysNV-width-02469
`width` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`
- VUID-vkCmdTraceRaysNV-height-02470
`height` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`
- VUID-vkCmdTraceRaysNV-depth-02471
`depth` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysNV-commandBuffer-parameter
commandBuffer **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-parameter
raygenShaderBindingTableBuffer **must** be a valid `VkBuffer` handle
- VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-parameter
If **missShaderBindingTableBuffer** is not `VK_NULL_HANDLE`, **missShaderBindingTableBuffer** **must** be a valid `VkBuffer` handle
- VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-parameter
If **hitShaderBindingTableBuffer** is not `VK_NULL_HANDLE`, **hitShaderBindingTableBuffer** **must** be a valid `VkBuffer` handle
- VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-parameter
If **callableShaderBindingTableBuffer** is not `VK_NULL_HANDLE`, **callableShaderBindingTableBuffer** **must** be a valid `VkBuffer` handle
- VUID-vkCmdTraceRaysNV-commandBuffer-recording
commandBuffer **must** be in the `recording` state
- VUID-vkCmdTraceRaysNV-commandBuffer-cmdpool
The `VkCommandPool` that **commandBuffer** was allocated from **must** support compute operations
- VUID-vkCmdTraceRaysNV-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdTraceRaysNV-commonparent
Each of **callableShaderBindingTableBuffer**, **commandBuffer**, **hitShaderBindingTableBuffer**, **missShaderBindingTableBuffer**, and **raygenShaderBindingTableBuffer** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the `VkCommandPool` that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

To dispatch ray tracing use:

```
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysKHR(
    VkCommandBuffer
    const VkStridedDeviceAddressRegionKHR*
    const VkStridedDeviceAddressRegionKHR*
    const VkStridedDeviceAddressRegionKHR*
    const VkStridedDeviceAddressRegionKHR*
    uint32_t
    uint32_t
    uint32_t
        commandBuffer,
        pRaygenShaderBindingTable,
        pMissShaderBindingTable,
        pHitShaderBindingTable,
        pCallableShaderBindingTable,
        width,
        height,
        depth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRaygenShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the ray generation shader stage.
- `pMissShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the miss shader stage.
- `pHitShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the hit shader stage.
- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of `width × height × depth` rays is assembled.

Valid Usage

- VUID-vkCmdTraceRaysKHR-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysKHR-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysKHR-None-06479
If a `VkImageView` is sampled with `depth comparison`, the image view's format features **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`
- VUID-vkCmdTraceRaysKHR-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdTraceRaysKHR-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdTraceRaysKHR-filterCubic-02694
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdTraceRaysKHR-filterCubicMinmax-02695
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdTraceRaysKHR-flags-02696
Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`
- VUID-vkCmdTraceRaysKHR-OpTypeImage-06423
Any `VkImageView` or `VkBufferView` being written as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`
- VUID-vkCmdTraceRaysKHR-OpTypeImage-06424
Any `VkImageView` or `VkBufferView` being read as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature

must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdTraceRaysKHR-None-02697

For each set n that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to n at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set n , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdTraceRaysKHR-maintenance4-06425

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdTraceRaysKHR-None-02699

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysKHR-None-02700

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysKHR-commandBuffer-02701

If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdTraceRaysKHR-None-02859

There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdTraceRaysKHR-None-02702

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- VUID-vkCmdTraceRaysKHR-None-02703

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- VUID-vkCmdTraceRaysKHR-None-02704

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdTraceRaysKHR-None-02705
 If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysKHR-None-02706
 If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysKHR-commandBuffer-02707
 If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by the **VkPipeline** object bound to the pipeline bind point used by this command **must** not be a protected resource
- VUID-vkCmdTraceRaysKHR-None-06550
 If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** only be used with **OpImageSample*** or **OpImageSparseSample*** instructions
- VUID-vkCmdTraceRaysKHR-ConstOffset-06551
 If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** not use the **ConstOffset** and **Offset** operands
- VUID-vkCmdTraceRaysKHR-None-04115
 If a **VkImageView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdTraceRaysKHR-OpImageWrite-04469
 If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdTraceRaysKHR-SampledType-04470
 If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdTraceRaysKHR-SampledType-04471
 If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32
- VUID-vkCmdTraceRaysKHR-SampledType-04472
 If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdTraceRaysKHR-SampledType-04473
 If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is

accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdTraceRaysKHR-None-03429

Any shader group handle referenced by this call **must** have been queried from the currently bound ray tracing pipeline

- VUID-vkCmdTraceRaysKHR-maxPipelineRayRecursionDepth-03679

This command **must** not cause a shader call instruction to be executed from a shader invocation with a `recursion depth` greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline

- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03680

If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03681

The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03682

`pRayGenShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysKHR-size-04023

The `size` member of `pRayGenShaderBindingTable` **must** be equal to its `stride` member

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03683

If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03684

The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03685

`pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysKHR-stride-03686

The `stride` member of `pMissShaderBindingTable` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- VUID-vkCmdTraceRaysKHR-stride-04029
The `stride` member of `pMissShaderBindingTable` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03687
If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03688
The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03689
`pHitShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`
- VUID-vkCmdTraceRaysKHR-stride-03690
The `stride` member of `pHitShaderBindingTable` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`
- VUID-vkCmdTraceRaysKHR-stride-04035
The `stride` member of `pHitShaderBindingTable` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`
- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03691
If the buffer from which `pCallableShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03692
The buffer from which the `pCallableShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03693
`pCallableShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`
- VUID-vkCmdTraceRaysKHR-stride-03694
The `stride` member of `pCallableShaderBindingTable` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`
- VUID-vkCmdTraceRaysKHR-stride-04041
The `stride` member of `pCallableShaderBindingTable` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`
- VUID-vkCmdTraceRaysKHR-flags-03696
If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, the `deviceAddress` member of `pHitShaderBindingTable` **must** not be zero
- VUID-vkCmdTraceRaysKHR-flags-03697
If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, the `deviceAddress` member of `pHitShaderBindingTable` **must** not be zero

- VUID-vkCmdTraceRaysKHR-flags-03511
 If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by `pMissShaderBindingTable` **must** not be set to zero
- VUID-vkCmdTraceRaysKHR-flags-03512
 If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in `pHitShaderBindingTable` accessed as a result of this command in order to execute an any-hit shader **must** not be set to zero
- VUID-vkCmdTraceRaysKHR-flags-03513
 If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in `pHitShaderBindingTable` accessed as a result of this command in order to execute a closest hit shader **must** not be set to zero
- VUID-vkCmdTraceRaysKHR-flags-03514
 If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in `pHitShaderBindingTable` accessed as a result of this command in order to execute an intersection shader **must** not be set to zero
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04735
 Any non-zero hit shader group entries in `pHitShaderBindingTable` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` **must** have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04736
 Any non-zero hit shader group entries in `pHitShaderBindingTable` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` **must** have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`
- VUID-vkCmdTraceRaysKHR-commandBuffer-04625
`commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdTraceRaysKHR-width-03626
`width` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`
- VUID-vkCmdTraceRaysKHR-height-03627
`height` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`
- VUID-vkCmdTraceRaysKHR-depth-03628
`depth` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`
- VUID-vkCmdTraceRaysKHR-width-03629
`width × height × depth` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysKHR-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdTraceRaysKHR-pRaygenShaderBindingTable-parameter
`pRaygenShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure
- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-parameter
`pMissShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-parameter
`pHitShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure
- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-parameter
`pCallableShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure
- VUID-vkCmdTraceRaysKHR-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdTraceRaysKHR-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdTraceRaysKHR-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

The `VkStridedDeviceAddressRegionKHR` structure is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkStridedDeviceAddressRegionKHR {
    VkDeviceAddress    deviceAddress;
    VkDeviceSize       stride;
    VkDeviceSize       size;
} VkStridedDeviceAddressRegionKHR;
```

- **deviceAddress** is the device address (as returned by the `vkGetBufferDeviceAddress` command) at which the region starts, or zero if the region is unused.
- **stride** is the byte stride between consecutive elements.
- **size** is the size in bytes of the region starting at **deviceAddress**.

Valid Usage

- VUID-VkStridedDeviceAddressRegionKHR-size-04631
If **size** is not zero, all addresses between **deviceAddress** and **deviceAddress + size - 1** must be in the buffer device address range of the same buffer
- VUID-VkStridedDeviceAddressRegionKHR-size-04632
If **size** is not zero, **stride** must be less than or equal to the size of the buffer from which **deviceAddress** was queried

When invocation mask image usage is enabled in the bound ray tracing pipeline, the pipeline uses an invocation mask image specified by the command:

```
// Provided by VK_HUAWEI_invocation_mask
void vkCmdBindInvocationMaskHUAWEI(
    VkCommandBuffer                      commandBuffer,
    VkImageView                          imageView,
    VkImageLayout                        imageLayout);
```

- **commandBuffer** is the command buffer into which the command will be recorded
- **imageView** is an image view handle specifying the invocation mask image **imageView** may be set to `VK_NULL_HANDLE`, which is equivalent to specifying a view of an image filled with ones value.
- **imageLayout** is the layout that the image subresources accessible from **imageView** will be in when the invocation mask image is accessed

Valid Usage

- VUID-vkCmdBindInvocationMaskHUAWEI-None-04976
The `invocation mask image` feature **must** be enabled
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04977
If `imageView` is not `VK_NULL_HANDLE`, it **must** be a valid `VkImageView` handle of type `VK_IMAGE_VIEW_TYPE_2D`
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04978
If `imageView` is not `VK_NULL_HANDLE`, it **must** have a format of `VK_FORMAT_R8_UINT`
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04979
If `imageView` is not `VK_NULL_HANDLE`, it **must** have been created with `VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI` set
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04980
If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** be `VK_IMAGE_LAYOUT_GENERAL`
- VUID-vkCmdBindInvocationMaskHUAWEI-width-04981
Thread mask image resolution must match the `width` and `height` in `vkCmdTraceRaysKHR`
- VUID-vkCmdBindInvocationMaskHUAWEI-None-04982
Each element in the invocation mask image **must** have the value `0` or `1`. The value `1` means the invocation is active
- VUID-vkCmdBindInvocationMaskHUAWEI-width-04983
`width` in `vkCmdTraceRaysKHR` should be `1`

Valid Usage (Implicit)

- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-parameter
If `imageView` is not `VK_NULL_HANDLE`, `imageView` **must** be a valid `VkImageView` handle
- VUID-vkCmdBindInvocationMaskHUAWEI-imageLayout-parameter
`imageLayout` **must** be a valid `VkImageLayout` value
- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdBindInvocationMaskHUAWEI-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBindInvocationMaskHUAWEI-commonparent
Both of `commandBuffer`, and `imageView` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Outside	Compute
Secondary		

To dispatch ray tracing, with some parameters sourced on the device, use:

```
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirectKHR(
    VkCommandBuffer
    const VkStridedDeviceAddressRegionKHR*
    const VkStridedDeviceAddressRegionKHR*
    const VkStridedDeviceAddressRegionKHR*
    const VkStridedDeviceAddressRegionKHR*
    VkDeviceAddress
        commandBuffer,
        pRaygenShaderBindingTable,
        pMissShaderBindingTable,
        pHitShaderBindingTable,
        pCallableShaderBindingTable,
        indirectDeviceAddress);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRaygenShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the ray generation shader stage.
- `pMissShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the miss shader stage.
- `pHitShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the hit shader stage.
- `pCallableShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the callable shader stage.
- `indirectDeviceAddress` is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommandKHR` structure containing the trace ray parameters.

`vkCmdTraceRaysIndirectKHR` behaves similarly to `vkCmdTraceRaysKHR` except that the ray trace query dimensions are read by the device from `indirectDeviceAddress` during execution.

Valid Usage

- VUID-vkCmdTraceRaysIndirectKHR-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysIndirectKHR-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysIndirectKHR-None-06479
If a `VkImageView` is sampled with `depth comparison`, the image view's format features **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`
- VUID-vkCmdTraceRaysIndirectKHR-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdTraceRaysIndirectKHR-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdTraceRaysIndirectKHR-filterCubic-02694
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdTraceRaysIndirectKHR-filterCubicMinmax-02695
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdTraceRaysIndirectKHR-flags-02696
Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`
- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-06423
Any `VkImageView` or `VkBufferView` being written as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`
- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-06424
Any `VkImageView` or `VkBufferView` being read as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature

must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdTraceRaysIndirectKHR-None-02697

For each set n that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to n at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set n , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdTraceRaysIndirectKHR-maintenance4-06425

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdTraceRaysIndirectKHR-None-02699

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysIndirectKHR-None-02700

A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-02701

If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdTraceRaysIndirectKHR-None-02859

There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdTraceRaysIndirectKHR-None-02702

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- VUID-vkCmdTraceRaysIndirectKHR-None-02703

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- VUID-vkCmdTraceRaysIndirectKHR-None-02704

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdTraceRaysIndirectKHR-None-02705
If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysIndirectKHR-None-02706
If the **robust buffer access** feature is not enabled, and if the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-02707
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by the **VkPipeline** object bound to the pipeline bind point used by this command **must** not be a protected resource
- VUID-vkCmdTraceRaysIndirectKHR-None-06550
If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** only be used with **OpImageSample*** or **OpImageSparseSample*** instructions
- VUID-vkCmdTraceRaysIndirectKHR-ConstOffset-06551
If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a **VkSampler** or **VkImageView** object that enables **sampler Y'C_BC_R conversion**, that object **must** not use the **ConstOffset** and **Offset** operands
- VUID-vkCmdTraceRaysIndirectKHR-None-04115
If a **VkImageView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-04469
If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04470
If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04471
If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32
- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04472
If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04473
If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is

accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdTraceRaysIndirectKHR-None-03429

Any shader group handle referenced by this call **must** have been queried from the currently bound ray tracing pipeline

- VUID-vkCmdTraceRaysIndirectKHR-maxPipelineRayRecursionDepth-03679

This command **must** not cause a shader call instruction to be executed from a shader invocation with a `recursion depth` greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline

- VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03680

If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03681

The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03682

`pRayGenShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysIndirectKHR-size-04023

The `size` member of `pRayGenShaderBindingTable` **must** be equal to its `stride` member

- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03683

If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03684

The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03685

`pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysIndirectKHR-stride-03686

The `stride` member of `pMissShaderBindingTable` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- VUID-vkCmdTraceRaysIndirectKHR-stride-04029
The `stride` member of `pMissShaderBindingTable` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03687
If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03688
The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03689
`pHitShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`
- VUID-vkCmdTraceRaysIndirectKHR-stride-03690
The `stride` member of `pHitShaderBindingTable` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`
- VUID-vkCmdTraceRaysIndirectKHR-stride-04035
The `stride` member of `pHitShaderBindingTable` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`
- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03691
If the buffer from which `pCallableShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03692
The buffer from which the `pCallableShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03693
`pCallableShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`
- VUID-vkCmdTraceRaysIndirectKHR-stride-03694
The `stride` member of `pCallableShaderBindingTable` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`
- VUID-vkCmdTraceRaysIndirectKHR-stride-04041
The `stride` member of `pCallableShaderBindingTable` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`
- VUID-vkCmdTraceRaysIndirectKHR-flags-03696
If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, the `deviceAddress` member of `pHitShaderBindingTable` **must** not be zero
- VUID-vkCmdTraceRaysIndirectKHR-flags-03697
If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, the `deviceAddress` member of `pHitShaderBindingTable` **must** not be zero

- VUID-vkCmdTraceRaysIndirectKHR-flags-03511
If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by `pMissShaderBindingTable` **must** not be set to zero
- VUID-vkCmdTraceRaysIndirectKHR-flags-03512
If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in `pHitShaderBindingTable` accessed as a result of this command in order to execute an any-hit shader **must** not be set to zero
- VUID-vkCmdTraceRaysIndirectKHR-flags-03513
If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in `pHitShaderBindingTable` accessed as a result of this command in order to execute a closest hit shader **must** not be set to zero
- VUID-vkCmdTraceRaysIndirectKHR-flags-03514
If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in `pHitShaderBindingTable` accessed as a result of this command in order to execute an intersection shader **must** not be set to zero
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04735
Any non-zero hit shader group entries in `pHitShaderBindingTable` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` **must** have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04736
Any non-zero hit shader group entries in `pHitShaderBindingTable` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` **must** have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`
- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03632
If the buffer from which `indirectDeviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03633
The buffer from which `indirectDeviceAddress` was queried **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03634
`indirectDeviceAddress` **must** be a multiple of 4
- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-03635
`commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03636
All device addresses between `indirectDeviceAddress` and `indirectDeviceAddress + sizeof(VkTraceRaysIndirectCommandKHR) - 1` **must** be in the buffer device address range of the same buffer
- VUID-vkCmdTraceRaysIndirectKHR-rayTracingPipelineTraceRaysIndirect-03637
The `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineTraceRaysIndirect`

feature must be enabled

- VUID-vkCmdTraceRaysIndirectKHR-rayTracingMotionBlurPipelineTraceRaysIndirect-04951
If the bound ray tracing pipeline was created with
`VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV`
`VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdTraceRaysIndirectKHR-pRaygenShaderBindingTable-parameter
`pRaygenShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure
- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-parameter
`pMissShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-parameter
`pHitShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure
- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-parameter
`pCallableShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure
- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdTraceRaysIndirectKHR-renderpass
This command **must** only be called outside of a render pass instance

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Outside	Compute

The `VkTraceRaysIndirectCommandKHR` structure is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommandKHR {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkTraceRaysIndirectCommandKHR;
```

- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

The members of `VkTraceRaysIndirectCommandKHR` have the same meaning as the similarly named parameters of `vkCmdTraceRaysKHR`.

Valid Usage

- VUID-VkTraceRaysIndirectCommandKHR-width-03638
`width` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`
- VUID-VkTraceRaysIndirectCommandKHR-height-03639
`height` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`
- VUID-VkTraceRaysIndirectCommandKHR-depth-03640
`depth` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`
- VUID-VkTraceRaysIndirectCommandKHR-width-03641
`width × height × depth` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`

38.3. Shader Binding Table

A *shader binding table* is a resource which establishes the relationship between the ray tracing pipeline and the acceleration structures that were built for the ray tracing pipeline. It indicates the shaders that operate on each geometry in an acceleration structure. In addition, it contains the

resources accessed by each shader, including indices of textures, buffer device addresses, and constants. The application allocates and manages *shader binding tables* as [VkBuffer](#) objects.

Each entry in the shader binding table consists of `shaderGroupHandleSize` bytes of data, either as queried by `vkGetRayTracingShaderGroupHandlesKHR` to refer to those specified shaders, or all zeros to refer to a zero shader group. A zero shader group behaves as though it is a shader group consisting entirely of `VK_SHADER_UNUSED_KHR`. The remainder of the data specified by the stride is application-visible data that can be referenced by a `ShaderRecordBufferKHR` block in the shader.

The shader binding tables to use in a ray tracing pipeline are passed to the `vkCmdTraceRaysNV`, `vkCmdTraceRaysKHR`, or `vkCmdTraceRaysIndirectKHR` commands. Shader binding tables are read-only in shaders that are executing on the ray tracing pipeline.

Shader variables identified with the `ShaderRecordBufferKHR` storage class are used to access the provided shader binding table. Such variables **must** be:

- typed as `OpTypeStruct`, or an array of this type,
- identified with a `Block` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in [Offset and Stride Assignment](#).

The `Offset` decoration for any member of a `Block`-decorated variable in the `ShaderRecordBufferKHR` storage class **must** not cause the space required for that variable to extend outside the range `[0, maxStorageBufferRange]`.

Accesses to the shader binding table from ray tracing pipelines **must** be synchronized with the `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_SHADER_READ_BIT`.

Note

Because different shader record buffers can be associated with the same shader, a shader variable with `ShaderRecordBufferKHR` storage class will not be dynamically uniform if different invocations of the same shader can reference different data in the shader record buffer, such as if the same shader occurs twice in the shader binding table with a different shader record buffer. In this case, indexing resources based on values in the `ShaderRecordBufferKHR` storage class, the index should be decorated as `NonUniform`.

38.3.1. Indexing Rules

In order to execute the correct shaders and access the correct resources during a ray tracing dispatch, the implementation **must** be able to locate shader binding table entries at various stages of execution. This is accomplished by defining a set of indexing rules that compute shader binding table record positions relative to the buffer's base address in memory. The application **must** organize the contents of the shader binding table's memory in a way that application of the indexing rules will lead to correct records.

Ray Generation Shaders

Only one ray generation shader is executed per ray tracing dispatch.

For `vkCmdTraceRaysKHR`, the location of the ray generation shader is specified by the `pRaygenShaderBindingTable->deviceAddress` parameter—there is no indexing. All data accessed **must** be less than `pRaygenShaderBindingTable->size` bytes from `deviceAddress`. `pRaygenShaderBindingTable->stride` is unused, and **must** be equal to `pRaygenShaderBindingTable->size`.

For `vkCmdTraceRaysNV`, the location of the ray generation shader is specified by the `raygenShaderBindingTableBuffer` and `raygenShaderBindingOffset` parameters—there is no indexing.

Hit Shaders

The base for the computation of intersection, any-hit, and closest hit shader locations is the `instanceShaderBindingTableRecordOffset` value stored with each instance of a top-level acceleration structure (`VkAccelerationStructureInstanceKHR`). This value determines the beginning of the shader binding table records for a given instance.

In the following rule, `geometryIndex` refers to the `geometry index` of the intersected geometry within the instance.

The `sbtRecordOffset` and `sbtRecordStride` values are passed in as parameters to `traceNV()` or `traceRayEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, these correspond to the `SBTOffset` and `SBTStride` parameters to the `OpTraceRayNV` or `OpTraceRayKHR` or `OpTraceRayMotionNV` instruction.

The result of this computation is then added to `pHitShaderBindingTable->deviceAddress`, a device address passed to `vkCmdTraceRaysKHR`, or `hitShaderBindingOffset`, a base offset passed to `vkCmdTraceRaysNV`.

For `vkCmdTraceRaysKHR`, the complete rule to compute a hit shader binding table record address in the `pHitShaderBindingTable` is:

$$\text{pHitShaderBindingTable->deviceAddress} + \text{pHitShaderBindingTable->stride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})$$

All data accessed **must** be less than `pHitShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a hit shader binding table record address in the `hitShaderBindingTableBuffer` is:

$$\text{hitShaderBindingOffset} + \text{hitShaderBindingStride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})$$

Miss Shaders

A miss shader is executed whenever a ray query fails to find an intersection for the given scene geometry. Multiple miss shaders **may** be executed throughout a ray tracing dispatch.

The base for the computation of miss shader locations is `pMissShaderBindingTable->deviceAddress`, a device address passed into `vkCmdTraceRaysKHR`, or `missShaderBindingOffset`, a base offset passed into `vkCmdTraceRaysNV`.

The `missIndex` value is passed in as a parameter to `traceNV()` or `traceRayEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the `MissIndex` parameter to the `OpTraceRayNV` or `OpTraceRayKHR` or `OpTraceRayMotionNV` instruction.

For `vkCmdTraceRaysKHR`, the complete rule to compute a miss shader binding table record address in the `pMissShaderBindingTable` is:

$$\text{pMissShaderBindingTable->deviceAddress} + \text{pMissShaderBindingTable->stride} \times \text{missIndex}$$

All data accessed **must** be less than `pMissShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a miss shader binding table record address in the `missShaderBindingTableBuffer` is:

$$\text{missShaderBindingOffset} + \text{missShaderBindingStride} \times \text{missIndex}$$

Callable Shaders

A callable shader is executed when requested by a ray tracing shader. Multiple callable shaders **may** be executed throughout a ray tracing dispatch.

The base for the computation of callable shader locations is `pCallableShaderBindingTable->deviceAddress`, a device address passed into `vkCmdTraceRaysKHR`, or `callableShaderBindingOffset`, a base offset passed into `vkCmdTraceRaysNV`.

The `sbtRecordIndex` value is passed in as a parameter to `executeCallableNV()` or `executeCallableEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the `SBTIndex` parameter to the `OpExecuteCallableNV` or `OpExecuteCallableKHR` instruction.

For `vkCmdTraceRaysKHR`, the complete rule to compute a callable shader binding table record address in the `pCallableShaderBindingTable` is:

$$\text{pCallableShaderBindingTable->deviceAddress} + \text{pCallableShaderBindingTable->stride} \times \text{sbtRecordIndex}$$

All data accessed **must** be less than `pCallableShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a callable shader binding table record address in the `callableShaderBindingTableBuffer` is:

`callableShaderBindingOffset + callableShaderBindingStride × sbtRecordIndex`

38.4. Ray Tracing Pipeline Stack

Ray tracing pipelines have a potentially large set of shaders which **may** be invoked in various call chain combinations to perform ray tracing. To store parameters for a given shader execution, an implementation **may** use a stack of data in memory. This stack **must** be sized to the sum of the stack sizes of all shaders in any call chain executed by the application.

If the stack size is not set explicitly, the stack size for a pipeline is:

$$\text{rayGenStackMax} + \min(1, \text{maxPipelineRayRecursionDepth}) \times \max(\text{closestHitStackMax}, \text{missStackMax}, \text{intersectionStackMax} + \text{anyHitStackMax}) + \max(0, \text{maxPipelineRayRecursionDepth} - 1) \times \max(\text{closestHitStackMax}, \text{missStackMax}) + 2 \times \text{callableStackMax}$$

where `rayGenStackMax`, `closestHitStackMax`, `missStackMax`, `anyHitStackMax`, `intersectionStackMax`, and `callableStackMax` are the maximum stack values queried by the respective shader stages for any shaders in any shader groups defined by the pipeline.

This stack size is potentially significant, so an application **may** want to provide a more accurate stack size after pipeline compilation. The value that the application provides is the maximum value of the sum of all shaders in a call chain across all possible call chains, taking into account any application specific knowledge about the properties of the call chains.

Note

For example, if an application has two types of closest hit and miss shaders that it can use but the first level of rays will only use the first kind (possibly reflection) and the second level will only use the second kind (occlusion or shadow ray, for example) then the application can compute the stack size by something similar to:

$$\text{rayGenStack} + \max(\text{closestHit1Stack}, \text{miss1Stack}) + \max(\text{closestHit2Stack}, \text{miss2Stack})$$

This is guaranteed to be no larger than the default stack size computation which assumes that both call levels may be the larger of the two.

Chapter 39. Video Decode and Encode Operations

Vulkan implementations **can** expose video decode and encode engines, which are independent from the graphics and compute engines. Video decode and encode is performed by recording video operations and submitting them to video decode and encode queues. Vulkan provides core support for video decode and encode and **can** support a variety of video codecs through individual extensions built on the core video support.

The subsections below detail the fundamental components and operation of Vulkan video.

39.1. Technical Terminology and Semantics

39.1.1. Video Picture Resources

Video Picture Resources contain format information, **can** be multidimensional and **may** have associated metadata. The metadata **can** include implementation-private details required for the decode or encode operations and application managed color-space related information.

In Vulkan, a [Video Picture Resource](#) is represented by a [VkImage](#). The [VkImageView](#), representing the [VkImage](#), is used with the decode operations as [Output](#) and [Decoded Picture Buffer \(DPB\)](#), and with the encode operation as [Input](#) and [Reconstructed Video Picture Resource](#).

39.1.2. Reference Picture

Video Reference Picture is a [Video Picture Resource](#) that **can** be used in the video decode or encode process to provide predictions of the values of samples in the subsequently decoded or encoded pictures.

39.1.3. Decoded Output Picture

The pixels resulting from the video decoding process are stored in a **Decoded Output Picture**, represented by a [VkImageView](#). This **can** be shared with the [Encoder Reconstructed or Decoder DPB Video Picture Resources](#). It **can** also be used as an input for Video Encode, Graphics, Compute processing, or WSI presentation.

39.1.4. Input Picture to Encode

The primary source of input pixels for the video encoding process is the **Input Picture to Encode**, represented by a [VkImageView](#). This **can** be shared with the [Encoder Reconstructed or Decoder DPB Video Picture Resources](#). It **can** be a direct target of Video Decode, Graphics, Compute processing, or WSI presentation.

39.1.5. Decoded Picture Buffer (DPB)

Previously decoded pictures are used by video codecs to provide predictions of the values of samples in the subsequently decoded pictures. At the decoder, such [Video Picture Resources](#) are

stored in a **Decoded Picture Buffer (DPB)** as an indexed set of [Reference Pictures](#).

39.1.6. Reconstructed Pictures

An integral part of the video decoding pipeline is the reconstruction of pictures from the compressed stream. A similar stage exists in the video encoding pipeline as well. Such reconstructed pictures **may** be used as [Reference Pictures](#) for subsequently decoded or encoded pictures. The correct use of such [Reference Pictures](#) is driven by the video compression standard, the implementation, and the application-specific use cases.

This specification refers to the collection of the **Decoded Picture Buffer** and **Reconstructed Pictures** as [Decoded Picture Buffer \(DPB\) Set](#), or only, **DPB**.

39.1.7. Decoded Picture Buffer (DPB) Slot

Decoded Picture Buffer (DPB) Slot represents a single or multi-layer indexed [Reference Picture](#)'s entry within the [Video Session's DPB Set](#). A valid **DPB Slot** index starts from zero and goes up to the maximum of N - 1, where N is the number of [Reference Picture](#) entries requested for a [Video Session](#).

39.1.8. Reference Picture Metadata

The opaque **DPB Slot** state managed by the implementation **may** contain **Reference Picture Metadata**, present when the [picture resource](#) associated with the **DPB Slot** is used as a [reference picture](#) in one or more video decode or encode operations.

An implementation or application **may** have other Picture Metadata related to the Video Picture Resource or the DPB Slot, but such data is outside the scope of this specification.

Note:

The video decode or encode implementation does not maintain internal references to the [Reference Pictures](#), beyond the [Reference Picture Metadata](#). It is the responsibility of the Vulkan Application to create, manage, and destroy, as well as to provide those Video Picture Resources, when required, during the decoding or encoding process.

39.1.9. Color Space Metadata

Color Space Metadata is the additional static or dynamic state associated with a [Video Picture Resource](#) specifying the color volume (the color primaries, white point, and luminance range) of the display that was used in mastering the video content. The use of **Color Space Metadata** is outside the scope of the current version of the video core specification.

39.2. Introduction

This chapter discusses extensions supporting Video Decode or Encode operations. Video Decode and Encode operations are supported by queues with an advertised queue capability of `VK_QUEUE_VIDEO_DECODE_BIT_KHR` and `VK_QUEUE_VIDEO_ENCODE_BIT_KHR`, respectively. Video Decode or

Encode queue operation support allows for Vulkan applications to cooperate closely with other graphics or compute operations seamlessly and efficiently, therefore improving the overall application performance.

39.2.1. Video Decode Queue

`VK_KHR_video_decode_queue` adds a video decode queue type bit `VK_QUEUE_VIDEO_DECODE_BIT_KHR` to `VkQueueFlagBits`. As in the case of other queue types, an application **must** use `vkGetPhysicalDeviceQueueFamilyProperties` to query whether the physical device has support for the Video Decode Queue. When the implementation reports the `VK_QUEUE_VIDEO_DECODE_BIT_KHR` bit for a queue family, it advertises general support for Vulkan queue operations described in [Devices and Queues](#).

39.2.2. Video Encode Queue

`VK_KHR_video_encode_queue` adds a video encode queue type bit `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` to `VkQueueFlagBits`. As in the case of other queue types, an application **must** use `vkGetPhysicalDeviceQueueFamilyProperties` to query whether the physical device has support for the Video Encode Queue. When the implementation reports the `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` bit for a queue family, it advertises general support for Vulkan queue operations described in [Devices and Queues](#).

The rest of the chapter focuses, specifically, on Video Decode and Encode queue operations.

39.2.3. Video Session

Before performing any video decoding or encoding operations, the application **must** create a [Video Session](#) instance, of type `VkVideoSessionKHR`. A [Video Session](#) instance is an immutable object and supports a single compression standard (for example, H.264, H.265, VP9, AV1, etc.). The implementation uses the `VkVideoSessionKHR` object to maintain the video state for the video decode or video encode operation. A [Video Session](#) instance is created specifically:

- For a particular video compression standard;
- For video decoding or video encoding;
- With maximum supported decoded or encoded picture width/height;
- With the maximum number of supported [DPB](#) or [Reconstructed Pictures](#) slots that can be allocated;
- With the maximum number of [Reference Pictures](#) that **can** be used simultaneously for video decode or encode operations;
- Codec color and features profile;
- Color Space format description (not supported with this version of the specification);

`VkVideoSessionKHR` represents a single video decode or encode stream. For each concurrently used stream, a separate instance of `VkVideoSessionKHR` is required. After the application has finished with the processing of a stream, it can reuse the [Video Session](#) instance for another, provided that the configuration parameters between the two usages are compatible (as determined by the video

compression standard in use). Once the `VkVideoSessionKHR` instance has been created, the video compression standard and profiles, `Input / Output / DPB` formats, and the settings like the maximum extent **cannot** be changed.

The values of the following `VkVideoSessionKHR` parameters **can** be updated each frame, subject to the restrictions imposed on parameter updates by the video compression standard in use:

- decoded or encoded picture size
- number of active `DPB` or `Reconstructed Picture` slots
- number of `Reference Pictures` in use,
- color space and color space metadata
- color space metadata.

The updated parameters **must** not exceed the maximum limits specified when creating the `VkVideoSessionKHR` instance.

39.2.4. Video Session Device Memory Heaps

After creating a `Video Session` instance, and before the object can be used for any of the decode or encode operations, the application **must** allocate and bind device memory resources to the Video Session object. An implementation **may** require one or more device memory heaps of different memory types, as reported by the `vkGetVideoSessionMemoryRequirementsKHR` function, to be bound with the `vkBindVideoSessionMemoryKHR` function to the `Video Session`. For more information about the `Video Session Device Memory`, please refer to the `Binding the Session Object Device Memory` section, below.

39.2.5. Video Session Parameters

A lot of codec standards require parameters that are in use for the entire video stream. For example, H.264/AVC and HEVC standards require sequence and picture parameter sets (SPS and PPS) that apply to multiple Video Decode and Encode frames, layers, and sub-layers. Vulkan Video uses `Video Session Parameters` objects to store such standard parameters. The application creates one or more `Video Session Parameters` Objects against a `Video Session`, with a set of common Video Parameters that are required for the processing of the video content. During the object creation, the implementation stores the parameters to the created instance. During command buffer recording, it is the responsibility of the application to provide the `Video Session Parameters` object containing the parameters that are necessary for the processing the portion of the stream under consideration.

39.2.6. Video Picture Subresources

For `Video Picture Resources`, an application has the option to use single or multi-layer `images` for `image views`. The layer to be used during decode or encode operations **can** be specified when the `image view` is being created with the `VkImageSubresourceRange::baseArrayLayer` parameter, and/or within the resource binding operations in command buffer by using the `VkVideoPictureResourceKHR::baseArrayLayer` parameter.

Note:

Both Video Decode and Encode operations only work with a single layer at the time.

The [Image views](#) representing the [Input / Output / DPB Video Picture Resources](#) could have been created with sizes bigger than the coded size that is used with Video Decode and Encode operations. This allows for the same Video Picture Resources to be reused when there is a change in the input video content resolution. The effective coded size of the [Video Picture Resources](#) used for Video Decode and Encode operations is provided with `VkVideoPictureResourceKHR::extent` parameter of each resource in use.

Note:

Many codec standards require the coded and [Video Picture Resources](#)' sizes to match.

Video Session DPB and Reconstructed Video Picture Resources

The video compression standard chosen **may** require the use of [Reference Pictures](#). In Vulkan Video, like any other [Video Picture Resources](#), the [Reference Pictures](#) are represented with [Image Views](#).

When an application requires [Reference Picture Resources](#), it creates and then associates [image views](#), representing these resources, with Video Session [DPB](#) or [Reconstructed slots](#) while recording the command buffer.

[Decoded output pictures](#) **may** be used as [reference pictures](#) in future video decode operations. The same pictures **may** be used in texture sampling operations or in the (WSI) presentation pipeline. Representing the [DPB's Video Picture Resources](#) by [image views](#) makes it possible to accommodate all these use cases in a “zero-copy” fashion. Also, it provides more fine-grained control of the application over the efficient usage of the DPB and Reconstructed [Device Memory Resources](#).

Video Session DPB and Reconstructed Slot Resource Management

Before [Video Picture Resources](#) can be used as [Reference Picture Resources](#), Video Session [DPB](#) or [Reconstructed Slots](#) **must** be associated with those resources.

The application allocates a [DPB or Reconstructed Slot](#) and associates it with a [Video Picture Resource](#) and then sets up the resource as a target of decode or encode operation. After successfully decoding or encoding a picture with the targeted [DPB or Reconstructed Slot](#), in addition to the [Reference Picture](#) pixel data, the implementation **may** generate an opaque [Reference Picture Metadata](#) for that video session Slot and its associated [Video Picture Resource](#).

Subsequently, one or more [DPB or Reconstructed video session Slots](#), along with their associated [Video Picture Resources](#), **can** be used as [Reference Picture's](#) source for the video decode or encode operations.

If [Reference Pictures](#) were to be required for decoding or encoding of the video bitstream, the `VkVideoSessionCreateInfoKHR::maxReferencePicturesSlotsCount` **must** be set to a value bigger than `0` when the instance of the [Video Session](#) object is created.

Up to `VkVideoSessionCreateInfoKHR::maxReferencePicturesSlotsCount` slots **can** be activated with `Video Picture Resources` for a video session and up to `VkVideoSessionCreateInfoKHR ::maxReferencePicturesActiveCount` active slots **can** be used as DPB or Reconstructed `Reference Pictures` within a single decode or encode operation.

When the implementation is associating `Reference Picture Metadata` with the `Video Picture Resources` themselves, such data **must** be independent of the `Video Session` to allow for those `Video Picture Resources` to be shared with other Video Session instances. All of the `Video Session`-dependent `Reference Picture Metadata` **must** only be associated with the `Video Session DPB` or `Reconstructed Slots`.

The application with the help of the implementation is responsible for managing the individual `DPB`, or `Reconstructed Slots` that belong to a single `Video Session DPB set`:

- The application maintains the Slot allocation and per-slot `Reference Picture Resources`;
- Implementation maintains global and per-slot opaque `Reference Picture Metadata`;

The application also manages the mapping between the codec-specific picture IDs and `DPB Slots`.

When a `Video Picture` is decoded and is set as a `Reference Picture` against a `Video Session DPB Slot`, or is encoded and a `Reconstructed Video Picture Resource` is associated with a `Video Session DPB Slot` then:

- The `Video Picture Resource` associated with the Slot is filled with the decoded or reconstructed pixel data;
- The implementation generates the `DPB Slot's Reference Picture Metadata`;

When a `DPB's Slot` is deactivated, or a different `Video Picture Resource` is used with the Slot, or the content of the `Video Picture Resource` is modified, the `Reference Picture Metadata` associated with the `DPB Slot` gets invalidated by the implementation. Subsequent attempts to use such, invalidated, `DPB Slot` as a `Reference source` would produce undefined results.

Video Session DPB Slot subresources

DPB `Reference Picture's` coded width and height **can** change, dynamically, via `VkVideoPictureResourceKHR::extent`, and the picture parameters from the codec-specific extensions. When a `DPB Slot` is activated as a `Reference Picture` and a decode or encode operation is performed against that slot, the coded extent **can** be recorded by the implementation to the corresponding `DPB Slot's` metadata state. Subsequently, when the `Reference Pictures` are used with the decoded `Output` or encoded `Input Picture`, their coded extent can differ. Decoding or encoding pictures, using picture sizes, different from the previously produced `Reference Pictures` **should** be used with care, not to conflict with the codec standard and the implementation's support for that. It is the responsibility of the application to ensure that valid `DPB Set` of `Reference Pictures` are in use, according to the codec standard.

In addition, the `Video Picture Resources` extent **cannot** exceed the `VkVideoSessionCreateInfoKHR ::maxCodedExtent`.

Note:

Coding Standards such as VP9 and AV1 allow for images with different sizes to be used as [Reference Pictures](#). Others, like H.264 and H.265, do not support [Reference Pictures](#) with different sizes. Using [Reference Pictures](#) with incompatible sizes with such standards would render undefined results.

The application is in control of the allocation and use of the system resource

In Vulkan Video, the application has complete control over how and when system resources are used. The Vulkan Video framework provides the following tools to ensure that device and host memory resources are used in an optimal way:

- The video application **can** allocate or destroy the number of allocated [Output](#) or [Input](#) Pictures, and **can** grow, or shrink the DPB set of [Reference Pictures](#), dynamically, based on the changing video content requirement.
- [Reference Pictures](#) **can** be shared with the decoded [Output](#) or encoded [Input](#) pictures.
- The application **can** use [sparse memory](#) for the [images](#), representing [Video Picture Resources](#). The use of sparse memory would allow the application to remove the [Device Memory](#) backing of the [image resources](#) when the [DPB Slot](#) is not in active use. Furthermore, if the [sparse residency feature](#) is supported by the implementation (see [Sparse Resources](#)), then [images](#) can be, partially, bound with the resource memory. This feature is particularly important when using video content with a significant change of decoded or encoded resolution.
- If the implementation supports [image arrays](#), and [sparse memory resources](#), then the application **can** remove the [Device Memory](#) backing of [image array](#) layers that are not used by any [DPB Slots](#).

Using DPB and Reconstructed Slot's Associated Resources

Before a [DPB Slot](#) is to become [Valid](#) for use with a [Reference Picture](#), it requires memory resources to be bound to it.

Some of the memory resources required for the [DPB Slot](#), are opaquely managed by the implementation and, internally, allocated from the [Session's Device Memory Heaps](#). The application provides the [image resources](#) of one or more [Reference Pictures](#), in the [VkVideoBeginCodingInfoKHR::pReferenceSlots](#) as part of the [vkCmdBeginVideoCodingKHR](#) command.

If a [DPB Slot](#) was already used with an [image view](#), and a new image view or a [VK_NULL_HANDLE](#) handle is used with that Slot, then the [DPB Slot's state](#) will be invalidated by the implementation. If a [DPB Slot](#) were to be reused with the same [image view](#), the state of the Slot would not change.

Video Session Activating DPB Slot as a Reference

Before a [DPB Slot](#) is to be used for a [Reference Pictures](#) index, it **must** be activated. The activation of a [DPB Slot](#) is done within the [vkCmdDecodeVideoKHR](#) command's [VkVideoDecodeInfoKHR::slotIndex](#) field for the decode operations, and within the [vkCmdEncodeVideoKHR](#) command's [VkVideoEncodeInfoKHR::slotIndex](#) field for the encode operations.

While activating a Slot for DPB, it **must** already have an associated [image view](#), within the `VkVideoBeginCodingInfoKHR::pReferenceSlots` in the `vkCmdBeginVideoCodingKHR` command and Device Memory backing of the [image resources](#) **must** be resident.

When a [DPB Slot](#) were to be activated, the `VkVideoDecodeInfoKHR::slotIndex` for decode, or `VkVideoEncodeInfoKHR::slotIndex` for encode, **must** be set to the application's allocated DPB Slot's index. When activating a [DPB Slot](#), the application will perform a decode or encode operation against its Slot's index in order to enable its state as a **Valid Picture Reference**. If a [DPB Slot](#) is activated, but a decode or encode operation is not performed against that Slot's index, or the decode or encode operation was unsuccessful, then the [DPB Slot](#) would remain in the **Invalid Picture Reference** state (see below the [DPB Slot States](#)).

By just providing a [Video Picture Resources](#) for a [DPB Slot](#) within the `VkVideoBeginCodingInfoKHR::pReferenceSlots`, and without successfully performing a decode or encode operation against that Slot, the [DPB Slot's](#) state **cannot** be changed to **Valid Picture Reference**. If the [DPB Slots](#) were already in **Valid Picture Reference**, and there is no [Video Picture Resources](#) associated with the [DPB Slot](#) for a decode or encode operation, the state [DPB Slot](#) would not change. However, if an application is referring to a valid [DPB Slot](#) in its current decode or encode operations, then a valid [image view](#) **must** be provided for that Slot within `VkVideoPictureResourceKHR::imageViewBinding` for that decode or encode operation.

Video Session Invalidating DPB Slot's Reference State

When a [DPB Slot](#) is invalidated, its state is set to **Invalid Picture Reference**. Using a [DPB Slot](#) as a [Reference Picture](#) index for video decode or encode operations while the Slot is in **Invalid Picture Reference** state would render undefined results.

Video Session DPB Slot States

To help understand the valid use of the [Video Session DPB](#) and its resource management, this section aims to explain the different states and correct usage of [DPB Slots](#).

There are four (4) states that a [DPB Slot](#) could be in:

- Picture Reference Unused;
- Invalid Picture Reference;
- Updating Picture Reference;
- Valid Picture Reference;

The different states are outlined within the [DPB Slot States](#) and [DPB Slot States Flow Diagram](#) below.

All DPB Slot management operations are performed via the `VkVideoDecodeInfoKHR::slotIndex` or `VkVideoEncodeInfoKHR::slotIndex` field.

All DPB resource binding, invalidating, and activating Slot management operations are performed, by the implementation, **before** the decoding or encoding commands, based on the `VkVideoDecodeInfoKHR::slotIndex` or `VkVideoEncodeInfoKHR::slotIndex` field and the entries from the `VkVideoBeginCodingInfoKHR::pReferenceSlots`. The application **cannot** move a DPB Slot from a **Picture Reference Unused** to **Updating Picture Reference** state, implicitly, within a decode or

encode command operation. Such a DPB Slot **must** first be transitioned to an **Invalid Picture Reference** state using `VkVideoDecodeInfoKHR::slotIndex` or `VkVideoEncodeInfoKHR::slotIndex`, as part of a decode command. For more details, see [Video Picture Decode Modes](#).

When using [sparse memory resources](#), it would be acceptable and valid behavior for the application to unbind the memory while the DPB Slot is any of the DPB Slot states, provided the command buffers, in a [pending state](#), do not reference any such [Video Picture Resources](#).

Accessing [unbound regions](#) of the [sparse memory resources](#) by the decoder or encoder, regardless if those are used as [Output](#), [Input](#), [DPB](#) or [Reconstructed Video Picture Resources](#), would render undefined results. The `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property reported by the implementation does not offer guarantees on the behavior of decode or encode operations when it comes to accessing [unbound regions](#). However, both reads and writes are still considered safe and will not affect other resources or populated regions of the image.

Table 49. Video Session DPB Slot States

DPB Slot State	Moving to DPB Slot State	Exiting DPB Slot State	Retain Video Picture Resource Memory
Picture Reference	* Bind Device Memory; * Reset decode or encode state;	* Activate Reference DPB Slot → Invalid Picture Reference	Application Controlled
Unused	* Invalidate, delete or unbind memory of a Picture Reference associated with Reference DPB Slot		
Invalid Picture Reference	* Activate Reference DPB Slot; * Unsuccessful video decode or encode operation;	* Start decode or encode operation with an active Reference DPB Slot target → Updating Picture Reference ; * Updating a Picture Resource outside the decoder or encoder or deleting or removing the memory binding(sparse) → Picture Reference Unused ;	Application Controlled
Updating Picture Reference	Start decode or encode operation with an active Reference DPB Slot target;	Decode or encode operation with an active Reference DPB Slot target Completed Successfully → Valid Picture Reference ; Unsuccessful video decode or encode operation → Invalid Picture Reference	Yes
Valid Picture Reference	Video decode or encode operation with an active Reference DPB Slot target Completed Successfully;	* Replace Reference DPB Slot → Invalid Picture Reference ; * Invalidate, delete or unbind memory of a Picture Reference of the Reference DPB Slot → Picture Reference Unused ;	Yes

Figure 27. DPB Slot States Flow Diagram

39.3. Video Physical Device Capabilities

39.3.1. Supported Video Codec Operations Enumeration

The structure [VkVideoQueueFamilyProperties2KHR](#) may be chained to [VkQueueFamilyProperties2](#) when calling [vkGetPhysicalDeviceQueueFamilyProperties2](#) to retrieve the video codec operations supported for the physical device queue family index.

The [VkVideoQueueFamilyProperties2KHR](#) structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoQueueFamilyProperties2KHR {
    VkStructureType          sType;
    void*                  pNext;
    VkVideoCodecOperationFlagsKHR videoCodecOperations;
} VkVideoQueueFamilyProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **videoCodecOperations** is a bitmask of [VkVideoCodecOperationFlagBitsKHR](#) specifying supported video codec operation(s).

Valid Usage (Implicit)

- VUID-VkVideoQueueFamilyProperties2KHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_QUEUE_FAMILY_PROPERTIES_2_KHR`
- VUID-VkVideoQueueFamilyProperties2KHR-videoCodecOperations-parameter
`videoCodecOperations` **must** be a valid combination of `VkVideoCodecOperationFlagBitsKHR` values
- VUID-VkVideoQueueFamilyProperties2KHR-videoCodecOperations-requiredbitmask
`videoCodecOperations` **must** not be 0

The codec operations are defined with the `VkVideoCodecOperationFlagBitsKHR` enum:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodecOperationFlagBitsKHR {
    VK_VIDEO_CODEC_OPERATION_INVALID_BIT_KHR = 0,
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_EXT_video_encode_h264
    VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT = 0x00010000,
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_EXT_video_encode_h265
    VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT = 0x00020000,
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_EXT_video_decode_h264
    VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_EXT = 0x00000001,
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_EXT_video_decode_h265
    VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT = 0x00000002,
#endif
} VkVideoCodecOperationFlagBitsKHR;
```

Each decode or encode codec-specific extension extends this enumeration with the appropriate bit corresponding to the extension's codec operation:

- `VK_VIDEO_CODEC_OPERATION_INVALID_BIT_KHR` - No video operations are supported for this queue family.
- `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT` - H.264 video encode operations are supported by this queue family.
- `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_EXT` - H.264 video decode operations are supported by this queue family.
- `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT` - H.265 video decode operations are supported by this queue family.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodecOperationFlagsKHR;
```

[VkVideoCodecOperationFlagsKHR](#) is a bitmask type for setting a mask of zero or more [VkVideoCodecOperationFlagBitsKHR](#).

39.3.2. Video Profiles

A video profile is defined by [VkVideoProfileKHR](#) structure as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileKHR {
    VkStructureType          sType;
    void*                   pNext;
    VkVideoCodecOperationFlagBitsKHR videoCodecOperation;
    VkVideoChromaSubsamplingFlagsKHR chromaSubsampling;
    VkVideoComponentBitDepthFlagsKHR lumaBitDepth;
    VkVideoComponentBitDepthFlagsKHR chromaBitDepth;
} VkVideoProfileKHR;
```

- [sType](#) is the type of this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [videoCodecOperation](#) is a [VkVideoCodecOperationFlagBitsKHR](#) value specifying a video codec operation.
- [chromaSubsampling](#) is a bitmask of [VkVideoChromaSubsamplingFlagBitsKHR](#) specifying video chroma subsampling information.
- [lumaBitDepth](#) is a bitmask of [VkVideoComponentBitDepthFlagBitsKHR](#) specifying video luma bit depth information.
- [chromaBitDepth](#) is a bitmask of [VkVideoComponentBitDepthFlagBitsKHR](#) specifying video chroma bit depth information.

Valid Usage (Implicit)

- VUID-VkVideoProfileKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_PROFILE_KHR`
- VUID-VkVideoProfileKHR-videoCodecOperation-parameter
videoCodecOperation **must** be a valid `VkVideoCodecOperationFlagBitsKHR` value
- VUID-VkVideoProfileKHR-chromaSubsampling-parameter
chromaSubsampling **must** be a valid combination of `VkVideoChromaSubsamplingFlagBitsKHR` values
- VUID-VkVideoProfileKHR-chromaSubsampling-requiredbitmask
chromaSubsampling **must** not be `0`
- VUID-VkVideoProfileKHR-lumaBitDepth-parameter
lumaBitDepth **must** be a valid combination of `VkVideoComponentBitDepthFlagBitsKHR` values
- VUID-VkVideoProfileKHR-lumaBitDepth-requiredbitmask
lumaBitDepth **must** not be `0`
- VUID-VkVideoProfileKHR-chromaBitDepth-parameter
chromaBitDepth **must** be a valid combination of `VkVideoComponentBitDepthFlagBitsKHR` values
- VUID-VkVideoProfileKHR-chromaBitDepth-requiredbitmask
chromaBitDepth **must** not be `0`

The video format chroma subsampling is defined with the following enums:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoChromaSubsamplingFlagBitsKHR {
    VK_VIDEO_CHROMA_SUBSAMPLING_INVALID_BIT_KHR = 0,
    VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR = 0x00000001,
    VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR = 0x00000002,
    VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR = 0x00000004,
    VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR = 0x00000008,
} VkVideoChromaSubsamplingFlagBitsKHR;
```

- `VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR` - the format is monochrome.
- `VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR` - the format is 4:2:0 chroma subsampled. The two chroma components are each subsampled at a factor of 2 both horizontally and vertically.
- `VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR` - the format is 4:2:2 chroma subsampled. The two chroma components are sampled at half the sample rate of luma. The horizontal chroma resolution is halved.
- `VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR` - the format is 4:4:4 chroma sampled. Each of the three YCbCr components have the same sample rate, thus there is no chroma subsampling.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoChromaSubsamplingFlagsKHR;
```

VkVideoChromaSubsamplingFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoChromaSubsamplingFlagBitsKHR.

The video format component bit depth is defined with the following enums:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoComponentBitDepthFlagBitsKHR {
    VK_VIDEO_COMPONENT_BIT_DEPTH_INVALID_KHR = 0,
    VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR = 0x00000001,
    VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR = 0x00000004,
    VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR = 0x00000010,
} VkVideoComponentBitDepthFlagBitsKHR;
```

- **VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR** - the format component bit depth is 8 bits.
- **VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR** - the format component bit depth is 10 bits.
- **VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR** - the format component bit depth is 12 bits.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoComponentBitDepthFlagsKHR;
```

VkVideoComponentBitDepthFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoComponentBitDepthFlagBitsKHR.

A video profile is provided when querying capabilities or image formats for video using `vkGetPhysicalDeviceVideoCapabilitiesKHR` or `vkGetPhysicalDeviceVideoFormatPropertiesKHR`, respectively. A video profile is also provided when creating resources (images, video sessions, etc.) used by video queues. Each instance of `VkVideoProfileKHR` **must** chain a codec-operation specific video profile extension structure, corresponding to the codec-operation specified in `VkVideoProfileKHR::videoCodecOperation`. Additional information is provided in each codec-operation-specific video extension.

39.3.3. Supported Video Decode or Encode Capabilities

To query video decode or encode capabilities for a specific codec, call:

```
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoCapabilitiesKHR(  
    VkPhysicalDevice physicalDevice,  
    const VkVideoProfileKHR* pVideoProfile,  
    VkVideoCapabilitiesKHR* pCapabilities);
```

- **physicalDevice** is the physical device whose video decode or encode capabilities will be queried.

- `pVideoProfile` is a pointer to a `VkVideoProfileKHR` structure with a chained codec-operation specific video profile structure.
- `pCapabilities` is a pointer to a `VkVideoCapabilitiesKHR` structure in which the capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-parameter
`pVideoProfile` **must** be a valid pointer to a valid `VkVideoProfileKHR` structure
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pCapabilities-parameter
`pCapabilities` **must** be a valid pointer to a `VkVideoCapabilitiesKHR` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_FEATURE_NOT_PRESENT`
- `VK_ERROR_FORMAT_NOT_SUPPORTED`

If `pVideoProfile` and chained codec-operation specific profile is not supported, `VK_ERROR_FORMAT_NOT_SUPPORTED` is returned.

Otherwise, the implementation will fill `pCapabilities` with capabilities associated with this video profile.

The `VkVideoCapabilitiesKHR` structure is defined as:

```

// Provided by VK_KHR_video_queue
typedef struct VkVideoCapabilitiesKHR {
    VkStructureType          sType;
    void*                  pNext;
    VkVideoCapabilityFlagsKHR capabilityFlags;
    VkDeviceSize              minBitstreamBufferOffsetAlignment;
    VkDeviceSize              minBitstreamBufferSizeAlignment;
    VkExtent2D                videoPictureExtentGranularity;
    VkExtent2D                minExtent;
    VkExtent2D                maxExtent;
    uint32_t                maxReferencePicturesSlotsCount;
    uint32_t                maxReferencePicturesActiveCount;
} VkVideoCapabilitiesKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **capabilityFlags** is a bitmask of [VkVideoCapabilityFlagBitsKHR](#) specifying capability flags.
- **minBitstreamBufferOffsetAlignment** is the minimum alignment for the input or output bitstream buffer offset.
- **minBitstreamBufferSizeAlignment** is the minimum alignment for the input or output bitstream buffer size
- **videoPictureExtentGranularity** is the minimum size alignment of the extent with the required padding for the decoded or encoded video images.
- **minExtent** is the minimum width and height of the decoded or encoded video.
- **maxExtent** is the maximum width and height of the decoded or encoded video.
- **maxReferencePicturesSlotsCount** is the maximum number of DPB Slots supported by the implementation for a single video session instance.
- **maxReferencePicturesActiveCount** is the maximum slots that can be used as [Reference Pictures](#) with a single decode or encode operation.

Valid Usage (Implicit)

- VUID-VkVideoCapabilitiesKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_VIDEO_CAPABILITIES_KHR](#)
- VUID-VkVideoCapabilitiesKHR-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of [VkVideoDecodeCapabilitiesKHR](#) or [VkVideoEncodeCapabilitiesKHR](#)
- VUID-VkVideoCapabilitiesKHR-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique

The [VkVideoCapabilitiesKHR](#) flags are defined with the following enumeration:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoCapabilityFlagBitsKHR {
    VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
    VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR = 0x00000002,
} VkVideoCapabilityFlagBitsKHR;
```

- **VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR** - the decode or encode session supports protected content.
- **VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR** - the DPB or Reconstructed Video Picture Resources for the video session **may** be created as a separate [VkImage](#) for each DPB picture. If not supported, the DPB **must** be created as single multi-layered image where each layer represents one of the DPB Video Picture Resources.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCapabilityFlagsKHR;
```

[VkVideoCapabilityFlagsKHR](#) is a bitmask type for setting a mask of zero or more [VkVideoCapabilityFlagBitsKHR](#).

39.3.4. Enumeration of Supported Video Output, Input and DPB Formats

To enumerate the supported output, input and DPB image formats for a specific codec operation and video profile, call:

```
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoFormatPropertiesKHR(  

    VkPhysicalDevice physicalDevice,  

    const VkPhysicalDeviceVideoFormatInfoKHR* pVideoFormatInfo,  

    uint32_t* pVideoFormatPropertyCount,  

    VkVideoFormatPropertiesKHR* pVideoFormatProperties);
```

- **physicalDevice** is the physical device being queried.
- **pVideoFormatInfo** is a pointer to a [VkPhysicalDeviceVideoFormatInfoKHR](#) structure specifying the codec and video profile for which information is returned.
- **pVideoFormatPropertyCount** is a pointer to an integer related to the number of video format properties available or queried, as described below.
- **pVideoFormatProperties** is a pointer to an array of [VkVideoFormatPropertiesKHR](#) structures in which supported formats are returned.

If **pVideoFormatProperties** is **NULL**, then the number of video format properties supported for the given **physicalDevice** is returned in **pVideoFormatPropertyCount**. Otherwise, **pVideoFormatPropertyCount** **must** point to a variable set by the user to the number of elements in the **pVideoFormatProperties** array, and on return the variable is overwritten with the number of values actually written to **pVideoFormatProperties**. If the value of **pVideoFormatPropertyCount** is less than the

number of video format properties supported, at most `pVideoFormatPropertyCount` values will be written to `pVideoFormatProperties`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

If an implementation reports `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` is supported but `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` is not supported in `VkVideoDecodeCapabilitiesKHR::flags`, then to query for video format properties for decode DPB or output, `imageUsage` **must** have both `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` and `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` set. Otherwise, the call will fail with `VK_ERROR_FORMAT_NOT_SUPPORTED`.

If an implementation reports `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` is supported but `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` is not supported in `VkVideoDecodeCapabilitiesKHR::flags`, then to query for video format properties for decode DPB, `imageUsage` **must** have `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` set and `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` not set. Otherwise, the call will fail with `VK_ERROR_FORMAT_NOT_SUPPORTED`. Similarly, to query for video format properties for decode output, `imageUsage` **must** have `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` set and `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` not set. Otherwise, the call will fail with `VK_ERROR_FORMAT_NOT_SUPPORTED`.

Valid Usage

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-imageUsage-04844

The `imageUsage` enum of `VkPhysicalDeviceVideoFormatInfoKHR` **must** contain at least one of the following video image usage bit(s): `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, or `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`

Note:

 For most use cases, only decode or encode related usage flags are going to be specified. For a use case such as transcode, if the image were to be shared between decode and encode session(s), then both decode and encode related usage flags **can** be set.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-physicalDevice-parameter
physicalDevice **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatInfo-parameter
pVideoFormatInfo **must** be a valid pointer to a [VkPhysicalDeviceVideoFormatInfoKHR](#) structure
- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatPropertyCount-parameter
pVideoFormatPropertyCount **must** be a valid pointer to a [uint32_t](#) value
- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatProperties-parameter
If the value referenced by **pVideoFormatPropertyCount** is not `0`, and **pVideoFormatProperties** is not `NULL`, **pVideoFormatProperties** **must** be a valid pointer to an array of **pVideoFormatPropertyCount** [VkVideoFormatPropertiesKHR](#) structures

Return Codes

Success

- [VK_SUCCESS](#)
- [VK_INCOMPLETE](#)

Failure

- [VK_ERROR_EXTENSION_NOT_PRESENT](#)
- [VK_ERROR_INITIALIZATION_FAILED](#)
- [VK_ERROR_FORMAT_NOT_SUPPORTED](#)

The [VkPhysicalDeviceVideoFormatInfoKHR](#) input structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkPhysicalDeviceVideoFormatInfoKHR {
    VkStructureType          sType;
    void*                    pNext;
    VkImageUsageFlags        imageUsage;
    const VkVideoProfilesKHR* pVideoProfiles;
} VkPhysicalDeviceVideoFormatInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **imageUsage** is a bitmask of [VkImageUsageFlagBits](#) specifying intended video image usages.
- **pVideoProfiles** is a pointer to a [VkVideoProfilesKHR](#) structure providing the video profile(s) of video session(s) that will use the image. For most use cases, the image is used by a single video session and a single video profile is provided. For a use case such as transcode, where a decode

session output image **may** be used as encode input for one or more encode sessions, multiple video profiles representing the video sessions that will share the image **may** be provided.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_FORMAT_INFO_KHR`
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-pNext-pNext
pNext **must** be `NULL`

The `VkVideoProfilesKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfilesKHR {
    VkStructureType           sType;
    void*                  pNext;
    uint32_t                profileCount;
    const VkVideoProfileKHR* pProfiles;
} VkVideoProfilesKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **profileCount** is an integer which holds the number of video profiles included in **pProfiles**.
- **pProfiles** is a pointer to an array of `VkVideoProfileKHR` structures. Each `VkVideoProfileKHR` structure **must** chain the corresponding codec-operation specific extension video profile structure.

Valid Usage (Implicit)

- VUID-VkVideoProfilesKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_PROFILES_KHR`
- VUID-VkVideoProfilesKHR-pProfiles-parameter
pProfiles **must** be a valid pointer to an array of **profileCount** valid `VkVideoProfileKHR` structures
- VUID-VkVideoProfilesKHR-profileCount-arraylength
profileCount **must** be greater than `0`

The `VkVideoFormatPropertiesKHR` output structure for `vkGetPhysicalDeviceVideoFormatPropertiesKHR` is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoFormatPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkFormat format;
} VkVideoFormatPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is one of the supported formats reported by the implementation.

If the `pVideoProfiles` or `imageUsage` provided in input structure `pVideoFormatInfo` are not supported, `VK_ERROR_FORMAT_NOT_SUPPORTED` is returned.

Valid Usage (Implicit)

- VUID-VkVideoFormatPropertiesKHR-sType-sType
`sType` **must be** `VK_STRUCTURE_TYPE_VIDEO_FORMAT_PROPERTIES_KHR`
- VUID-VkVideoFormatPropertiesKHR-pNext-pNext
`pNext` **must be** `NULL`

Before creating an image, the application should obtain the supported image creation parameters by querying with `vkGetPhysicalDeviceFormatProperties2` or `vkGetPhysicalDeviceImageFormatProperties2` using one of the reported `pImageFormats` and adding `VkVideoProfileKHR` to the `pNext` chain of `VkFormatProperties2`.

39.4. Video Session Objects

39.4.1. Video Session

Video session objects are abstracted and represented by `VkVideoSessionKHR` handles:

```
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionKHR)
```

Creating a Video Session

To create a video session object, call:

```
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionKHR(
    VkDevice device,
    const VkVideoSessionCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkVideoSessionKHR* pVideoSession);
```

- `device` is the logical device that creates the decode or encode session object.
- `pCreateInfo` is a pointer to a `VkVideoSessionCreateInfoKHR` structure containing parameters specifying the creation of the decode or encode session.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pVideoSession` is a pointer to a `VkVideoSessionKHR` structure specifying the decode or encode video session object which will be created by this function when it returns `VK_SUCCESS`

Valid Usage (Implicit)

- VUID-vkCreateVideoSessionKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateVideoSessionKHR-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkVideoSessionCreateInfoKHR` structure
- VUID-vkCreateVideoSessionKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateVideoSessionKHR-pVideoSession-parameter
`pVideoSession` **must** be a valid pointer to a `VkVideoSessionKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_INCOMPATIBLE_DRIVER`
- `VK_ERROR_FEATURE_NOT_PRESENT`

The `VkVideoSessionCreateInfoKHR` structure is defined as:

```

// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    VkVideoSessionCreateFlagsKHR flags;
    const VkVideoProfileKHR* pVideoProfile;
    VkFormat pictureFormat;
    VkExtent2D maxCodedExtent;
    VkFormat referencePicturesFormat;
    uint32_t maxReferencePicturesSlotsCount;
    uint32_t maxReferencePicturesActiveCount;
} VkVideoSessionCreateInfoKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **queueFamilyIndex** is the queue family of the created video session.
- **flags** is a bitmask of **VkVideoSessionCreateFlagBitsKHR** specifying creation flags.
- **pVideoProfile** is a pointer to a **VkVideoProfileKHR** structure.
- **pictureFormat** is the format of the **image views** representing decoded **Output** or encoded **Input** pictures.
- **maxCodedExtent** is the maximum width and height of the coded pictures that this instance will be able to support.
- **referencePicturesFormat** is the format of the **DPB** image views representing the **Reference Pictures**.
- **maxReferencePicturesSlotsCount** is the maximum number of **DPB Slots** that can be activated with associated **Video Picture Resources** for the created video session.
- **maxReferencePicturesActiveCount** is the maximum number of active **DPB Slots** that can be used as Dpb or Reconstructed **Reference Pictures** within a single decode or encode operation for the created video session.

Valid Usage

- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-04845
`pVideoProfile` **must** be a pointer to a valid `VkVideoProfileKHR` structure whose `pNext` chain **must** include a valid codec-specific profile structure
- VUID-VkVideoSessionCreateInfoKHR-maxReferencePicturesSlotsCount-04846
If `Reference Pictures` are required for use with the created video session, the `maxReferencePicturesSlotsCount` **must** be set to a value bigger than `0`
- VUID-VkVideoSessionCreateInfoKHR-maxReferencePicturesSlotsCount-04847
`maxReferencePicturesSlotsCount` **cannot** exceed the implementation reported `VkVideoCapabilitiesKHR::maxReferencePicturesSlotsCount`
- VUID-VkVideoSessionCreateInfoKHR-maxReferencePicturesActiveCount-04848
If `Reference Pictures` are required for use with the created video session, the `maxReferencePicturesActiveCount` **must** be set to a value bigger than `0`
- VUID-VkVideoSessionCreateInfoKHR-maxReferencePicturesActiveCount-04849
`maxReferencePicturesActiveCount` **cannot** exceed the implementation reported `VkVideoCapabilitiesKHR::maxReferencePicturesActiveCount`
- VUID-VkVideoSessionCreateInfoKHR-maxReferencePicturesActiveCount-04850
`maxReferencePicturesActiveCount` **cannot** exceed the `maxReferencePicturesSlotsCount`
- VUID-VkVideoSessionCreateInfoKHR-maxCodedExtent-04851
`maxCodedExtent` **cannot** be smaller than `VkVideoCapabilitiesKHR::minExtent` and bigger than `VkVideoCapabilitiesKHR::maxExtent`
- VUID-VkVideoSessionCreateInfoKHR-referencePicturesFormat-04852
`referencePicturesFormat` **must** be one of the supported formats in `VkVideoFormatPropertiesKHR` `format` returned by the `vkGetPhysicalDeviceVideoFormatPropertiesKHR` when the `VkPhysicalDeviceVideoFormatInfoKHR` `imageUsage` contains `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` or `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR` depending on the session codec operation
- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04853
`pictureFormat` for decode output **must** be one of the supported formats in `VkVideoFormatPropertiesKHR` `format` returned by the `vkGetPhysicalDeviceVideoFormatPropertiesKHR` when the `VkPhysicalDeviceVideoFormatInfoKHR` `imageUsage` contains `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`
- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04854
`pictureFormat` targeting encode operations **must** be one of the supported formats in `VkVideoFormatPropertiesKHR` `format` returned by the `vkGetPhysicalDeviceVideoFormatPropertiesKHR` when the `VkPhysicalDeviceVideoFormatInfoKHR` `imageUsage` contains `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`

Valid Usage (Implicit)

- VUID-VkVideoSessionCreateInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_SESSION_CREATE_INFO_KHR`
- VUID-VkVideoSessionCreateInfoKHR-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264SessionCreateInfoEXT`, `VkVideoDecodeH265SessionCreateInfoEXT`, `VkVideoEncodeH264SessionCreateInfoEXT`, or `VkVideoEncodeH265SessionCreateInfoEXT`
- VUID-VkVideoSessionCreateInfoKHR-sType-unique
The sType value of each struct in the pNext chain **must** be unique
- VUID-VkVideoSessionCreateInfoKHR-flags-parameter
flags **must** be a valid combination of `VkVideoSessionCreateFlagBitsKHR` values
- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-parameter
pVideoProfile **must** be a valid pointer to a valid `VkVideoProfileKHR` structure
- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-parameter
pictureFormat **must** be a valid `VkFormat` value
- VUID-VkVideoSessionCreateInfoKHR-referencePicturesFormat-parameter
referencePicturesFormat **must** be a valid `VkFormat` value

The decode or encode session creation flags defined with the following enums:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoSessionCreateFlagBitsKHR {
    VK_VIDEO_SESSION_CREATE_DEFAULT_KHR = 0,
    VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
} VkVideoSessionCreateFlagBitsKHR;
```

- `VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR` - create the video session for use with protected video content

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoSessionCreateFlagsKHR;
```

`VkVideoSessionCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoSessionCreateFlagBitsKHR`.

39.4.2. Destroying a Video Session

To destroy a decode session object, call:

```
// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the device that was used for the creation of the video session.
- **videoSession** is the decode or encode video session to be destroyed.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage (Implicit)

- VUID-vkDestroyVideoSessionKHR-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkDestroyVideoSessionKHR-videoSession-parameter
videoSession **must** be a valid **VkVideoSessionKHR** handle
- VUID-vkDestroyVideoSessionKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroyVideoSessionKHR-videoSession-parent
videoSession **must** have been created, allocated, or retrieved from **device**

39.4.3. Video Session Memory Resource Management

Obtaining the Video Session Object Device Memory Requirements

To get memory requirements for a video session, call:

```
// Provided by VK_KHR_video_queue
VkResult vkGetVideoSessionMemoryRequirementsKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    uint32_t* pVideoSessionMemoryRequirementsCount,
    VkVideoGetMemoryPropertiesKHR* pVideoSessionMemoryRequirements);
```

- **device** is the logical device that owns the video session.
- **videoSession** is the video session to query.
- **pVideoSessionMemoryRequirementsCount** is a pointer to an integer related to the number of memory heap requirements available or queried, as described below.
- **pVideoSessionMemoryRequirements** is **NULL** or a pointer to an array of **VkVideoGetMemoryPropertiesKHR** structures in which the memory heap requirements of the video session are returned.

If `pVideoSessionMemoryRequirements` is `NULL`, then the number of memory heap types required for the video session is returned in `pVideoSessionMemoryRequirementsCount`. Otherwise, `pVideoSessionMemoryRequirementsCount` **must** point to a variable set by the user with the number of elements in the `pVideoSessionMemoryRequirements` array, and on return the variable is overwritten with the number of formats actually written to `pVideoSessionMemoryRequirements`. If `pVideoSessionMemoryRequirementsCount` is less than the number of memory heap types required for the video session, then at most `pVideoSessionMemoryRequirementsCount` elements will be written to `pVideoSessionMemoryRequirements`, and `VK_INCOMPLETE` will be returned, instead of `VK_SUCCESS`, to indicate that not all required memory heap types were returned.

Valid Usage (Implicit)

- VUID-vkGetVideoSessionMemoryRequirementsKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parameter
`videoSession` **must** be a valid `VkVideoSessionKHR` handle
- VUID-vkGetVideoSessionMemoryRequirementsKHR-pVideoSessionMemoryRequirementsCount-parameter
`pVideoSessionMemoryRequirementsCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetVideoSessionMemoryRequirementsKHR-pVideoSessionMemoryRequirements-parameter
If the value referenced by `pVideoSessionMemoryRequirementsCount` is not `0`, and `pVideoSessionMemoryRequirements` is not `NULL`, `pVideoSessionMemoryRequirements` **must** be a valid pointer to an array of `pVideoSessionMemoryRequirementsCount` `VkVideoGetMemoryPropertiesKHR` structures
- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parent
`videoSession` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`

The `VkVideoGetMemoryPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoGetMemoryPropertiesKHR {
    VkStructureType          sType;
    const void*            pNext;
    uint32_t                memoryBindIndex;
    VkMemoryRequirements2* pMemoryRequirements;
} VkVideoGetMemoryPropertiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **memoryBindIndex** is the memory bind index of the memory heap type described by the information returned in **pMemoryRequirements**.
- **pMemoryRequirements** is a pointer to a **VkMemoryRequirements2** structure in which the requested memory heap requirements for the heap with index **memoryBindIndex** are returned.

Valid Usage (Implicit)

- VUID-VkVideoGetMemoryPropertiesKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_VIDEO_GET_MEMORY_PROPERTIES_KHR**
- VUID-VkVideoGetMemoryPropertiesKHR-pNext-pNext
pNext **must** be **NULL**
- VUID-VkVideoGetMemoryPropertiesKHR-pMemoryRequirements-parameter
pMemoryRequirements **must** be a valid pointer to a **VkMemoryRequirements2** structure

Binding the Session Object Device Memory

To attach memory to a video session object, call:

```
// Provided by VK_KHR_video_queue
VkResult vkBindVideoSessionMemoryKHR(
    VkDevice           device,
    VkVideoSessionKHR videoSession,
    uint32_t          videoSessionBindMemoryCount,
    const VkVideoBindMemoryKHR* pVideoSessionBindMemories);
```

- **device** is the logical device that owns the video session's memory.
- **videoSession** is the video session to be bound with device memory.
- **videoSessionBindMemoryCount** is the number of **pVideoSessionBindMemories** to be bound.
- **pVideoSessionBindMemories** is a pointer to an array of **VkVideoBindMemoryKHR** structures specifying memory regions to be bound to a device memory heap.

Valid Usage (Implicit)

- VUID-vkBindVideoSessionMemoryKHR-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkBindVideoSessionMemoryKHR-videoSession-parameter
videoSession **must** be a valid [VkVideoSessionKHR](#) handle
- VUID-vkBindVideoSessionMemoryKHR-pVideoSessionBindMemories-parameter
pVideoSessionBindMemories **must** be a valid pointer to an array of **videoSessionBindMemoryCount** valid [VkVideoBindMemoryKHR](#) structures
- VUID-vkBindVideoSessionMemoryKHR-videoSessionBindMemoryCount-arraylength
videoSessionBindMemoryCount **must** be greater than 0
- VUID-vkBindVideoSessionMemoryKHR-videoSession-parent
videoSession **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_INITIALIZATION_FAILED](#)

The [VkVideoBindMemoryKHR](#) structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoBindMemoryKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           memoryBindIndex;
    VkDeviceMemory     memory;
    VkDeviceSize        memoryOffset;
    VkDeviceSize        memorySize;
} VkVideoBindMemoryKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **memoryBindIndex** is the index of the device memory heap returned in [VkVideoGetMemoryPropertiesKHR::memoryBindIndex](#) from [vkGetVideoSessionMemoryRequirementsKHR](#).
- **memory** is the allocated device memory to be bound to the video session's heap with index

`memoryBindIndex`.

- `memoryOffset` is the start offset of the region of `memory` which is to be bound.
- `memorySize` is the size in bytes of the region of `memory`, starting from `memoryOffset` bytes, to be bound.

Valid Usage (Implicit)

- VUID-VkVideoBindMemoryKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_BIND_MEMORY_KHR`
- VUID-VkVideoBindMemoryKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkVideoBindMemoryKHR-memory-parameter
`memory` **must** be a valid `VkDeviceMemory` handle

39.4.4. Video Session Parameters

This specification supports several classes of preprocessed parameters stored in Video Session Parameters objects. The Video Session Parameters objects reduces the number of parameters being dispatched and then processed by the implementation while recording video command buffers.

39.4.5. Creating Video Session Parameters

Video session parameter objects are represented by `VkVideoSessionParametersKHR` handles:

```
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionParametersKHR)
```

To create a video session parameters object, call:

```
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionParametersKHR(
    VkDevice                                     device,
    const VkVideoSessionParametersCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks*                  pAllocator,
    VkVideoSessionParametersKHR*                 pVideoSessionParameters);
```

- `device` is the logical device that was used for the creation of the video session object.
- `pCreateInfo` is a pointer to `VkVideoSessionParametersCreateInfoKHR` structure specifying the video session parameters.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pVideoSessionParameters` is a pointer to a `VkVideoSessionParametersKHR` handle in which the video session parameters object is returned.

Valid Usage (Implicit)

- VUID-vkCreateVideoSessionParametersKHR-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkCreateVideoSessionParametersKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid `VkVideoSessionParametersCreateInfoKHR` structure
- VUID-vkCreateVideoSessionParametersKHR-pAllocator-parameter
If **pAllocator** is not `NULL`, **pAllocator** **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateVideoSessionParametersKHR-pVideoSessionParameters-parameter
pVideoSessionParameters **must** be a valid pointer to a `VkVideoSessionParametersKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_TOO_MANY_OBJECTS`

The `VkVideoSessionParametersCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersCreateInfoKHR {
    VkStructureType          sType;
    const void*            pNext;
    VkVideoSessionParametersKHR videoSessionParametersTemplate;
    VkVideoSessionKHR       videoSession;
} VkVideoSessionParametersCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **videoSessionParametersTemplate** is `VK_NULL_HANDLE` or a valid handle to a `VkVideoSessionParametersKHR` object. If this parameter represents a valid handle, then the underlying Video Session Parameters object will be used as a template for constructing the new video session parameters object. All of the template object's current parameters will be inherited by the new object in such a case. Optionally, some of the template's parameters can be

updated or new parameters added to the newly constructed object via the extension-specific parameters.

- `videoSession` is the video session object against which the video session parameters object is going to be created.

Valid Usage

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-04855
If `videoSessionParametersTemplate` represents a valid handle, it **must** have been created against `videoSession`

Valid Usage (Implicit)

- VUID-VkVideoSessionParametersCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_CREATE_INFO_KHR`
- VUID-VkVideoSessionParametersCreateInfoKHR-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264SessionParametersCreateInfoEXT`, `VkVideoDecodeH265SessionParametersCreateInfoEXT`, `VkVideoEncodeH264SessionParametersCreateInfoEXT`, or `VkVideoEncodeH265SessionParametersCreateInfoEXT`
- VUID-VkVideoSessionParametersCreateInfoKHR-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parameter
If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, `videoSessionParametersTemplate` **must** be a valid `VkVideoSessionParametersKHR` handle
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-parameter
`videoSession` **must** be a valid `VkVideoSessionKHR` handle
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parent
If `videoSessionParametersTemplate` is a valid handle, it **must** have been created, allocated, or retrieved from `videoSession`
- VUID-VkVideoSessionParametersCreateInfoKHR-commonparent
Both of `videoSession`, and `videoSessionParametersTemplate` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

39.4.6. Updating the parameters of the Video Session Parameters object

To update, add, or remove video session parameters state, call:

```
// Provided by VK_KHR_video_queue
VkResult vkUpdateVideoSessionParametersKHR(  

    VkDevice                                device,  

    VkVideoSessionParametersKHR           videoSessionParameters,  

    const VkVideoSessionParametersUpdateInfoKHR* pUpdateInfo);
```

- **device** is the logical device that was used for the creation of the video session object.
- **videoSessionParameters** is the video session object that is going to be updated.
- **pUpdateInfo** is a pointer to a **VkVideoSessionParametersUpdateInfoKHR** structure containing the session parameters update information.

Valid Usage (Implicit)

- VUID-vkUpdateVideoSessionParametersKHR-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-parameter
videoSessionParameters **must** be a valid **VkVideoSessionParametersKHR** handle
- VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-parameter
pUpdateInfo **must** be a valid pointer to a valid **VkVideoSessionParametersUpdateInfoKHR** structure

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_TOO_MANY_OBJECTS**

The **VkVideoSessionParametersUpdateInfoKHR** structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersUpdateInfoKHR {  

    VkStructureType      sType;  

    const void*          pNext;  

    uint32_t             updateSequenceCount;  
} VkVideoSessionParametersUpdateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `updateSequenceCount` is the sequence number of the object update with parameters, starting from 1 and incrementing the value by one with each subsequent update.

Valid Usage (Implicit)

- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_UPDATE_INFO_KHR`
- VUID-VkVideoSessionParametersUpdateInfoKHR-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264SessionParametersAddInfoEXT`, `VkVideoDecodeH265SessionParametersAddInfoEXT`, `VkVideoEncodeH264SessionParametersAddInfoEXT`, or `VkVideoEncodeH265SessionParametersAddInfoEXT`
- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique

39.4.7. Destroying Video Session Parameters

To destroy a video session object, call:

```
// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionParametersKHR(
    VkDevice                                     device,
    VkVideoSessionParametersKHR                  videoSessionParameters,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the device the video session was created with.
- `videoSessionParameters` is the video session parameters object to be destroyed.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage (Implicit)

- VUID-vkDestroyVideoSessionParametersKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-parameter
`videoSessionParameters` **must** be a valid `VkVideoSessionParametersKHR` handle
- VUID-vkDestroyVideoSessionParametersKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

39.4.8. Video Encode and Decode commands

To start video decode or encode operations, call:

```
// Provided by VK_KHR_video_queue
void vkCmdBeginVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoBeginCodingInfoKHR* pBeginInfo);
```

- **commandBuffer** is the command buffer to be used when recording commands for the video decode or encode operations.
- **pBeginInfo** is a pointer to a [VkVideoBeginCodingInfoKHR](#) structure.

Valid Usage (Implicit)

- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-parameter
pBeginInfo **must** be a valid pointer to a valid [VkVideoBeginCodingInfoKHR](#) structure
- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support decode, or encode operations
- VUID-vkCmdBeginVideoCodingKHR-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBeginVideoCodingKHR-bufferlevel
commandBuffer **must** be a primary [VkCommandBuffer](#)

Host Synchronization

- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Outside	Decode Encode

The [VkVideoBeginCodingInfoKHR](#) structure is defined as:

```

// Provided by VK_KHR_video_queue
typedef struct VkVideoBeginCodingInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoBeginCodingFlagsKHR flags;
    VkVideoCodingQualityPresetFlagsKHR codecQualityPreset;
    VkVideoSessionKHR videoSession;
    VkVideoSessionParametersKHR videoSessionParameters;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotKHR* pReferenceSlots;
} VkVideoBeginCodingInfoKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **codecQualityPreset** is a bitmask of **VkVideoCodingQualityPresetFlagBitsKHR** specifying the Video Decode or Encode quality preset.
- **videoSession** is the video session object to be bound for the processing of the video commands.
- **videoSessionParameters** is **VK_NULL_HANDLE** or a handle of a **VkVideoSessionParametersKHR** object to be used for the processing of the video commands. If **VK_NULL_HANDLE**, then no video session parameters apply to this command buffer context.
- **referenceSlotCount** is the number of reference slot entries provided in **pReferenceSlots**.
- **pReferenceSlots** is a pointer to an array of **VkVideoReferenceSlotKHR** structures specifying reference slots, used within the video command context between this **vkCmdBeginVideoCodingKHR** command and the **vkCmdEndVideoCodingKHR** command that follows. Each reference slot provides a slot index and the **VkVideoPictureResourceKHR** specifying the reference picture resource bound to this slot index. A slot index **must** not appear more than once in **pReferenceSlots** in a given command.

Valid Usage

- VUID-VkVideoBeginCodingInfoKHR-referenceSlotCount-04856
VkVideoBeginCodingInfoKHR::referenceSlotCount **must** not exceed the value specified in **VkVideoSessionCreateInfoKHR::maxReferencePicturesSlotsCount** when creating the video session object that is being provided in **videoSession**
- VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-04857
If **videoSessionParameters** is not **VK_NULL_HANDLE**, it **must** have been created using **videoSession** as a parent object

Valid Usage (Implicit)

- VUID-VkVideoBeginCodingInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_BEGIN_CODING_INFO_KHR`
- VUID-VkVideoBeginCodingInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkVideoBeginCodingInfoKHR-flags-zero bitmask
flags **must** be `0`
- VUID-VkVideoBeginCodingInfoKHR-codecQualityPreset-parameter
codecQualityPreset **must** be a valid combination of `VkVideoCodingQualityPresetFlagBitsKHR` values
- VUID-VkVideoBeginCodingInfoKHR-codecQualityPreset-required bitmask
codecQualityPreset **must** not be `0`
- VUID-VkVideoBeginCodingInfoKHR-videoSession-parameter
videoSession **must** be a valid `VkVideoSessionKHR` handle
- VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-parameter
If **videoSessionParameters** is not `VK_NULL_HANDLE`, **videoSessionParameters** **must** be a valid `VkVideoSessionParametersKHR` handle
- VUID-VkVideoBeginCodingInfoKHR-pReferenceSlots-parameter
If **referenceSlotCount** is not `0`, **pReferenceSlots** **must** be a valid pointer to an array of **referenceSlotCount** valid `VkVideoReferenceSlotKHR` structures
- VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-parent
If **videoSessionParameters** is a valid handle, it **must** have been created, allocated, or retrieved from **videoSession**
- VUID-VkVideoBeginCodingInfoKHR-commonparent
Both of **videoSession**, and **videoSessionParameters** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoBeginCodingFlagsKHR;
```

`VkVideoBeginCodingFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

The decode preset types are defined with the following:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodingQualityPresetFlagBitsKHR {
    VK_VIDEO_CODING_QUALITY_PRESET_NORMAL_BIT_KHR = 0x00000001,
    VK_VIDEO_CODING_QUALITY_PRESET_POWER_BIT_KHR = 0x00000002,
    VK_VIDEO_CODING_QUALITY_PRESET_QUALITY_BIT_KHR = 0x00000004,
} VkVideoCodingQualityPresetFlagBitsKHR;
```

- **VK_VIDEO_CODING_QUALITY_PRESET_NORMAL_BIT_KHR** defines normal decode case.
- **VK_VIDEO_CODING_QUALITY_PRESET_POWER_BIT_KHR** defines power efficient case.
- **VK_VIDEO_CODING_QUALITY_PRESET_QUALITY_BIT_KHR** defines quality focus case.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodingQualityPresetFlagsKHR;
```

VkVideoCodingQualityPresetFlagsKHR is a bitmask type for setting a mask of zero or more **VkVideoCodingQualityPresetFlagBitsKHR**.

The **VkVideoReferenceSlotKHR** structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoReferenceSlotKHR {
    VkStructureType sType;
    const void* pNext;
    int8_t slotIndex;
    const VkVideoPictureResourceKHR* pPictureResource;
} VkVideoReferenceSlotKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **slotIndex** is the unique reference slot index used for the encode or decode operation.
- **pPictureResource** is a pointer to a **VkVideoPictureResourceKHR** structure describing the picture resource bound to this slot index.

Valid Usage (Implicit)

- VUID-VkVideoReferenceSlotKHR-sType-sType
sType must be `VK_STRUCTURE_TYPE_VIDEO_REFERENCE_SLOT_KHR`
- VUID-VkVideoReferenceSlotKHR-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain must be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264DpbSlotInfoEXT` or `VkVideoDecodeH265DpbSlotInfoEXT`
- VUID-VkVideoReferenceSlotKHR-sType-unique
The **sType** value of each struct in the **pNext** chain must be unique
- VUID-VkVideoReferenceSlotKHR-pPictureResource-parameter
pPictureResource must be a valid pointer to a valid `VkVideoPictureResourceKHR` structure

The `VkVideoPictureResourceKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoPictureResourceKHR {
    VkStructureType      sType;
    const void*        pNext;
    VkOffset2D           codedOffset;
    VkExtent2D           codedExtent;
    uint32_t            baseArrayLayer;
    VkImageView       imageViewBinding;
} VkVideoPictureResourceKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **codedOffset** is the offset to be used for the picture resource.
- **codedExtent** is the extent to be used for the picture resource.
- **baseArrayLayer** is the first array layer to be accessed for the Decode or Encode Operations.
- **imageViewBinding** is a `VkImageView` image view representing this picture resource.

Valid Usage (Implicit)

- VUID-VkVideoPictureResourceKHR-sType-sType
sType must be `VK_STRUCTURE_TYPE_VIDEO_PICTURE_RESOURCE_KHR`
- VUID-VkVideoPictureResourceKHR-pNext-pNext
pNext must be `NULL`
- VUID-VkVideoPictureResourceKHR-imageViewBinding-parameter
imageViewBinding must be a valid `VkImageView` handle

39.4.9. End of the Video Session

To end video decode or encode operations, call:

```
// Provided by VK_KHR_video_queue
void vkCmdEndVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoEndCodingInfoKHR* pEndCodingInfo);
```

- **commandBuffer** is the command buffer to be filled by this function.
- **pEndCodingInfo** is a pointer to a [VkVideoEndCodingInfoKHR](#) structure.

Valid Usage (Implicit)

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdEndVideoCodingKHR-pEndCodingInfo-parameter
pEndCodingInfo **must** be a valid pointer to a valid [VkVideoEndCodingInfoKHR](#) structure
- VUID-vkCmdEndVideoCodingKHR-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdEndVideoCodingKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support decode, or encode operations
- VUID-vkCmdEndVideoCodingKHR-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdEndVideoCodingKHR-bufferlevel
commandBuffer **must** be a primary [VkCommandBuffer](#)

Host Synchronization

- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Outside	Decode Encode

The [VkVideoEndCodingInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoEndCodingInfoKHR {
    VkStructureType          sType;
    const void*             pNext;
    VkVideoEndCodingFlagsKHR flags;
} VkVideoEndCodingInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

Valid Usage (Implicit)

- VUID-VkVideoEndCodingInfoKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_VIDEO_END_CODING_INFO_KHR**
- VUID-VkVideoEndCodingInfoKHR-pNext-pNext
pNext **must** be **NULL**
- VUID-VkVideoEndCodingInfoKHR-flags-zero bitmask
flags **must** be **0**

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoEndCodingFlagsKHR;
```

VkVideoEndCodingFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

39.4.10. Video Session Control Command

To apply dynamic controls to video decode or video encode operations, call:

```
// Provided by VK_KHR_video_queue
void vkCmdControlVideoCodingKHR(
    VkCommandBuffer                      commandBuffer,
    const VkVideoCodingControlInfoKHR* pCodingControlInfo);
```

- **commandBuffer** is the command buffer to be filled by this function.
- **pCodingControlInfo** is a pointer to a **VkVideoCodingControlInfoKHR** structure.

Valid Usage (Implicit)

- VUID-vkCmdControlVideoCodingKHR-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdControlVideoCodingKHR-pCodingControlInfo-parameter
pCodingControlInfo **must** be a valid pointer to a valid [VkVideoCodingControlInfoKHR](#) structure
- VUID-vkCmdControlVideoCodingKHR-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdControlVideoCodingKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support decode, or encode operations
- VUID-vkCmdControlVideoCodingKHR-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdControlVideoCodingKHR-bufferlevel
commandBuffer **must** be a primary [VkCommandBuffer](#)

Host Synchronization

- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Outside	Decode Encode

The settings provided in this call are applied to the video stream at the time of queue submission and are in effect until the submission of a subsequent [vkCmdControlVideoCodingKHR](#).

The [VkVideoCodingControlInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoCodingControlInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkVideoCodingControlFlagsKHR flags;
} VkVideoCodingControlInfoKHR;
```

- **sType** is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoCodingControlFlagsKHR` specifying control flags.

Valid Usage

- VUID-VkVideoCodingControlInfoKHR-flags-06518

The first command buffer submitted for a newly created video session **must** set the `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR` bit in `VkVideoCodingControlInfoKHR::flags` to reset the session device context before any video decode or encode operations are performed on the session.

Valid Usage (Implicit)

- VUID-VkVideoCodingControlInfoKHR-sType-sType
 - `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_CODING_CONTROL_INFO_KHR`
- VUID-VkVideoCodingControlInfoKHR-pNext-pNext
 - Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoEncodeRateControlInfoKHR` or `VkVideoEncodeRateControlLayerInfoKHR`
- VUID-VkVideoCodingControlInfoKHR-sType-unique
 - The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkVideoCodingControlInfoKHR-flags-parameter
 - `flags` **must** be a valid combination of `VkVideoCodingControlFlagBitsKHR` values

The `vkCmdControlVideoCodingKHR` flags are defined with the following enumeration:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodingControlFlagBitsKHR {
    VK_VIDEO_CODING_CONTROL_DEFAULT_KHR = 0,
    VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR = 0x00000001,
} VkVideoCodingControlFlagBitsKHR;
```

- `VK_VIDEO_CODING_CONTROL_DEFAULT_KHR` indicates a request for the coding control parameters to be applied to the current state of the bound video session.
- `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR` indicates a request for the bound video session device context to be reset before the coding control parameters are applied.

A newly created video session **must** be reset before use for video decode or encode operations. The reset operation returns all session DPB slots to the unused state (see [DPB Slot States](#)). For encode sessions, the reset operation returns rate control configuration to implementation default settings. After decode or encode operations are performed on a session, the reset operation **may** be used to return the video session device context to the same initial state as after the reset of a newly created video session. This **may** be used when different video sequences are processed with the same

session.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodingControlFlagsKHR;
```

`VkVideoCodingControlFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoCodingControlFlagBitsKHR`.

39.5. Video Decode Operations

Before the application can start recording Vulkan command buffers for the Video Decode Operations, it **must** do the following, beforehand:

1. Ensure that the implementation can decode the Video Content by querying the supported codec operations and profiles using `vkGetPhysicalDeviceQueueFamilyProperties2`.
2. By using `vkGetPhysicalDeviceVideoFormatPropertiesKHR` and providing one or more video profiles, choose the Vulkan formats supported by the implementation. The formats for `output` and `reference` pictures **must** be queried and chosen separately. Refer to the section on [enumeration of supported video formats](#).
3. Before creating an image to be used as a video picture resource, obtain the supported image creation parameters by querying with `vkGetPhysicalDeviceFormatProperties2` and `vkGetPhysicalDeviceImageFormatProperties2` using one of the reported formats and adding `VkVideoProfilesKHR` to the `pNext` chain of `VkFormatProperties2`. When querying the parameters with `vkGetPhysicalDeviceImageFormatProperties2` for images targeting decoded `output` and `reference (DPB)` pictures, the `VkPhysicalDeviceImageFormatInfo2::usage` field should contain `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` and `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, respectively.
4. Create none, some, or all of the required `images` for the `decoded output` and `reference` pictures. More Video Picture Resources **can** be created at some later point if needed while processing the decoded content. Also, if the decoded picture size is expected to change, the images **can** be created based on the maximum decoded content size required.
5. Create the `video session` to be used for video decode operations. Before creating the Decode Video Session, the decode capabilities **should** be queried with `vkGetPhysicalDeviceVideoCapabilitiesKHR` to obtain the limits of the parameters allowed by the implementation for a particular codec profile.
6. Bind memory resources with the decode video session by calling `vkBindVideoSessionMemoryKHR`. The video session **cannot** be used until memory resources are allocated and bound to it. In order to determine the required memory sizes and heap types of the device memory allocations, `vkGetVideoSessionMemoryRequirementsKHR` **should** be called.
7. Create one or more `Session Parameter objects` for use across command buffer recording operations, if required by the codec extension in use. These objects **must** be created against a `video session` with the parameters required by the codec. Each `Session Parameter object` created is a child object of the associated `Session object` and **cannot** be bound in the command buffer

with any other [Session Object](#).

The recording of Video Decode Commands against a Vulkan command buffer consists of the following sequence:

1. [vkCmdBeginVideoCodingKHR](#) starts the recording of one or more Video Decode operations in the command buffer. For each Video Decode Command operation, a Video Session **must** be bound to the command buffer within this command. This command establishes a Vulkan Video Decode Context that consists of the bound Video Session Object, Session Parameters Object, and the required Video Picture Resources. The established Video Decode Context is in effect until the [vkCmdEndVideoCodingKHR](#) command is recorded. If more Video Decode operations are to be required after the [vkCmdEndVideoCodingKHR](#) command, another Video Decode Context **can** be started with the [vkCmdBeginVideoCodingKHR](#) command.
2. [vkCmdDecodeVideoKHR](#) specifies one or more compressed data buffers to be decoded. The [VkVideoDecodeInfoKHR](#) parameters, and the codec extension structures chained to this, specify the details of the decode operation.
3. [vkCmdControlVideoCodingKHR](#) records operations against the decoded data, decoding device, or the Video Session state.
4. [vkCmdEndVideoCodingKHR](#) signals the end of the recording of the Vulkan Video Decode Context, as established by [vkCmdBeginVideoCodingKHR](#).

In addition to the above, the following commands **can** be recorded between [vkCmdBeginVideoCodingKHR](#) and [vkCmdEndVideoCodingKHR](#):

- Query operations
- Global Memory Barriers
- Buffer Memory Barriers
- Image Memory Barriers (these **must** be used to transition the Video Picture Resources to the proper `VK_IMAGE_LAYOUT_VIDEO_DECODE_DBP_KHR` and `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` layouts).
- Pipeline Barriers
- Events
- Timestamps
- Device Groups (device mask)

The following Video Decode related commands **must** be recorded **outside** the Vulkan Video Decode Context established with the [vkCmdBeginVideoCodingKHR](#) and [vkCmdEndVideoCodingKHR](#) commands:

- Sparse Memory Binding
- Copy Commands
- Clear Commands

39.5.1. Video Picture Decode Modes

There are a few ways that the `vkCmdDecodeVideoKHR` can be configured for the Video Picture Decode Operations, based on:

- if the `output resource` would need to be used as `Reference Picture` for subsequent decode operations and;
- if `DPB Slots` are required for use as `Reference Pictures` indexes.

The most basic Video Picture Decode operation with the `vkCmdDecodeVideoKHR` command is to output the decoded pixel data without using any DPB `Reference Pictures` and without updating any `DPB Slot's` indexes.

In this case, the following `VkVideoDecodeInfoKHR` parameters **must** be set:

- `VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding` **must** be a valid `VkImageView`. This `VkImageView` represents the `output resource` where the decoded pixels will be populated after a successful decode operation.
- `VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex` **must** be an invalid `DPB Slot` index (-1) since the decoded picture is not intended to be used as a reference picture with subsequent video decode operations.
- The value of the `VkVideoDecodeInfoKHR::referenceSlotCount` **can** be `0` and `VkVideoDecodeInfoKHR::pReferenceSlots` **can** be `NULL`.
- If `VkVideoDecodeInfoKHR::pReferenceSlots` is not `NULL`, it **can** still have entries representing `DPB Slot` indexes with a `Valid Picture Reference`. The codec extension selects the actual use of the `Reference Pictures` by referring to a `DPB Slot` index with a `Valid Picture Reference`.

Video Picture Decode operations with the `vkCmdDecodeVideoKHR` command, requiring one or more `Reference Pictures` for the predictions of the values of samples for the `decoded output picture` would require `DPB Slots` with `Valid Picture Reference`.

In this case, the following `VkVideoDecodeInfoKHR` parameters **must** be set:

- `VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding` **must** be a valid `VkImageView`. This `VkImageView` represents the `output resource` where the decoded pixels will be populated after a successful decode operation.
- `VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex` **must** be an invalid `DPB Slot` index (-1) since the decoded picture is not intended to be used as a reference picture with subsequent video decode operations.
- The value of the `VkVideoDecodeInfoKHR::referenceSlotCount` **must** not be `0` and `VkVideoDecodeInfoKHR::pReferenceSlots` should represent at least the number of the reference slots required for the decode operation. The codec extension selects the actual use of the `Reference Pictures` by referring to a `DPB Slot` index with a `Valid Picture Reference`. If the implementation does not use an opaque DPB, each `DPB slot` representing a reference picture **must** refer to a valid `image view`. The `image views` **must** represent the same `image resources` that were used to create the `reference picture` for the corresponding `DPB Slot` index.
- `VkVideoDecodeInfoKHR::pReferenceSlots` **can** still have entries representing `DPB Slot` indexes

with a [Valid Picture Reference](#).

After the `vkCmdDecodeVideoKHR` operation is completed successfully, the `VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding` pixel data will be updated with the decoded content. The operation will not update any [DPB Slot](#) with [Reference Pictures](#) data. However, any [DPB Slot](#) activation, invalidation, or deactivation operations requested via `VkVideoDecodeInfoKHR::pReferenceSlots` are still going to be performed.

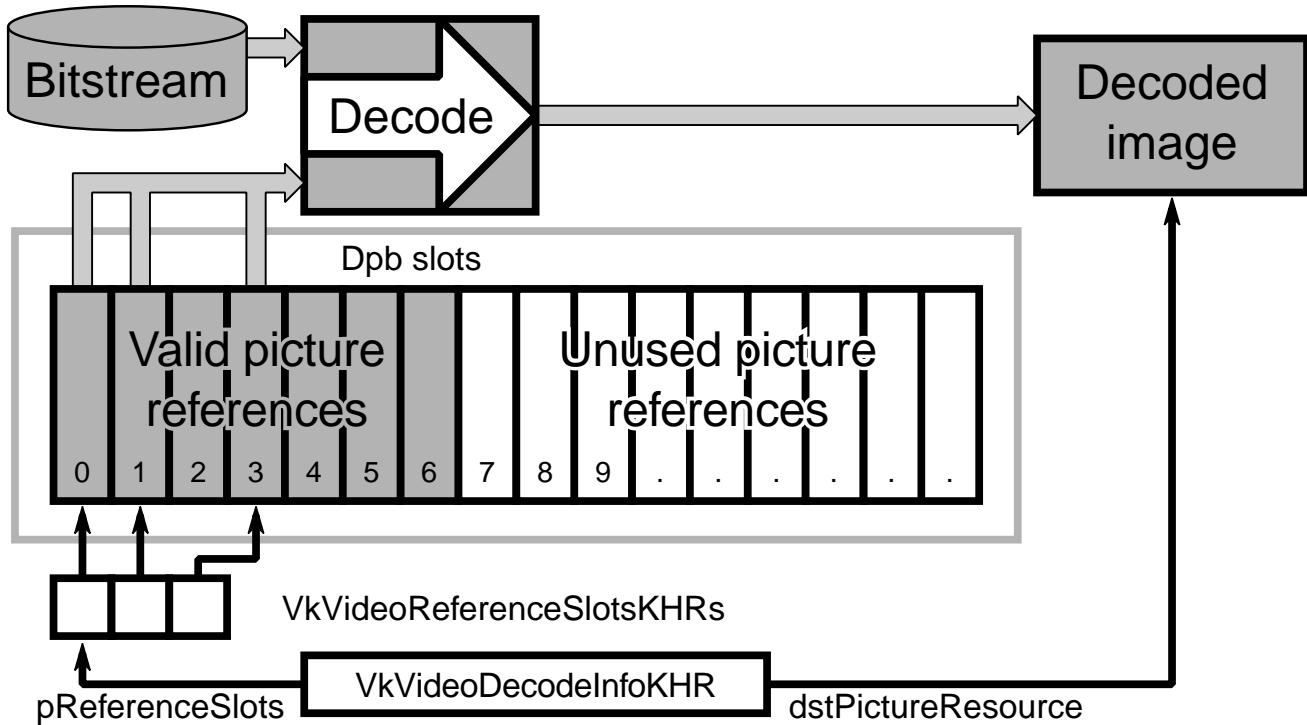

Figure 28. Decoding a Frame to `VkImageView` without a slot update for a Reference Picture

Video Picture Decode with a [Reference Picture](#) slot update and using optional [Reference Pictures](#)

When it is known that the picture to be decoded will be used as a [reference picture](#) for subsequent decode operations, one of the available [DPB Slots](#) needs to be selected for [activation and update](#) operations as part of the `vkCmdDecodeVideoKHR` command.

Based on whether a decode operation with [reference pictures](#) or [without reference pictures](#) is required, the `vkCmdDecodeVideoKHR` should be configured with parameters as described in the previous sections. In addition, one of the available [DPB Slots](#) **must** be selected by the application, activated with resources and then set-up for an update with the decode operation.

In this case, the following `VkVideoDecodeInfoKHR` parameters **must** be set:

- `VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding` **must** be a valid `VkImageView`. This `VkImageView` represents the [output resource](#) where the decoded pixels will be populated after a successful decode operation. If the implementation does not use an opaque DPB, both the [output](#) and [reference picture](#) resource coincide.
- `VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex` **must** be a valid [DPB Slot](#) index selected by the application, based on the currently available slots.

- `VkVideoDecodeInfoKHR::pReferenceSlots` can still have entries representing DPB Slot indexes with a [Valid Picture Reference](#).

After the `vkCmdDecodeVideoKHR` operation has completed successfully, the decoded content will be available in the resource provided for `VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding`. In addition, this operation will update the selected DPB Slot with [Reference Pictures](#) data. Any other DPB Slot activation, invalidation, or deactivation operation requested via the `VkVideoDecodeInfoKHR::pReferenceSlots` are going to be performed as well.

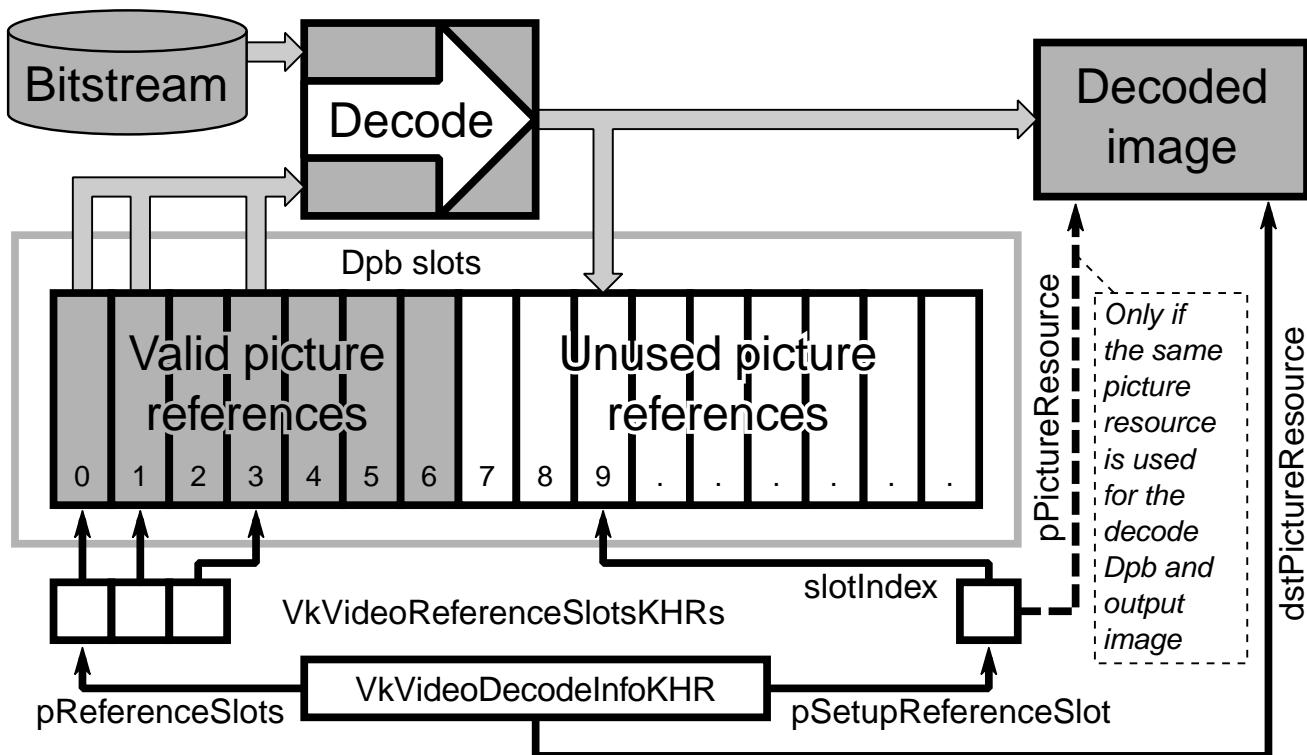

Figure 29. Decoding a Frame to `VkImageView` with an update to a [Reference Pictures](#) DPB Slot

39.5.2. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as one of the decode operation bits, the `VkVideoDecodeCapabilitiesKHR` structure **must** be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve capabilities specific to video decoding.

The `VkVideoDecodeCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeCapabilitiesKHR {
    VkStructureType          sType;
    void*                    pNext;
    VkVideoDecodeCapabilityFlagsKHR flags;
} VkVideoDecodeCapabilitiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `flags` is a bitmask of `VkVideoDecodeCapabilityFlagBitsKHR` describing supported decoding features.

Valid Usage (Implicit)

- VUID-VkVideoDecodeCapabilitiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_CAPABILITIES_KHR`

```
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeCapabilityFlagsKHR;
```

`VkVideoDecodeCapabilityFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoDecodeCapabilityFlagBitsKHR`.

Bits which **may** be set in `VkVideoDecodeCapabilitiesKHR::flags`, indicating the decoding features supported, are:

```
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeCapabilityFlagBitsKHR {
    VK_VIDEO_DECODE_CAPABILITY_DEFAULT_KHR = 0,
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR = 0x00000002,
} VkVideoDecodeCapabilityFlagBitsKHR;
```

- `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` - reports the implementation supports using the same [Video Picture Resource](#) for decode DPB and decode output.
- `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` - reports the implementation supports using distinct [Video Picture Resources](#) for decode DPB and decode output.

An implementation **must** report at least one of `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` or `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` as supported.

Note:

If both `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` and `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` are supported, an application **may** choose to create separate images for decode DPB and decode output in the case where linear tiling is required for output but optimal tiling **must** still be used for DPB. This avoids scheduling layout transitions at the expense of extra overhead during decoding to write both images and the additional memory requirements.

39.5.3. Video Decode Command Buffer Commands

To decode a frame, call:

```
// Provided by VK_KHR_video_decode_queue
void vkCmdDecodeVideoKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoDecodeInfoKHR* pFrameInfo);
```

- **commandBuffer** is the command buffer to be filled with this function for decode frame command.
- **pFrameInfo** is a pointer to a [VkVideoDecodeInfoKHR](#) structure.

Valid Usage (Implicit)

- VUID-vkCmdDecodeVideoKHR-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdDecodeVideoKHR-pFrameInfo-parameter
pFrameInfo **must** be a valid pointer to a valid [VkVideoDecodeInfoKHR](#) structure
- VUID-vkCmdDecodeVideoKHR-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdDecodeVideoKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support decode operations
- VUID-vkCmdDecodeVideoKHR-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdDecodeVideoKHR-bufferlevel
commandBuffer **must** be a primary [VkCommandBuffer](#)

Host Synchronization

- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Outside	Decode

The [VkVideoDecodeInfoKHR](#) structure is defined as:

```

// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoDecodeFlagsKHR flags;
    VkOffset2D codedOffset;
    VkExtent2D codedExtent;
    VkBuffer srcBuffer;
    VkDeviceSize srcBufferOffset;
    VkDeviceSize srcBufferSize;
    VkVideoPictureResourceKHR dstPictureResource;
    const VkVideoReferenceSlotKHR* pSetupReferenceSlot;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotKHR* pReferenceSlots;
} VkVideoDecodeInfoKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure. All the codec specific structures related to each frame(picture parameters, quantization matrix, etc.) **must** be chained here and pass to decode session with the function call [vkCmdDecodeVideoKHR](#).
- **flags** is a bitmask of [VkVideoDecodeFlagBitsKHR](#) specifying decode flags, reserved for future versions of this specification.
- **codedOffset** is the coded offset of the decode operations. The purpose of this field is interpreted based on the codec extension. When decoding content in H.264 field mode, the **codedOffset** specifies the line or picture field's offset within the image.
- **codedExtent** is the coded size of the decode operations.
- **srcBuffer** is the source buffer that holds the encoded bitstream.
- **srcBufferOffset** is the buffer offset where the valid encoded bitstream starts in **srcBuffer**. It **must** meet the alignment requirement [minBitstreamBufferOffsetAlignment](#) within [VkVideoCapabilitiesKHR](#) queried with the [vkGetPhysicalDeviceVideoCapabilitiesKHR](#) function.
- **srcBufferSize** is the size of the **srcBuffer** with valid encoded bitstream, starting from **srcBufferOffset**. It **must** meet the alignment requirement [minBitstreamBufferSizeAlignment](#) within [VkVideoCapabilitiesKHR](#) queried with the [vkGetPhysicalDeviceVideoCapabilitiesKHR](#) function.
- **dstPictureResource** is the destination [Decoded Output Picture](#) Resource.
- **pSetupReferenceSlot** is **NULL** or a pointer to a [VkVideoReferenceSlotKHR](#) structure used for generating a DPB reference slot and Picture Resource. **pSetupReferenceSlot->slotIndex** specifies the slot index number to use as a target for producing the DPB data. **slotIndex** **must** reference a valid entry as specified in [VkVideoBeginCodingInfoKHR](#) via the **pReferenceSlots** within the [vkCmdBeginVideoCodingKHR](#) command that established the Vulkan Video Decode Context for this command.
- **referenceSlotCount** is the number of the DPB Reference Pictures that will be used when this decoding operation is executing.

- `pReferenceSlots` is a pointer to an array of `VkVideoReferenceSlotKHR` structures specifying the DPB Reference pictures that will be used when this decoding operation is executing.

Valid Usage (Implicit)

- VUID-VkVideoDecodeInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_INFO_KHR`
- VUID-VkVideoDecodeInfoKHR-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264PictureInfoEXT` or `VkVideoDecodeH265PictureInfoEXT`
- VUID-VkVideoDecodeInfoKHR-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkVideoDecodeInfoKHR-flags-parameter
`flags` **must** be a valid combination of `VkVideoDecodeFlagBitsKHR` values
- VUID-VkVideoDecodeInfoKHR-srcBuffer-parameter
`srcBuffer` **must** be a valid `VkBuffer` handle
- VUID-VkVideoDecodeInfoKHR-dstPictureResource-parameter
`dstPictureResource` **must** be a valid `VkVideoPictureResourceKHR` structure
- VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-parameter
`pSetupReferenceSlot` **must** be a valid pointer to a valid `VkVideoReferenceSlotKHR` structure
- VUID-VkVideoDecodeInfoKHR-pReferenceSlots-parameter
If `referenceSlotCount` is not `0`, `pReferenceSlots` **must** be a valid pointer to an array of `referenceSlotCount` valid `VkVideoReferenceSlotKHR` structures

The `vkCmdDecodeVideoKHR` flags are defined with the following enumeration:

```
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeFlagBitsKHR {
    VK_VIDEO_DECODE_DEFAULT_KHR = 0,
    VK_VIDEO_DECODE_RESERVED_0_BIT_KHR = 0x00000001,
} VkVideoDecodeFlagBitsKHR;
```

- `VK_VIDEO_DECODE_RESERVED_0_BIT_KHR` The current version of the specification has reserved this value for future use.

```
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeFlagsKHR;
```

`VkVideoDecodeFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoDecodeFlagBitsKHR`.

39.6. Video Decode of AVC (ITU-T H.264)

This extension adds H.264 codec specific structures needed for decode session to execute decode jobs which include H.264 sequence header, picture parameter header and quantization matrix etc. Unless otherwise noted, all references to the H.264 specification are to the 2010 edition published by the ITU-T, dated March 2010. This specification is available at <https://www.itu.int/rec/T-REC-H.264>.

39.6.1. H.264 decode profile

A H.264 decode profile is specified using `VkVideoDecodeH264ProfileEXT` chained to `VkVideoProfileKHR` when the codec-operation in `VkVideoProfileKHR` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_EXT`.

The `VkVideoDecodeH264ProfileEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264ProfileEXT {
    VkStructureType           sType;
    const void*               pNext;
    StdVideoH264ProfileIdc   stdProfileIdc;
    VkVideoDecodeH264PictureLayoutFlagsEXT pictureLayout;
} VkVideoDecodeH264ProfileEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH264ProfileIdc` value specifying the H.264 codec profile IDC
- `pictureLayout` is a bitmask of `VkVideoDecodeH264PictureLayoutFlagBitsEXT` specifying the layout of the decoded picture's contents depending on the nature (progressive vs. interlaced) of the input content.

Note

When passing `VkVideoDecodeH264ProfileEXT` to `vkCreateVideoSessionKHR` in the `pNext` chain of `VkVideoSessionCreateInfoKHR`, requests for a `pictureLayout` not supported by the implementation will result in failure of the command.

Valid Usage

- VUID-VkVideoDecodeH264ProfileEXT-pNext-06259

If the `VkVideoDecodeH264ProfileEXT` structure is included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure passed to `vkGetPhysicalDeviceVideoCapabilitiesKHR`, the value in `pictureLayout` is treated as a bitmask of requested picture layouts. It is always valid to use the value `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_EXT` as the implementation is guaranteed to support decoding of progressive content.

- VUID-VkVideoDecodeH264ProfileEXT-pNext-06260

If the `VkVideoDecodeH264ProfileEXT` structure is included in the `pNext` chain of the `VkVideoSessionCreateInfoKHR` structure passed to `vkCreateVideoSessionKHR`, the value in `pictureLayout` **must** be exactly one of `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_EXT`, `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_EXT` or `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_EXT`.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264ProfileEXT-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PROFILE_EXT`

```
// Provided by VK_EXT_video_decode_h264
typedef VkFlags VkVideoDecodeH264PictureLayoutFlagsEXT;
```

`VkVideoDecodeH264PictureLayoutFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoDecodeH264PictureLayoutFlagBitsEXT`.

The H.264 video decode picture layout flags are defined with the following enum:

```
// Provided by VK_EXT_video_decode_h264
typedef enum VkVideoDecodeH264PictureLayoutFlagBitsEXT {
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_EXT = 0,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_EXT =
0x00000001,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_EXT =
0x00000002,
} VkVideoDecodeH264PictureLayoutFlagBitsEXT;
```

- `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_EXT` specifies support for progressive content. This flag has the value `0`.
- `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_EXT` specifies support for or use of a picture layout for interlaced content where all lines belonging to the first field are decoded to the even-numbered lines within the picture resource, and all lines belonging to

the second field are decoded to the odd-numbered lines within the picture resource.

- `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_EXT` specifies support for or use of a picture layout for interlaced content where all lines belonging to the first field are grouped together in a single plane, followed by another plane containing all lines belonging to the second field.

39.6.2. Selecting a H.264 decode profile

When using `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for the input `pVideoProfile` with `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_EXT`, a `VkVideoDecodeH264ProfileEXT` structure **must** be chained to `VkVideoProfileKHR` to select a H.264 decode profile. If supported, the implementation returns the capabilities associated with the specified H.264 decode profile. The requirement is similar when querying supported image formats using `vkGetPhysicalDeviceVideoFormatPropertiesKHR`.

A supported H.264 decode profile **must** be selected when creating a video session by chaining `VkVideoDecodeH264ProfileEXT` to the `VkVideoProfileKHR` field of `VkVideoSessionCreateInfoKHR`.

39.6.3. Capabilities

The `VkVideoDecodeH264CapabilitiesEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264CapabilitiesEXT {
    VkStructureType          sType;
    void*                   pNext;
    uint32_t                maxLevel;
    VkOffset2D                fieldOffsetGranularity;
    VkExtensionProperties     stdExtensionVersion;
} VkVideoDecodeH264CapabilitiesEXT;
```

When using `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for the input `pVideoProfile` with `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_EXT`, a `VkVideoDecodeH264CapabilitiesEXT` structure **must** be chained to `VkVideoCapabilitiesKHR` to get this H.264 decode profile specific capabilities.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxLevel` is the maximum H.264 level supported by the device.
- `fieldOffsetGranularity` - if Interlaced Video Content is supported, the maximum field offset granularity supported for the picture resource.
- `stdExtensionVersion` is a `VkExtensionProperties` structure specifying the H.264 extension name and version supported by this implementation.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264CapabilitiesEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_CAPABILITIES_EXT`

39.6.4. Create Information

The `VkVideoDecodeH264SessionCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264SessionCreateInfoEXT {
    VkStructureType                      sType;
    const void*                         pNext;
    VkVideoDecodeH264CreateFlagsEXT      flags;
    const VkExtensionProperties*       pStdExtensionVersion;
} VkVideoDecodeH264SessionCreateInfoEXT;
```

A `VkVideoDecodeH264SessionCreateInfoEXT` structure can be chained to `VkVideoSessionCreateInfoKHR` when the function `vkCreateVideoSessionKHR` is called to create a video session for H.264 decode.

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pStdExtensionVersion** is a pointer to a `VkExtensionProperties` structure specifying the H.264 codec extensions defined in `StdVideoH264Extensions`.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264SessionCreateInfoEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_CREATE_INFO_EXT`
- VUID-VkVideoDecodeH264SessionCreateInfoEXT-flags-zero bitmask
flags must be `0`
- VUID-VkVideoDecodeH264SessionCreateInfoEXT-pStdExtensionVersion-parameter
pStdExtensionVersion must be a valid pointer to a valid `VkExtensionProperties` structure

```
// Provided by VK_EXT_video_decode_h264
typedef VkFlags VkVideoDecodeH264CreateFlagsEXT;
```

`VkVideoDecodeH264CreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

39.6.5. Decoder Parameter Sets

To reduce parameter traffic during decoding, the decoder parameter set object supports storing H.264 SPS/PPS parameter sets that **may** be later referenced during decoding.

The `VkVideoDecodeH264SessionParametersCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxSpsStdCount;
    uint32_t maxPpsStdCount;
    const VkVideoDecodeH264SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoDecodeH264SessionParametersCreateInfoEXT;
```

A `VkVideoDecodeH264SessionParametersCreateInfoEXT` structure holding one H.264 SPS and at least one H.264 PPS parameter set **must** be chained to `VkVideoSessionParametersCreateInfoKHR` when calling `vkCreateVideoSessionParametersKHR` to store these parameter set(s) with the decoder parameter set object for later reference. The provided H.264 SPS/PPS parameters **must** be within the limits specified during decoder creation for the decoder specified in `VkVideoSessionParametersCreateInfoKHR`.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxSpsStdCount` is the maximum number of SPS parameters that the `VkVideoSessionParametersKHR` can contain.
- `maxPpsStdCount` is the maximum number of PPS parameters that the `VkVideoSessionParametersKHR` can contain.
- `pParametersAddInfo` is `NULL` or a pointer to a `VkVideoDecodeH264SessionParametersAddInfoEXT` structure specifying H.264 parameters to add upon object creation.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264SessionParametersCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_CREATE_INFO_EXT`
- VUID-VkVideoDecodeH264SessionParametersCreateInfoEXT-pParametersAddInfo-parameter
If `pParametersAddInfo` is not `NULL`, `pParametersAddInfo` **must** be a valid pointer to a valid `VkVideoDecodeH264SessionParametersAddInfoEXT` structure

The `VkVideoDecodeH264SessionParametersAddInfoEXT` structure is defined as:

```

// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersAddInfoEXT {
    VkStructureType          sType;
    const void*             pNext;
    uint32_t                spsStdCount;
    const StdVideoH264SequenceParameterSet* pSpsStd;
    uint32_t                ppsStdCount;
    const StdVideoH264PictureParameterSet* pPpsStd;
} VkVideoDecodeH264SessionParametersAddInfoEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **spsStdCount** is the number of SPS elements in **pSpsStd**. Its value **must** be less than or equal to the value of **maxSpsStdCount**.
- **pSpsStd** is a pointer to an array of **StdVideoH264SequenceParameterSet** structures representing H.264 sequence parameter sets. Each element of the array **must** have a unique H.264 SPS ID.
- **ppsStdCount** is the number of PPS provided in **pPpsStd**. Its value **must** be less than or equal to the value of **maxPpsStdCount**.
- **pPpsStd** is a pointer to an array of **StdVideoH264PictureParameterSet** structures representing H.264 picture parameter sets. Each element of the array **must** have a unique H.264 SPS-PPS ID pair.

Valid Usage

- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-spsStdCount-04822

The values of `spsStdCount` and `ppsStdCount` **must** be less than or equal to the values of `maxSpsStdCount` and `maxPpsStdCount`, respectively

- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-maxSpsStdCount-04823

When the `maxSpsStdCount` number of parameters of type `StdVideoH264SequenceParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to this object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point

- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-maxPpsStdCount-04824

When the `maxPpsStdCount` number of parameters of type `StdVideoH264PictureParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to this object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point

- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-None-04825

Each entry to be added **must** have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, SPS-PPS IDs

- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-None-04826

Parameter entries that already exist in Video Session Parameters object with a particular SPS-PPS IDs **cannot** be replaced nor updated

- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-None-04827

When creating a new object using a Video Session Parameters as a template, the array's parameters with the same SPS-PPS IDs as the ones from the template take precedence

- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-None-04828

SPS/PPS parameters **must** comply with the limits specified in [VkVideoSessionCreateInfoKHR](#) during Video Session creation

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_ADD_INFO_EXT`
- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-pSpsStd-parameter
If pSpsStd is not `NULL`, pSpsStd **must** be a valid pointer to an array of `spsStdCount` `StdVideoH264SequenceParameterSet` values
- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-pPpsStd-parameter
If pPpsStd is not `NULL`, pPpsStd **must** be a valid pointer to an array of `ppsStdCount` `StdVideoH264PictureParameterSet` values
- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-spsStdCount-arraylength
`spsStdCount` **must** be greater than `0`
- VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-ppsStdCount-arraylength
`ppsStdCount` **must** be greater than `0`

39.6.6. Picture Decoding

To decode a picture, the structure `VkVideoDecodeH264PictureInfoEXT` **may** be chained to `VkVideoDecodeInfoKHR` when calling `vkCmdDecodeVideoKHR`.

The `VkVideoDecodeH264PictureInfoEXT` structure represents a picture decode operation and is defined as:

```
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264PictureInfoEXT {
    VkStructureType                     sType;
    const void*                         pNext;
    const StdVideoDecodeH264PictureInfo* pStdPictureInfo;
    uint32_t                            slicesCount;
    const uint32_t*                      pSlicesDataOffsets;
} VkVideoDecodeH264PictureInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdPictureInfo` is a pointer to a `StdVideoDecodeH264PictureInfo` structure specifying the codec standard specific picture information from the H.264 specification.
- `slicesCount` is the number of slices in this picture.
- `pSlicesDataOffsets` is a pointer to an array of `slicesCount` offsets indicating the start offset of each slice within the bitstream buffer.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264PictureInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PICTURE_INFO_EXT`
- VUID-VkVideoDecodeH264PictureInfoEXT-pStdPictureInfo-parameter
pStdPictureInfo **must** be a valid pointer to a valid `StdVideoDecodeH264PictureInfo` value
- VUID-VkVideoDecodeH264PictureInfoEXT-pSlicesDataOffsets-parameter
pSlicesDataOffsets **must** be a valid pointer to an array of `slicesCount uint32_t` values
- VUID-VkVideoDecodeH264PictureInfoEXT-slicesCount-arraylength
slicesCount **must** be greater than `0`

The `VkVideoDecodeH264DpbSlotInfoEXT` structure correlates a DPB Slot index with codec-specific information and is defined as:

```
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264DpbSlotInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH264DpbSlotInfoEXT;
```

- **sType** is the type of this structure.
- **pStdReferenceInfo** is a pointer to a `StdVideoDecodeH264ReferenceInfo` structure specifying the codec standard specific picture reference information from the H.264 specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264DpbSlotInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_DPB_SLOT_INFO_EXT`
- VUID-VkVideoDecodeH264DpbSlotInfoEXT-pStdReferenceInfo-parameter
pStdReferenceInfo **must** be a valid pointer to a valid `StdVideoDecodeH264ReferenceInfo` value

The `VkVideoDecodeH264MvcEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264MvcEXT {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH264Mvc* pStdMvc;
} VkVideoDecodeH264MvcEXT;
```

- **sType** is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdMvc` is a pointer to a `StdVideoDecodeH264Mvc` structure specifying H.264 codec specification information for MVC.

When the content type is H.264 MVC, a `VkVideoDecodeH264MvcEXT` structure **must** be chained to `VkVideoDecodeH264PictureInfoEXT`.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264MvcEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_MVC_EXT`
- VUID-VkVideoDecodeH264MvcEXT-pStdMvc-parameter
`pStdMvc` **must** be a valid pointer to a valid `StdVideoDecodeH264Mvc` value

39.7. Video Decode of HEVC (ITU-T H.265)

This extension adds H.265 codec specific structures needed for decode session to execute decode jobs which include H.265 sequence header, picture parameter header and quantization matrix etc. Unless otherwise noted, all references to the H.265 specification are to the 2013 edition published by the ITU-T, dated April 2013. This specification is available at <https://www.itu.int/rec/T-REC-H.265>.

39.7.1. H.265 decode profile

A H.265 decode profile is specified using `VkVideoDecodeH265ProfileEXT` chained to `VkVideoProfileKHR` when the codec-operation in `VkVideoProfileKHR` is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT`.

The `VkVideoDecodeH265ProfileEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265ProfileEXT {
    VkStructureType          sType;
    const void*              pNext;
    StdVideoH265ProfileIdc  stdProfileIdc;
} VkVideoDecodeH265ProfileEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH265ProfileIdc` value specifying the H.265 codec profile IDC.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265ProfileEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PROFILE_EXT`

39.7.2. Selecting an H.265 Profile

When using `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for the input `pVideoProfile` with `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT`, a `VkVideoDecodeH265ProfileEXT` structure **must** be chained to `VkVideoProfileKHR` to select a H.265 decode profile. If supported, the implementation returns the capabilities associated with the specified H.265 decode profile. The requirement is similar when querying supported image formats using `vkGetPhysicalDeviceVideoFormatPropertiesKHR`.

A supported H.265 decode profile **must** be selected when creating a video session by chaining `VkVideoDecodeH265ProfileEXT` to the `VkVideoProfileKHR` field of `VkVideoSessionCreateInfoKHR`.

39.7.3. Capabilities

The `VkVideoDecodeH265CapabilitiesEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265CapabilitiesEXT {
    VkStructureType          sType;
    void*                   pNext;
    uint32_t                maxLevel;
    VkExtensionProperties   stdExtensionVersion;
} VkVideoDecodeH265CapabilitiesEXT;
```

When using `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for the parameter `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT`, a `VkVideoDecodeH265CapabilitiesEXT` structure **can** be chained to `VkVideoCapabilitiesKHR` to return this H.265 extension specific capabilities.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxLevel` is the maximum H.265 level supported by the device.
- `stdExtensionVersion` is a `VkExtensionProperties` structure specifying the H.265 extension name and version supported by this implementation.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265CapabilitiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_CAPABILITIES_EXT`

39.7.4. Create Infomation

The `VkVideoDecodeH265SessionCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265SessionCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkVideoDecodeH265CreateFlagsEXT flags;
    const VkExtensionProperties* pStdExtensionVersion;
} VkVideoDecodeH265SessionCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pStdExtensionVersion** is a pointer to a **VkExtensionProperties** structure specifying H.265 codec extensions.

A **VkVideoDecodeH265SessionCreateInfoEXT** structure can be chained to **VkVideoSessionCreateInfoKHR** when the function **vkCreateVideoSessionKHR** is called to create a video session for H.265 decode operations.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265SessionCreateInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_CREATE_INFO_EXT**
- VUID-VkVideoDecodeH265SessionCreateInfoEXT-flags-zero bitmask
flags **must** be **0**
- VUID-VkVideoDecodeH265SessionCreateInfoEXT-pStdExtensionVersion-parameter
pStdExtensionVersion **must** be a valid pointer to a valid **VkExtensionProperties** structure

```
// Provided by VK_EXT_video_decode_h265
typedef VkFlags VkVideoDecodeH265CreateFlagsEXT;
```

VkVideoDecodeH265CreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

39.7.5. Decoder Parameter Sets

To reduce parameter traffic during decoding, the decoder parameter set object supports storing H.265 SPS/PPS parameter sets that may be later referenced during decoding.

The **VkVideoDecodeH265SessionParametersCreateInfoEXT** structure is defined as:

```

// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxSpsStdCount;
    uint32_t maxPpsStdCount;
    const VkVideoDecodeH265SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoDecodeH265SessionParametersCreateInfoEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxSpsStdCount** is the maximum number of SPS parameters that the **VkVideoSessionParametersKHR** can contain.
- **maxPpsStdCount** is the maximum number of PPS parameters that the **VkVideoSessionParametersKHR** can contain.
- **pParametersAddInfo** is **NULL** or a pointer to a **VkVideoDecodeH265SessionParametersAddInfoEXT** structure specifying H.265 parameters to add upon object creation.

A **VkVideoDecodeH265SessionParametersCreateInfoEXT** structure holding one H.265 SPS and at least one H.265 PPS parameter set **must** be chained to **VkVideoSessionParametersCreateInfoKHR** when calling **vkCreateVideoSessionParametersKHR** to store these parameter set(s) with the decoder parameter set object for later reference. The provided H.265 SPS/PPS parameters **must** be within the limits specified during decoder creation for the decoder specified in **VkVideoSessionParametersCreateInfoKHR**.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265SessionParametersCreateInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_CREATE_INFO_EXT**
- VUID-VkVideoDecodeH265SessionParametersCreateInfoEXT-pParametersAddInfo-parameter
If **pParametersAddInfo** is not **NULL**, **pParametersAddInfo** **must** be a valid pointer to a valid **VkVideoDecodeH265SessionParametersAddInfoEXT** structure

The **VkVideoDecodeH265SessionParametersAddInfoEXT** structure is defined as:

```

// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersAddInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t spsStdCount;
    const StdVideoH265SequenceParameterSet* pSpsStd;
    uint32_t ppsStdCount;
    const StdVideoH265PictureParameterSet* pPpsStd;
} VkVideoDecodeH265SessionParametersAddInfoEXT;

```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `spsStdCount` is the number of SPS elements in the `pSpsStd`. Its value **must** be less than or equal to the value of `maxSpsStdCount`.
- `pSpsStd` is a pointer to an array of `StdVideoH265SequenceParameterSet` structures representing H.265 sequence parameter sets. Each element of the array **must** have a unique H.265 VPS-SPS ID pair.
- `ppsStdCount` is the number of PPS provided in `pPpsStd`. Its value **must** be less than or equal to the value of `maxPpsStdCount`.
- `pPpsStd` is a pointer to an array of `StdVideoH265PictureParameterSet` structures representing H.265 picture parameter sets. Each element of the array entry **must** have a unique H.265 VPS-SPS-PPS ID tuple.

Valid Usage

- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-vpsStdCount-04829

The values of `vpsStdCount`, `spsStdCount` and `ppsStdCount` **must** be less than or equal to the values of `maxVpsStdCount`, `maxSpsStdCount` and `maxPpsStdCount`, respectively

- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-maxVpsStdCount-04830

When the `maxVpsStdCount` number of parameters of type `StdVideoH265VideoParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point

- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-maxSpsStdCount-04831

When the `maxSpsStdCount` number of parameters of type `StdVideoH265SequenceParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point

- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-maxPpsStdCount-04832

When the `maxPpsStdCount` number of parameters of type `StdVideoH265PictureParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point

- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-None-04833

Each entry to be added **must** have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, VPS-SPS-PPS IDs

- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-None-04834

Parameter entries that already exist in Video Session Parameters object with a particular VPS-SPS-PPS IDs **cannot** be replaced nor updated

- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-None-04835

When creating a new object using a Video Session Parameters as a template, the array's parameters with the same VPS-SPS-PPS IDs as the ones from the template take precedence

- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-None-04836

VPS/SPS/PPS parameters **must** comply with the limits specified in [VkVideoSessionCreateInfoKHR](#) during Video Session creation

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_ADD_INFO_EXT`
- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-pSpsStd-parameter
If pSpsStd is not `NULL`, pSpsStd **must** be a valid pointer to an array of `spsStdCount` `StdVideoH265SequenceParameterSet` values
- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-pPpsStd-parameter
If pPpsStd is not `NULL`, pPpsStd **must** be a valid pointer to an array of `ppsStdCount` `StdVideoH265PictureParameterSet` values
- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-spsStdCount-arraylength
`spsStdCount` **must** be greater than `0`
- VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-ppsStdCount-arraylength
`ppsStdCount` **must** be greater than `0`

39.7.6. Picture Parameters

The `VkVideoDecodeH265PictureInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265PictureInfoEXT {
    VkStructureType                      sType;
    const void*                          pNext;
    StdVideoDecodeH265PictureInfo*      pStdPictureInfo;
    uint32_t                            slicesCount;
    const uint32_t*                     pSlicesDataOffsets;
} VkVideoDecodeH265PictureInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdPictureInfo` is a pointer to a `StdVideoDecodeH265PictureInfo` structure specifying codec standard specific picture information from the H.265 specification.
- `slicesCount` is the number of slices in this picture.
- `pSlicesDataOffsets` is a pointer to an array of `slicesCount` offsets indicating the start offset of each slice within the bitstream buffer.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265PictureInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PICTURE_INFO_EXT`
- VUID-VkVideoDecodeH265PictureInfoEXT-pStdPictureInfo-parameter
pStdPictureInfo **must** be a valid pointer to a `StdVideoDecodeH265PictureInfo` value
- VUID-VkVideoDecodeH265PictureInfoEXT-pSlicesDataOffsets-parameter
pSlicesDataOffsets **must** be a valid pointer to an array of `slicesCount uint32_t` values
- VUID-VkVideoDecodeH265PictureInfoEXT-slicesCount-arraylength
slicesCount **must** be greater than `0`

The `VkVideoDecodeH265DpbSlotInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265DpbSlotInfoEXT {
    VkStructureType                     sType;
    const void*                         pNext;
    const StdVideoDecodeH265ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH265DpbSlotInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pStdReferenceInfo** is a pointer to a `StdVideoDecodeH265ReferenceInfo` structure specifying the codec standard specific picture reference information from the H.264 specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265DpbSlotInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_DBP_SLOT_INFO_EXT`
- VUID-VkVideoDecodeH265DpbSlotInfoEXT-pStdReferenceInfo-parameter
pStdReferenceInfo **must** be a valid pointer to a valid `StdVideoDecodeH265ReferenceInfo` value

39.8. Video Encode Operations

Before the application can start recording Vulkan command buffers for the Video Encode Operations, it **must** do the following, beforehand:

1. Ensure that the implementation can encode the Video Content by querying the supported codec operations and profiles using `vkGetPhysicalDeviceQueueFamilyProperties2`.
2. By using `vkGetPhysicalDeviceVideoFormatPropertiesKHR` and providing one or more video profiles, choose the Vulkan formats supported by the implementation. The formats for `input`

and [reference](#) pictures **must** be queried and chosen separately. Refer to the section on [enumeration of supported video formats](#).

3. Before creating an image to be used as a video picture resource, obtain the supported image creation parameters by querying with [vkGetPhysicalDeviceFormatProperties2](#) and [vkGetPhysicalDeviceImageFormatProperties2](#) using one of the reported formats and adding [VkVideoProfilesKHR](#) to the [pNext](#) chain of [VkFormatProperties2](#). When querying the parameters with [vkGetPhysicalDeviceImageFormatProperties2](#) for images targeting [input](#) and [reference](#) (DPB) pictures, the [VkPhysicalDeviceImageFormatInfo2::usage](#) field should contain [VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR](#) and [VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR](#), respectively.
4. Create none, some, or all of the required [images](#) for the [input](#) and [reference](#) pictures. More Video Picture Resources **can** be created at some later point if needed while processing the content to be encoded. Also, if the size of the picture to be encoded is expected to change, the images **can** be created based on the maximum expected content size.
5. Create the [video session](#) to be used for video encode operations. Before creating the Encode Video Session, the encode capabilities **should** be queried with [vkGetPhysicalDeviceVideoCapabilitiesKHR](#) to obtain the limits of the parameters allowed by the implementation for a particular codec profile.
6. Bind memory resources with the encode video session by calling [vkBindVideoSessionMemoryKHR](#). The video session **cannot** be used until memory resources are allocated and bound to it. In order to determine the required memory sizes and heap types of the device memory allocations, [vkGetVideoSessionMemoryRequirementsKHR](#) **should** be called.
7. Create one or more [Session Parameter objects](#) for use across command buffer recording operations, if required by the codec extension in use. These objects **must** be created against a [video session](#) with the parameters required by the codec. Each [Session Parameter object](#) created is a child object of the associated [Session object](#) and **cannot** be bound in the command buffer with any other [Session Object](#).

The recording of Video Encode Commands against a Vulkan Command Buffer consists of the following sequence:

1. [vkCmdBeginVideoCodingKHR](#) starts the recording of one or more Video Encode operations in the command buffer. For each Video Encode Command operation, a Video Session **must** be bound to the command buffer within this command. This command establishes a Vulkan Video Encode Context that consists of the bound Video Session Object, Session Parameters Object, and the required Video Picture Resources. The established Video Encode Context is in effect until the [vkCmdEndVideoCodingKHR](#) command is recorded. If more Video Encode operations are to be required after the [vkCmdEndVideoCodingKHR](#) command, another Video Encode Context **can** be started with the [vkCmdBeginVideoCodingKHR](#) command.
2. [vkCmdEncodeVideoKHR](#) specifies one or more frames to be encoded. The [VkVideoEncodeInfoKHR](#) parameters, and the codec extension structures chained to this, specify the details of the encode operation.
3. [vkCmdControlVideoCodingKHR](#) records operations against the encoded data, encoding device, or the Video Session state.

4. `vkCmdEndVideoCodingKHR` signals the end of the recording of the Vulkan Video Encode Context, as established by `vkCmdBeginVideoCodingKHR`.

In addition to the above, the following commands **can** be recorded between `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR`:

- Query operations
- Global Memory Barriers
- Buffer Memory Barriers
- Image Memory Barriers (these **must** be used to transition the Video Picture Resources to the proper `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` and `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` layouts).
- Pipeline Barriers
- Events
- Timestamps
- Device Groups (device mask)

The following Video Encode related commands **must** be recorded **outside** the Vulkan Video Encode Context established with the `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR` commands:

- Sparse Memory Binding
- Copy Commands
- Clear Commands

39.8.1. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as one of the encode operation bits, the `VkVideoEncodeCapabilitiesKHR` structure **must** be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve capabilities specific to video encoding.

The `VkVideoEncodeCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeCapabilitiesKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkVideoEncodeCapabilityFlagsKHR flags;
    VkVideoEncodeRateControlModeFlagsKHR rateControlModes;
    uint8_t                   rateControlLayerCount;
    uint8_t                   qualityLevelCount;
    VkExtent2D                inputImageDataFillAlignment;
} VkVideoEncodeCapabilitiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoEncodeCapabilityFlagBitsKHR` describing supported encoding features.
- `rateControlModes` is a bitmask of `VkVideoEncodeRateControlModeFlagBitsKHR` describing supported rate control modes. All implementations **must** support `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`.
- `rateControlLayerCount` reports the maximum number of rate control layers supported. Implementations **must** report at least 1.
- `qualityLevelCount` is the number of discrete quality levels supported. Implementations **must** report at least 1.
- `inputImageDataFillAlignment` reports alignment of data that should be filled in the input image horizontally and vertically in pixels before encode operations are performed on the input image.

The input content and encode resolution (specified in `VkVideoEncodeInfoKHR::codedExtent`) may not be aligned with the codec-specific coding block size. For example, the input content may be 1920x1080 and the coding block size may be 16x16 pixel blocks. In this example, the content is horizontally aligned with the coding block size, but not vertically aligned with the coding block size. Encoding of the last row of blocks may be impacted by contents of the input image in pixel rows 1081 to 1088 (the next vertical alignment with the coding block size). In general, to ensure efficient encoding for the last row/column of blocks, and/or to ensure consistent encoding results between repeated encoding of the same input content, these extra pixel rows/columns should be filled to known values up to the coding block size alignment before encoding operations are performed. Some implementations support performing auto-fill of unaligned pixels beyond a specific alignment, which is reported in `inputImageDataFillAlignment`. For example, if an implementation reports 1x1 in `inputImageDataFillAlignment`, then the implementation will perform auto-fill for any unaligned pixels beyond the encode resolution up to the next coding block size. For a coding block size of 16x16, if the implementation reports 16x16 in `inputImageDataFillAlignment`, then it is the application's responsibility to fill any unaligned pixels, if desired. If not, it may impact the encoding efficiency, but it will not affect the validity of the generated bitstream. If the implementation reports 8x8 in `inputImageDataFillAlignment`, then for the 1920x1080 example, since the content is aligned to 8 pixels vertically, the implementation will auto-fill pixel rows 1081 to 1088 (up to the 16x16 coding block size in the example). The auto-fill value(s) are implementation-specific. The auto-fill value(s) are not written to the input image memory, but are used as part of the encoding operation on the input image.

Valid Usage (Implicit)

- `VUID-VkVideoEncodeCapabilitiesKHR-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_CAPABILITIES_KHR`
- `VUID-VkVideoEncodeCapabilitiesKHR-rateControlModes-parameter`
`rateControlModes` **must** be a valid combination of `VkVideoEncodeRateControlModeFlagBitsKHR` values
- `VUID-VkVideoEncodeCapabilitiesKHR-rateControlModes-requiredbitmask`
`rateControlModes` **must** not be `0`

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeCapabilityFlagsKHR;
```

`VkVideoEncodeCapabilityFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeCapabilityFlagBitsKHR`.

Bits which **may** be set in `VkVideoEncodeCapabilitiesKHR::flags`, indicating the encoding tools supported, are:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeCapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_CAPABILITY_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR =
    0x00000001,
} VkVideoEncodeCapabilityFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR` reports that the implementation supports use of `VkVideoEncodeInfoKHR::precedingExternallyEncodedBytes`.

39.8.2. Video Encode Vulkan Command Buffer Commands

To launch an encode operation that results in bitstream generation, call:

```
// Provided by VK_KHR_video_encode_queue
void vkCmdEncodeVideoKHR(
    VkCommandBuffer                                commandBuffer,
    const VkVideoEncodeInfoKHR*                    pEncodeInfo);
```

- `commandBuffer` is the command buffer to be filled with this function for encoding to generate a bitstream.
- `pEncodeInfo` is a pointer to a `VkVideoEncodeInfoKHR` structure.

Valid Usage (Implicit)

- VUID-vkCmdEncodeVideoKHR-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-parameter
pEncodeInfo **must** be a valid pointer to a valid [VkVideoEncodeInfoKHR](#) structure
- VUID-vkCmdEncodeVideoKHR-commandBuffer-recording
commandBuffer **must** be in the [recording](#) state
- VUID-vkCmdEncodeVideoKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support encode operations
- VUID-vkCmdEncodeVideoKHR-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdEncodeVideoKHR-bufferlevel
commandBuffer **must** be a primary [VkCommandBuffer](#)

Host Synchronization

- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Outside	Encode

The [VkVideoEncodeInfoKHR](#) structure is defined as:

```

// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeFlagsKHR flags;
    uint32_t qualityLevel;
    VkExtent2D codedExtent;
    VkBuffer dstBitstreamBuffer;
    VkDeviceSize dstBitstreamBufferOffset;
    VkDeviceSize dstBitstreamBufferMaxRange;
    VkVideoPictureResourceKHR srcPictureResource;
    const VkVideoReferenceSlotKHR* pSetupReferenceSlot;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotKHR** pReferenceSlots;
    uint32_t precedingExternallyEncodedBytes;
} VkVideoEncodeInfoKHR;

```

- **sType** is the type of this structure.
- **pNext** is a pointer to a structure extending this structure. A codec-specific extension structure **must** be chained to specify what bitstream unit to generate with this encode operation.
- **flags** is a bitmask of **VkVideoEncodeFlagBitsKHR** specifying encode flags, and is reserved for future versions of this specification.
- **qualityLevel** is the coding quality level of the encoding. It is defined by the codec-specific extensions.
- **codedExtent** is the coded size of the encode operations.
- **dstBitstreamBuffer** is the buffer where the encoded bitstream output will be produced.
- **dstBitstreamBufferOffset** is the offset in the **dstBitstreamBuffer** where the encoded bitstream output will start. **dstBitstreamBufferOffset**'s value **must** be aligned to **VkVideoCapabilitiesKHR::minBitstreamBufferOffsetAlignment**, as reported by the implementation.
- **dstBitstreamBufferMaxRange** is the maximum size of the **dstBitstreamBuffer** that can be used while the encoded bitstream output is produced. **dstBitstreamBufferMaxRange**'s value **must** be aligned to **VkVideoCapabilitiesKHR::minBitstreamBufferSizeAlignment**, as reported by the implementation.
- **srcPictureResource** is the Picture Resource of the **Input Picture** to be encoded by the operation.
- **pSetupReferenceSlot** is a pointer to a **VkVideoReferenceSlotKHR** structure used for generating a reconstructed reference slot and Picture Resource. **pSetupReferenceSlot->slotIndex** specifies the slot index number to use as a target for producing the Reconstructed (DPB) data. **pSetupReferenceSlot** **must** be one of the entries provided in **VkVideoBeginCodingInfoKHR** via the **pReferenceSlots** within the **vkCmdBeginVideoCodingKHR** command that established the Vulkan Video Encode Context for this command.
- **referenceSlotCount** is the number of Reconstructed Reference Pictures that will be used when this encoding operation is executing.
- **pReferenceSlots** is **NULL** or a pointer to an array of **VkVideoReferenceSlotKHR** structures that will

be used when this encoding operation is executing. Each entry in `pReferenceSlots` **must** be one of the entries provided in `VkVideoBeginCodingInfoKHR` via the `pReferenceSlots` within the `vkCmdBeginVideoCodingKHR` command that established the Vulkan Video Encode Context for this command.

- `precedingExternallyEncodedBytes` is the number of bytes externally encoded for insertion in the active video encode session overall bitstream prior to the bitstream that will be generated by the implementation for this instance of `VkVideoEncodeInfoKHR`. Valid when `VkVideoEncodeRateControlInfoKHR::rateControlMode` is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`. The value provided is used to update the implementation’s rate control algorithm for the rate control layer this instance of `VkVideoEncodeInfoKHR` belongs to, by accounting for the bitrate budget consumed by these externally encoded bytes. See `VkVideoEncodeRateControlInfoKHR` for additional information about encode rate control.

Multiple `vkCmdEncodeVideoKHR` commands **may** be recorded within a Vulkan Video Encode Context. The execution of each `vkCmdEncodeVideoKHR` command will result in generating codec-specific bitstream units. These bitstream units are generated consecutively into the bitstream buffer specified in `dstBitstreamBuffer` of a `VkVideoEncodeInfoKHR` structure within the `vkCmdBeginVideoCodingKHR` command. The produced bitstream is the sum of all these bitstream units, including any padding between the bitstream units. Any bitstream padding **must** be filled with data compliant to the codec standard so as not to cause any syntax errors during decoding of the bitstream units with the padding included. The range of the bitstream buffer written **can** be queried via `video encode bitstream buffer range queries`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeInfoKHR-sType-sType
 sType **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_INFO_KHR`
- VUID-VkVideoEncodeInfoKHR-pNext-pNext
 Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264EmitPictureParametersEXT`, `VkVideoEncodeH264VclFrameInfoEXT`, `VkVideoEncodeH265EmitPictureParametersEXT`, or `VkVideoEncodeH265VclFrameInfoEXT`
- VUID-VkVideoEncodeInfoKHR-sType-unique
 The **sType** value of each struct in the **pNext** chain **must** be unique
- VUID-VkVideoEncodeInfoKHR-flags-parameter
 flags **must** be a valid combination of `VkVideoEncodeFlagBitsKHR` values
- VUID-VkVideoEncodeInfoKHR-dstBitstreamBuffer-parameter
 dstBitstreamBuffer **must** be a valid `VkBuffer` handle
- VUID-VkVideoEncodeInfoKHR-srcPictureResource-parameter
 srcPictureResource **must** be a valid `VkVideoPictureResourceKHR` structure
- VUID-VkVideoEncodeInfoKHR-pSetupReferenceSlot-parameter
 pSetupReferenceSlot **must** be a valid pointer to a valid `VkVideoReferenceSlotKHR` structure
- VUID-VkVideoEncodeInfoKHR-pReferenceSlots-parameter
 If **referenceSlotCount** is not `0`, **pReferenceSlots** **must** be a valid pointer to an array of **referenceSlotCount** valid `VkVideoReferenceSlotKHR` structures

The `vkCmdEncodeVideoKHR` flags are defined with the following enumeration:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeFlagBitsKHR {
    VK_VIDEO_ENCODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_RESERVED_0_BIT_KHR = 0x00000001,
} VkVideoEncodeFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_RESERVED_0_BIT_KHR** The current version of the specification has reserved this value for future use.

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeFlagsKHR;
```

`VkVideoEncodeFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeFlagBitsKHR`.

The `VkVideoEncodeRateControlInfoKHR` structure is defined as:

```

// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeRateControlInfoKHR {
    VkStructureType                         sType;
    const void*                           pNext;
    VkVideoEncodeRateControlFlagsKHR        flags;
    VkVideoEncodeRateControlModeFlagBitsKHR rateControlMode;
    uint8_t                             layerCount;
    const VkVideoEncodeRateControlLayerInfoKHR* pLayerConfigs;
} VkVideoEncodeRateControlInfoKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkVideoEncodeRateControlFlagBitsKHR](#) specifying encode rate control flags.
- **rateControlMode** is a [VkVideoEncodeRateControlModeFlagBitsKHR](#) value specifying the encode stream rate control mode.
- **layerCount** specifies the number of rate control layers in the video encode stream.
- **pLayerConfigs** is a pointer to an array of [VkVideoEncodeRateControlLayerInfoKHR](#) structures specifying the rate control configurations of **layerCount** rate control layers.

In order to provide video encode stream rate control settings, add a [VkVideoEncodeRateControlInfoKHR](#) structure to the **pNext** chain of the [VkVideoCodingControlInfoKHR](#) structure passed to the [vkCmdControlVideoCodingKHR](#) command.

A codec-specific extension structure for further encode stream rate control parameter settings **may** be chained to [VkVideoEncodeRateControlInfoKHR](#).

To ensure that the video session is properly initialized with stream-level rate control settings, the application **must** call [vkCmdControlVideoCodingKHR](#) with stream-level rate control settings at least once in execution order before the first [vkCmdEncodeVideoKHR](#) command that is executed after video session reset. If not provided, default implementation-specific stream rate control settings will be used.

Stream rate control settings **can** also be re-initialized during an active video encoding session. The re-initialization takes effect whenever the [VkVideoEncodeRateControlInfoKHR](#) structure is included in the **pNext** chain of the [VkVideoCodingControlInfoKHR](#) structure in the call to [vkCmdControlVideoCodingKHR](#), and only impacts [vkCmdEncodeVideoKHR](#) operations that follow in execution order.

Valid Usage

- VUID-VkVideoEncodeH264RateControlInfoEXT-chainrequirement
`VkVideoEncodeH264RateControlInfoEXT` **must** be included in the `pNext` chain of `VkVideoEncodeRateControlInfoKHR` if and only if `VkVideoEncodeRateControlInfoKHR::rateControlMode` is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR` and the bound video session was created with `VkVideoProfileKHR::videoCodecOperation` set to `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`.
- VUID-VkVideoEncodeH264RateControlInfoEXT-temporalLayerCount
If `VkVideoEncodeRateControlInfoKHR::layerCount` is greater than 1, then `VkVideoEncodeH264RateControlInfoEXT::temporalLayerCount` **must** be equal to `layerCount`.
- VUID-VkVideoEncodeH265RateControlInfoEXT-chainrequirement
`VkVideoEncodeH265RateControlInfoEXT` **must** be included in the `pNext` chain of `VkVideoEncodeRateControlInfoKHR` if and only if `VkVideoEncodeRateControlInfoKHR::rateControlMode` is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR` and the bound video session was created with `VkVideoProfileKHR::videoCodecOperation` set to `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT`.
- VUID-VkVideoEncodeH265RateControlInfoEXT-subLayerCount
If `VkVideoEncodeRateControlInfoKHR::layerCount` is greater than 1, then `VkVideoEncodeH265RateControlInfoEXT::subLayerCount` **must** be equal to `layerCount`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_INFO_KHR`
- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-parameter
`rateControlMode` **must** be a valid `VkVideoEncodeRateControlModeFlagBitsKHR` value
- VUID-VkVideoEncodeRateControlInfoKHR-pLayerConfigs-parameter
`pLayerConfigs` **must** be a valid pointer to an array of `layerCount` valid `VkVideoEncodeRateControlLayerInfoKHR` structures
- VUID-VkVideoEncodeRateControlInfoKHR-layerCount-arraylength
`layerCount` **must** be greater than 0

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeRateControlFlagsKHR;
```

`VkVideoEncodeRateControlFlagsKHR` is a bitmask type for setting a mask, but currently reserved for future use.

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeRateControlFlagBitsKHR {
    VK_VIDEO_ENCODE_RATE_CONTROL_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_RATE_CONTROL_RESERVED_0_BIT_KHR = 0x00000001,
} VkVideoEncodeRateControlFlagBitsKHR;
```

VkVideoEncodeRateControlFlagBitsKHR defines bits which may be set in a VkVideoEncodeRateControlFlagsKHR value, but is currently unused.

The rate control modes are defined with the following enums:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeRateControlModeFlagBitsKHR {
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR = 0,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR = 1,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR = 2,
} VkVideoEncodeRateControlModeFlagBitsKHR;
```

- VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR for disabling rate control.
- VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR for constant bitrate rate control mode.
- VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR for variable bitrate rate control mode.

The [VkVideoEncodeRateControlLayerInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeRateControlLayerInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t averageBitrate;
    uint32_t maxBitrate;
    uint32_t frameRateNumerator;
    uint32_t frameRateDenominator;
    uint32_t virtualBufferSizeInMs;
    uint32_t initialVirtualBufferSizeInMs;
} VkVideoEncodeRateControlLayerInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is a pointer to a structure extending this structure.
- **averageBitrate** is the average bitrate in bits/second. Valid when rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR.
- **maxBitrate** is the peak bitrate in bits/second. Valid when rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR.
- **frameRateNumerator** is the numerator of the frame rate. Valid when rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR.

- `frameRateDenominator` is the denominator of the frame rate. Valid when rate control mode is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`.
- `virtualBufferSizeInMs` is the leaky bucket model virtual buffer size in milliseconds, with respect to peak bitrate. Valid when rate control mode is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`. For example, virtual buffer size is $(\text{virtualBufferSizeInMs} * \text{maxBitrate} / 1000)$.
- `initialVirtualBufferSizeInMs` is the initial occupancy in milliseconds of the virtual buffer in the leaky bucket model. Valid when the rate control mode is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`.

A codec-specific structure specifying additional per-layer rate control settings **must** be chained to `VkVideoEncodeRateControlLayerInfoKHR`. If multiple rate control layers are enabled (`VkVideoEncodeRateControlInfoKHR::layerCount` is greater than 1), then the chained codec-specific extension structure also identifies the specific video coding layer its parent `VkVideoEncodeRateControlLayerInfoKHR` applies to. If multiple rate control layers are enabled, the number of rate control layers **must** match the number of video coding layers. The specification for an encode codec-specific extension would describe how multiple video coding layers are enabled for the corresponding codec.

Per-layer rate control settings for all enabled rate control layers **must** be initialized or re-initialized whenever stream rate control settings are provided via `VkVideoEncodeRateControlInfoKHR`. This is done by specifying settings for all enabled rate control layers in `VkVideoEncodeRateControlInfoKHR::pLayerConfigs`.

To adjust rate control settings for an individual layer at runtime, add a `VkVideoEncodeRateControlLayerInfoKHR` structure to the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command. This adjustment only impacts the specified layer without impacting the rate control settings or implementation rate control algorithm behavior for any other enabled rate control layers. The adjustment takes effect whenever the corresponding `vkCmdControlVideoCodingKHR` is executed, and only impacts `vkCmdEncodeVideoKHR` operations pertaining to the corresponding video coding layer that follow in execution order.

It is possible for an application to enable multiple video coding layers (via codec-specific extensions to encoding operations) while only enabling a single layer of rate control for the entire video stream. To achieve this, `layerCount` in `VkVideoEncodeRateControlInfoKHR` **must** be set to 1, and the single `VkVideoEncodeRateControlLayerInfoKHR` provided in `pLayerConfigs` would apply to all encoded segments of the video stream, regardless of which codec-defined video coding layer they belong to. In this case, the implementation decides bitrate distribution across video coding layers (if applicable to the specified stream rate control mode).

Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-sType
 - `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_LAYER_INFO_KHR`

39.9. Encode H.264

This extension adds H.264 codec specific structures/types needed to support H.264 encoding. Unless otherwise noted, all references to the H.264 specification are to the 2010 edition published by the ITU-T, dated March 2010. This specification is available at <https://www.itu.int/rec/T-REC-H.264>.

39.9.1. H.264 encode profile

The `VkVideoEncodeH264ProfileEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264ProfileEXT {
    VkStructureType          sType;
    const void*              pNext;
    StdVideoH264ProfileIdc   stdProfileIdc;
} VkVideoEncodeH264ProfileEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH264ProfileIdc` value specifying the H.264 codec profile IDC.

An H.264 encode profile is specified by including a `VkVideoEncodeH264ProfileEXT` structure in the `pNext` chain of the `VkVideoProfileKHR` structure when `VkVideoProfileKHR::videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264ProfileEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PROFILE_EXT`

39.9.2. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, the `VkVideoEncodeH264CapabilitiesEXT` structure **must** be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve more capabilities specific to H.264 video encoding.

The `VkVideoEncodeH264CapabilitiesEXT` structure is defined as:

```

// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264CapabilitiesEXT {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeH264CapabilityFlagsEXT flags;
    VkVideoEncodeH264InputModeFlagsEXT inputModeFlags;
    VkVideoEncodeH264OutputModeFlagsEXT outputModeFlags;
    uint8_t maxPPictureL0ReferenceCount;
    uint8_t maxBPictureL0ReferenceCount;
    uint8_t maxL1ReferenceCount;
    VkBool32 motionVectorsOverPicBoundariesFlag;
    uint32_t maxBytesPerPicDenom;
    uint32_t maxBitsPerMbDenom;
    uint32_t log2MaxMvLengthHorizontal;
    uint32_t log2MaxMvLengthVertical;
    VkExtensionProperties stdExtensionVersion;
} VkVideoEncodeH264CapabilitiesEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkVideoEncodeH264CapabilityFlagBitsEXT** describing supported encoding tools.
- **inputModeFlags** is a bitmask of **VkVideoEncodeH264InputModeFlagBitsEXT** describing supported command buffer input granularities/modes.
- **outputModeFlags** is a bitmask of **VkVideoEncodeH264OutputModeFlagBitsEXT** describing supported output (bitstream size reporting) granularities/modes.
- **maxPPictureL0ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.
- **maxBPictureL0ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures. The reported value is **0** if encoding of B pictures is not supported.
- **maxL1ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported. The reported value is **0** if encoding of B pictures is not supported.
- **motionVectorsOverPicBoundariesFlag** if **VK_TRUE**, indicates motion_vectors_over_pic_boundaries_flag will be enabled if bitstream_restriction_flag is enabled in StdVideoH264SpsVuiFlags.
- **maxBytesPerPicDenom** reports the value that will be used for max_bytes_per_pic_denom if bitstream_restriction_flag is enabled in StdVideoH264SpsVuiFlags.
- **maxBitsPerMbDenom** reports the value that will be used for max_bits_per_mb_denom if bitstream_restriction_flag is enabled in StdVideoH264SpsVuiFlags.
- **log2MaxMvLengthHorizontal** reports the value that will be used for log2_max_mv_length_horizontal if bitstream_restriction_flag is enabled in StdVideoH264SpsVuiFlags.

StdVideoH264SpsVuiFlags.

- `log2MaxMvLengthVertical` reports the value that will be used for `log2_max_mv_length_vertical` if `bitstream_restriction_flag` is enabled in StdVideoH264SpsVuiFlags.
- `stdExtensionVersion` is the specific H.264 extension name and version supported by this implementation.

When `vkGetPhysicalDeviceVideoCapabilitiesKHR` is called to query the capabilities with parameter `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, a `VkVideoEncodeH264CapabilitiesEXT` structure **can** be chained to `VkVideoCapabilitiesKHR` to retrieve H.264 extension specific capabilities.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264CapabilitiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_CAPABILITIES_EXT`
- VUID-VkVideoEncodeH264CapabilitiesEXT-inputModeFlags-parameter
`inputModeFlags` **must** be a valid combination of `VkVideoEncodeH264InputModeFlagBitsEXT` values
- VUID-VkVideoEncodeH264CapabilitiesEXT-inputModeFlags-requiredbitmask
`inputModeFlags` **must** not be `0`
- VUID-VkVideoEncodeH264CapabilitiesEXT-outputModeFlags-parameter
`outputModeFlags` **must** be a valid combination of `VkVideoEncodeH264OutputModeFlagBitsEXT` values
- VUID-VkVideoEncodeH264CapabilitiesEXT-outputModeFlags-requiredbitmask
`outputModeFlags` **must** not be `0`
- VUID-VkVideoEncodeH264CapabilitiesEXT-stdExtensionVersion-parameter
`stdExtensionVersion` **must** be a valid `VkExtensionProperties` structure

```
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264CapabilityFlagsEXT;
```

`VkVideoEncodeH264CapabilityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH264CapabilityFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH264CapabilitiesEXT::flags`, indicating the encoding tools supported, are:

```

// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264CapabilityFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_CAPABILITY_DIRECT_8X8_INFERENCE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_CAPABILITY_SEPARATE_COLOUR_PLANE_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_CAPABILITY_QPPRIME_Y_ZERO_TRANSFORM_BYPASS_BIT_EXT =
0x00000004,
    VK_VIDEO_ENCODE_H264_CAPABILITY_SCALING_LISTS_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_EXT = 0x00000010,
    VK_VIDEO_ENCODE_H264_CAPABILITY_CHROMA_QP_OFFSET_BIT_EXT = 0x00000020,
    VK_VIDEO_ENCODE_H264_CAPABILITY_SECOND_CHROMA_QP_OFFSET_BIT_EXT = 0x00000040,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PIC_INIT_QP_MINUS26_BIT_EXT = 0x00000080,
    VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_PRED_BIT_EXT = 0x00000100,
    VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_BIPRED_EXPLICIT_BIT_EXT = 0x00000200,
    VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_BIPRED_IMPLICIT_BIT_EXT = 0x00000400,
    VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_PRED_NO_TABLE_BIT_EXT = 0x00000800,
    VK_VIDEO_ENCODE_H264_CAPABILITY_TRANSFORM_8X8_BIT_EXT = 0x00001000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_CABAC_BIT_EXT = 0x00002000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_CAVLC_BIT_EXT = 0x00004000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_DEBLOCKING_FILTER_DISABLED_BIT_EXT = 0x00008000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_DEBLOCKING_FILTER_ENABLED_BIT_EXT = 0x00010000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_DEBLOCKING_FILTER_PARTIAL_BIT_EXT = 0x00020000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_DISABLE_DIRECT_SPATIAL_MV_PRED_BIT_EXT =
0x00040000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_MULTIPLE_SLICE_PER_FRAME_BIT_EXT = 0x00080000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_SLICE_MB_COUNT_BIT_EXT = 0x00100000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_EXT = 0x00200000,
    VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT = 0x00400000,
} VkVideoEncodeH264CapabilityFlagBitsEXT;

```

- **VK_VIDEO_ENCODE_H264_CAPABILITY_DIRECT_8X8_INFERENCE_BIT_EXT** reports if enabling direct_8x8_inference_flag in StdVideoH264SpsFlags is supported.
- **VK_VIDEO_ENCODE_H264_CAPABILITY_SEPARATE_COLOUR_PLANE_BIT_EXT** reports if enabling separate_colour_plane_flag in StdVideoH264SpsFlags is supported.
- **VK_VIDEO_ENCODE_H264_CAPABILITY_QPPRIME_Y_ZERO_TRANSFORM_BYPASS_BIT_EXT** reports if enabling qpprime_y_zero_transform_bypass_flag in StdVideoH264SpsFlags is supported.
- **VK_VIDEO_ENCODE_H264_CAPABILITY_SCALING_LISTS_BIT_EXT** reports if enabling seq_scaling_matrix_present_flag in StdVideoH264SpsFlags or pic_scaling_matrix_present_flag in StdVideoH264PpsFlags are supported.
- **VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_EXT** reports if the implementation guarantees generating a HRD compliant bitstream if nal_hrd_parameters_present_flag or vcl_hrd_parameters_present_flag are enabled in StdVideoH264SpsVuiFlags.
- **VK_VIDEO_ENCODE_H264_CAPABILITY_CHROMA_QP_OFFSET_BIT_EXT** reports if setting non-zero chroma_qp_index_offset in StdVideoH264PictureParameterSet is supported.
- **VK_VIDEO_ENCODE_H264_CAPABILITY_SECOND_CHROMA_QP_OFFSET_BIT_EXT** reports if setting non-zero second_chroma_qp_index_offset in StdVideoH264PictureParameterSet is supported.
- **VK_VIDEO_ENCODE_H264_CAPABILITY_PIC_INIT_QP_MINUS26_BIT_EXT** reports if setting non-zero

`pic_init_qp_minus26` in `StdVideoH264PictureParameterSet` is supported.

- `VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_PRED_BIT_EXT` reports if enabling `weighted_pred_flag` in `StdVideoH264PpsFlags` is supported.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_BIPRED_EXPLICIT_BIT_EXT` reports if using `STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT` from `StdVideoH264WeightedBipredIdc` is supported.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_BIPRED_IMPLICIT_BIT_EXT` reports if using `STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_IMPLICIT` from `StdVideoH264WeightedBipredIdc` is supported.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_PRED_NO_TABLE_BIT_EXT` reports that when `weighted_pred_flag` is enabled or `STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT` from `StdVideoH264WeightedBipredIdc` is used, the implementation is able to internally decide syntax for `pred_weight_table`.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_TRANSFORM_8X8_BIT_EXT` reports if enabling `transform_8x8_mode_flag` in `StdVideoH264PpsFlags` is supported.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_CABAC_BIT_EXT` reports if CABAC entropy coding is supported.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_CAVLC_BIT_EXT` reports if CAVLC entropy coding is supported. An implementation **must** support at least one entropy coding mode.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_DEBLOCKING_FILTER_DISABLED_BIT_EXT` reports if using `STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_DISABLED` from `StdVideoH264DisableDeblockingFilterIdc` is supported.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_DEBLOCKING_FILTER_ENABLED_BIT_EXT` reports if using `STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_ENABLED` from `StdVideoH264DisableDeblockingFilterIdc` is supported.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_DEBLOCKING_FILTER_PARTIAL_BIT_EXT` reports if using `STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_PARTIAL` from `StdVideoH264DisableDeblockingFilterIdc` is supported. An implementation **must** support at least one deblocking filter mode.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_DISABLE_DIRECT_SPATIAL_MV_PRED_BIT_EXT` reports if disabling `StdVideoEncodeH264SliceHeaderFlags::direct_spatial_mv_pred_flag` is supported when it is present in the slice header.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_MULTIPLE_SLICE_PER_FRAME_BIT_EXT` reports if encoding multiple slices per frame is supported. If not set, the implementation is only able to encode a single slice for the entire frame.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_SLICE_MB_COUNT_BIT_EXT` reports support for configuring `VkVideoEncodeH264NaluSliceEXT::mbCount` and `first_mb_in_slice` in `StdVideoEncodeH264SliceHeader` for each slice in a frame with multiple slices. If not supported, the implementation decides the number of macroblocks in each slice based on `VkVideoEncodeH264VclFrameInfoEXT::naluSliceEntryCount`.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_EXT` reports that each slice in a frame with multiple slices may begin or finish at any offset in a macroblock row. If not supported, all slices in the frame **must** begin at the start of a macroblock row (and hence each slice **must**

finish at the end of a macroblock row).

- `VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT` reports that when `VK_VIDEO_ENCODE_H264_CAPABILITY_MULTIPLE_SLICE_PER_FRAME_BIT_EXT` is supported and a frame is encoded with multiple slices, the implementation allows encoding each slice with a different `StdVideoEncodeH264SliceHeader::slice_type`. If not supported, all slices of the frame **must** be encoded with the same `slice_type` which corresponds to the picture type of the frame. For example, all slices of a P-frame would be encoded as P-slices.

```
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264InputModeFlagsEXT;
```

`VkVideoEncodeH264InputModeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH264InputModeFlagBitsEXT`.

The `inputModeFlags` field reports the various command buffer input granularities supported by the implementation as follows:

```
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264InputModeFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_INPUT_MODE_FRAME_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_INPUT_MODE_SLICE_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_INPUT_MODE_NON_VCL_BIT_EXT = 0x00000004,
} VkVideoEncodeH264InputModeFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H264_INPUT_MODE_FRAME_BIT_EXT` indicates that a single command buffer **must** at least encode an entire frame. Any non-VCL NALUs **must** be encoded using the same command buffer as the frame if `VK_VIDEO_ENCODE_H264_INPUT_MODE_NON_VCL_BIT_EXT` is not supported.
- `VK_VIDEO_ENCODE_H264_INPUT_MODE_SLICE_BIT_EXT` indicates that a single command buffer **must** at least encode a single slice. Any non-VCL NALUs **must** be encoded using the same command buffer as the first slice of the frame if `VK_VIDEO_ENCODE_H264_INPUT_MODE_NON_VCL_BIT_EXT` is not supported.
- `VK_VIDEO_ENCODE_H264_INPUT_MODE_NON_VCL_BIT_EXT` indicates that a single command buffer **may** encode a non-VCL NALU by itself.

An implementation **must** support at least one of `VK_VIDEO_ENCODE_H264_INPUT_MODE_FRAME_BIT_EXT` or `VK_VIDEO_ENCODE_H264_INPUT_MODE_SLICE_BIT_EXT`.

If `VK_VIDEO_ENCODE_H264_INPUT_MODE_SLICE_BIT_EXT` is not supported, the following two additional restrictions apply for frames encoded with multiple slices. First, all frame slices **must** have the same `pRefList0ModOperations` and the same `pRefList1ModOperations`. Second, the order in which slices appear in `VkVideoEncodeH264VclFrameInfoEXT::pNaluSliceEntries` or in the command buffer **must** match the placement order of the slices in the frame.

```
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264OutputModeFlagsEXT;
```

`VkVideoEncodeH264OutputModeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH264InputModeFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH264CapabilitiesEXT::outputModeFlags`, indicating the minimum bitstream generation commands that **must** be included between each `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR` pair (henceforth simply begin/end pair), are:

```
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264OutputModeFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_OUTPUT_MODE_FRAME_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_OUTPUT_MODE_SLICE_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_OUTPUT_MODE_NON_VCL_BIT_EXT = 0x00000004,
} VkVideoEncodeH264OutputModeFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H264_OUTPUT_MODE_FRAME_BIT_EXT` indicates that calls to generate all NALUs of a frame **must** be included within a single begin/end pair. Any non-VCL NALUs **must** be encoded within the same begin/end pair if `VK_VIDEO_ENCODE_H264_OUTPUT_MODE_NON_VCL_BIT_EXT` is not supported.
- `VK_VIDEO_ENCODE_H264_OUTPUT_MODE_SLICE_BIT_EXT` indicates that each begin/end pair **must** encode at least one slice. Any non-VCL NALUs **must** be encoded within the same begin/end pair as the first slice of the frame if `VK_VIDEO_ENCODE_H264_OUTPUT_MODE_NON_VCL_BIT_EXT` is not supported.
- `VK_VIDEO_ENCODE_H264_OUTPUT_MODE_NON_VCL_BIT_EXT` indicates that each begin/end pair **may** encode only a non-VCL NALU by itself. An implementation **must** support at least one of `VK_VIDEO_ENCODE_H264_OUTPUT_MODE_FRAME_BIT_EXT` or `VK_VIDEO_ENCODE_H264_OUTPUT_MODE_SLICE_BIT_EXT`.

A single begin/end pair **must** not encode more than a single frame.

The bitstreams of NALUs generated within a single begin/end pair are written continuously into the same bitstream buffer (any padding between the NALUs **must** be compliant to the H.264 standard).

The supported input modes **must** be coarser or equal to the supported output modes. For example, it is illegal to report slice input is supported but only frame output is supported.

An implementation **must** report one of the following combinations of input/output modes:

- Input: Frame, Output: Frame
- Input: Frame, Output: Frame and Non-VCL
- Input: Frame, Output: Slice
- Input: Frame, Output: Slice and Non-VCL
- Input: Slice, Output: Slice
- Input: Slice, Output: Slice and Non-VCL
- Input: Frame and Non-VCL, Output: Frame and Non-VCL

- Input: Frame and Non-VCL, Output: Slice and Non-VCL
- Input: Slice and Non-VCL, Output: Slice and Non-VCL

39.9.3. Create Information

The `VkVideoEncodeH264SessionCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeH264CreateFlagsEXT flags;
    VkExtent2D maxPictureSizeInMbs;
    const VkExtensionProperties* pStdExtensionVersion;
} VkVideoEncodeH264SessionCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoEncodeH264CreateFlagsEXT` specifying H.264 encoder creation flags.
- `maxPictureSizeInMbs` specifies the syntax element `pic_width_in_mbs_minus1 + 1` and the syntax element `pic_height_in_map_units_minus1 + 1`.
- `pStdExtensionVersion` is a pointer to a `VkExtensionProperties` structure specifying H.264 codec extensions.

A `VkVideoEncodeH264SessionCreateInfoEXT` structure **must** be chained to `VkVideoSessionCreateInfoKHR` when the function `vkCreateVideoSessionKHR` is called with `videoCodecOperation` in `VkVideoSessionCreateInfoKHR` set to `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`.

Valid Usage (Implicit)

- VUID-`VkVideoEncodeH264SessionCreateInfoEXT-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_CREATE_INFO_EXT`
- VUID-`VkVideoEncodeH264SessionCreateInfoEXT-flags-parameter`
`flags` **must** be a valid combination of `VkVideoEncodeH264CreateFlagBitsEXT` values
- VUID-`VkVideoEncodeH264SessionCreateInfoEXT-flags-requiredbitmask`
`flags` **must not** be `0`
- VUID-`VkVideoEncodeH264SessionCreateInfoEXT-pStdExtensionVersion-parameter`
`pStdExtensionVersion` **must** be a valid pointer to a valid `VkExtensionProperties` structure

```
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264CreateFlagsEXT;
```

`VkVideoEncodeH264CreateFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH264CreateFlagBitsEXT`.

Bits which **can** be set in `VkVideoEncodeH264SessionCreateInfoEXT::flags` are:

```
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264CreateFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_CREATE_DEFAULT_EXT = 0,
    VK_VIDEO_ENCODE_H264_CREATE_RESERVED_0_BIT_EXT = 0x00000001,
} VkVideoEncodeH264CreateFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H264_CREATE_DEFAULT_EXT` is 0, and specifies no additional creation flags.
- `VK_VIDEO_ENCODE_H264_CREATE_RESERVED_0_BIT_EXT` The current version of the specification has reserved this value for future use.

39.9.4. Encoder Parameter Sets

To reduce parameter traffic during encoding, the encoder parameter set object supports storing H.264 SPS/PPS parameter sets that **may** be later referenced during encoding.

The `VkVideoEncodeH264SessionParametersCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersCreateInfoEXT {
    VkStructureType                                     sType;
    const void*                                         pNext;
    uint32_t                                           maxSpsStdCount;
    uint32_t                                           maxPpsStdCount;
    const VkVideoEncodeH264SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoEncodeH264SessionParametersCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxSpsStdCount` is the maximum number of SPS parameters that the `VkVideoSessionParametersKHR` can contain.
- `maxPpsStdCount` is the maximum number of PPS parameters that the `VkVideoSessionParametersKHR` can contain.
- `pParametersAddInfo` is `NULL` or a pointer to a `VkVideoEncodeH264SessionParametersAddInfoEXT` structure specifying H.264 parameters to add upon object creation.

A `VkVideoEncodeH264SessionParametersCreateInfoEXT` structure holding one H.264 SPS and at least one H.264 PPS parameter set **must** be chained to `VkVideoSessionParametersCreateInfoKHR` when

calling `vkCreateVideoSessionParametersKHR` to store these parameter set(s) with the encoder parameter set object for later reference. The provided H.264 SPS/PPS parameters **must** be within the limits specified during encoder creation for the encoder specified in `VkVideoSessionParametersCreateInfoKHR`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_CREATE_INFO_EXT`
- VUID-VkVideoEncodeH264SessionParametersCreateInfoEXT-pParametersAddInfo-parameter
If `pParametersAddInfo` is not `NULL`, `pParametersAddInfo` **must** be a valid pointer to a valid `VkVideoEncodeH264SessionParametersAddInfoEXT` structure

The `VkVideoEncodeH264SessionParametersAddInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersAddInfoEXT {
    VkStructureType                      sType;
    const void*                         pNext;
    uint32_t                           spsStdCount;
    const StdVideoH264SequenceParameterSet** pSpsStd;
    uint32_t                           ppsStdCount;
    const StdVideoH264PictureParameterSet** pPpsStd;
} VkVideoEncodeH264SessionParametersAddInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `spsStdCount` is the number of SPS elements in the `pSpsStd`. Its value **must** be less than or equal to the value of `maxSpsStdCount`.
- `pSpsStd` is a pointer to an array of `StdVideoH264SequenceParameterSet` structures representing H.264 sequence parameter sets. Each element of the array **must** have a unique H.264 SPS ID.
- `ppsStdCount` is the number of PPS provided in `pPpsStd`. Its value **must** be less than or equal to the value of `maxPpsStdCount`.
- `pPpsStd` is a pointer to an array of `StdVideoH264PictureParameterSet` structures representing H.264 picture parameter sets. Each element of the array **must** have a unique H.264 SPS-PPS ID pair.

Valid Usage

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-spsStdCount-04837
The values of `spsStdCount` and `ppsStdCount` **must** be less than or equal to the values of `maxSpsStdCount` and `maxPpsStdCount`, respectively
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-maxSpsStdCount-04838
When the `maxSpsStdCount` number of parameters of type `StdVideoH264SequenceParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-maxPpsStdCount-04839
When the `maxPpsStdCount` number of parameters of type `StdVideoH264PictureParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04840
Each entry to be added **must** have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, SPS-PPS IDs
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04841
Parameter entries that already exist in Video Session Parameters object with a particular SPS-PPS IDs **cannot** be replaced nor updated
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04842
When creating a new object using a Video Session Parameters as a template, the array's parameters with the same SPS-PPS IDs as the ones from the template take precedence
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04843
SPS/PPS parameters **must** comply with the limits specified in [VkVideoSessionCreateInfoKHR](#) during Video Session creation

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_ADD_INFO_EXT`
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-pSpsStd-parameter
If pSpsStd is not `NULL`, pSpsStd **must** be a valid pointer to an array of `spsStdCount` `StdVideoH264SequenceParameterSet` values
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-pPpsStd-parameter
If pPpsStd is not `NULL`, pPpsStd **must** be a valid pointer to an array of `ppsStdCount` `StdVideoH264PictureParameterSet` values
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-spsStdCount-arraylength
`spsStdCount` **must** be greater than `0`
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-ppsStdCount-arraylength
`ppsStdCount` **must** be greater than `0`

39.9.5. Frame Encoding

In order to encode a frame, add a `VkVideoEncodeH264VclFrameInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeInfoKHR` structure passed to the `vkCmdEncodeVideoKHR` command.

The `VkVideoEncodeH264VclFrameInfoEXT` structure representing a frame encode operation is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264VclFrameInfoEXT {
    VkStructureType                         sType;
    const void*                             pNext;
    const VkVideoEncodeH264ReferenceListsEXT* pReferenceFinalLists;
    uint32_t                                naluSliceEntryCount;
    const VkVideoEncodeH264NaluSliceEXT*      pNaluSliceEntries;
    const StdVideoEncodeH264PictureInfo*       pCurrentPictureInfo;
} VkVideoEncodeH264VclFrameInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pReferenceFinalLists` is `NULL` or a pointer to a `VkVideoEncodeH264ReferenceListsEXT` structure specifying the reference lists to be used for the current picture.
- `naluSliceEntryCount` is the number of slice NALUs in the frame.
- `pNaluSliceEntries` is a pointer to an array of `naluSliceEntryCount` `VkVideoEncodeH264NaluSliceEXT` structures specifying the division of the current picture into slices and the properties of these slices. This is an ordered sequence; the NALUs are generated consecutively in `VkVideoEncodeInfoKHR::dstBitstreamBuffer` in the same order as in this array.
- `pCurrentPictureInfo` is a pointer to a `StdVideoEncodeH264PictureInfo` structure specifying the

syntax and other codec-specific information from the H.264 specification associated with this picture. The information provided **must** reflect the decoded picture marking operations that are applicable to this frame.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264VclFrameInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_VCL_FRAME_INFO_EXT`
- VUID-VkVideoEncodeH264VclFrameInfoEXT-pReferenceFinalLists-parameter
If `pReferenceFinalLists` is not `NULL`, `pReferenceFinalLists` **must** be a valid pointer to a valid `VkVideoEncodeH264ReferenceListsEXT` structure
- VUID-VkVideoEncodeH264VclFrameInfoEXT-pNaluSliceEntries-parameter
`pNaluSliceEntries` **must** be a valid pointer to an array of `naluSliceEntryCount` valid `VkVideoEncodeH264NaluSliceEXT` structures
- VUID-VkVideoEncodeH264VclFrameInfoEXT-pCurrentPictureInfo-parameter
`pCurrentPictureInfo` **must** be a valid pointer to a valid `StdVideoEncodeH264PictureInfo` value
- VUID-VkVideoEncodeH264VclFrameInfoEXT-naluSliceEntryCount-arraylength
`naluSliceEntryCount` **must** be greater than `0`

The `VkVideoEncodeH264NaluSliceEXT` structure representing a slice is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264NaluSliceEXT {
    VkStructureType                                sType;
    const void*                                 pNext;
    uint32_t                                    mbCount;
    const VkVideoEncodeH264ReferenceListsEXT*   pReferenceFinalLists;
    const StdVideoEncodeH264SliceHeader*        pSliceHeaderStd;
} VkVideoEncodeH264NaluSliceEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mbCount` is the number of macroblocks in this slice.
- `pReferenceFinalLists` is `NULL` or a pointer to a `VkVideoEncodeH264ReferenceListsEXT` structure specifying the reference lists to be used for the current slice. If `pReferenceFinalLists` is not `NULL`, these reference lists override the reference lists provided in `VkVideoEncodeH264VclFrameInfoEXT::pReferenceFinalLists`.
- `pSliceHeaderStd` is a pointer to a `StdVideoEncodeH264SliceHeader` structure specifying the slice header for the current slice.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264NaluSliceEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_NALU_SLICE_EXT`
- VUID-VkVideoEncodeH264NaluSliceEXT-pNext-pNext
pNext **must** be `NULL`
- VUID-VkVideoEncodeH264NaluSliceEXT-pReferenceFinalLists-parameter
If **pReferenceFinalLists** is not `NULL`, **pReferenceFinalLists** **must** be a valid pointer to a valid `VkVideoEncodeH264ReferenceListsEXT` structure
- VUID-VkVideoEncodeH264NaluSliceEXT-pSliceHeaderStd-parameter
pSliceHeaderStd **must** be a valid pointer to a valid `StdVideoEncodeH264SliceHeader` value

The `VkVideoEncodeH264DpbSlotInfoEXT` structure, representing a reconstructed picture that is being used as a reference picture, is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264DpbSlotInfoEXT {
    VkStructureType                     sType;
    const void*                         pNext;
    int8_t                             slotIndex;
    const StdVideoEncodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoEncodeH264DpbSlotInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **slotIndex** is the `DPB Slot` index for this picture. **slotIndex** **must** match the **slotIndex** in **pSetupReferenceSlot** of `VkVideoEncodeInfoKHR` in the command used to encode the corresponding picture.
- **pStdReferenceInfo** is a pointer to a `StdVideoEncodeH264ReferenceInfo` structure specifying the syntax and other codec-specific information from the H.264 specification associated with this reference picture.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264DpbSlotInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_DBP_SLOT_INFO_EXT`
- VUID-VkVideoEncodeH264DpbSlotInfoEXT-pNext-pNext
pNext **must** be `NULL`
- VUID-VkVideoEncodeH264DpbSlotInfoEXT-pStdReferenceInfo-parameter
pStdReferenceInfo **must** be a valid pointer to a valid `StdVideoEncodeH264ReferenceInfo` value

The [VkVideoEncodeH264ReferenceListsEXT](#) structure representing reference lists is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264ReferenceListsEXT {
    VkStructureType                         sType;
    const void*                             pNext;
    uint8_t                                referenceList0EntryCount;
    const VkVideoEncodeH264DpbSlotInfoEXT*  pReferenceList0Entries;
    uint8_t                                referenceList1EntryCount;
    const VkVideoEncodeH264DpbSlotInfoEXT*  pReferenceList1Entries;
    const StdVideoEncodeH264RefMemMgmtCtrlOperations* pMemMgmtCtrlOperations;
} VkVideoEncodeH264ReferenceListsEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `referenceList0EntryCount` is the number of reference pictures in reference list L0 and is identical to `StdVideoEncodeH264SliceHeader::num_ref_idx_l0_active_minus1 + 1`.
- `pReferenceList0Entries` is a pointer to an array of `referenceList0EntryCount` [VkVideoEncodeH264DpbSlotInfoEXT](#) structures specifying the reference list L0 entries for the current picture. The entries provided **must** be ordered after all reference list L0 modification operations are applied (i.e. final list order). The entries provided **must** not reflect decoded picture marking operations in this frame that are applicable to references; the impact of such operations **must** be reflected in future frame encode commands. The slot index in each entry **must** match one of the slot indexes provided in the `pReferenceSlots` of the parent [VkVideoEncodeInfoKHR](#) structure.
- `referenceList1EntryCount` is the number of reference pictures in reference list L1 and is identical to `StdVideoEncodeH264SliceHeader::num_ref_idx_l1_active_minus1 + 1`.
- `pReferenceList1Entries` is a pointer to an array of `referenceList1EntryCount` [VkVideoEncodeH264DpbSlotInfoEXT](#) structures specifying the reference list L1 entries for the current picture. The entries provided **must** be ordered after all reference list L1 modification operations are applied (i.e. final list order). The entries provided **must** not reflect decoded picture marking operations in this frame that are applicable to references; the impact of such operations **must** be reflected in future frame encode commands. The slot index in each entry **must** match one of the slot indexes provided in the `pReferenceSlots` of the parent [VkVideoEncodeInfoKHR](#) structure.
- `pMemMgmtCtrlOperations` is a pointer to a [StdVideoEncodeH264RefMemMgmtCtrlOperations](#) structure specifying reference lists modifications and decoded picture marking operations.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264ReferenceListsEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_REFERENCE_LISTS_EXT`
- VUID-VkVideoEncodeH264ReferenceListsEXT-pNext-pNext
pNext **must** be `NULL`
- VUID-VkVideoEncodeH264ReferenceListsEXT-pReferenceList0Entries-parameter
If `referenceList0EntryCount` is not `0`, `pReferenceList0Entries` **must** be a valid pointer to an array of `referenceList0EntryCount` valid `VkVideoEncodeH264DpbSlotInfoEXT` structures
- VUID-VkVideoEncodeH264ReferenceListsEXT-pReferenceList1Entries-parameter
If `referenceList1EntryCount` is not `0`, `pReferenceList1Entries` **must** be a valid pointer to an array of `referenceList1EntryCount` valid `VkVideoEncodeH264DpbSlotInfoEXT` structures
- VUID-VkVideoEncodeH264ReferenceListsEXT-pMemMgmtCtrlOperations-parameter
`pMemMgmtCtrlOperations` **must** be a valid pointer to a valid `StdVideoEncodeH264RefMemMgmtCtrlOperations` value

The `VkVideoEncodeH264EmitPictureParametersEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264EmitPictureParametersEXT {
    VkStructureType sType;
    const void* pNext;
    uint8_t spsId;
    VkBool32 emitSpsEnable;
    uint32_t ppsIdEntryCount;
    const uint8_t* ppsIdEntries;
} VkVideoEncodeH264EmitPictureParametersEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `spsId` is the H.264 SPS ID for the H.264 SPS to insert in the bitstream. The SPS ID **must** match the SPS provided in `spsStd` of `VkVideoEncodeH264SessionParametersCreateInfoEXT`. This is retrieved from the `VkVideoSessionParametersKHR` object provided in `VkVideoBeginCodingInfoKHR`.
- `emitSpsEnable` enables the emitting of the SPS structure with id of `spsId`.
- `ppsIdEntryCount` is the number of entries in the `ppsIdEntries`. If this parameter is `0` then no pps entries are going to be emitted in the bitstream.
- `ppsIdEntries` is a pointer to an array of H.264 PPS IDs for the H.264 PPS to insert in the bitstream. The PPS IDs **must** match one of the IDs of the PPS(s) provided in `pPpsStd` of `VkVideoEncodeH264SessionParametersCreateInfoEXT` to identify the PPS parameter set to insert in the bitstream. This is retrieved from the `VkVideoSessionParametersKHR` object provided in `VkVideoBeginCodingInfoKHR`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264EmitPictureParametersEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_EMIT_PICTURE_PARAMETERS_EXT`
- VUID-VkVideoEncodeH264EmitPictureParametersEXT-ppsIdEntries-parameter
ppsIdEntries must be a valid pointer to an array of `ppsIdEntryCount uint8_t` values
- VUID-VkVideoEncodeH264EmitPictureParametersEXT-ppsIdEntryCount-arraylength
ppsIdEntryCount must be greater than 0

39.9.6. Rate control

The `VkVideoEncodeH264RateControlInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264RateControlInfoEXT {
    VkStructureType                         sType;
    const void*                             pNext;
    uint32_t                                gopFrameCount;
    uint32_t                                idrPeriod;
    uint32_t                                consecutiveBFrameCount;
    VkVideoEncodeH264RateControlStructureFlagBitsEXT rateControlStructure;
    uint8_t                                 temporalLayerCount;
} VkVideoEncodeH264RateControlInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **gopFrameCount** is the number of frames contained within the group of pictures (GOP), starting from an intra frame and until the next intra frame. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- **idrPeriod** is the interval, in terms of number of frames, between two IDR frames. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the IDR period is treated as infinite.
- **consecutiveBFrameCount** is the number of consecutive B-frames between I- and/or P-frames within the GOP.
- **rateControlStructure** is a `VkVideoEncodeH264RateControlStructureFlagBitsEXT` value specifying the expected encode stream reference structure, to aid in rate control calculations.
- **temporalLayerCount** specifies the number of temporal layers enabled in the stream.

In order to provide H.264-specific stream rate control parameters, add a `VkVideoEncodeH264RateControlInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeRateControlInfoKHR` structure in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command.

The parameters from this structure act as a guidance for implementations to apply various rate

control heuristics.

It is possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided in `vkCmdEncodeVideoKHR`. Additionally, it is not required for the video session to be reset if the inferred picture type does not match the actual picture type.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264RateControlInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_INFO_EXT`
- VUID-VkVideoEncodeH264RateControlInfoEXT-rateControlStructure-parameter
`rateControlStructure` **must** be a `VkVideoEncodeH264RateControlStructureFlagBitsEXT` value

The `rateControlStructure` in `VkVideoEncodeH264RateControlInfoEXT` specifies one of the following video stream reference structures as a hint for the rate control implementation:

```
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264RateControlStructureFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_UNKNOWN_EXT = 0,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_FLAT_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_DYADIC_BIT_EXT = 0x00000002,
} VkVideoEncodeH264RateControlStructureFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_UNKNOWN_EXT` is `0`, and specifies a reference structure unknown at the time of stream rate control configuration.
- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_FLAT_BIT_EXT` specifies a flat reference structure.
- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_DYADIC_BIT_EXT` specifies a dyadic reference structure.

The `VkVideoEncodeH264RateControlLayerInfoEXT` structure is defined as:

```

// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264RateControlLayerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint8_t temporalLayerId;
    VkBool32 useInitialRcQp;
    VkVideoEncodeH264QpEXT initialRcQp;
    VkBool32 useMinQp;
    VkVideoEncodeH264QpEXT minQp;
    VkBool32 useMaxQp;
    VkVideoEncodeH264QpEXT maxQp;
    VkBool32 useMaxFrameSize;
    VkVideoEncodeH264FrameSizeEXT maxFrameSize;
} VkVideoEncodeH264RateControlLayerInfoEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **temporalLayerId** specifies the H.264 temporal layer ID of the video coding layer that settings provided in this structure and its parent **VkVideoEncodeRateControlLayerInfoKHR** structure apply to.
- **useInitialRcQp** indicates whether the values within **initialRcQp** should be used by the implementation.
- **initialRcQp** provides the QP values for each picture type, to be used in rate control calculations at the start of video encode operations on a newly-created video session, or immediately after a session reset. These values are ignored when **VkVideoEncodeRateControlInfoKHR** ::**rateControlMode** is **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR**.
- **useMinQp** indicates whether the values within **minQp** should be used by the implementation. When it is set to **VK_FALSE**, the implementation ignores the values in **minQp** and chooses suitable values.
- **minQp** provides the lower bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxQp** indicates whether the values within **maxQp** should be used by the implementation. When it is set to **VK_FALSE**, the implementation ignores the values in **maxQp** and chooses suitable values.
- **maxQp** provides the upper bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxFrameSize** indicates whether the values within **maxFrameSize** should be used by the implementation.
- **maxFrameSize** provides the upper bound on the encoded frame size for each picture type. The implementation does not guarantee the encoded frame sizes will be within the specified limits, however these limits **may** be used as a guide in rate control calculations. If enabled and not set properly, the **maxQp** limit may prevent the implementation from respecting the **maxFrameSize** limit.

H.264-specific per-layer rate control parameters **must** be specified by adding a `VkVideoEncodeH264RateControlLayerInfoEXT` structure to the `pNext` chain of each `VkVideoEncodeRateControlLayerInfoKHR` structure in a call to `vkCmdControlVideoCodingKHR` command, when the command buffer context has an active video encode H.264 session.

Valid Usage

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-rateControlMode-06474
When `VkVideoEncodeRateControlInfoKHR::rateControlMode` is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`, both `useMinQp` and `useMaxQp` must be set to `VK_TRUE`.
- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-rateControlMode-06475
When `VkVideoEncodeRateControlInfoKHR::rateControlMode` is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`, the values provided in `minQP` must be identical to those provided in `maxQp`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_LAYER_INFO_EXT`
- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-initialRcQp-parameter
`initialRcQp` **must** be a valid `VkVideoEncodeH264QpEXT` structure
- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-minQp-parameter
`minQp` **must** be a valid `VkVideoEncodeH264QpEXT` structure
- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-maxQp-parameter
`maxQp` **must** be a valid `VkVideoEncodeH264QpEXT` structure
- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-maxFrameSize-parameter
`maxFrameSize` **must** be a valid `VkVideoEncodeH264FrameSizeEXT` structure

The `VkVideoEncodeH264QpEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264QpEXT {
    int32_t qpI;
    int32_t qpP;
    int32_t qpB;
} VkVideoEncodeH264QpEXT;
```

- `qpI` is the QP to be used for I-frames.
- `qpP` is the QP to be used for P-frames.
- `qpB` is the QP to be used for B-frames.

The `VkVideoEncodeH264FrameSizeEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264FrameSizeEXT {
    uint32_t frameISize;
    uint32_t framePSize;
    uint32_t frameBSize;
} VkVideoEncodeH264FrameSizeEXT;
```

- `frameISize` is the size in bytes to be used for I-frames.
- `framePSize` is the size in bytes to be used for P-frames.
- `frameBSize` is the size in bytes to be used for B-frames.

39.10. Encode H.265

This extension adds H.265 codec-specific structures/types needed to support H.265 video encoding. Unless otherwise noted, all references to the H.265 specification are to the 2013 edition published by the ITU-T, dated April 2013. This specification is available at <https://www.itu.int/rec/T-REC-H.265>.

39.10.1. H.265 encode profile

An H.265 encode profile is specified by including the `VkVideoEncodeH265ProfileEXT` structure in the `pNext` chain of the `VkVideoProfileKHR` structure when `VkVideoProfileKHR::videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT`.

The `VkVideoEncodeH265ProfileEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265ProfileEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoH265ProfileIdc stdProfileIdc;
} VkVideoEncodeH265ProfileEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH265ProfileIdc` value specifying the H.265 codec profile IDC.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265ProfileEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PROFILE_EXT`

39.10.2. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation`

specified as `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT`, the `VkVideoEncodeH265CapabilitiesEXT` structure **must** be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve more capabilities specific to H.265 video encoding.

The `VkVideoEncodeH265CapabilitiesEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265CapabilitiesEXT {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeH265CapabilityFlagsEXT flags;
    VkVideoEncodeH265InputModeFlagsEXT inputModeFlags;
    VkVideoEncodeH265OutputModeFlagsEXT outputModeFlags;
    VkVideoEncodeH265CtbSizeFlagsEXT ctbSizes;
    VkVideoEncodeH265TransformBlockSizeFlagsEXT transformBlockSizes;
    uint8_t maxPPictureL0ReferenceCount;
    uint8_t maxBPictureL0ReferenceCount;
    uint8_t maxL1ReferenceCount;
    uint8_t maxSubLayersCount;
    uint8_t minLog2MinLumaCodingBlockSizeMinus3;
    uint8_t maxLog2MinLumaCodingBlockSizeMinus3;
    uint8_t minLog2MinLumaTransformBlockSizeMinus2;
    uint8_t maxLog2MinLumaTransformBlockSizeMinus2;
    uint8_t minMaxTransformHierarchyDepthInter;
    uint8_t maxMaxTransformHierarchyDepthInter;
    uint8_t minMaxTransformHierarchyDepthIntra;
    uint8_t maxMaxTransformHierarchyDepthIntra;
    uint8_t maxDiffCuQpDeltaDepth;
    uint8_t minMaxNumMergeCand;
    uint8_t maxMaxNumMergeCand;
    VkExtensionProperties stdExtensionVersion;
} VkVideoEncodeH265CapabilitiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoEncodeH265CapabilityFlagBitsEXT` describing supported encoding tools.
- `inputModeFlags` is a bitmask of `VkVideoEncodeH265InputModeFlagBitsEXT` describing the command buffer input granularities/modes supported by the implementation.
- `outputModeFlags` is a bitmask of `VkVideoEncodeH265OutputModeFlagBitsEXT` describing the output (bitstream size reporting) granularities/modes supported by the implementation.
- `ctbSizes` is a bitmask of `VkVideoEncodeH265CtbSizeFlagBitsEXT` describing the supported CTB sizes.

- `transformBlockSizes` is a bitmask of `VkVideoEncodeH265TransformBlockSizeFlagBitsEXT` describing the supported transform block sizes.
- `maxPPictureL0ReferenceCount` reports the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.
- `maxBPictureL0ReferenceCount` reports the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures. The reported value is `0` if encoding of B pictures is not supported.
- `maxL1ReferenceCount` reports the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported. The reported value is `0` if encoding of B pictures is not supported.
- `maxSubLayersCount` reports the maximum number of sublayers.
- `minLog2MinLumaCodingBlockSizeMinus3` reports the minimum value that may be set for `log2_min_luma_coding_block_size_minus3` in `StdVideoH265SequenceParameterSet`.
- `maxLog2MinLumaCodingBlockSizeMinus3` reports the maximum value that may be set for `log2_min_luma_coding_block_size_minus3` in `StdVideoH265SequenceParameterSet`.
- `minLog2MinLumaTransformBlockSizeMinus2` reports the minimum value that may be set for `log2_min_luma_transform_block_size_minus2` in `StdVideoH265SequenceParameterSet`.
- `maxLog2MinLumaTransformBlockSizeMinus2` reports the maximum value that may be set for `log2_min_luma_transform_block_size_minus2` in `StdVideoH265SequenceParameterSet`.
- `minMaxTransformHierarchyDepthInter` reports the minimum value that may be set for `max_transform_hierarchy_depth_inter` in `StdVideoH265SequenceParameterSet`.
- `maxMaxTransformHierarchyDepthInter` reports the maximum value that may be set for `max_transform_hierarchy_depth_inter` in `StdVideoH265SequenceParameterSet`.
- `minMaxTransformHierarchyDepthIntra` reports the minimum value that may be set for `max_transform_hierarchy_depth_intra` in `StdVideoH265SequenceParameterSet`.
- `maxMaxTransformHierarchyDepthIntra` reports the maximum value that may be set for `max_transform_hierarchy_depth_intra` in `StdVideoH265SequenceParameterSet`.
- `maxDiffCuQpDeltaDepth` reports the maximum value that may be set for `diff_cu_qp_delta_depth` in `StdVideoH265PictureParameterSet`.
- `minMaxNumMergeCand` reports the minimum value that may be set for `MaxNumMergeCand` in `StdVideoEncodeH265SliceHeader`.
- `maxMaxNumMergeCand` reports the maximum value that may be set for `MaxNumMergeCand` in `StdVideoEncodeH265SliceHeader`.
- `stdExtensionVersion` is a `VkExtensionProperties` structure in which the H.265 extension name and version supported by the implementation are returned.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265CapabilitiesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_CAPABILITIES_EXT`
- VUID-VkVideoEncodeH265CapabilitiesEXT-inputModeFlags-parameter
inputModeFlags **must** be a valid combination of `VkVideoEncodeH265InputModeFlagBitsEXT` values
- VUID-VkVideoEncodeH265CapabilitiesEXT-inputModeFlags-requiredbitmask
inputModeFlags **must** not be `0`
- VUID-VkVideoEncodeH265CapabilitiesEXT-outputModeFlags-parameter
outputModeFlags **must** be a valid combination of `VkVideoEncodeH265OutputModeFlagBitsEXT` values
- VUID-VkVideoEncodeH265CapabilitiesEXT-outputModeFlags-requiredbitmask
outputModeFlags **must** not be `0`
- VUID-VkVideoEncodeH265CapabilitiesEXT-ctbSizes-parameter
ctbSizes **must** be a valid combination of `VkVideoEncodeH265CtbSizeFlagBitsEXT` values
- VUID-VkVideoEncodeH265CapabilitiesEXT-ctbSizes-requiredbitmask
ctbSizes **must** not be `0`
- VUID-VkVideoEncodeH265CapabilitiesEXT-transformBlockSizes-parameter
transformBlockSizes **must** be a valid combination of `VkVideoEncodeH265TransformBlockSizeFlagBitsEXT` values
- VUID-VkVideoEncodeH265CapabilitiesEXT-transformBlockSizes-requiredbitmask
transformBlockSizes **must** not be `0`
- VUID-VkVideoEncodeH265CapabilitiesEXT-stdExtensionVersion-parameter
stdExtensionVersion **must** be a valid `VkExtensionProperties` structure

```
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265CapabilityFlagsEXT;
```

`VkVideoEncodeH265CapabilityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265CapabilityFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH265CapabilitiesEXT::flags`, indicating the encoding tools supported, are:

```

// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265CapabilityFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_CAPABILITY_SEPARATE_COLOUR_PLANE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_CAPABILITY_SCALING_LISTS_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_CAPABILITY_SAMPLE_ADAPTIVE_OFFSET_ENABLED_BIT_EXT =
0x00000004,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PCM_ENABLE_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H265_CAPABILITY_SPS_TEMPORAL_MVP_ENABLED_BIT_EXT = 0x00000010,
    VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_EXT = 0x00000020,
    VK_VIDEO_ENCODE_H265_CAPABILITY_INIT_QP_MINUS26_BIT_EXT = 0x00000040,
    VK_VIDEO_ENCODE_H265_CAPABILITY_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_EXT =
0x00000080,
    VK_VIDEO_ENCODE_H265_CAPABILITY_SIGN_DATA HIDING_ENABLED_BIT_EXT = 0x00000100,
    VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSFORM_SKIP_ENABLED_BIT_EXT = 0x00000200,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PPS_SLICE_CHROMA_QP_OFFSETS_PRESENT_BIT_EXT =
0x00000400,
    VK_VIDEO_ENCODE_H265_CAPABILITY_WEIGHTED_PRED_BIT_EXT = 0x00000800,
    VK_VIDEO_ENCODE_H265_CAPABILITY_WEIGHTED_BIPRED_BIT_EXT = 0x00001000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_WEIGHTED_PRED_NO_TABLE_BIT_EXT = 0x00002000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSQUANT_BYPASS_ENABLED_BIT_EXT = 0x00004000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_ENTROPY_CODING_SYNC_ENABLED_BIT_EXT = 0x00008000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_DEBLOCKING_FILTER_OVERRIDE_ENABLED_BIT_EXT =
0x00010000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILE_PER_FRAME_BIT_EXT = 0x00020000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_PER_TILE_BIT_EXT = 0x00040000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILE_PER_SLICE_BIT_EXT = 0x00080000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_SLICE_SEGMENT_CTB_COUNT_BIT_EXT = 0x00100000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_EXT = 0x00200000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_DEPENDENT_SLICE_SEGMENT_BIT_EXT = 0x00400000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT = 0x00800000,
} VkVideoEncodeH265CapabilityFlagBitsEXT;

```

- **VK_VIDEO_ENCODE_H265_CAPABILITY_SEPARATE_COLOUR_PLANE_BIT_EXT** reports if enabling separate_colour_plane_flag in StdVideoH265SpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_CAPABILITY_SCALING_LISTS_BIT_EXT** reports if enabling scaling_list_enabled_flag and sps_scaling_list_data_present_flag in StdVideoH265SpsFlags, or enabling pps_scaling_list_data_present_flag in StdVideoH265PpsFlags are supported.
- **VK_VIDEO_ENCODE_H265_CAPABILITY_SAMPLE_ADAPTIVE_OFFSET_ENABLED_BIT_EXT** reports if enabling sample_adaptive_offset_enabled_flag in StdVideoH265SpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_CAPABILITY_PCM_ENABLE_BIT_EXT** reports if enabling pcm_enable_flag in StdVideoH265SpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_CAPABILITY_SPS_TEMPORAL_MVP_ENABLED_BIT_EXT** reports if enabling sps_temporal_mvp_enabled_flag in StdVideoH265SpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_EXT** reports if the implementation guarantees generating a HRD compliant bitstream if nal_hrd_parameters_present_flag, vcl_hrd_parameters_present_flag, or sub_pic_hrd_params_present_flag are enabled in StdVideoH265HrdFlags, or vui_hrd_parameters_present_flag is enabled in

StdVideoH265SpsVuiFlags.

- `VK_VIDEO_ENCODE_H265_CAPABILITY_INIT_QP_MINUS26_BIT_EXT` reports if setting non-zero `init_qp_minus26` in StdVideoH265PictureParameterSet is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_EXT` reports if setting non-zero value for `log2_parallel_merge_level_minus2` in StdVideoH265PictureParameterSet is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_SIGN_DATA HIDING_ENABLED_BIT_EXT` reports if enabling `sign_data_hiding_enabled_flag` in StdVideoH265PpsFlags is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSFORM_SKIP_ENABLED_BIT_EXT` reports if enabling `transform_skip_enabled_flag` in StdVideoH265PpsFlags is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_PPS_SLICE_CHROMA_QP_OFFSETS_PRESENT_BIT_EXT` reports if enabling `pps_slice_chroma_qp_offsets_present_flag` in StdVideoH265PpsFlags is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_WEIGHTED_PRED_BIT_EXT` reports if enabling `weighted_pred_flag` in StdVideoH265PpsFlags is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_WEIGHTED_BIPRED_BIT_EXT` reports if enabling `weighted_bipred_flag` in StdVideoH265PpsFlags is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_WEIGHTED_PRED_NO_TABLE_BIT_EXT` reports that when `weighted_pred_flag` or `weighted_bipred_flag` in StdVideoH265PpsFlags are enabled, the implementation is able to internally decide syntax for `pred_weight_table`.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSQUANT_BYPASS_ENABLED_BIT_EXT` reports if enabling `transquant_bypass_enabled_flag` in StdVideoH265PpsFlags is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_ENTROPY_CODING_SYNC_ENABLED_BIT_EXT` reports if enabling `entropy_coding_sync_enabled_flag` in StdVideoH265PpsFlags is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_DEBLOCKING_FILTER_OVERRIDE_ENABLED_BIT_EXT` reports if enabling `deblocking_filter_override_enabled_flag` in StdVideoH265PpsFlags is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILE_PER_FRAME_BIT_EXT` reports if encoding multiple tiles per frame is supported. If not set, the implementation is only able to encode a single tile for each frame.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_PER_TILE_BIT_EXT` reports if encoding multiple slices per tile is supported. If not set, the implementation is only able to encode a single slice for each tile.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILE_PER_SLICE_BIT_EXT` reports if encoding multiple tiles per slice is supported. If not set, the implementation is only able to encode a single tile for each slice.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_SLICE_SEGMENT_CTB_COUNT_BIT_EXT` reports support for configuring `VkVideoEncodeH265NaluSliceSegmentEXT::ctbCount` and `slice_segment_address` in StdVideoEncodeH265SliceSegmentHeader for each slice segment in a frame with multiple slice segments. If not supported, the implementation decides the number of CTBs in each slice segment based on `VkVideoEncodeH265VclFrameInfoEXT::naluSliceSegmentEntryCount`.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_EXT` reports that each slice segment in a frame with a single or multiple tiles per slice may begin or finish at any offset in a CTB row. If not supported, all slice segments in such a frame **must** begin at the start of a CTB

row (and hence each slice segment **must** finish at the end of a CTB row). Also reports that each slice segment in a frame with multiple slices per tile may begin or finish at any offset within the enclosing tile's CTB row. If not supported, slice segments in such a frame **must** begin at the start of the enclosing tile's CTB row (and hence each slice segment **must** finish at the end of the enclosing tile's CTB row).

- `VK_VIDEO_ENCODE_H265_CAPABILITY_DEPENDENT_SLICE_SEGMENT_BIT_EXT` reports if enabling `dependent_slice_segment_flag` in `StdVideoEncodeH265SliceHeaderFlags` is supported.
- `VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT` reports that when `VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_PER_TILE_BIT_EXT` is supported and a frame is encoded with multiple slices, the implementation allows encoding each slice segment with a different `StdVideoEncodeH265SliceSegmentHeader::slice_type`. If not supported, all slice segments of the frame **must** be encoded with the same `slice_type` which corresponds to the picture type of the frame. For example, all slice segments of a P-frame would be encoded as P-slices.

```
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265InputModeFlagsEXT;
```

`VkVideoEncodeH265InputModeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265InputModeFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH265CapabilitiesEXT::inputModeFlags`, indicating the command buffer input granularities supported by the implementation, are:

```
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265InputModeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_INPUT_MODE_FRAME_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_INPUT_MODE_SLICE_SEGMENT_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_INPUT_MODE_NON_VCL_BIT_EXT = 0x00000004,
} VkVideoEncodeH265InputModeFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H265_INPUT_MODE_FRAME_BIT_EXT` indicates that a single command buffer **must** at least encode an entire frame. Any non-VCL NALUs **must** be encoded using the same command buffer as the frame if `VK_VIDEO_ENCODE_H265_INPUT_MODE_NON_VCL_BIT_EXT` is not supported.
- `VK_VIDEO_ENCODE_H265_INPUT_MODE_SLICE_SEGMENT_BIT_EXT` indicates that a single command buffer **must** at least encode a single slice segment. Any non-VCL NALUs **must** be encoded using the same command buffer as the first slice segment of the frame if `VK_VIDEO_ENCODE_H265_INPUT_MODE_NON_VCL_BIT_EXT` is not supported.
- `VK_VIDEO_ENCODE_H265_INPUT_MODE_NON_VCL_BIT_EXT` indicates that a single command buffer **may** encode a non-VCL NALU by itself.

An implementation **must** support at least one of `VK_VIDEO_ENCODE_H265_INPUT_MODE_FRAME_BIT_EXT` or `VK_VIDEO_ENCODE_H265_INPUT_MODE_SLICE_SEGMENT_BIT_EXT`.

If `VK_VIDEO_ENCODE_H265_INPUT_MODE_SLICE_SEGMENT_BIT_EXT` is not supported, the following two additional restrictions apply for frames encoded with multiple slice segments. First, all frame slice segments **must** have the same `pReferenceFinalLists`. Second, the order in which slice segments

appear in `VkVideoEncodeH265VclFrameInfoEXT::pNaluSliceSegmentEntries` or in the command buffer **must** match the placement order of the slice segments in the frame.

```
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265OutputModeFlagsEXT;
```

`VkVideoEncodeH265OutputModeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265OutputModeFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH265CapabilitiesEXT::outputModeFlags`, indicating the minimum bitstream generation commands that **must** be included between each `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR` pair (henceforth simply begin/end pair), are:

```
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265OutputModeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_OUTPUT_MODE_FRAME_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_OUTPUT_MODE_SLICE_SEGMENT_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_OUTPUT_MODE_NON_VCL_BIT_EXT = 0x00000004,
} VkVideoEncodeH265OutputModeFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H265_OUTPUT_MODE_FRAME_BIT_EXT` indicates that calls to generate all NALUs of a frame **must** be included within a single begin/end pair. Any non-VCL NALUs **must** be encoded within the same begin/end pair if `VK_VIDEO_ENCODE_H265_OUTPUT_MODE_NON_VCL_BIT_EXT` is not supported.
- `VK_VIDEO_ENCODE_H265_OUTPUT_MODE_SLICE_SEGMENT_BIT_EXT` indicates that each begin/end pair **must** encode at least one slice segment. Any non-VCL NALUs **must** be encoded within the same begin/end pair as the first slice segment of the frame if `VK_VIDEO_ENCODE_H265_OUTPUT_MODE_NON_VCL_BIT_EXT` is not supported.
- `VK_VIDEO_ENCODE_H265_OUTPUT_MODE_NON_VCL_BIT_EXT` indicates that each begin/end pair **may** encode only a non-VCL NALU by itself. An implementation **must** support at least one of `VK_VIDEO_ENCODE_H265_OUTPUT_MODE_FRAME_BIT_EXT` or `VK_VIDEO_ENCODE_H265_OUTPUT_MODE_SLICE_SEGMENT_BIT_EXT`.

A single begin/end pair **must** not encode more than a single frame.

The bitstreams of NALUs generated within a single begin/end pair are written continuously into the same bitstream buffer (any padding between the NALUs **must** be compliant to the H.265 standard).

The supported input modes **must** be coarser or equal to the supported output modes. For example, it is illegal to report slice segment input is supported but only frame output is supported.

An implementation **must** report one of the following combinations of input/output modes:

- Input: Frame, Output: Frame
- Input: Frame, Output: Frame and Non-VCL

- Input: Frame, Output: Slice Segment
- Input: Frame, Output: Slice Segment and Non-VCL
- Input: Slice Segment, Output: Slice Segment
- Input: Slice Segment, Output: Slice Segment and Non-VCL
- Input: Frame and Non-VCL, Output: Frame and Non-VCL
- Input: Frame and Non-VCL, Output: Slice Segment and Non-VCL
- Input: Slice Segment and Non-VCL, Output: Slice Segment and Non-VCL

```
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265CtbSizeFlagsEXT;
```

`VkVideoEncodeH265CtbSizeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265CtbSizeFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH265CapabilitiesEXT::ctbSizes`, indicating the CTB sizes supported by the implementation, are:

```
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265CtbSizeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_EXT = 0x00000004,
} VkVideoEncodeH265CtbSizeFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_EXT` specifies that a CTB size of 16x16 is supported.
- `VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_EXT` specifies that a CTB size of 32x32 is supported.
- `VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_EXT` specifies that a CTB size of 64x64 is supported.

```
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265TransformBlockSizeFlagsEXT;
```

`VkVideoEncodeH265TransformBlockSizeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265TransformBlockSizeFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH265CapabilitiesEXT::transformBlockSizes`, indicating the transform block sizes supported by the implementation, are:

```
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265TransformBlockSizeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_EXT = 0x00000008,
} VkVideoEncodeH265TransformBlockSizeFlagBitsEXT;
```

- **VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_EXT** specifies that a transform block size of 4x4 is supported.
- **VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_EXT** specifies that a transform block size of 8x8 is supported.
- **VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_EXT** specifies that a transform block size of 16x16 is supported.
- **VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_EXT** specifies that a transform block size of 32x32 is supported.

39.10.3. Create Information

When creating a Video Session object with [VkVideoSessionCreateInfoKHR::pVideoProfile->videoCodecOperation](#) specified as **VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT**, add a **VkVideoEncodeH265SessionCreateInfoEXT** structure to the **pNext** chain of the **VkVideoSessionCreateInfoKHR** structure passed to [vkCreateVideoSessionKHR](#) in order to specify the H.265-specific video encoder session creation parameters.

The **VkVideoEncodeH265SessionCreateInfoEXT** structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionCreateInfoEXT {
    VkStructureType          sType;
    const void*             pNext;
    VkVideoEncodeH265CreateFlagsEXT flags;
    const VkExtensionProperties* pStdExtensionVersion;
} VkVideoEncodeH265SessionCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pStdExtensionVersion** is a pointer to a **VkExtensionProperties** structure specifying the H.265 codec extension version.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionCreateInfoEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_CREATE_INFO_EXT`
- VUID-VkVideoEncodeH265SessionCreateInfoEXT-flags-zero bitmask
flags must be `0`
- VUID-VkVideoEncodeH265SessionCreateInfoEXT-pStdExtensionVersion-parameter
pStdExtensionVersion must be a valid pointer to a valid `VkExtensionProperties` structure

```
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265CreateFlagsEXT;
```

`VkVideoEncodeH265CreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

39.10.4. Encoder H.265 Video Session Parameters Object

When creating a Video Session Parameters object, add a `VkVideoEncodeH265SessionParametersCreateInfoEXT` structure to the `pNext` chain of the `VkVideoSessionParametersCreateInfoKHR` structure passed to `vkCreateVideoSessionParametersKHR` in order to specify the H.265-specific video encoder session parameters.

The `VkVideoEncodeH265SessionParametersCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersCreateInfoEXT {
    VkStructureType                         sType;
    const void*                           pNext;
    uint32_t                            maxVpsStdCount;
    uint32_t                            maxSpsStdCount;
    uint32_t                            maxPpsStdCount;
    const VkVideoEncodeH265SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoEncodeH265SessionParametersCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxVpsStdCount` is the maximum number of entries of type `StdVideoH265VideoParameterSet` within `VkVideoSessionParametersKHR`.
- `maxSpsStdCount` is the maximum number of entries of type `StdVideoH265SequenceParameterSet` within `VkVideoSessionParametersKHR`.
- `maxPpsStdCount` is the maximum number of entries of type `StdVideoH265PictureParameterSet` within `VkVideoSessionParametersKHR`.

- `pParametersAddInfo` is `NULL` or a pointer to a `VkVideoEncodeH265SessionParametersAddInfoEXT` structure specifying the video session parameters to add upon creation of this object.

When a `VkVideoSessionParametersKHR` object contains `maxVpsStdCount` `StdVideoH265VideoParameterSet` entries, no additional `StdVideoH265VideoParameterSet` entries can be added to it, and `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add these entries. When a `VkVideoSessionParametersKHR` object contains `maxSpsStdCount` `StdVideoH265SequenceParameterSet` entries, no additional `StdVideoH265SequenceParameterSet` entries can be added to it, and `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add these entries. When a `VkVideoSessionParametersKHR` object contains `maxPpsStdCount` `StdVideoH265PictureParameterSet` entries, no additional `StdVideoH265PictureParameterSet` entries can be added to it, and `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add these entries.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_CREATE_INFO_EXT`
- VUID-VkVideoEncodeH265SessionParametersCreateInfoEXT-pParametersAddInfo-parameter
If `pParametersAddInfo` is not `NULL`, `pParametersAddInfo` **must** be a valid pointer to a valid `VkVideoEncodeH265SessionParametersAddInfoEXT` structure

The `VkVideoEncodeH265SessionParametersAddInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersAddInfoEXT {
    VkStructureType                         sType;
    const void*                             pNext;
    uint32_t                                vpsStdCount;
    const StdVideoH265VideoParameterSet*     pVpsStd;
    uint32_t                                spsStdCount;
    const StdVideoH265SequenceParameterSet*  pSpsStd;
    uint32_t                                ppsStdCount;
    const StdVideoH265PictureParameterSet*   pPpsStd;
} VkVideoEncodeH265SessionParametersAddInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vpsStdCount` is the number of VPS elements in `pVpsStd`.
- `pVpsStd` is a pointer to an array of `vpsStdCount` `StdVideoH265VideoParameterSet` structures representing H.265 video parameter sets.
- `spsStdCount` is the number of SPS elements in `pSpsStd`.
- `pSpsStd` is a pointer to an array of `spsStdCount` `StdVideoH265SequenceParameterSet` structures representing H.265 sequence parameter sets.

- `ppsStdCount` is the number of PPS elements in `pPpsStd`.
- `pPpsStd` is a pointer to an array of `ppsStdCount StdVideoH265PictureParameterSet` structures representing H.265 picture parameter sets.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_ADD_INFO_EXT`
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pVpsStd-parameter
If `pVpsStd` is not `NULL`, `pVpsStd` **must** be a valid pointer to an array of `vpsStdCount StdVideoH265VideoParameterSet` values
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pSpsStd-parameter
If `pSpsStd` is not `NULL`, `pSpsStd` **must** be a valid pointer to an array of `spsStdCount StdVideoH265SequenceParameterSet` values
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pPpsStd-parameter
If `pPpsStd` is not `NULL`, `pPpsStd` **must** be a valid pointer to an array of `ppsStdCount StdVideoH265PictureParameterSet` values
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-vpsStdCount-arraylength
`vpsStdCount` **must** be greater than `0`
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-spsStdCount-arraylength
`spsStdCount` **must** be greater than `0`
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-ppsStdCount-arraylength
`ppsStdCount` **must** be greater than `0`

Valid Usage

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-vpsStdCount-06438
The values of `vpsStdCount`, `spsStdCount` and `ppsStdCount` **must** be less than or equal to the values of `VkVideoEncodeH265SessionParametersCreateInfoEXT::maxVpsStdCount`, `VkVideoEncodeH265SessionParametersCreateInfoEXT::maxSpsStdCount`, and `VkVideoEncodeH265SessionParametersCreateInfoEXT::maxPPsStdCount`, respectively
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pVpsStd-06439
Each `StdVideoH265VideoParameterSet` entry in `pVpsStd` **must** have a unique H.265 VPS ID
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pSpsStd-06440
Each `StdVideoH265SequenceParameterSet` entry in `pSpsStd` **must** have a unique H.265 VPS-SPS ID pair
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pPpsStd-06441
Each `StdVideoH265PictureParameterSet` entry in `pPpsStd` **must** have a unique H.265 VPS-SPS-PPS ID tuple
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06442
Each entry to be added **must** have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, VPS-SPS-PPS IDs
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06443
Parameter entries that already exist in Video Session Parameters object with a particular VPS-SPS-PPS IDs **must** not be replaced nor updated
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06444
When creating a new object using a Video Session Parameters as a template, the array's parameters with the same VPS-SPS-PPS IDs as the ones from the template take precedence
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06445
VPS/SPS/PPS parameters **must** comply with the limits specified in `VkVideoSessionCreateInfoKHR` during Video Session creation

39.10.5. Frame Encoding

In order to encode a frame, add a `VkVideoEncodeH265VclFrameInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeInfoKHR` structure passed to the `vkCmdEncodeVideoKHR` command.

The `VkVideoEncodeH265VclFrameInfoEXT` structure representing a frame encode operation is defined as:

```

// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265VclFrameInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const VkVideoEncodeH265ReferenceListsEXT* pReferenceFinalLists;
    uint32_t naluSliceSegmentEntryCount;
    const VkVideoEncodeH265NaluSliceSegmentEXT* pNaluSliceSegmentEntries;
    const StdVideoEncodeH265PictureInfo* pCurrentPictureInfo;
} VkVideoEncodeH265VclFrameInfoEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pReferenceFinalLists** is **NULL** or a pointer to a **VkVideoEncodeH265ReferenceListsEXT** structure specifying the reference lists to be used for the current picture.
- **naluSliceSegmentEntryCount** is the number of slice segment NALUs in the frame.
- **pNaluSliceSegmentEntries** is a pointer to an array of **VkVideoEncodeH265NaluSliceSegmentEXT** structures specifying the division of the current picture into slice segments and the properties of these slice segments.
- **pCurrentPictureInfo** is a pointer to a **StdVideoEncodeH265PictureInfo** structure specifying the syntax and other codec-specific information from the H.265 specification, associated with this picture.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265VclFrameInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_VCL_FRAME_INFO_EXT**
- VUID-VkVideoEncodeH265VclFrameInfoEXT-pReferenceFinalLists-parameter
If **pReferenceFinalLists** is not **NULL**, **pReferenceFinalLists** **must** be a valid pointer to a valid **VkVideoEncodeH265ReferenceListsEXT** structure
- VUID-VkVideoEncodeH265VclFrameInfoEXT-pNaluSliceSegmentEntries-parameter
pNaluSliceSegmentEntries **must** be a valid pointer to an array of **naluSliceSegmentEntryCount** valid **VkVideoEncodeH265NaluSliceSegmentEXT** structures
- VUID-VkVideoEncodeH265VclFrameInfoEXT-pCurrentPictureInfo-parameter
pCurrentPictureInfo **must** be a valid pointer to a valid **StdVideoEncodeH265PictureInfo** value
- VUID-VkVideoEncodeH265VclFrameInfoEXT-naluSliceSegmentEntryCount-arraylength
naluSliceSegmentEntryCount **must** be greater than **0**

The **VkVideoEncodeH265NaluSliceSegmentEXT** structure representing a slice segment is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265NaluSliceSegmentEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t ctbCount;
    const VkVideoEncodeH265ReferenceListsEXT* pReferenceFinalLists;
    const StdVideoEncodeH265SliceSegmentHeader* pSliceSegmentHeaderStd;
} VkVideoEncodeH265NaluSliceSegmentEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **ctbCount** is the number of CTBs in this slice segment.
- **pReferenceFinalLists** is **NULL** or a pointer to a **VkVideoEncodeH265ReferenceListsEXT** structure specifying the reference lists to be used for the current slice segment. If **pReferenceFinalLists** is not **NULL**, these reference lists override the reference lists provided in **VkVideoEncodeH265VclFrameInfoEXT::pReferenceFinalLists**.
- **pSliceSegmentHeaderStd** is a pointer to a **StdVideoEncodeH265SliceSegmentHeader** structure specifying the slice segment header for the current slice segment.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265NaluSliceSegmentEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_NALU_SLICE_SEGMENT_EXT**
- VUID-VkVideoEncodeH265NaluSliceSegmentEXT-pNext-pNext
pNext **must** be **NULL**
- VUID-VkVideoEncodeH265NaluSliceSegmentEXT-pReferenceFinalLists-parameter
If **pReferenceFinalLists** is not **NULL**, **pReferenceFinalLists** **must** be a valid pointer to a valid **VkVideoEncodeH265ReferenceListsEXT** structure
- VUID-VkVideoEncodeH265NaluSliceSegmentEXT-pSliceSegmentHeaderStd-parameter
pSliceSegmentHeaderStd **must** be a valid pointer to a valid **StdVideoEncodeH265SliceSegmentHeader** value

The **VkVideoEncodeH265DpbSlotInfoEXT** structure, representing a reconstructed picture that is being used as a reference picture, is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265DpbSlotInfoEXT {
    VkStructureType sType;
    const void* pNext;
    int8_t slotIndex;
    const StdVideoEncodeH265ReferenceInfo* pStdReferenceInfo;
} VkVideoEncodeH265DpbSlotInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `slotIndex` is the `DPB Slot` index for this picture.
- `pStdReferenceInfo` is a pointer to a `StdVideoEncodeH265ReferenceInfo` structure specifying the syntax and other codec-specific information from the H.265 specification, associated with this reference picture.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265DpbSlotInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_DPB_SLOT_INFO_EXT`
- VUID-VkVideoEncodeH265DpbSlotInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkVideoEncodeH265DpbSlotInfoEXT-pStdReferenceInfo-parameter
`pStdReferenceInfo` **must** be a valid pointer to a valid `StdVideoEncodeH265ReferenceInfo` value

The `VkVideoEncodeH265ReferenceListsEXT` structure representing reference lists is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265ReferenceListsEXT {
    VkStructureType
    const void*
    uint8_t
    const VkVideoEncodeH265DpbSlotInfoEXT*
    uint8_t
    const VkVideoEncodeH265DpbSlotInfoEXT*
    const StdVideoEncodeH265ReferenceModifications*
} VkVideoEncodeH265ReferenceListsEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `referenceList0EntryCount` is the number of reference pictures in reference list L0 and is identical to `StdVideoEncodeH265SliceSegmentHeader::num_ref_idx_l0_active_minus1 + 1`.
- `pReferenceList0Entries` is a pointer to an array of `referenceList0EntryCount` `VkVideoEncodeH265DpbSlotInfoEXT` structures specifying the reference list L0 entries for the current picture.
- `referenceList1EntryCount` is the number of reference pictures in reference list L1 and is identical to `StdVideoEncodeH265SliceSegmentHeader::num_ref_idx_l1_active_minus1 + 1`.
- `pReferenceList1Entries` is a pointer to an array of `referenceList1EntryCount` `VkVideoEncodeH265DpbSlotInfoEXT` structures specifying the reference list L1 entries for the current picture.

- `pReferenceModifications` is a pointer to a `StdVideoEncodeH265ReferenceModifications` structure specifying reference list modifications.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265ReferenceListsEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_REFERENCE_LISTS_EXT`
- VUID-VkVideoEncodeH265ReferenceListsEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkVideoEncodeH265ReferenceListsEXT-pReferenceList0Entries-parameter
If `referenceList0EntryCount` is not `0`, `pReferenceList0Entries` **must** be a valid pointer to an array of `referenceList0EntryCount` valid `VkVideoEncodeH265DpbSlotInfoEXT` structures
- VUID-VkVideoEncodeH265ReferenceListsEXT-pReferenceList1Entries-parameter
If `referenceList1EntryCount` is not `0`, `pReferenceList1Entries` **must** be a valid pointer to an array of `referenceList1EntryCount` valid `VkVideoEncodeH265DpbSlotInfoEXT` structures
- VUID-VkVideoEncodeH265ReferenceListsEXT-pReferenceModifications-parameter
`pReferenceModifications` **must** be a valid pointer to a valid `StdVideoEncodeH265ReferenceModifications` value

The `VkVideoEncodeH265EmitPictureParametersEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265EmitPictureParametersEXT {
    VkStructureType sType;
    const void* pNext;
    uint8_t vpsId;
    uint8_t spsId;
    VkBool32 emitVpsEnable;
    VkBool32 emitSpsEnable;
    uint32_t ppsIdEntryCount;
    const uint8_t* ppsIdEntries;
} VkVideoEncodeH265EmitPictureParametersEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vpsId` is the H.265 VPS ID for the H.265 VPS to insert in the bitstream. The VPS ID **must** match the VPS provided in `vpsStd` of `VkVideoEncodeH265SessionParametersCreateInfoEXT`. This is retrieved from the `VkVideoSessionParametersKHR` object provided in `VkVideoBeginCodingInfoKHR`.
- `spsId` is the H.265 SPS ID for the H.265 SPS to insert in the bitstream. The SPS ID **must** match one of the IDs of the SPS(s) provided in `pSpsStd` of `VkVideoEncodeH265SessionParametersCreateInfoEXT` to identify the SPS parameter set to insert in the bitstream. This is retrieved from the `VkVideoSessionParametersKHR` object provided in `VkVideoBeginCodingInfoKHR`.

- `emitVpsEnable` enables the emitting of the VPS structure with id of `vpsId`.
- `emitSpsEnable` enables the emitting of the SPS structure with id of `spsId`.
- `ppsIdEntryCount` is the number of entries in the `ppsIdEntries`. If this parameter is `0` then no pps entries are going to be emitted in the bitstream.
- `ppsIdEntries` is the H.265 PPS IDs for the H.265 PPS to insert in the bitstream. The PPS IDs **must** match one of the IDs of the PPS(s) provided in `pPpsStd` of `VkVideoEncodeH265SessionParametersCreateInfoEXT` to identify the PPS parameter set to insert in the bitstream. This is retrieved from the `VkVideoSessionParametersKHR` object provided in `VkVideoBeginCodingInfoKHR`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265EmitPictureParametersEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_EMIT_PICTURE_PARAMETERS_EXT`
- VUID-VkVideoEncodeH265EmitPictureParametersEXT-ppsIdEntries-parameter
If `ppsIdEntryCount` is not `0`, `ppsIdEntries` **must** be a valid pointer to an array of `ppsIdEntryCount uint8_t` values

39.10.6. Rate control

The `VkVideoEncodeH265RateControlInfoEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265RateControlInfoEXT {
    VkStructureType                         sType;
    const void*                             pNext;
    uint32_t                                gopFrameCount;
    uint32_t                                idrPeriod;
    uint32_t                                consecutiveBFrameCount;
    VkVideoEncodeH265RateControlStructureFlagBitsEXT rateControlStructure;
    uint8_t                                 subLayerCount;
} VkVideoEncodeH265RateControlInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `gopFrameCount` is the number of frames contained within the group of pictures (GOP), starting from an intra frame and until the next intra frame. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- `idrPeriod` is the interval, in terms of number of frames, between two IDR frames. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the IDR period is treated as infinite.
- `consecutiveBFrameCount` is the number of consecutive B-frames between I- and/or P-frames within the GOP.

- `rateControlStructure` is a `VkVideoEncodeH265RateControlStructureFlagBitsEXT` value specifying the expected encode stream reference structure, to aid in rate control calculations.
- `subLayerCount` specifies the number of sub layers enabled in the stream.

In order to provide H.265-specific stream rate control parameters, add a `VkVideoEncodeH265RateControlInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeRateControlInfoKHR` structure in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command.

The parameters from this structure act as a guidance for implementations to apply various rate control heuristics.

It is possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided in `vkCmdEncodeVideoKHR`. Additionally, it is not required for the video session to be reset if the inferred picture type does not match the actual picture type.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265RateControlInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_INFO_EXT`
- VUID-VkVideoEncodeH265RateControlInfoEXT-rateControlStructure-parameter
`rateControlStructure` **must** be a valid `VkVideoEncodeH265RateControlStructureFlagBitsEXT` value

Possible values of `VkVideoEncodeH265RateControlInfoEXT::rateControlStructure`, specifying a video stream reference structure as a hint for the rate control implementation, are:

```
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265RateControlStructureFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_UNKNOWN_EXT = 0,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_FLAT_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_DYADIC_BIT_EXT = 0x00000002,
} VkVideoEncodeH265RateControlStructureFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_UNKNOWN_EXT` is `0`, and specifies a reference structure unknown at the time of stream rate control configuration.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_FLAT_BIT_EXT` specifies a flat reference structure.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_DYADIC_BIT_EXT` specifies a dyadic reference structure.

The `VkVideoEncodeH265RateControlLayerInfoEXT` structure is defined as:

```

// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265RateControlLayerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint8_t temporalId;
    VkBool32 useInitialRcQp;
    VkVideoEncodeH265QpEXT initialRcQp;
    VkBool32 useMinQp;
    VkVideoEncodeH265QpEXT minQp;
    VkBool32 useMaxQp;
    VkVideoEncodeH265QpEXT maxQp;
    VkBool32 useMaxFrameSize;
    VkVideoEncodeH265FrameSizeEXT maxFrameSize;
} VkVideoEncodeH265RateControlLayerInfoEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **temporalId** specifies the H.265 temporal ID of the video coding layer that settings provided in this structure and its parent **VkVideoEncodeRateControlLayerInfoKHR** structure apply to.
- **useInitialRcQp** indicates whether the values within **initialRcQp** should be used by the implementation.
- **initialRcQp** provides the QP values for each picture type, to be used in rate control calculations at the start of video encode operations on a newly-created video session, or immediately after a session reset. These values are ignored when **VkVideoEncodeRateControlInfoKHR** ::**rateControlMode** is **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR**.
- **useMinQp** indicates whether the values within **minQp** should be used by the implementation. When it is set to **VK_FALSE**, the implementation ignores the values in **minQp** and chooses suitable values.
- **minQp** provides the lower bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxQp** indicates whether the values within **maxQp** should be used by the implementation. When it is set to **VK_FALSE**, the implementation ignores the values in **maxQp** and chooses suitable values.
- **maxQp** provides the upper bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxFrameSize** indicates whether the values within **maxFrameSize** should be used by the implementation.
- **maxFrameSize** provides the upper bound on the encoded frame size for each picture type. The implementation does not guarantee the encoded frame sizes will be within the specified limits, however these limits **may** be used as a guide in rate control calculations. If enabled and not set properly, the **maxQp** limit may prevent the implementation from respecting the **maxFrameSize** limit.

H.265-specific per-layer rate control parameters **must** be specified by adding a

`VkVideoEncodeH265RateControlLayerInfoEXT` structure to the `pNext` chain of each `VkVideoEncodeRateControlLayerInfoKHR` structure in a call to `vkCmdControlVideoCodingKHR` command, when the command buffer context has an active video encode H.265 session.

Valid Usage

- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-rateControlMode-06476
When `VkVideoEncodeRateControlInfoKHR::rateControlMode` is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`, both `useMinQp` and `useMaxQp` must be set to `VK_TRUE`.
- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-rateControlMode-06477
When `VkVideoEncodeRateControlInfoKHR::rateControlMode` is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`, the values provided in `minQP` must be identical to those provided in `maxQP`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_LAYER_INFO_EXT`
- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-initialRcQp-parameter
`initialRcQp` **must** be a valid `VkVideoEncodeH265QpEXT` structure
- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-minQp-parameter
`minQp` **must** be a valid `VkVideoEncodeH265QpEXT` structure
- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-maxQp-parameter
`maxQp` **must** be a valid `VkVideoEncodeH265QpEXT` structure
- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-maxFrameSize-parameter
`maxFrameSize` **must** be a valid `VkVideoEncodeH265FrameSizeEXT` structure

The `VkVideoEncodeH265QpEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265QpEXT {
    int32_t qpI;
    int32_t qpP;
    int32_t qpB;
} VkVideoEncodeH265QpEXT;
```

- `qpI` is the QP to be used for I-frames.
- `qpP` is the QP to be used for P-frames.
- `qpB` is the QP to be used for B-frames.

The `VkVideoEncodeH265FrameSizeEXT` structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265FrameSizeEXT {
    uint32_t      frameISize;
    uint32_t      framePSize;
    uint32_t      frameBSize;
} VkVideoEncodeH265FrameSizeEXT;
```

- **frameISize** is the size in bytes to be used for I-frames.
- **framePSize** is the size in bytes to be used for P-frames.
- **frameBSize** is the size in bytes to be used for B-frames.

Chapter 40. Extending Vulkan

New functionality **may** be added to Vulkan via either new extensions or new versions of the core, or new versions of an extension in some cases.

This chapter describes how Vulkan is versioned, how compatibility is affected between different versions, and compatibility rules that are followed by the Vulkan Working Group.

40.1. Instance and Device Functionality

Commands that enumerate instance properties, or that accept a `VkInstance` object as a parameter, are considered instance-level functionality. Commands that enumerate physical device properties, or that accept a `VkDevice` object or any of a device's child objects as a parameter, are considered device-level functionality.

Note

Applications usually interface to Vulkan using a loader that implements only instance-level functionality, passing device-level functionality to implementations of the full Vulkan API on the system. In some circumstances, as these may be implemented independently, it is possible that the loader and device implementations on a given installation will support different versions. To allow for this and call out when it happens, the Vulkan specification enumerates device and instance level functionality separately - they have [independent version queries](#).

Note

Vulkan 1.0 initially specified new physical device enumeration functionality as instance-level, requiring it to be included in an instance extension. As the capabilities of device-level functionality require discovery via physical device enumeration, this led to the situation where many device extensions required an instance extension as well. To alleviate this extra work, `VK_KHR_get_physical_device_properties2` (and subsequently Vulkan 1.1) redefined device-level functionality to include physical device enumeration.

40.2. Core Versions

The Vulkan Specification is regularly updated with bug fixes and clarifications. Occasionally new functionality is added to the core and at some point it is expected that there will be a desire to perform a large, breaking change to the API. In order to indicate to developers how and when these changes are made to the specification, and to provide a way to identify each set of changes, the Vulkan API maintains a version number.

40.2.1. Version Numbers

The Vulkan version number comprises four parts indicating the variant, major, minor and patch version of the Vulkan API Specification.

The *variant* indicates the variant of the Vulkan API supported by the implementation. This is always 0 for the Vulkan API.

Note

A non-zero variant indicates the API is a variant of the Vulkan API and applications will typically need to be modified to run against it. The variant field was a later addition to the version number, added in version 1.2.175 of the Specification. As Vulkan uses variant 0, this change is fully backwards compatible with the previous version number format for Vulkan implementations. New version number macros have been added for this change and the old macros deprecated. For existing applications using the older format and macros, an implementation with non-zero variant will decode as a very high Vulkan version. The high version number should be detectable by applications performing suitable version checking.

The *major version* indicates a significant change in the API, which will encompass a wholly new version of the specification.

The *minor version* indicates the incorporation of new functionality into the core specification.

The *patch version* indicates bug fixes, clarifications, and language improvements have been incorporated into the specification.

Compatibility guarantees made about versions of the API sharing any of the same version numbers are documented in [Core Versions](#)

The version number is used in several places in the API. In each such use, the version numbers are packed into a 32-bit integer as follows:

- The variant is a 3-bit integer packed into bits 31-29.
- The major version is a 7-bit integer packed into bits 28-22.
- The minor version number is a 10-bit integer packed into bits 21-12.
- The patch version number is a 12-bit integer packed into bits 11-0.

VK_API_VERSION_VARIANT extracts the API variant number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_VARIANT(version) ((uint32_t)(version) >> 29)
```

VK_API_VERSION_MAJOR extracts the API major version number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MAJOR(version) (((uint32_t)(version) >> 22) & 0x7FU)
```

VK_VERSION_MAJOR extracts the API major version number from a packed version number:

```
// Provided by VK_VERSION_1_0
// DEPRECATED: This define is deprecated. VK_API_VERSION_MAJOR should be used instead.
#define VK_VERSION_MAJOR(version) ((uint32_t)(version) >> 22)
```

VK_API_VERSION_MINOR extracts the API minor version number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MINOR(version) (((uint32_t)(version) >> 12) & 0x3FFU)
```

VK_VERSION_MINOR extracts the API minor version number from a packed version number:

```
// Provided by VK_VERSION_1_0
// DEPRECATED: This define is deprecated. VK_API_VERSION_MINOR should be used instead.
#define VK_VERSION_MINOR(version) ((uint32_t)(version) >> 12) & 0x3FFU)
```

VK_API_VERSION_PATCH extracts the API patch version number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFFU)
```

VK_VERSION_PATCH extracts the API patch version number from a packed version number:

```
// Provided by VK_VERSION_1_0
// DEPRECATED: This define is deprecated. VK_API_VERSION_PATCH should be used instead.
#define VK_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFFU)
```

VK_MAKE_API_VERSION constructs an API version number.

```
// Provided by VK_VERSION_1_0
#define VK_MAKE_API_VERSION(variant, major, minor, patch) \
    (((uint32_t)(variant)) << 29) | (((uint32_t)(major)) << 22) | \
    (((uint32_t)(minor)) << 12) | ((uint32_t)(patch)))
```

- **variant** is the variant number.
- **major** is the major version number.
- **minor** is the minor version number.
- **patch** is the patch version number.

VK_MAKE_VERSION constructs an API version number.

```
// Provided by VK_VERSION_1_0
// DEPRECATED: This define is deprecated. VK_MAKE_API_VERSION should be used instead.
#define VK_MAKE_VERSION(major, minor, patch) \
(((uint32_t)(major)) << 22) | ((uint32_t)(minor)) << 12) | ((uint32_t)(patch)))
```

- `major` is the major version number.
- `minor` is the minor version number.
- `patch` is the patch version number.

`VK_API_VERSION_1_0` returns the API version number for Vulkan 1.0.0.

```
// Provided by VK_VERSION_1_0
// Vulkan 1.0 version number
#define VK_API_VERSION_1_0 VK_MAKE_API_VERSION(0, 1, 0, 0)// Patch version should
always be set to 0
```

`VK_API_VERSION_1_1` returns the API version number for Vulkan 1.1.0.

```
// Provided by VK_VERSION_1_1
// Vulkan 1.1 version number
#define VK_API_VERSION_1_1 VK_MAKE_API_VERSION(0, 1, 1, 0)// Patch version should
always be set to 0
```

`VK_API_VERSION_1_2` returns the API version number for Vulkan 1.2.0.

```
// Provided by VK_VERSION_1_2
// Vulkan 1.2 version number
#define VK_API_VERSION_1_2 VK_MAKE_API_VERSION(0, 1, 2, 0)// Patch version should
always be set to 0
```

`VK_API_VERSION_1_3` returns the API version number for Vulkan 1.3.0.

```
// Provided by VK_VERSION_1_3
// Vulkan 1.3 version number
#define VK_API_VERSION_1_3 VK_MAKE_API_VERSION(0, 1, 3, 0)// Patch version should
always be set to 0
```

40.2.2. Querying Version Support

The version of instance-level functionality can be queried by calling [vkEnumerateInstanceVersion](#).

The version of device-level functionality can be queried by calling [vkGetPhysicalDeviceProperties](#) or [vkGetPhysicalDeviceProperties2](#), and is returned in [VkPhysicalDeviceProperties::apiVersion](#), encoded as described in [Version Numbers](#).

40.3. Layers

When a layer is enabled, it inserts itself into the call chain for Vulkan commands the layer is interested in. Layers **can** be used for a variety of tasks that extend the base behavior of Vulkan beyond what is required by the specification - such as call logging, tracing, validation, or providing additional extensions.

Note

For example, an implementation is not expected to check that the value of enums used by the application fall within allowed ranges. Instead, a validation layer would do those checks and flag issues. This avoids a performance penalty during production use of the application because those layers would not be enabled in production.

Note

Vulkan layers **may** wrap object handles (i.e. return a different handle value to the application than that generated by the implementation). This is generally discouraged, as it increases the probability of incompatibilities with new extensions. The validation layers wrap handles in order to track the proper use and destruction of each object. See the [“Architecture of the Vulkan Loader Interfaces”](#) document for additional information.

To query the available layers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceLayerProperties(
    uint32_t* pPropertyCount,
    VkLayerProperties* pProperties);
```

- **pPropertyCount** is a pointer to an integer related to the number of layer properties available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkLayerProperties** structures.

If **pProperties** is **NULL**, then the number of layer properties available is returned in **pPropertyCount**. Otherwise, **pPropertyCount** **must** point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If **pPropertyCount** is less than the number of layer properties available, at most **pPropertyCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available properties were returned.

The list of available layers may change at any time due to actions outside of the Vulkan implementation, so two calls to **vkEnumerateInstanceLayerProperties** with the same parameters **may** return different results, or retrieve different **pPropertyCount** values or **pProperties** contents. Once an instance has been created, the layers enabled for that instance will continue to be enabled and valid for the lifetime of that instance, even if some of them become unavailable for future instances.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceLayerProperties-pPropertyCount-parameter
pPropertyCount **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateInstanceLayerProperties-pProperties-parameter
If the value referenced by **pPropertyCount** is not `0`, and **pProperties** is not `NULL`, **pProperties** **must** be a valid pointer to an array of **pPropertyCount** `VkLayerProperties` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkLayerProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkLayerProperties {
    char      layerName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t  specVersion;
    uint32_t  implementationVersion;
    char      description[VK_MAX_DESCRIPTION_SIZE];
} VkLayerProperties;
```

- **layerName** is an array of `VK_MAX_EXTENSION_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the layer. Use this name in the `ppEnabledLayerNames` array passed in the `VkInstanceCreateInfo` structure to enable this layer for an instance.
- **specVersion** is the Vulkan version the layer was written to, encoded as described in [Version Numbers](#).
- **implementationVersion** is the version of this layer. It is an integer, increasing with backward compatible changes.
- **description** is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which provides additional details that **can** be used by the application to identify the layer.

`VK_MAX_EXTENSION_NAME_SIZE` is the length in `char` values of an array containing a layer or extension name string, as returned in `VkLayerProperties::layerName`, `VkExtensionProperties::extensionName`, and other queries.

```
#define VK_MAX_EXTENSION_NAME_SIZE
```

256U

`VK_MAX_DESCRIPTION_SIZE` is the length in `char` values of an array containing a string with additional descriptive information about a query, as returned in `VkLayerProperties::description` and other queries.

```
#define VK_MAX_DESCRIPTION_SIZE
```

256U

To enable a layer, the name of the layer **should** be added to the `ppEnabledLayerNames` member of `VkInstanceCreateInfo` when creating a `VkInstance`.

Loader implementations **may** provide mechanisms outside the Vulkan API for enabling specific layers. Layers enabled through such a mechanism are *implicitly enabled*, while layers enabled by including the layer name in the `ppEnabledLayerNames` member of `VkInstanceCreateInfo` are *explicitly enabled*. Implicitly enabled layers are loaded before explicitly enabled layers, such that implicitly enabled layers are closer to the application, and explicitly enabled layers are closer to the driver. Except where otherwise specified, implicitly enabled and explicitly enabled layers differ only in the way they are enabled, and the order in which they are loaded. Explicitly enabling a layer that is implicitly enabled results in this layer being loaded as an implicitly enabled layer; it has no additional effect.

40.3.1. Device Layer Deprecation

Previous versions of this specification distinguished between instance and device layers. Instance layers were only able to intercept commands that operate on `VkInstance` and `VkPhysicalDevice`, except they were not able to intercept `vkCreateDevice`. Device layers were enabled for individual devices when they were created, and could only intercept commands operating on that device or its child objects.

Device-only layers are now deprecated, and this specification no longer distinguishes between instance and device layers. Layers are enabled during instance creation, and are able to intercept all commands operating on that instance or any of its child objects. At the time of deprecation there were no known device-only layers and no compelling reason to create one.

In order to maintain compatibility with implementations released prior to device-layer deprecation, applications **should** still enumerate and enable device layers. The behavior of `vkEnumerateDeviceLayerProperties` and valid usage of the `ppEnabledLayerNames` member of `VkDeviceCreateInfo` maximizes compatibility with applications written to work with the previous requirements.

To enumerate device layers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceLayerProperties(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkLayerProperties* pProperties);
```

- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkLayerProperties` structures.

If `pProperties` is `NULL`, then the number of layer properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of layer properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The list of layers enumerated by `vkEnumerateDeviceLayerProperties` **must** be exactly the sequence of layers enabled for the instance. The members of `VkLayerProperties` for each enumerated layer **must** be the same as the properties when the layer was enumerated by `vkEnumerateInstanceLayerProperties`.

Valid Usage (Implicit)

- VUID-vkEnumerateDeviceLayerProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkEnumerateDeviceLayerProperties-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateDeviceLayerProperties-pProperties-parameter
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkLayerProperties` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `ppEnabledLayerNames` and `enabledLayerCount` members of `VkDeviceCreateInfo` are deprecated

and their values **must** be ignored by implementations. However, for compatibility, only an empty list of layers or a list that exactly matches the sequence enabled at instance creation time are valid, and validation layers **should** issue diagnostics for other cases.

Regardless of the enabled layer list provided in [VkDeviceCreateInfo](#), the sequence of layers active for a device will be exactly the sequence of layers enabled when the parent instance was created.

40.4. Extensions

Extensions **may** define new Vulkan commands, structures, and enumerants. For compilation purposes, the interfaces defined by registered extensions, including new structures and enumerants as well as function pointer types for new commands, are defined in the Khronos-supplied `vulkan_core.h` together with the core API. However, commands defined by extensions **may** not be available for static linking - in which case function pointers to these commands **should** be queried at runtime as described in [Command Function Pointers](#). Extensions **may** be provided by layers as well as by a Vulkan implementation.

Because extensions **may** extend or change the behavior of the Vulkan API, extension authors **should** add support for their extensions to the Khronos validation layers. This is especially important for new commands whose parameters have been wrapped by the validation layers. See the “[Architecture of the Vulkan Loader Interfaces](#)” document for additional information.

Note

To enable an instance extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of [VkInstanceCreateInfo](#) when creating a [VkInstance](#).

To enable a device extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of [VkDeviceCreateInfo](#) when creating a [VkDevice](#).

Physical-Device-Level functionality does not have any enabling mechanism and **can** be used as long as the [VkPhysicalDevice](#) supports the device extension as determined by [vkEnumerateDeviceExtensionProperties](#).

Enabling an extension (with no further use of that extension) does not change the behavior of functionality exposed by the core Vulkan API or any other extension, other than making valid the use of the commands, enums and structures defined by that extension.

Valid Usage sections for individual commands and structures do not currently contain which extensions have to be enabled in order to make their use valid, although they might do so in the future. It is defined only in the [Valid Usage for Extensions](#) section.

40.4.1. Instance Extensions

Instance extensions add new [instance-level functionality](#) to the API, outside of the core specification.

To query the available instance extensions, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceExtensionProperties(
    const char* pLayerName,
    uint32_t* pPropertyCount,
    VkExtensionProperties* pProperties);
```

- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the instance extensions provided by that layer are returned.

If `pProperties` is `NULL`, then the number of extensions properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of extension properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Because the list of available layers may change externally between calls to `vkEnumerateInstanceExtensionProperties`, two calls may retrieve different results if a `pLayerName` is available in one call but not in another. The extensions supported by a layer may also change between two calls, e.g. if the layer implementation is replaced by a different version between those calls.

Implementations **must** not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceExtensionProperties-pLayerName-parameter
If `pLayerName` is not `NULL`, `pLayerName` **must** be a null-terminated UTF-8 string
- VUID-vkEnumerateInstanceExtensionProperties-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateInstanceExtensionProperties-pProperties-parameter
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkExtensionProperties` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_LAYER_NOT_PRESENT`

40.4.2. Device Extensions

Device extensions add new [device-level functionality](#) to the API, outside of the core specification.

To query the extensions available to a given physical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceExtensionProperties(
    VkPhysicalDevice           physicalDevice,
    const char*                pLayerName,
    uint32_t*                  pPropertyCount,
    VkExtensionProperties*     pProperties);
```

- `physicalDevice` is the physical device that will be queried.
- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, and is treated in the same fashion as the `vkEnumerateInstanceExtensionProperties` `::pPropertyCount` parameter.
- `pProperties` is either `NULL` or a pointer to an array of [VkExtensionProperties](#) structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the device extensions provided by that layer are returned.

Implementations **must** not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

Implementations claiming support for the [Roadmap 2022](#) profile **must** advertise the [VK_KHR_global_priority](#) extension in `pProperties`.

Valid Usage (Implicit)

- VUID-vkEnumerateDeviceExtensionProperties-physicalDevice-parameter
physicalDevice **must** be a valid `VkPhysicalDevice` handle
- VUID-vkEnumerateDeviceExtensionProperties-pLayerName-parameter
If `pLayerName` is not `NULL`, `pLayerName` **must** be a null-terminated UTF-8 string
- VUID-vkEnumerateDeviceExtensionProperties-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateDeviceExtensionProperties-pProperties-parameter
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkExtensionProperties` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_LAYER_NOT_PRESENT`

The `VkExtensionProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkExtensionProperties {
    char      extensionName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t   specVersion;
} VkExtensionProperties;
```

- `extensionName` is an array of `VK_MAX_EXTENSION_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the extension.
- `specVersion` is the version of this extension. It is an integer, incremented with backward compatible changes.

40.5. Extension Dependencies

Some extensions are dependent on other extensions, or on specific core API versions, to function. To enable extensions with dependencies, any *required extensions* **must** also be enabled through the same API mechanisms when creating an instance with `vkCreateInstance` or a device with `vkCreateDevice`. Each extension which has such dependencies documents them in the [appendix](#)

summarizing that extension.

If an extension is supported (as queried by `vkEnumerateInstanceExtensionProperties` or `vkEnumerateDeviceExtensionProperties`), then *required extensions* of that extension **must** also be supported for the same instance or physical device.

Any device extension that has an instance extension dependency that is not enabled by `vkCreateInstance` is considered to be unsupported, hence it **must** not be returned by `vkEnumerateDeviceExtensionProperties` for any `VkPhysicalDevice` child of the instance. Instance extensions do not have dependencies on device extensions.

If a required extension has been [promoted](#) to another extension or to a core API version, then as a *general* rule, the dependency is also satisfied by the promoted extension or core version. This will be true so long as any features required by the original extension are also required or enabled by the promoted extension or core version. However, in some cases an extension is promoted while making some of its features optional in the promoted extension or core version. In this case, the dependency **may** not be satisfied. The only way to be certain is to look at the descriptions of the original dependency and the promoted version in the [Layers & Extensions](#) and [Core Revisions](#) appendices.

Note

There is metadata in `vk.xml` describing some aspects of promotion, especially `requires`, `promotedto` and `deprecatedby` attributes of `<extension>` tags. However, the metadata does not yet fully describe this scenario. In the future, we may extend the XML schema to describe the full set of extensions and versions satisfying a dependency.

40.6. Compatibility Guarantees (Informative)

This section is marked as informal as there is no binding responsibility on implementations of the Vulkan API - these guarantees are however a contract between the Vulkan Working Group and developers using this Specification.

40.6.1. Core Versions

Each of the [major, minor, and patch versions](#) of the Vulkan specification provide different compatibility guarantees.

Patch Versions

A difference in the patch version indicates that a set of bug fixes or clarifications have been made to the Specification. Informative enums returned by Vulkan commands that will not affect the runtime behavior of a valid application may be added in a patch version (e.g. `VkVendorId`).

The specification's patch version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the patch version being increased by 1. Patch versions are applied to all minor versions, even if a given minor version is not affected by the provoking change.

Specifications with different patch versions but the same major and minor version are *fully compatible* with each other - such that a valid application written against one will work with an implementation of another.

Note

If a patch version includes a bug fix or clarification that could have a significant impact on developer expectations, these will be highlighted in the change log. Generally the Vulkan Working Group tries to avoid these kinds of changes, instead fixing them in either an extension or core version.

Minor Versions

Changes in the minor version of the specification indicate that new functionality has been added to the core specification. This will usually include new interfaces in the header, and **may** also include behavior changes and bug fixes. Core functionality **may** be deprecated in a minor version, but will not be obsoleted or removed.

The specification's minor version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the minor version being increased by 1. Changes that can be accommodated in a patch version will not increase the minor version.

Specifications with a lower minor version are *backwards compatible* with an implementation of a specification with a higher minor version for core functionality and extensions issued with the KHR vendor tag. Vendor and multi-vendor extensions are not guaranteed to remain functional across minor versions, though in general they are with few exceptions - see [Obsoletion](#) for more information.

Major Versions

A difference in the major version of specifications indicates a large set of changes which will likely include interface changes, behavioral changes, removal of [deprecated functionality](#), and the modification, addition, or replacement of other functionality.

The specification's major version is monotonically increasing; any change to the specification as described above will result in the major version being increased. Changes that can be accommodated in a patch or minor version will not increase the major version.

The Vulkan Working Group intends to only issue a new major version of the Specification in order to realise significant improvements to the Vulkan API that will necessarily require breaking compatibility.

A new major version will likely include a wholly new version of the specification to be issued - which could include an overhaul of the versioning semantics for the minor and patch versions. The patch and minor versions of a specification are therefore not meaningful across major versions. If a major version of the specification includes similar versioning semantics, it is expected that the patch and the minor version will be reset to 0 for that major version.

40.6.2. Extensions

A KHR extension **must** be able to be enabled alongside any other KHR extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A multi-vendor extension **should** be able to be enabled alongside any KHR extension or other multi-vendor extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **should** be able to be enabled alongside any KHR extension, multi-vendor extension, or other vendor extension from the same vendor, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **may** be able to be enabled alongside vendor extensions from another vendor.

The one other exception to this is if a vendor or multi-vendor extension is [made obsolete](#) by either a core version or another extension, which will be highlighted in the [extension appendix](#).

Promotion

Extensions, or features of an extension, **may** be promoted to a new [core version of the API](#), or a newer extension which an equal or greater number of implementors are in favour of.

When extension functionality is promoted, minor changes **may** be introduced, limited to the following:

- Naming
- Non-intrusive parameters changes
- [Feature advertisement/enablement](#)
- Combining structure parameters into larger structures
- Author ID suffixes changed or removed

Note

If extension functionality is promoted, there is no guarantee of direct compatibility, however it should require little effort to port code from the original feature to the promoted one.

The Vulkan Working Group endeavours to ensure that larger changes are marked as either [deprecated](#) or [obsoleted](#) as appropriate, and can do so retroactively if necessary.

Extensions that are promoted are listed as being promoted in their extension appendices, with reference to where they were promoted to.

When an extension is promoted, any backwards compatibility aliases which exist in the extension will **not** be promoted.

Note

As a hypothetical example, if the `VK_KHR_surface` extension were promoted to part of a future core version, the `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` token defined by that extension would be promoted to `VK_COLOR_SPACE_SRGB_NONLINEAR`. However, the `VK_COLORSPACE_SRGB_NONLINEAR_KHR` token aliases `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR`. The `VK_COLORSPACE_SRGB_NONLINEAR_KHR` would not be promoted, because it is a backwards compatibility alias that exists only due to a naming mistake when the extension was initially published.

Deprecation

Extensions **may** be marked as deprecated when the intended use cases either become irrelevant or can be solved in other ways. Generally, a new feature will become available to solve the use case in another extension or core version of the API, but it is not guaranteed.

Note

Features that are intended to replace deprecated functionality have no guarantees of compatibility, and applications may require drastic modification in order to make use of the new features.

Extensions that are deprecated are listed as being deprecated in their extension appendices, with an explanation of the deprecation and any features that are relevant.

Obsoletion

Occasionally, an extension will be marked as obsolete if a new version of the core API or a new extension is fundamentally incompatible with it. An obsoleted extension **must** not be used with the extension or core version that obsoleted it.

Extensions that are obsoleted are listed as being obsoleted in their extension appendices, with reference to what they were obsoleted by.

Aliases

When an extension is promoted or deprecated by a newer feature, some or all of its functionality **may** be replicated into the newer feature. Rather than duplication of all the documentation and definitions, the specification instead identifies the identical commands and types as *aliases* of one another. Each alias is mentioned together with the definition it aliases, with the older aliases marked as “equivalents”. Each alias of the same command has identical behavior, and each alias of the same type has identical meaning - they can be used interchangeably in an application with no compatibility issues.

Note

For promoted types, the aliased extension type is semantically identical to the new core type. The C99 headers simply **typedef** the older aliases to the promoted types.

For promoted command aliases, however, there are two separate entry point definitions, due to the fact that the C99 ABI has no way to alias command definitions without resorting to macros. Calling via either entry point definition will produce identical behavior within the bounds of the specification, and should still invoke the same entry point in the implementation. Debug tools may use separate entry points with different debug behavior; to write the appropriate command name to an output log, for instance.

Special Use Extensions

Some extensions exist only to support a specific purpose or specific class of application. These are referred to as “special use extensions”. Use of these extensions in applications not meeting the special use criteria is not recommended.

Special use cases are restricted, and only those defined below are used to describe extensions:

Table 50. Extension Special Use Cases

Special Use	XML Tag	Full Description
CAD support	cadsupport	Extension is intended to support specialized functionality used by CAD/CAM applications.
D3D support	d3demulation	Extension is intended to support D3D emulation layers, and applications ported from D3D, by adding functionality specific to D3D.
Developer tools	devtools	Extension is intended to support developer tools such as capture-replay libraries.
Debugging tools	debugging	Extension is intended for use by applications when debugging.
OpenGL / ES support	glemulation	Extension is intended to support OpenGL and/or OpenGL ES emulation layers, and applications ported from those APIs, by adding functionality specific to those APIs.

Special use extensions are identified in the metadata for each such extension in the [Layers & Extensions](#) appendix, using the name in the “Special Use” column above.

Special use extensions are also identified in `vk.xml` with the short name in “XML Tag” column above, as described in the “API Extensions (**extension** tag)” section of the [registry schema documentation](#).

Chapter 41. Features

Features describe functionality which is not supported on all implementations. Features are properties of the physical device. Features are **optional**, and **must** be explicitly enabled before use. Support for features is reported and enabled on a per-feature basis.

Note

Features are reported via the basic `VkPhysicalDeviceFeatures` structure, as well as the extensible structure `VkPhysicalDeviceFeatures2`, which was added in the `VK_KHR_get_physical_device_properties2` extension and included in Vulkan 1.1. When new features are added in future Vulkan versions or extensions, each extension **should** introduce one new feature structure, if needed. This structure **can** be added to the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure.

For convenience, new core versions of Vulkan **may** introduce new unified feature structures for features promoted from extensions. At the same time, the extension's original feature structure (if any) is also promoted to the core API, and is an alias of the extension's structure. This results in multiple names for the same feature: in the original extension's feature structure and the promoted structure alias, in the unified feature structure. When a feature was implicitly supported and enabled in the extension, but an explicit name was added during promotion, then the extension itself acts as an alias for the feature as listed in the table below.

All aliases of the same feature in the core API **must** be reported consistently: either all **must** be reported as supported, or none of them. When a promoted extension is available, any corresponding feature aliases **must** be supported.

Table 51. Extension Feature Aliases

Extension	Feature(s)
<code>VK_KHR_shader_draw_parameters</code>	<code>shaderDrawParameters</code>
<code>VK_KHR_draw_indirect_count</code>	<code>drawIndirectCount</code>
<code>VK_KHR_sampler_mirror_clamp_to_edge</code>	<code>samplerMirrorClampToEdge</code>
<code>VK_EXT_descriptor_indexing</code>	<code>descriptorIndexing</code>
<code>VK_EXT_sampler_filter_minmax</code>	<code>samplerFilterMinmax</code>
<code>VK_EXT_shader_viewport_index_layer</code>	<code>shaderOutputViewportIndex, shaderOutputLayer</code>

To query supported features, call:

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFeatures(
    VkPhysicalDevice           physicalDevice,
    VkPhysicalDeviceFeatures* pFeatures);
```

- `physicalDevice` is the physical device from which to query the supported features.
- `pFeatures` is a pointer to a `VkPhysicalDeviceFeatures` structure in which the physical device

features are returned. For each feature, a value of `VK_TRUE` specifies that the feature is supported on this physical device, and `VK_FALSE` specifies that the feature is not supported.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFeatures-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFeatures-pFeatures-parameter
`pFeatures` **must** be a valid pointer to a `VkPhysicalDeviceFeatures` structure

Fine-grained features used by a logical device **must** be enabled at `VkDevice` creation time. If a feature is enabled that the physical device does not support, `VkDevice` creation will fail and return `VK_ERROR_FEATURE_NOT_PRESENT`.

The fine-grained features are enabled by passing a pointer to the `VkPhysicalDeviceFeatures` structure via the `pEnabledFeatures` member of the `VkDeviceCreateInfo` structure that is passed into the `vkCreateDevice` call. If a member of `pEnabledFeatures` is set to `VK_TRUE` or `VK_FALSE`, then the device will be created with the indicated feature enabled or disabled, respectively. Features **can** also be enabled by using the `VkPhysicalDeviceFeatures2` structure.

If an application wishes to enable all features supported by a device, it **can** simply pass in the `VkPhysicalDeviceFeatures` structure that was previously returned by `vkGetPhysicalDeviceFeatures`. To disable an individual feature, the application **can** set the desired member to `VK_FALSE` in the same structure. Setting `pEnabledFeatures` to `NULL` and not including a `VkPhysicalDeviceFeatures2` in the `pNext` chain of `VkDeviceCreateInfo` is equivalent to setting all members of the structure to `VK_FALSE`.

Note

Some features, such as `robustBufferAccess`, **may** incur a runtime performance cost. Application writers **should** carefully consider the implications of enabling all supported features.

To query supported features defined by the core or extensions, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceFeatures2(
    VkPhysicalDevice                      physicalDevice,
    VkPhysicalDeviceFeatures2*            pFeatures);
```

or the equivalent command

```
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceFeatures2KHR(
    VkPhysicalDevice                      physicalDevice,
    VkPhysicalDeviceFeatures2*            pFeatures);
```

- `physicalDevice` is the physical device from which to query the supported features.
- `pFeatures` is a pointer to a `VkPhysicalDeviceFeatures2` structure in which the physical device features are returned.

Each structure in `pFeatures` and its `pNext` chain contains members corresponding to fine-grained features. `vkGetPhysicalDeviceFeatures2` writes each member to a boolean value indicating whether that feature is supported.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFeatures2-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFeatures2-pFeatures-parameter
`pFeatures` **must** be a valid pointer to a `VkPhysicalDeviceFeatures2` structure

The `VkPhysicalDeviceFeatures2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceFeatures2 {
    VkStructureType          sType;
    void*                    pNext;
    VkPhysicalDeviceFeatures features;
} VkPhysicalDeviceFeatures2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceFeatures2 VkPhysicalDeviceFeatures2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `features` is a `VkPhysicalDeviceFeatures` structure describing the fine-grained features of the Vulkan 1.0 API.

The `pNext` chain of this structure is used to extend the structure with features defined by extensions. This structure **can** be used in `vkGetPhysicalDeviceFeatures2` or **can** be included in the `pNext` chain of a `VkDeviceCreateInfo` structure, in which case it controls which features are enabled in the device in lieu of `pEnabledFeatures`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFeatures2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2`

The [VkPhysicalDeviceFeatures](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceFeatures {
    VkBool32 robustBufferAccess;
    VkBool32 fullDrawIndexUint32;
    VkBool32 imageCubeArray;
    VkBool32 independentBlend;
    VkBool32 geometryShader;
    VkBool32 tessellationShader;
    VkBool32 sampleRateShading;
    VkBool32 dualSrcBlend;
    VkBool32 logicOp;
    VkBool32 multiDrawIndirect;
    VkBool32 drawIndirectFirstInstance;
    VkBool32 depthClamp;
    VkBool32 depthBiasClamp;
    VkBool32 fillModeNonSolid;
    VkBool32 depthBounds;
    VkBool32 wideLines;
    VkBool32 largePoints;
    VkBool32 alphaToOne;
    VkBool32 multiViewport;
    VkBool32 samplerAnisotropy;
    VkBool32 textureCompressionETC2;
    VkBool32 textureCompressionASTC_LDR;
    VkBool32 textureCompressionBC;
    VkBool32 occlusionQueryPrecise;
    VkBool32 pipelineStatisticsQuery;
    VkBool32 vertexPipelineStoresAndAtomics;
    VkBool32 fragmentStoresAndAtomics;
    VkBool32 shaderTessellationAndGeometryPointSize;
    VkBool32 shaderImageGatherExtended;
    VkBool32 shaderStorageImageExtendedFormats;
    VkBool32 shaderStorageImageMultisample;
    VkBool32 shaderStorageImageReadWithoutFormat;
    VkBool32 shaderStorageImageWriteWithoutFormat;
    VkBool32 shaderUniformBufferArrayDynamicIndexing;
    VkBool32 shaderSampledImageArrayDynamicIndexing;
    VkBool32 shaderStorageBufferArrayDynamicIndexing;
    VkBool32 shaderStorageImageArrayDynamicIndexing;
    VkBool32 shaderClipDistance;
    VkBool32 shaderCullDistance;
    VkBool32 shaderFloat64;
    VkBool32 shaderInt64;
    VkBool32 shaderInt16;
    VkBool32 shaderResourceResidency;
    VkBool32 shaderResourceMinLod;
    VkBool32 sparseBinding;
    VkBool32 sparseResidencyBuffer;
```

```

VkBool32    sparseResidencyImage2D;
VkBool32    sparseResidencyImage3D;
VkBool32    sparseResidency2Samples;
VkBool32    sparseResidency4Samples;
VkBool32    sparseResidency8Samples;
VkBool32    sparseResidency16Samples;
VkBool32    sparseResidencyAliased;
VkBool32    variableMultisampleRate;
VkBool32    inheritedQueries;
} VkPhysicalDeviceFeatures;

```

This structure describes the following features:

- **robustBufferAccess** specifies that accesses to buffers are bounds-checked against the range of the buffer descriptor (as determined by [VkDescriptorBufferInfo::range](#), [VkBufferViewCreateInfo::range](#), or the size of the buffer). Out of bounds accesses **must** not cause application termination, and the effects of shader loads, stores, and atomics **must** conform to an implementation-dependent behavior as described below.
 - A buffer access is considered to be out of bounds if any of the following are true:
 - The pointer was formed by [OpImageTexelPointer](#) and the coordinate is less than zero or greater than or equal to the number of whole elements in the bound range.
 - The pointer was not formed by [OpImageTexelPointer](#) and the object pointed to is not wholly contained within the bound range. This includes accesses performed via *variable pointers* where the buffer descriptor being accessed cannot be statically determined. Uninitialized pointers and pointers equal to [OpConstantNull](#) are treated as pointing to a zero-sized object, so all accesses through such pointers are considered to be out of bounds. Buffer accesses through buffer device addresses are not bounds-checked. If the [cooperativeMatrixRobustBufferAccess](#) feature is not enabled, then accesses using [OpCooperativeMatrixLoadNV](#) and [OpCooperativeMatrixStoreNV](#) **may** not be bounds-checked.

Note

If a SPIR-V [OpLoad](#) instruction loads a structure and the tail end of the structure is out of bounds, then all members of the structure are considered out of bounds even if the members at the end are not statically used.

- If [robustBufferAccess2](#) is not enabled and any buffer access is determined to be out of bounds, then any other access of the same type (load, store, or atomic) to the same buffer that accesses an address less than 16 bytes away from the out of bounds address **may** also be considered out of bounds.
- If the access is a load that reads from the same memory locations as a prior store in the same shader invocation, with no other intervening accesses to the same memory locations in that shader invocation, then the result of the load **may** be the value stored by the store instruction, even if the access is out of bounds. If the load is [Volatile](#), then an out of bounds load **must** return the appropriate out of bounds value.
- Accesses to descriptors written with a [VK_NULL_HANDLE](#) resource or view are not

considered to be out of bounds. Instead, each type of descriptor access defines a specific behavior for accesses to a null descriptor.

- Out-of-bounds buffer loads will return any of the following values:
 - If the access is to a uniform buffer and `robustBufferAccess2` is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of `robustUniformBufferSizeAlignment` bytes **must** return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of `robustUniformBufferSizeAlignment` bytes **must** return zero values.
 - If the access is to a storage buffer and `robustBufferAccess2` is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of `robustStorageBufferSizeAlignment` bytes **must** return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of `robustStorageBufferSizeAlignment` bytes **must** return zero values. Similarly, stores to addresses between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of `robustStorageBufferSizeAlignment` bytes **may** be discarded.
 - Non-atomic accesses to storage buffers that are a multiple of 32 bits **may** be decomposed into 32-bit accesses that are individually bounds-checked.
 - If the access is to an index buffer and `robustBufferAccess2` is enabled, zero values **must** be returned.
 - If the access is to a uniform texel buffer or storage texel buffer and `robustBufferAccess2` is enabled, zero values **must** be returned, and then [Conversion to RGBA](#) is applied based on the buffer view's format.
 - Values from anywhere within the memory range(s) bound to the buffer (possibly including bytes of memory past the end of the buffer, up to the end of the bound range).
 - Zero values, or (0,0,0,x) vectors for vector reads where x is a valid value represented in the type of the vector components and **may** be any of:
 - 0, 1, or the maximum representable positive integer value, for signed or unsigned integer components
 - 0.0 or 1.0, for floating-point components
- Out-of-bounds writes **may** modify values within the memory range(s) bound to the buffer, but **must** not modify any other memory.
 - If `robustBufferAccess2` is enabled, out of bounds writes **must** not modify any memory.
- Out-of-bounds atomics **may** modify values within the memory range(s) bound to the buffer, but **must** not modify any other memory, and return an undefined value.
 - If `robustBufferAccess2` is enabled, out of bounds atomics **must** not modify any memory, and return an undefined value.
- If `robustBufferAccess2` is disabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than either:

- `vertexBufferRangeSize`, if `bindingStride` == 0; or
- `(vertexBufferRangeSize - (vertexBufferRangeSize % bindingStride))`

where `vertexBufferRangeSize` is the byte size of the memory range bound to the vertex buffer binding and `bindingStride` is the byte stride of the corresponding vertex input binding. Further, if any vertex input attribute using a specific vertex input binding is out of bounds, then all vertex input attributes using that vertex input binding for that vertex shader invocation are considered out of bounds.

- If a vertex input attribute is out of bounds, it will be assigned one of the following values:
 - Values from anywhere within the memory range(s) bound to the buffer, converted according to the format of the attribute.
 - Zero values, format converted according to the format of the attribute.
 - Zero values, or (0,0,0,x) vectors, as described above.
- If `robustBufferAccess2` is enabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than the byte size of the memory range bound to the vertex buffer binding.
 - If a vertex input attribute is out of bounds, the `raw data` extracted are zero values, and missing G, B, or A components are `filled with (0,0,1)`.
- If `robustBufferAccess` is not enabled, applications **must** not perform out of bounds accesses.
- `fullDrawIndexUInt32` specifies the full 32-bit range of indices is supported for indexed draw calls when using a `VkIndexType` of `VK_INDEX_TYPE_UINT32`. `maxDrawIndexedIndexValue` is the maximum index value that **may** be used (aside from the primitive restart index, which is always $2^{32}-1$ when the `VkIndexType` is `VK_INDEX_TYPE_UINT32`). If this feature is supported, `maxDrawIndexedIndexValue` **must** be $2^{32}-1$; otherwise it **must** be no smaller than $2^{24}-1$. See `maxDrawIndexedIndexValue`.
- `imageCubeArray` specifies whether image views with a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` **can** be created, and that the corresponding `SampledCubeArray` and `ImageCubeArray` SPIR-V capabilities **can** be used in shader code.
- `independentBlend` specifies whether the `VkPipelineColorBlendAttachmentState` settings are controlled independently per-attachment. If this feature is not enabled, the `VkPipelineColorBlendAttachmentState` settings for all color attachments **must** be identical. Otherwise, a different `VkPipelineColorBlendAttachmentState` **can** be provided for each bound color attachment.
- `geometryShader` specifies whether geometry shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_GEOMETRY_BIT` and `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT` enum values **must** not be used. This also specifies whether shader modules **can** declare the `Geometry` capability.
- `tessellationShader` specifies whether tessellation control and evaluation shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`, `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`, and `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO` enum values **must** not be used.

This also specifies whether shader modules **can** declare the [Tessellation](#) capability.

- `sampleRateShading` specifies whether [Sample Shading](#) and multisample interpolation are supported. If this feature is not enabled, the `sampleShadingEnable` member of the `VkPipelineMultisampleStateCreateInfo` structure **must** be set to `VK_FALSE` and the `minSampleShading` member is ignored. This also specifies whether shader modules **can** declare the [SampleRateShading](#) capability.
- `dualSrcBlend` specifies whether blend operations which take two sources are supported. If this feature is not enabled, the `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, and `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA` enum values **must** not be used as source or destination blending factors. See [Dual-Source Blending](#).
- `logicOp` specifies whether logic operations are supported. If this feature is not enabled, the `logicOpEnable` member of the `VkPipelineColorBlendStateCreateInfo` structure **must** be set to `VK_FALSE`, and the `logicOp` member is ignored.
- `multiDrawIndirect` specifies whether multiple draw indirect is supported. If this feature is not enabled, the `drawCount` parameter to the `vkCmdDrawIndirect` and `vkCmdDrawIndexedIndirect` commands **must** be 0 or 1. The `maxDrawIndirectCount` member of the `VkPhysicalDeviceLimits` structure **must** also be 1 if this feature is not supported. See [maxDrawIndirectCount](#).
- `drawIndirectFirstInstance` specifies whether indirect drawing calls support the `firstInstance` parameter. If this feature is not enabled, the `firstInstance` member of all `VkDrawIndirectCommand` and `VkDrawIndexedIndirectCommand` structures that are provided to the `vkCmdDrawIndirect` and `vkCmdDrawIndexedIndirect` commands **must** be 0.
- `depthClamp` specifies whether depth clamping is supported. If this feature is not enabled, the `depthClampEnable` member of the `VkPipelineRasterizationStateCreateInfo` structure **must** be set to `VK_FALSE`. Otherwise, setting `depthClampEnable` to `VK_TRUE` will enable depth clamping.
- `depthBiasClamp` specifies whether depth bias clamping is supported. If this feature is not enabled, the `depthBiasClamp` member of the `VkPipelineRasterizationStateCreateInfo` structure **must** be set to 0.0 unless the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state is enabled, and the `depthBiasClamp` parameter to `vkCmdSetDepthBias` **must** be set to 0.0.
- `fillModeNonSolid` specifies whether point and wireframe fill modes are supported. If this feature is not enabled, the `VK_POLYGON_MODE_POINT` and `VK_POLYGON_MODE_LINE` enum values **must** not be used.
- `depthBounds` specifies whether depth bounds tests are supported. If this feature is not enabled, the `depthBoundsTestEnable` member of the `VkPipelineDepthStencilStateCreateInfo` structure **must** be set to `VK_FALSE`. When `depthBoundsTestEnable` is set to `VK_FALSE`, the `minDepthBounds` and `maxDepthBounds` members of the `VkPipelineDepthStencilStateCreateInfo` structure are ignored.
- `wideLines` specifies whether lines with width other than 1.0 are supported. If this feature is not enabled, the `lineWidth` member of the `VkPipelineRasterizationStateCreateInfo` structure **must** be set to 1.0 unless the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state is enabled, and the `lineWidth` parameter to `vkCmdSetLineWidth` **must** be set to 1.0. When this feature is supported, the range and granularity of supported line widths are indicated by the `lineWidthRange` and `lineWidthGranularity` members of the `VkPhysicalDeviceLimits` structure, respectively.
- `largePoints` specifies whether points with size greater than 1.0 are supported. If this feature is not enabled, only a point size of 1.0 written by a shader is supported. The range and granularity

of supported point sizes are indicated by the `pointSizeRange` and `pointSizeGranularity` members of the `VkPhysicalDeviceLimits` structure, respectively.

- `alphaToOne` specifies whether the implementation is able to replace the alpha value of the fragment shader color output in the `Multisample Coverage` fragment operation. If this feature is not enabled, then the `alphaToOneEnable` member of the `VkPipelineMultisampleStateCreateInfo` structure **must** be set to `VK_FALSE`. Otherwise setting `alphaToOneEnable` to `VK_TRUE` will enable alpha-to-one behavior.
- `multiViewport` specifies whether more than one viewport is supported. If this feature is not enabled:
 - The `viewportCount` and `scissorCount` members of the `VkPipelineViewportStateCreateInfo` structure **must** be set to 1.
 - The `firstViewport` and `viewportCount` parameters to the `vkCmdSetViewport` command **must** be set to 0 and 1, respectively.
 - The `firstScissor` and `scissorCount` parameters to the `vkCmdSetScissor` command **must** be set to 0 and 1, respectively.
 - The `exclusiveScissorCount` member of the `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure **must** be set to 0 or 1.
 - The `firstExclusiveScissor` and `exclusiveScissorCount` parameters to the `vkCmdSetExclusiveScissorNV` command **must** be set to 0 and 1, respectively.
- `samplerAnisotropy` specifies whether anisotropic filtering is supported. If this feature is not enabled, the `anisotropyEnable` member of the `VkSamplerCreateInfo` structure **must** be `VK_FALSE`.
- `textureCompressionETC2` specifies whether all of the ETC2 and EAC compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:
 - `VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK`
 - `VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK`
 - `VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK`
 - `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK`
 - `VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK`
 - `VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK`
 - `VK_FORMAT_EAC_R11_UNORM_BLOCK`
 - `VK_FORMAT_EAC_R11_SNORM_BLOCK`
 - `VK_FORMAT_EAC_R11G11_UNORM_BLOCK`
 - `VK_FORMAT_EAC_R11G11_SNORM_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` **can** be used to check for supported properties of individual formats as normal.

- `textureCompressionASTC_LDR` specifies whether all of the ASTC LDR compressed texture formats

are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:

- `VK_FORMAT_ASTC_4x4_UNORM_BLOCK`
- `VK_FORMAT_ASTC_4x4_SRGB_BLOCK`
- `VK_FORMAT_ASTC_5x4_UNORM_BLOCK`
- `VK_FORMAT_ASTC_5x4_SRGB_BLOCK`
- `VK_FORMAT_ASTC_5x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_5x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_6x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_6x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_6x6_UNORM_BLOCK`
- `VK_FORMAT_ASTC_6x6_SRGB_BLOCK`
- `VK_FORMAT_ASTC_8x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_8x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_8x6_UNORM_BLOCK`
- `VK_FORMAT_ASTC_8x6_SRGB_BLOCK`
- `VK_FORMAT_ASTC_8x8_UNORM_BLOCK`
- `VK_FORMAT_ASTC_8x8_SRGB_BLOCK`
- `VK_FORMAT_ASTC_10x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_10x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_10x6_UNORM_BLOCK`
- `VK_FORMAT_ASTC_10x6_SRGB_BLOCK`
- `VK_FORMAT_ASTC_10x8_UNORM_BLOCK`
- `VK_FORMAT_ASTC_10x8_SRGB_BLOCK`
- `VK_FORMAT_ASTC_10x10_UNORM_BLOCK`
- `VK_FORMAT_ASTC_10x10_SRGB_BLOCK`
- `VK_FORMAT_ASTC_12x10_UNORM_BLOCK`
- `VK_FORMAT_ASTC_12x10_SRGB_BLOCK`
- `VK_FORMAT_ASTC_12x12_UNORM_BLOCK`
- `VK_FORMAT_ASTC_12x12_SRGB_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

- `textureCompressionBC` specifies whether all of the BC compressed texture formats are supported.

If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:

- `VK_FORMAT_BC1_RGB_UNORM_BLOCK`
- `VK_FORMAT_BC1_RGB_SRGB_BLOCK`
- `VK_FORMAT_BC1_RGBA_UNORM_BLOCK`
- `VK_FORMAT_BC1_RGBA_SRGB_BLOCK`
- `VK_FORMAT_BC2_UNORM_BLOCK`
- `VK_FORMAT_BC2_SRGB_BLOCK`
- `VK_FORMAT_BC3_UNORM_BLOCK`
- `VK_FORMAT_BC3_SRGB_BLOCK`
- `VK_FORMAT_BC4_UNORM_BLOCK`
- `VK_FORMAT_BC4_SNORM_BLOCK`
- `VK_FORMAT_BC5_UNORM_BLOCK`
- `VK_FORMAT_BC5_SNORM_BLOCK`
- `VK_FORMAT_BC6H_UFLOAT_BLOCK`
- `VK_FORMAT_BC6H_SFLOAT_BLOCK`
- `VK_FORMAT_BC7_UNORM_BLOCK`
- `VK_FORMAT_BC7_SRGB_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` **can** be used to check for supported properties of individual formats as normal.

- `occlusionQueryPrecise` specifies whether occlusion queries returning actual sample counts are supported. Occlusion queries are created in a `VkQueryPool` by specifying the `queryType` of `VK_QUERY_TYPE_OCCLUSION` in the `VkQueryPoolCreateInfo` structure which is passed to `vkCreateQueryPool`. If this feature is enabled, queries of this type **can** enable `VK_QUERY_CONTROL_PRECISE_BIT` in the `flags` parameter to `vkCmdBeginQuery`. If this feature is not supported, the implementation supports only boolean occlusion queries. When any samples are passed, boolean queries will return a non-zero result value, otherwise a result value of zero is returned. When this feature is enabled and `VK_QUERY_CONTROL_PRECISE_BIT` is set, occlusion queries will report the actual number of samples passed.
- `pipelineStatisticsQuery` specifies whether the pipeline statistics queries are supported. If this feature is not enabled, queries of type `VK_QUERY_TYPE_PIPELINE_STATISTICS` **cannot** be created, and none of the `VkQueryPipelineStatisticFlagBits` bits **can** be set in the `pipelineStatistics` member of the `VkQueryPoolCreateInfo` structure.
- `vertexPipelineStoresAndAtomics` specifies whether storage buffers and images support stores and atomic operations in the vertex, tessellation, and geometry shader stages. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by these stages in shader modules **must** be decorated with the `NonWritable` decoration (or the `readonly`

memory qualifier in GLSL).

- `fragmentStoresAndAtomics` specifies whether storage buffers and images support stores and atomic operations in the fragment shader stage. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by the fragment stage in shader modules **must** be decorated with the `NonWritable` decoration (or the `readonly` memory qualifier in GLSL).
- `shaderTessellationAndGeometryPointSize` specifies whether the `PointSize` built-in decoration is available in the tessellation control, tessellation evaluation, and geometry shader stages. If this feature is not enabled, members decorated with the `PointSize` built-in decoration **must** not be read from or written to and all points written from a tessellation or geometry shader will have a size of 1.0. This also specifies whether shader modules **can** declare the `TessellationPointSize` capability for tessellation control and evaluation shaders, or if the shader modules **can** declare the `GeometryPointSize` capability for geometry shaders. An implementation supporting this feature **must** also support one or both of the `tessellationShader` or `geometryShader` features.
- `shaderImageGatherExtended` specifies whether the extended set of image gather instructions are available in shader code. If this feature is not enabled, the `OpImage*Gather` instructions do not support the `Offset` and `ConstOffsets` operands. This also specifies whether shader modules **can** declare the `ImageGatherExtended` capability.
- `shaderStorageImageExtendedFormats` specifies whether all the “storage image extended formats” below are supported; if this feature is supported, then the `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` **must** be supported in `optimalTilingFeatures` for the following formats:
 - `VK_FORMAT_R16G16_SFLOAT`
 - `VK_FORMAT_B10G11R11_UFLOAT_PACK32`
 - `VK_FORMAT_R16_SFLOAT`
 - `VK_FORMAT_R16G16B16A16_UNORM`
 - `VK_FORMAT_A2B10G10R10_UNORM_PACK32`
 - `VK_FORMAT_R16G16_UNORM`
 - `VK_FORMAT_R8G8_UNORM`
 - `VK_FORMAT_R16_UNORM`
 - `VK_FORMAT_R8_UNORM`
 - `VK_FORMAT_R16G16B16A16_SNORM`
 - `VK_FORMAT_R16G16_SNORM`
 - `VK_FORMAT_R8G8_SNORM`
 - `VK_FORMAT_R16_SNORM`
 - `VK_FORMAT_R8_SNORM`
 - `VK_FORMAT_R16G16_SINT`
 - `VK_FORMAT_R8G8_SINT`
 - `VK_FORMAT_R16_SINT`
 - `VK_FORMAT_R8_SINT`

- `VK_FORMAT_A2B10G10R10_UINT_PACK32`
- `VK_FORMAT_R16G16_UINT`
- `VK_FORMAT_R8G8_UINT`
- `VK_FORMAT_R16_UINT`
- `VK_FORMAT_R8_UINT`

Note

`shaderStorageImageExtendedFormats` feature only adds a guarantee of format support, which is specified for the whole physical device. Therefore enabling or disabling the feature via `vkCreateDevice` has no practical effect.

To query for additional properties, or if the feature is not supported, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` **can** be used to check for supported properties of individual formats, as usual rules allow.

`VK_FORMAT_R32G32_UINT`, `VK_FORMAT_R32G32_SINT`, and `VK_FORMAT_R32G32_SFLOAT` from `StorageImageExtendedFormats` SPIR-V capability, are already covered by core Vulkan **mandatory format support**.

- `shaderStorageImageMultisample` specifies whether multisampled storage images are supported. If this feature is not enabled, images that are created with a `usage` that includes `VK_IMAGE_USAGE_STORAGE_BIT` **must** be created with `samples` equal to `VK_SAMPLE_COUNT_1_BIT`. This also specifies whether shader modules **can** declare the `StorageImageMultisample` and `ImageMSArray` capabilities.
- `shaderStorageImageReadWithoutFormat` specifies whether storage images require a format qualifier to be specified when reading. `shaderStorageImageReadWithoutFormat` applies only to formats listed in the `storage without format` list.
- `shaderStorageImageWriteWithoutFormat` specifies whether storage images require a format qualifier to be specified when writing. `shaderStorageImageWriteWithoutFormat` applies only to formats listed in the `storage without format` list.
- `shaderUniformBufferArrayDynamicIndexing` specifies whether arrays of uniform buffers **can** be indexed by *dynamically uniform* integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the `UniformBufferArrayDynamicIndexing` capability.
- `shaderSampledImageArrayDynamicIndexing` specifies whether arrays of samplers or sampled images **can** be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the `SampledImageArrayDynamicIndexing` capability.
- `shaderStorageBufferArrayDynamicIndexing` specifies whether arrays of storage buffers **can** be

indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the `StorageBufferArrayDynamicIndexing` capability.

- `shaderStorageImageDynamicIndexing` specifies whether arrays of storage images **can** be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the `StorageImageDynamicIndexing` capability.
- `shaderClipDistance` specifies whether clip distances are supported in shader code. If this feature is not enabled, any members decorated with the `ClipDistance` built-in decoration **must** not be read from or written to in shader modules. This also specifies whether shader modules **can** declare the `ClipDistance` capability.
- `shaderCullDistance` specifies whether cull distances are supported in shader code. If this feature is not enabled, any members decorated with the `CullDistance` built-in decoration **must** not be read from or written to in shader modules. This also specifies whether shader modules **can** declare the `CullDistance` capability.
- `shaderFloat64` specifies whether 64-bit floats (doubles) are supported in shader code. If this feature is not enabled, 64-bit floating-point types **must** not be used in shader code. This also specifies whether shader modules **can** declare the `Float64` capability. Declaring and using 64-bit floats is enabled for all storage classes that SPIR-V allows with the `Float64` capability.
- `shaderInt64` specifies whether 64-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 64-bit integer types **must** not be used in shader code. This also specifies whether shader modules **can** declare the `Int64` capability. Declaring and using 64-bit integers is enabled for all storage classes that SPIR-V allows with the `Int64` capability.
- `shaderInt16` specifies whether 16-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 16-bit integer types **must** not be used in shader code. This also specifies whether shader modules **can** declare the `Int16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int16` SPIR-V capability: Declaring and using 16-bit integers in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.
- `shaderResourceResidency` specifies whether image operations that return resource residency information are supported in shader code. If this feature is not enabled, the `OpImageSparse*` instructions **must** not be used in shader code. This also specifies whether shader modules **can** declare the `SparseResidency` capability. The feature requires at least one of the `sparseResidency*` features to be supported.
- `shaderResourceMinLod` specifies whether image operations specifying the minimum resource LOD are supported in shader code. If this feature is not enabled, the `MinLod` image operand **must** not be used in shader code. This also specifies whether shader modules **can** declare the `MinLod` capability.
- `sparseBinding` specifies whether resource memory **can** be managed at opaque sparse block level instead of at the object level. If this feature is not enabled, resource memory **must** be bound

only on a per-object basis using the `vkBindBufferMemory` and `vkBindImageMemory` commands. In this case, buffers and images **must** not be created with `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in the `flags` member of the `VkBufferCreateInfo` and `VkImageCreateInfo` structures, respectively. Otherwise resource memory **can** be managed as described in [Sparse Resource Features](#).

- `sparseResidencyBuffer` specifies whether the device **can** access partially resident buffers. If this feature is not enabled, buffers **must** not be created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkBufferCreateInfo` structure.
- `sparseResidencyImage2D` specifies whether the device **can** access partially resident 2D images with 1 sample per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_1_BIT` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.
- `sparseResidencyImage3D` specifies whether the device **can** access partially resident 3D images. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_3D` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.
- `sparseResidency2Samples` specifies whether the physical device **can** access partially resident 2D images with 2 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_2_BIT` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.
- `sparseResidency4Samples` specifies whether the physical device **can** access partially resident 2D images with 4 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_4_BIT` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.
- `sparseResidency8Samples` specifies whether the physical device **can** access partially resident 2D images with 8 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_8_BIT` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.
- `sparseResidency16Samples` specifies whether the physical device **can** access partially resident 2D images with 16 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_16_BIT` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.
- `sparseResidencyAliased` specifies whether the physical device **can** correctly access data aliased into multiple locations. If this feature is not enabled, the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` enum values **must** not be used in `flags` members of the `VkBufferCreateInfo` and `VkImageCreateInfo` structures, respectively.
- `variableMultisampleRate` specifies whether all pipelines that will be bound to a command buffer during a subpass which uses no attachments **must** have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. If set to `VK_TRUE`, the

implementation supports variable multisample rates in a subpass which uses no attachments. If set to `VK_FALSE`, then all pipelines bound in such a subpass **must** have the same multisample rate. This has no effect in situations where a subpass uses any attachments.

- `inheritedQueries` specifies whether a secondary command buffer **may** be executed while a query is active.

The `VkPhysicalDeviceVulkan11Features` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            storageBuffer16BitAccess;
    VkBool32            uniformAndStorageBuffer16BitAccess;
    VkBool32            storagePushConstant16;
    VkBool32            storageInputOutput16;
    VkBool32            multiview;
    VkBool32            multiviewGeometryShader;
    VkBool32            multiviewTessellationShader;
    VkBool32            variablePointersStorageBuffer;
    VkBool32            variablePointers;
    VkBool32            protectedMemory;
    VkBool32            samplerYcbcrConversion;
    VkBool32            shaderDrawParameters;
} VkPhysicalDeviceVulkan11Features;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `storageBuffer16BitAccess` specifies whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StorageBuffer16BitAccess` capability.
- `uniformAndStorageBuffer16BitAccess` specifies whether objects in the `Uniform` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `UniformAndStorageBuffer16BitAccess` capability.
- `storagePushConstant16` specifies whether objects in the `PushConstant` storage class **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StoragePushConstant16` capability.
- `storageInputOutput16` specifies whether objects in the `Input` and `Output` storage classes **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or

16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StorageInputOutput16` capability.

- `multiview` specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass **must** always be zero.
- `multiviewGeometryShader` specifies whether the implementation supports multiview rendering within a render pass, with `geometry shaders`. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include a geometry shader.
- `multiviewTessellationShader` specifies whether the implementation supports multiview rendering within a render pass, with `tessellation shaders`. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include any tessellation shaders.
- `variablePointersStorageBuffer` specifies whether the implementation supports the SPIR-V `VariablePointersStorageBuffer` capability. When this feature is not enabled, shader modules **must** not declare the `SPV_KHR_variable_pointers` extension or the `VariablePointersStorageBuffer` capability.
- `variablePointers` specifies whether the implementation supports the SPIR-V `VariablePointers` capability. When this feature is not enabled, shader modules **must** not declare the `VariablePointers` capability.
- `protectedMemory` specifies whether protected memory is supported.
- `samplerYcbcrConversion` specifies whether the implementation supports `sampler Y'CBCR conversion`. If `samplerYcbcrConversion` is `VK_FALSE`, sampler Y'C_BC_R conversion is not supported, and samplers using sampler Y'C_BC_R conversion **must** not be used.
- `shaderDrawParameters` specifies whether the implementation supports the SPIR-V `DrawParameters` capability. When this feature is not enabled, shader modules **must** not declare the `SPV_KHR_shader_draw_parameters` extension or the `DrawParameters` capability.

If the `VkPhysicalDeviceVulkan11Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkan11Features` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan11Features-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_FEATURES`

The `VkPhysicalDeviceVulkan12Features` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan12Features {
    VkStructureType    sType;
    void*             pNext;
    VkBool32          samplerMirrorClampToEdge;
    VkBool32          drawIndirectCount;
```

```

VkBool32           storageBuffer8BitAccess;
VkBool32           uniformAndStorageBuffer8BitAccess;
VkBool32           storagePushConstant8;

} VkPhysicalDeviceVulkan12Features;

```

This structure describes the following features:

- **sType** is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `samplerMirrorClampToEdge` indicates whether the implementation supports the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode. If this feature is not enabled, the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode **must** not be used.
- `drawIndirectCount` indicates whether the implementation supports the `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` functions. If this feature is not enabled, these functions **must** not be used.
- `storageBuffer8BitAccess` indicates whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StorageBuffer8BitAccess` capability.
- `uniformAndStorageBuffer8BitAccess` indicates whether objects in the `Uniform` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `UniformAndStorageBuffer8BitAccess` capability.
- `storagePushConstant8` indicates whether objects in the `PushConstant` storage class **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StoragePushConstant8` capability.
- `shaderBufferInt64Atomics` indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on buffers.
- `shaderSharedInt64Atomics` indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on shared memory.
- `shaderFloat16` indicates whether 16-bit floats (halfs) are supported in shader code. This also indicates whether shader modules **can** declare the `Float16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Float16` SPIR-V capability: Declaring and using 16-bit floats in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.
- `shaderInt8` indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules **can** declare the `Int8` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int8` SPIR-V capability: Declaring and using 8-bit integers in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.
- `descriptorIndexing` indicates whether the implementation supports the minimum set of descriptor indexing features as described in the `Feature Requirements` section. Enabling the `descriptorIndexing` member when `vkCreateDevice` is called does not imply the other minimum descriptor indexing features are also enabled. Those other descriptor indexing features **must** be enabled individually as needed by the application.
- `shaderInputAttachmentArrayDynamicIndexing` indicates whether arrays of input attachments **can** be indexed by dynamically uniform integer expressions in shader code. If this feature is not

enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `InputAttachmentArrayDynamicIndexing` capability.

- `shaderUniformTexelBufferArrayDynamicIndexing` indicates whether arrays of uniform texel buffers **can** be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformTexelBufferArrayDynamicIndexing` capability.
- `shaderStorageTexelBufferArrayDynamicIndexing` indicates whether arrays of storage texel buffers **can** be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageTexelBufferArrayDynamicIndexing` capability.
- `shaderUniformBufferArrayNonUniformIndexing` indicates whether arrays of uniform buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformBufferArrayNonUniformIndexing` capability.
- `shaderSampledImageArrayNonUniformIndexing` indicates whether arrays of samplers or sampled images **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `SampledImageArrayNonUniformIndexing` capability.
- `shaderStorageBufferArrayNonUniformIndexing` indicates whether arrays of storage buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageBufferArrayNonUniformIndexing` capability.
- `shaderStorageImageArrayNonUniformIndexing` indicates whether arrays of storage images **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageImageArrayNonUniformIndexing` capability.
- `shaderInputAttachmentArrayNonUniformIndexing` indicates whether arrays of input attachments **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This

also indicates whether shader modules **can** declare the `InputAttachmentArrayNonUniformIndexing` capability.

- `shaderUniformTexelBufferArrayNonUniformIndexing` indicates whether arrays of uniform texel buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformTexelBufferArrayNonUniformIndexing` capability.
- `shaderStorageTexelBufferArrayNonUniformIndexing` indicates whether arrays of storage texel buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageTexelBufferArrayNonUniformIndexing` capability.
- `descriptorBindingUniformBufferUpdateAfterBind` indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`.
- `descriptorBindingSampledImageUpdateAfterBind` indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`.
- `descriptorBindingStorageImageUpdateAfterBind` indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.
- `descriptorBindingStorageBufferUpdateAfterBind` indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`.
- `descriptorBindingUniformTexelBufferUpdateAfterBind` indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.
- `descriptorBindingStorageTexelBufferUpdateAfterBind` indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`.
- `descriptorBindingUpdateUnusedWhilePending` indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED WHILE PENDING BIT` **must** not be used.
- `descriptorBindingPartiallyBound` indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not

enabled, `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` must not be used.

- `descriptorBindingVariableDescriptorCount` indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT` must not be used.
- `runtimeDescriptorArray` indicates whether the implementation supports the SPIR-V `RuntimeDescriptorArray` capability. If this feature is not enabled, descriptors must not be declared in runtime arrays.
- `samplerFilterMinmax` indicates whether the implementation supports a minimum set of required formats supporting min/max filtering as defined by the `filterMinmaxSingleComponentFormats` property minimum requirements. If this feature is not enabled, then no `VkSamplerCreateInfo` `pNext` chain can include a `VkSamplerReductionModeCreateInfo` structure.
- `scalarBlockLayout` indicates that the implementation supports the layout of resource blocks in shaders using `scalar alignment`.
- `imagelessFramebuffer` indicates that the implementation supports specifying the image view for attachments at render pass begin time via `VkRenderPassAttachmentBeginInfo`.
- `uniformBufferStandardLayout` indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See [Standard Buffer Layout](#).
- `shaderSubgroupExtendedTypes` is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in `group operations` with `subgroup scope`, if the implementation supports the types.
- `separateDepthStencilLayouts` indicates whether the implementation supports a `VkImageMemoryBarrier` for a depth/stencil image with only one of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` set, and whether `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` can be used.
- `hostQueryReset` indicates that the implementation supports resetting queries from the host with `vkResetQueryPool`.
- `timelineSemaphore` indicates whether semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.
- `bufferDeviceAddress` indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddress`.
- `bufferDeviceAddressCaptureReplay` indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.
- `bufferDeviceAddressMultiDevice` indicates that the implementation supports the `bufferDeviceAddress`, `rayTracingPipeline` and `rayQuery` features for logical devices created with multiple physical devices. If this feature is not supported, buffer and acceleration structure addresses must not be queried on a logical device created with more than one physical device.
- `vulkanMemoryModel` indicates whether the Vulkan Memory Model is supported, as defined in [Vulkan Memory Model](#). This also indicates whether shader modules can declare the `VulkanMemoryModel` capability.
- `vulkanMemoryModelDeviceScope` indicates whether the Vulkan Memory Model can use `Device` scope synchronization. This also indicates whether shader modules can declare the

`VulkanMemoryModelDeviceScope` capability.

- `vulkanMemoryModelAvailabilityVisibilityChains` indicates whether the Vulkan Memory Model can use **availability** and **visibility chains** with more than one element.
- `shaderOutputViewportIndex` indicates whether the implementation supports the `ShaderViewportIndex` SPIR-V capability enabling variables decorated with the `ViewportIndex` built-in to be exported from vertex or tessellation evaluation shaders. If this feature is not enabled, the `ViewportIndex` built-in decoration **must** not be used on outputs in vertex or tessellation evaluation shaders.
- `shaderOutputLayer` indicates whether the implementation supports the `ShaderLayer` SPIR-V capability enabling variables decorated with the `Layer` built-in to be exported from vertex or tessellation evaluation shaders. If this feature is not enabled, the `Layer` built-in decoration **must** not be used on outputs in vertex or tessellation evaluation shaders.
- If `subgroupBroadcastDynamicId` is `VK_TRUE`, the “`Id`” operand of `OpGroupNonUniformBroadcast` **can** be dynamically uniform within a subgroup, and the “`Index`” operand of `OpGroupNonUniformQuadBroadcast` **can** be dynamically uniform within the derivative group. If it is `VK_FALSE`, these operands **must** be constants.

If the `VkPhysicalDeviceVulkan12Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkan12Features` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan12Features-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_FEATURES`

The `VkPhysicalDeviceVulkan13Features` structure is defined as:

```

// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceVulkan13Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 robustImageAccess;
    VkBool32 inlineUniformBlock;
    VkBool32 descriptorBindingInlineUniformBlockUpdateAfterBind;
    VkBool32 pipelineCreationCacheControl;
    VkBool32 privateData;
    VkBool32 shaderDemoteToHelperInvocation;
    VkBool32 shaderTerminateInvocation;
    VkBool32 subgroupSizeControl;
    VkBool32 computeFullSubgroups;
    VkBool32 synchronization2;
    VkBool32 textureCompressionASTC_HDR;
    VkBool32 shaderZeroInitializeWorkgroupMemory;
    VkBool32 dynamicRendering;
    VkBool32 shaderIntegerDotProduct;
    VkBool32 maintenance4;
} VkPhysicalDeviceVulkan13Features;

```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **robustImageAccess** indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. **Invalid texels** resulting from out of bounds image loads will be replaced as described in [Texel Replacement](#), with either (0,0,1) or (0,0,0) values inserted for missing G, B, or A components based on the format.
- **inlineUniformBlock** indicates whether the implementation supports inline uniform block descriptors. If this feature is not enabled, **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** **must** not be used.
- **descriptorBindingInlineUniformBlockUpdateAfterBind** indicates whether the implementation supports updating inline uniform block descriptors after a set is bound. If this feature is not enabled, **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** **must** not be used with **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**.
- **pipelineCreationCacheControl** indicates that the implementation supports:
 - The following **can** be used in **Vk*PipelineCreateInfo::flags**:
 - **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT**
 - **VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT**
 - The following **can** be used in **VkPipelineCacheCreateInfo::flags**:
 - **VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT**
- **privateData** indicates whether the implementation supports private data. See [Private Data](#).

- `shaderDemoteToHelperInvocation` indicates whether the implementation supports the SPIR-V `DemoteToHelperInvocationEXT` capability.
- `shaderTerminateInvocation` specifies whether the implementation supports SPIR-V modules that use the `SPV_KHR_terminate_invocation` extension.
- `subgroupSizeControl` indicates whether the implementation supports controlling shader subgroup sizes via the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag and the `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure.
- `computeFullSubgroups` indicates whether the implementation supports requiring full subgroups in compute shaders via the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag.
- `synchronization2` indicates whether the implementation supports the new set of synchronization commands introduced in `VK_KHR_synchronization2`.
- `textureCompressionASTC_HDR` indicates whether all of the ASTC HDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:
 - `VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK`
 - `VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

- `shaderZeroInitializeWorkgroupMemory` specifies whether the implementation supports initializing a variable in Workgroup storage class.
- `dynamicRendering` specifies that the implementation supports dynamic render pass instances using the `vkCmdBeginRendering` command.
- `shaderIntegerDotProduct` specifies whether shader modules **can** declare the `DotProductInputAllKHR`, `DotProductInput4x8BitKHR`, `DotProductInput4x8BitPackedKHR` and

`DotProductKHR` capabilities.

- `maintenance4` indicates that the implementation supports the following:

- The application **may** destroy a `VkPipelineLayout` object immediately after using it to create another object.
- `LocalSizeId` **can** be used as an alternative to `LocalSize` to specify the local workgroup size with specialization constants.
- Images created with identical creation parameters will always have the same alignment requirements.
- The size memory requirement of a buffer or image is never greater than that of another buffer or image created with a greater or equal size.
- Push constants do not have to be initialized before they are dynamically accessed.
- The interface matching rules allow a larger output vector to match with a smaller input vector, with additional values being discarded.

If the `VkPhysicalDeviceVulkan13Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkan13Features` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan13Features-sType-sType
 - `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_FEATURES`

The `VkPhysicalDeviceVariablePointersFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceVariablePointersFeatures {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           variablePointersStorageBuffer;
    VkBool32           variablePointers;
} VkPhysicalDeviceVariablePointersFeatures;
```

```
// Provided by VK_VERSION_1_1
typedef VkPhysicalDeviceVariablePointersFeatures
VkPhysicalDeviceVariablePointerFeatures;
```

or the equivalent

```
// Provided by VK_KHR_variable_pointers
typedef VkPhysicalDeviceVariablePointersFeatures
VkPhysicalDeviceVariablePointersFeaturesKHR;
```

```
// Provided by VK_KHR_variable_pointers
typedef VkPhysicalDeviceVariablePointersFeatures
VkPhysicalDeviceVariablePointersFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `variablePointersStorageBuffer` specifies whether the implementation supports the SPIR-V `VariablePointersStorageBuffer` capability. When this feature is not enabled, shader modules **must** not declare the `SPV_KHR_variable_pointers` extension or the `VariablePointersStorageBuffer` capability.
- `variablePointers` specifies whether the implementation supports the SPIR-V `VariablePointers` capability. When this feature is not enabled, shader modules **must** not declare the `VariablePointers` capability.

If the `VkPhysicalDeviceVariablePointersFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVariablePointersFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage

- VUID-VkPhysicalDeviceVariablePointersFeatures-variablePointers-01431
If `variablePointers` is enabled then `variablePointersStorageBuffer` **must** also be enabled

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVariablePointersFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES`

The `VkPhysicalDeviceMultiviewFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMultiviewFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 multiview;
    VkBool32 multiviewGeometryShader;
    VkBool32 multiviewTessellationShader;
} VkPhysicalDeviceMultiviewFeatures;
```

or the equivalent

```
// Provided by VK_KHR_multiview
typedef VkPhysicalDeviceMultiviewFeatures VkPhysicalDeviceMultiviewFeaturesKHR;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **multiview** specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass **must** always be zero.
- **multiviewGeometryShader** specifies whether the implementation supports multiview rendering within a render pass, with **geometry shaders**. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include a geometry shader.
- **multiviewTessellationShader** specifies whether the implementation supports multiview rendering within a render pass, with **tessellation shaders**. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include any tessellation shaders.

If the **VkPhysicalDeviceMultiviewFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceMultiviewFeatures** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage

- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewGeometryShader-00580
If **multiviewGeometryShader** is enabled then **multiview** **must** also be enabled
- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewTessellationShader-00581
If **multiviewTessellationShader** is enabled then **multiview** **must** also be enabled

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceMultiviewFeatures-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_FEATURES`

The `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_shader_atomic_float
typedef struct VkPhysicalDeviceShaderAtomicFloatFeaturesEXT {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              shaderBufferFloat32Atomics;
    VkBool32              shaderBufferFloat32AtomicAdd;
    VkBool32              shaderBufferFloat64Atomics;
    VkBool32              shaderBufferFloat64AtomicAdd;
    VkBool32              shaderSharedFloat32Atomics;
    VkBool32              shaderSharedFloat32AtomicAdd;
    VkBool32              shaderSharedFloat64Atomics;
    VkBool32              shaderSharedFloat64AtomicAdd;
    VkBool32              shaderImageFloat32Atomics;
    VkBool32              shaderImageFloat32AtomicAdd;
    VkBool32              sparseImageFloat32Atomics;
    VkBool32              sparseImageFloat32AtomicAdd;
} VkPhysicalDeviceShaderAtomicFloatFeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderBufferFloat32Atomics` indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on storage buffers.
- `shaderBufferFloat32AtomicAdd` indicates whether shaders **can** perform 32-bit floating-point add atomic operations on storage buffers.
- `shaderBufferFloat64Atomics` indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on storage buffers.
- `shaderBufferFloat64AtomicAdd` indicates whether shaders **can** perform 64-bit floating-point add atomic operations on storage buffers.
- `shaderSharedFloat32Atomics` indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on shared memory.
- `shaderSharedFloat32AtomicAdd` indicates whether shaders **can** perform 32-bit floating-point add atomic operations on shared memory.
- `shaderSharedFloat64Atomics` indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on shared memory.

- `shaderSharedFloat64AtomicAdd` indicates whether shaders **can** perform 64-bit floating-point add atomic operations on shared memory.
- `shaderImageFloat32Atomics` indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic image operations.
- `shaderImageFloat32AtomicAdd` indicates whether shaders **can** perform 32-bit floating-point add atomic image operations.
- `sparseImageFloat32Atomics` indicates whether 32-bit floating-point load, store and exchange atomic operations **can** be used on sparse images.
- `sparseImageFloat32AtomicAdd` indicates whether 32-bit floating-point add atomic operations **can** be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderAtomicFloatFeaturesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_FEATURES_EXT`

The `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_shader_atomic_float
typedef struct VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32          shaderBufferFloat16Atomics;
    VkBool32          shaderBufferFloat16AtomicAdd;
    VkBool32          shaderBufferFloat16AtomicMinMax;
    VkBool32          shaderBufferFloat32AtomicMinMax;
    VkBool32          shaderBufferFloat64AtomicMinMax;
    VkBool32          shaderSharedFloat16Atomics;
    VkBool32          shaderSharedFloat16AtomicAdd;
    VkBool32          shaderSharedFloat16AtomicMinMax;
    VkBool32          shaderSharedFloat32AtomicMinMax;
    VkBool32          shaderSharedFloat64AtomicMinMax;
    VkBool32          shaderImageFloat32AtomicMinMax;
    VkBool32          sparseImageFloat32AtomicMinMax;
} VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderBufferFloat16Atomics` indicates whether shaders **can** perform 16-bit floating-point load, store, and exchange atomic operations on storage buffers.
- `shaderBufferFloat16AtomicAdd` indicates whether shaders **can** perform 16-bit floating-point add atomic operations on storage buffers.
- `shaderBufferFloat16AtomicMinMax` indicates whether shaders **can** perform 16-bit floating-point min and max atomic operations on storage buffers.
- `shaderBufferFloat32AtomicMinMax` indicates whether shaders **can** perform 32-bit floating-point min and max atomic operations on storage buffers.
- `shaderBufferFloat64AtomicMinMax` indicates whether shaders **can** perform 64-bit floating-point min and max atomic operations on storage buffers.
- `shaderSharedFloat16Atomics` indicates whether shaders **can** perform 16-bit floating-point load, store and exchange atomic operations on shared memory.
- `shaderSharedFloat16AtomicAdd` indicates whether shaders **can** perform 16-bit floating-point add atomic operations on shared memory.
- `shaderSharedFloat16AtomicMinMax` indicates whether shaders **can** perform 16-bit floating-point min and max atomic operations on shared memory.
- `shaderSharedFloat32AtomicMinMax` indicates whether shaders **can** perform 32-bit floating-point min and max atomic operations on shared memory.
- `shaderSharedFloat64AtomicMinMax` indicates whether shaders **can** perform 64-bit floating-point min and max atomic operations on shared memory.
- `shaderImageFloat32AtomicMinMax` indicates whether shaders **can** perform 32-bit floating-point min and max atomic image operations.
- `sparseImageFloat32AtomicMinMax` indicates whether 32-bit floating-point min and max atomic operations **can** be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_2_FEATURES_EXT`

The `VkPhysicalDeviceShaderAtomicInt64Features` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderAtomicInt64Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderBufferInt64Atomics;
    VkBool32 shaderSharedInt64Atomics;
} VkPhysicalDeviceShaderAtomicInt64Features;
```

or the equivalent

```
// Provided by VK_KHR_shader_atomic_int64
typedef VkPhysicalDeviceShaderAtomicInt64Features
VkPhysicalDeviceShaderAtomicInt64FeaturesKHR;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderBufferInt64Atomics** indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on buffers.
- **shaderSharedInt64Atomics** indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on shared memory.

If the **VkPhysicalDeviceShaderAtomicInt64Features** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceShaderAtomicInt64Features** **can** also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderAtomicInt64Features-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES**

The **VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT** structure is defined as:

```
// Provided by VK_EXT_shader_image_atomic_int64
typedef struct VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderImageInt64Atomics;
    VkBool32 sparseImageInt64Atomics;
} VKPhysicalDeviceShaderImageAtomicInt64FeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderImageInt64Atomics` indicates whether shaders **can** support 64-bit unsigned and signed integer atomic operations on images.
- `sparseImageInt64Atomics` indicates whether 64-bit integer atomics **can** be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicInt64FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicInt64FeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT-sType-sType
 - `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_ATOMIC_INT64_FEATURES_EXT`

The `VkPhysicalDevice8BitStorageFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDevice8BitStorageFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer8BitAccess;
    VkBool32 uniformAndStorageBuffer8BitAccess;
    VkBool32 storagePushConstant8;
} VkPhysicalDevice8BitStorageFeatures;
```

or the equivalent

```
// Provided by VK_KHR_8bit_storage
typedef VkPhysicalDevice8BitStorageFeatures VkPhysicalDevice8BitStorageFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `storageBuffer8BitAccess` indicates whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StorageBuffer8BitAccess` capability.

- `uniformAndStorageBuffer8BitAccess` indicates whether objects in the `Uniform` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `UniformAndStorageBuffer8BitAccess` capability.
- `storagePushConstant8` indicates whether objects in the `PushConstant` storage class **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StoragePushConstant8` capability.

If the `VkPhysicalDevice8BitStorageFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice8BitStorageFeatures` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevice8BitStorageFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_8BIT_STORAGE_FEATURES`

The `VkPhysicalDevice16BitStorageFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDevice16BitStorageFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            storageBuffer16BitAccess;
    VkBool32            uniformAndStorageBuffer16BitAccess;
    VkBool32            storagePushConstant16;
    VkBool32            storageInputOutput16;
} VkPhysicalDevice16BitStorageFeatures;
```

or the equivalent

```
// Provided by VK_KHR_16bit_storage
typedef VkPhysicalDevice16BitStorageFeatures VkPhysicalDevice16BitStorageFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `storageBuffer16BitAccess` specifies whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StorageBuffer16BitAccess` capability.

- `uniformAndStorageBuffer16BitAccess` specifies whether objects in the `Uniform` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `UniformAndStorageBuffer16BitAccess` capability.
- `storagePushConstant16` specifies whether objects in the `PushConstant` storage class **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StoragePushConstant16` capability.
- `storageInputOutput16` specifies whether objects in the `Input` and `Output` storage classes **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StorageInputOutput16` capability.

If the `VkPhysicalDevice16BitStorageFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice16BitStorageFeatures` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevice16BitStorageFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES`

The `VkPhysicalDeviceShaderFloat16Int8Features` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderFloat16Int8Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            shaderFloat16;
    VkBool32            shaderInt8;
} VkPhysicalDeviceShaderFloat16Int8Features;
```

or the equivalent

```
// Provided by VK_KHR_shader_float16_int8
typedef VkPhysicalDeviceShaderFloat16Int8Features
VkPhysicalDeviceShaderFloat16Int8FeaturesKHR;
```

```
// Provided by VK_KHR_shader_float16_int8
typedef VkPhysicalDeviceShaderFloat16Int8Features
VkPhysicalDeviceFloat16Int8FeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderFloat16` indicates whether 16-bit floats (halfs) are supported in shader code. This also indicates whether shader modules **can** declare the `Float16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Float16` SPIR-V capability: Declaring and using 16-bit floats in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.
- `shaderInt8` indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules **can** declare the `Int8` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int8` SPIR-V capability: Declaring and using 8-bit integers in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

If the `VkPhysicalDeviceShaderFloat16Int8Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderFloat16Int8Features` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderFloat16Int8Features-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_FLOAT16_INT8_FEATURES`

The `VkPhysicalDeviceShaderClockFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_shader_clock
typedef struct VkPhysicalDeviceShaderClockFeaturesKHR {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             shaderSubgroupClock;
    VkBool32             shaderDeviceClock;
} VkPhysicalDeviceShaderClockFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderSubgroupClock` indicates whether shaders **can** perform `Subgroup` scoped clock reads.
- `shaderDeviceClock` indicates whether shaders **can** perform `Device` scoped clock reads.

If the `VkPhysicalDeviceShaderClockFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderClockFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderClockFeaturesKHR-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CLOCK_FEATURES_KHR`

The `VkPhysicalDeviceSamplerYcbcrConversionFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSamplerYcbcrConversionFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            samplerYcbcrConversion;
} VkPhysicalDeviceSamplerYcbcrConversionFeatures;
```

or the equivalent

```
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkPhysicalDeviceSamplerYcbcrConversionFeatures
VkPhysicalDeviceSamplerYcbcrConversionFeaturesKHR;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `samplerYcbcrConversion` specifies whether the implementation supports `sampler Y'CBCR conversion`. If `samplerYcbcrConversion` is `VK_FALSE`, `sampler Y'CBCR` conversion is not supported, and samplers using `sampler Y'CBCR` conversion must not be used.

If the `VkPhysicalDeviceSamplerYcbcrConversionFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSamplerYcbcrConversionFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSamplerYcbcrConversionFeatures-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_YCBCR_CONVERSION_FEATURES`

The `VkPhysicalDeviceProtectedMemoryFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 protectedMemory;
} VkPhysicalDeviceProtectedMemoryFeatures;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `protectedMemory` specifies whether protected memory is supported.

If the `VkPhysicalDeviceProtectedMemoryFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceProtectedMemoryFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProtectedMemoryFeatures-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROTECTED_MEMORY_FEATURES`

The `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 advancedBlendCoherentOperations;
} VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `advancedBlendCoherentOperations` specifies whether blending using `advanced blend operations` is guaranteed to execute atomically and in `primitive order`. If this is `VK_TRUE`, `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` is treated the same as `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`, and advanced blending needs no additional synchronization over basic blending. If this is `VK_FALSE`, then memory dependencies are required to guarantee order between two advanced blending operations that occur on the same

sample.

If the `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BLEND_OPERATION_ADVANCED_FEATURES_EXT`

The `VkPhysicalDeviceConditionalRenderingFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_conditional_rendering
typedef struct VkPhysicalDeviceConditionalRenderingFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            conditionalRendering;
    VkBool32            inheritedConditionalRendering;
} VkPhysicalDeviceConditionalRenderingFeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `conditionalRendering` specifies whether conditional rendering is supported.
- `inheritedConditionalRendering` specifies whether a secondary command buffer can be executed while conditional rendering is active in the primary command buffer.

If the `VkPhysicalDeviceConditionalRenderingFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceConditionalRenderingFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceConditionalRenderingFeaturesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONDITIONAL_RENDERING_FEATURES_EXT`

The `VkPhysicalDeviceShaderDrawParametersFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceShaderDrawParametersFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderDrawParameters;
} VkPhysicalDeviceShaderDrawParametersFeatures;
```

```
// Provided by VK_VERSION_1_1
typedef VkPhysicalDeviceShaderDrawParametersFeatures
VkPhysicalDeviceShaderDrawParameterFeatures;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderDrawParameters** specifies whether the implementation supports the SPIR-V **DrawParameters** capability. When this feature is not enabled, shader modules **must** not declare the **SPV_KHR_shader_draw_parameters** extension or the **DrawParameters** capability.

If the **VkPhysicalDeviceShaderDrawParametersFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceShaderDrawParametersFeatures** **can** also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderDrawParametersFeatures-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DRAW_PARAMETERS_FEATURES**

The **VkPhysicalDeviceMeshShaderFeaturesNV** structure is defined as:

```
// Provided by VK_NV_mesh_shader
typedef struct VkPhysicalDeviceMeshShaderFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 taskShader;
    VkBool32 meshShader;
} VkPhysicalDeviceMeshShaderFeaturesNV;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `taskShader` indicates whether the task shader stage is supported.
- `meshShader` indicates whether the mesh shader stage is supported.

If the `VkPhysicalDeviceMeshShaderFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMeshShaderFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMeshShaderFeaturesNV-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_FEATURES_NV`

The `VkPhysicalDeviceDescriptorIndexingFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDescriptorIndexingFeatures {
    VkStructureType    sType;
    void*            pNext;
    VkBool32           shaderInputAttachmentArrayDynamicIndexing;
    VkBool32           shaderUniformTexelBufferArrayDynamicIndexing;
    VkBool32           shaderStorageTexelBufferArrayDynamicIndexing;
    VkBool32           shaderUniformBufferArrayNonUniformIndexing;
    VkBool32           shaderSampledImageArrayNonUniformIndexing;
    VkBool32           shaderStorageBufferArrayNonUniformIndexing;
    VkBool32           shaderStorageImageArrayNonUniformIndexing;
    VkBool32           shaderInputAttachmentArrayNonUniformIndexing;
    VkBool32           shaderUniformTexelBufferArrayNonUniformIndexing;
    VkBool32           shaderStorageTexelBufferArrayNonUniformIndexing;
    VkBool32           descriptorBindingUniformBufferUpdateAfterBind;
    VkBool32           descriptorBindingSampledImageUpdateAfterBind;
    VkBool32           descriptorBindingStorageImageUpdateAfterBind;
    VkBool32           descriptorBindingStorageBufferUpdateAfterBind;
    VkBool32           descriptorBindingUniformTexelBufferUpdateAfterBind;
    VkBool32           descriptorBindingStorageTexelBufferUpdateAfterBind;
    VkBool32           descriptorBindingUpdateUnusedWhilePending;
    VkBool32           descriptorBindingPartiallyBound;
    VkBool32           descriptorBindingVariableDescriptorCount;
    VkBool32           runtimeDescriptorArray;
} VkPhysicalDeviceDescriptorIndexingFeatures;
```

or the equivalent

```
// Provided by VK_EXT_descriptor_indexing
typedef VkPhysicalDeviceDescriptorIndexingFeatures
VkPhysicalDeviceDescriptorIndexingFeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderInputAttachmentArrayDynamicIndexing` indicates whether arrays of input attachments **can** be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `InputAttachmentArrayDynamicIndexing` capability.
- `shaderUniformTexelBufferArrayDynamicIndexing` indicates whether arrays of uniform texel buffers **can** be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformTexelBufferArrayDynamicIndexing` capability.
- `shaderStorageTexelBufferArrayDynamicIndexing` indicates whether arrays of storage texel buffers **can** be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageTexelBufferArrayDynamicIndexing` capability.
- `shaderUniformBufferArrayNonUniformIndexing` indicates whether arrays of uniform buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformBufferArrayNonUniformIndexing` capability.
- `shaderSampledImageArrayNonUniformIndexing` indicates whether arrays of samplers or sampled images **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `SampledImageArrayNonUniformIndexing` capability.
- `shaderStorageBufferArrayNonUniformIndexing` indicates whether arrays of storage buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageBufferArrayNonUniformIndexing` capability.
- `shaderStorageImageArrayNonUniformIndexing` indicates whether arrays of storage images **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` **must** not be indexed by

non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageImageArrayNonUniformIndexing` capability.

- `shaderInputAttachmentArrayNonUniformIndexing` indicates whether arrays of input attachments **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `InputAttachmentArrayNonUniformIndexing` capability.
- `shaderUniformTexelBufferArrayNonUniformIndexing` indicates whether arrays of uniform texel buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `UniformTexelBufferArrayNonUniformIndexing` capability.
- `shaderStorageTexelBufferArrayNonUniformIndexing` indicates whether arrays of storage texel buffers **can** be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules **can** declare the `StorageTexelBufferArrayNonUniformIndexing` capability.
- `descriptorBindingUniformBufferUpdateAfterBind` indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`.
- `descriptorBindingSampledImageUpdateAfterBind` indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`.
- `descriptorBindingStorageImageUpdateAfterBind` indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.
- `descriptorBindingStorageBufferUpdateAfterBind` indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`.
- `descriptorBindingUniformTexelBufferUpdateAfterBind` indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.
- `descriptorBindingStorageTexelBufferUpdateAfterBind` indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not

enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`.

- `descriptorBindingUpdateUnusedWhilePending` indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` **must** not be used.
- `descriptorBindingPartiallyBound` indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` **must** not be used.
- `descriptorBindingVariableDescriptorCount` indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT` **must** not be used.
- `runtimeDescriptorArray` indicates whether the implementation supports the SPIR-V `RuntimeDescriptorArray` capability. If this feature is not enabled, descriptors **must** not be declared in runtime arrays.

If the `VkPhysicalDeviceDescriptorIndexingFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDescriptorIndexingFeatures` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDescriptorIndexingFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_FEATURES`

The `VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            vertexAttributeInstanceRateDivisor;
    VkBool32            vertexAttributeInstanceRateZeroDivisor;
} VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexAttributeInstanceRateDivisor` specifies whether vertex attribute fetching may be repeated in case of instanced rendering.
- `vertexAttributeInstanceRateZeroDivisor` specifies whether a zero value for `VkVertexInputBindingDivisorDescriptionEXT::divisor` is supported.

If the `VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES_EXT`

The `VkPhysicalDeviceASTCDecodeFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_astc_decode_mode
typedef struct VkPhysicalDeviceASTCDecodeFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            decodeModeSharedExponent;
} VkPhysicalDeviceASTCDecodeFeaturesEXT;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `decodeModeSharedExponent` indicates whether the implementation supports decoding ASTC compressed formats to `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32` internal precision.

If the `VkPhysicalDeviceASTCDecodeFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceASTCDecodeFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceASTCDecodeFeaturesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT`

The `VkPhysicalDeviceTransformFeedbackFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_transform_feedback
typedef struct VkPhysicalDeviceTransformFeedbackFeaturesEXT {
    VkStructureType    sType;
    void*            pNext;
    VkBool32           transformFeedback;
    VkBool32           geometryStreams;
} VkPhysicalDeviceTransformFeedbackFeaturesEXT;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **transformFeedback** indicates whether the implementation supports transform feedback and shader modules **can** declare the **TransformFeedback** capability.
- **geometryStreams** indicates whether the implementation supports the **GeometryStreams** SPIR-V capability.

If the **VkPhysicalDeviceTransformFeedbackFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceTransformFeedbackFeaturesEXT** **can** also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTransformFeedbackFeaturesEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_FEATURES_EXT**

The **VkPhysicalDeviceVulkanMemoryModelFeatures** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkanMemoryModelFeatures {
    VkStructureType    sType;
    void*            pNext;
    VkBool32           vulkanMemoryModel;
    VkBool32           vulkanMemoryModelDeviceScope;
    VkBool32           vulkanMemoryModelAvailabilityVisibilityChains;
} VkPhysicalDeviceVulkanMemoryModelFeatures;
```

or the equivalent

```
// Provided by VK_KHR_vulkan_memory_model
typedef VkPhysicalDeviceVulkanMemoryModelFeatures
VkPhysicalDeviceVulkanMemoryModelFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vulkanMemoryModel` indicates whether the Vulkan Memory Model is supported, as defined in [Vulkan Memory Model](#). This also indicates whether shader modules **can** declare the `VulkanMemoryModel` capability.
- `vulkanMemoryModelDeviceScope` indicates whether the Vulkan Memory Model can use `Device` scope synchronization. This also indicates whether shader modules **can** declare the `VulkanMemoryModelDeviceScope` capability.
- `vulkanMemoryModelAvailabilityVisibilityChains` indicates whether the Vulkan Memory Model can use [availability](#) and [visibility chains](#) with more than one element.

If the `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkanMemoryModelFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_MEMORY_MODEL_FEATURES`

The `VkPhysicalDeviceInlineUniformBlockFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceInlineUniformBlockFeatures {
    VkStructureType    sType;
    void*            pNext;
    VkBool32          inlineUniformBlock;
    VkBool32          descriptorBindingInlineUniformBlockUpdateAfterBind;
} VkPhysicalDeviceInlineUniformBlockFeatures;
```

or the equivalent

```
// Provided by VK_EXT_inline_uniform_block
typedef VkPhysicalDeviceInlineUniformBlockFeatures
VkPhysicalDeviceInlineUniformBlockFeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `inlineUniformBlock` indicates whether the implementation supports inline uniform block descriptors. If this feature is not enabled, `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` **must** not be used.
- `descriptorBindingInlineUniformBlockUpdateAfterBind` indicates whether the implementation supports updating inline uniform block descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`.

If the `VkPhysicalDeviceInlineUniformBlockFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceInlineUniformBlockFeatures` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceInlineUniformBlockFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_FEATURES`

The `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV` structure is defined as:

```
// Provided by VK_NV_representative_fragment_test
typedef struct VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            representativeFragmentTest;
} VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `representativeFragmentTest` indicates whether the implementation supports the representative fragment test. See [Representative Fragment Test](#).

If the `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV-sType-sType`
`sType` **must** be
`VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_REPRESENTATIVE_FRAGMENT_TEST_FEATURES_NV`

The `VkPhysicalDeviceExclusiveScissorFeaturesNV` structure is defined as:

```
// Provided by VK_NV_scissor_exclusive
typedef struct VkPhysicalDeviceExclusiveScissorFeaturesNV {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              exclusiveScissor;
} VkPhysicalDeviceExclusiveScissorFeaturesNV;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `exclusiveScissor` indicates that the implementation supports the exclusive scissor test.

See [Exclusive Scissor Test](#) for more information.

If the `VkPhysicalDeviceExclusiveScissorFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExclusiveScissorFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceExclusiveScissorFeaturesNV-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXCLUSIVE_SCISSOR_FEATURES_NV`

The `VkPhysicalDeviceCornerSampledImageFeaturesNV` structure is defined as:

```
// Provided by VK_NV_corner_sampled_image
typedef struct VkPhysicalDeviceCornerSampledImageFeaturesNV {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              cornerSampledImage;
} VkPhysicalDeviceCornerSampledImageFeaturesNV;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `cornerSampledImage` specifies whether images can be created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`. See [Corner-Sampled Images](#).

If the `VkPhysicalDeviceCornerSampledImageFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCornerSampledImageFeaturesNV` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCornerSampledImageFeaturesNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CORNER_SAMPLED_IMAGE_FEATURES_NV`

The `VkPhysicalDeviceComputeShaderDerivativesFeaturesNV` structure is defined as:

```
// Provided by VK_NV_compute_shader_derivatives
typedef struct VkPhysicalDeviceComputeShaderDerivativesFeaturesNV {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            computeDerivativeGroupQuads;
    VkBool32            computeDerivativeGroupLinear;
} VkPhysicalDeviceComputeShaderDerivativesFeaturesNV;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `computeDerivativeGroupQuads` indicates that the implementation supports the `ComputeDerivativeGroupQuadsNV` SPIR-V capability.
- `computeDerivativeGroupLinear` indicates that the implementation supports the `ComputeDerivativeGroupLinearNV` SPIR-V capability.

See [Quad shader scope](#) for more information.

If the `VkPhysicalDeviceComputeShaderDerivativesFeaturesNVfeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceComputeShaderDerivativesFeaturesNVfeatures` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceComputeShaderDerivativesFeaturesNV-sType-sType`
`sType` **must** be
`VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_FEATURES_NV`

The `VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV` structure is defined as:

```
// Provided by VK_NV_fragment_shader_barycentric
typedef struct VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             fragmentShaderBarycentric;
} VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentShaderBarycentric` indicates that the implementation supports the `BaryCoordNV` and `BaryCoordNoPerspNV` SPIR-V fragment shader built-ins and supports the `PerVertexNV` SPIR-V decoration on fragment shader input variables.

See [Barycentric Interpolation](#) for more information.

If the `VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV-sType-sType`
`sType` **must** be
`VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_FEATURES_NV`

The `VkPhysicalDeviceShaderImageFootprintFeaturesNV` structure is defined as:

```
// Provided by VK_NV_shader_image_footprint
typedef struct VkPhysicalDeviceShaderImageFootprintFeaturesNV {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             imageFootprint;
} VkPhysicalDeviceShaderImageFootprintFeaturesNV;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **imageFootprint** specifies whether the implementation supports the **ImageFootprintNV** SPIR-V capability.

See [Texel Footprint Evaluation](#) for more information.

If the **VkPhysicalDeviceShaderImageFootprintFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceShaderImageFootprintFeaturesNV** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderImageFootprintFeaturesNV-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_FOOTPRINT_FEATURES_NV**

The **VkPhysicalDeviceShadingRateImageFeaturesNV** structure is defined as:

```
// Provided by VK_NV_shading_rate_image
typedef struct VkPhysicalDeviceShadingRateImageFeaturesNV {
    VkStructureType      sType;
    void*                pNext;
    VkBool32              shadingRateImage;
    VkBool32              shadingRateCoarseSampleOrder;
} VkPhysicalDeviceShadingRateImageFeaturesNV;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shadingRateImage** indicates that the implementation supports the use of a shading rate image to derive an effective shading rate for fragment processing. It also indicates that the implementation supports the **ShadingRateNV** SPIR-V execution mode.
- **shadingRateCoarseSampleOrder** indicates that the implementation supports a user-configurable ordering of coverage samples in fragments larger than one pixel.

See [Shading Rate Image](#) for more information.

If the **VkPhysicalDeviceShadingRateImageFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceShadingRateImageFeaturesNV** can also be used in the **pNext** chain of

[VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShadingRateImageFeaturesNV-sType-sType
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADING_RATE_IMAGE_FEATURES_NV`

The [VkPhysicalDeviceFragmentDensityMapFeaturesEXT](#) structure is defined as:

```
// Provided by VK_EXT_fragment_density_map
typedef struct VkPhysicalDeviceFragmentDensityMapFeaturesEXT {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              fragmentDensityMap;
    VkBool32              fragmentDensityMapDynamic;
    VkBool32              fragmentDensityMapNonSubsampledImages;
} VkPhysicalDeviceFragmentDensityMapFeaturesEXT;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **fragmentDensityMap** specifies whether the implementation supports render passes with a fragment density map attachment. If this feature is not enabled and the **pNext** chain of [VkRenderPassCreateInfo](#) includes a [VkRenderPassFragmentDensityMapCreateInfoEXT](#) structure, **fragmentDensityMapAttachment** must be `VK_ATTACHMENT_UNUSED`.
- **fragmentDensityMapDynamic** specifies whether the implementation supports dynamic fragment density map image views. If this feature is not enabled, `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` must not be included in [VkImageViewCreateInfo::flags](#).
- **fragmentDensityMapNonSubsampledImages** specifies whether the implementation supports regular non-subsampled image attachments with fragment density map render passes. If this feature is not enabled, render passes with a **fragment density map attachment** must only have **subsampled attachments** bound.

If the [VkPhysicalDeviceFragmentDensityMapFeaturesEXT](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. [VkPhysicalDeviceFragmentDensityMapFeaturesEXT](#) can also be used in the **pNext** chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMapFeaturesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_FEATURES_EXT`

The `VkPhysicalDeviceFragmentDensityMap2FeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_fragment_density_map2
typedef struct VkPhysicalDeviceFragmentDensityMap2FeaturesEXT {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             fragmentDensityMapDeferred;
} VkPhysicalDeviceFragmentDensityMap2FeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMapDeferred` specifies whether the implementation supports deferred reads of fragment density map image views. If this feature is not enabled, `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT` **must** not be included in `VkImageViewCreateInfo::flags`.

If the `VkPhysicalDeviceFragmentDensityMap2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported.

`VkPhysicalDeviceFragmentDensityMap2FeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMap2FeaturesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_2_FEATURES_EXT`

The `VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM` structure is defined as:

```
// Provided by VK_QCOM_fragment_density_map_offset
typedef struct VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             fragmentDensityMapOffset;
} VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMapOffsets` specifies whether the implementation supports fragment density map offsets

If the `VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_OFFSET_FEATURES_QCOM`

The `VkPhysicalDeviceInvocationMaskFeaturesHUAWEI` structure is defined as:

```
// Provided by VK_HUAWEI_invocation_mask
typedef struct VkPhysicalDeviceInvocationMaskFeaturesHUAWEI {
    VkStructureType    sType;
    void*             pNext;
    VkBool32          invocationMask;
} VkPhysicalDeviceInvocationMaskFeaturesHUAWEI;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `invocationMask` indicates that the implementation supports the use of an invocation mask image to optimize the ray dispatch.

If the `VkPhysicalDeviceInvocationMaskFeaturesHUAWEI` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceInvocationMaskFeaturesHUAWEI` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceInvocationMaskFeaturesHUAWEI-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INVOCATION_MASK_FEATURES_HUAWEI`

The `VkPhysicalDeviceScalarBlockLayoutFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceScalarBlockLayoutFeatures {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           scalarBlockLayout;
} VkPhysicalDeviceScalarBlockLayoutFeatures;
```

or the equivalent

```
// Provided by VK_EXT_scalar_block_layout
typedef VkPhysicalDeviceScalarBlockLayoutFeatures
VkPhysicalDeviceScalarBlockLayoutFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **scalarBlockLayout** indicates that the implementation supports the layout of resource blocks in shaders using **scalar alignment**.

If the **VkPhysicalDeviceScalarBlockLayoutFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceScalarBlockLayoutFeatures** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceScalarBlockLayoutFeatures-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCALAR_BLOCK_LAYOUT_FEATURES**

The **VkPhysicalDeviceUniformBufferStandardLayoutFeatures** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceUniformBufferStandardLayoutFeatures {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           uniformBufferStandardLayout;
} VkPhysicalDeviceUniformBufferStandardLayoutFeatures;
```

or the equivalent

```
// Provided by VK_KHR_uniform_buffer_standard_layout
typedef VkPhysicalDeviceUniformBufferStandardLayoutFeatures
VkPhysicalDeviceUniformBufferStandardLayoutFeaturesKHR;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **uniformBufferStandardLayout** indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See [Standard Buffer Layout](#).

If the **VkPhysicalDeviceUniformBufferStandardLayoutFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceUniformBufferStandardLayoutFeatures** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- **UID-VkPhysicalDeviceUniformBufferStandardLayoutFeatures-sType-sType**
sType must be
VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_UNIFORM_BUFFER_STANDARD_LAYOUT_FEATURES

The **VkPhysicalDeviceDepthClipEnableFeaturesEXT** structure is defined as:

```
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPhysicalDeviceDepthClipEnableFeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           depthClipEnable;
} VkPhysicalDeviceDepthClipEnableFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **depthClipEnable** indicates that the implementation supports setting the depth clipping operation explicitly via the **VkPipelineRasterizationDepthClipStateCreateInfoEXT** pipeline state. Otherwise depth clipping is only enabled when **VkPipelineRasterizationStateCreateInfo::depthClampEnable** is set to **VK_FALSE**.

If the **VkPhysicalDeviceDepthClipEnableFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceDepthClipEnableFeaturesEXT** can also be used in the **pNext** chain of

[VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDepthClipEnableFeaturesEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_ENABLE_FEATURES_EXT

The [VkPhysicalDeviceMemoryPriorityFeaturesEXT](#) structure is defined as:

```
// Provided by VK_EXT_memory_priority
typedef struct VkPhysicalDeviceMemoryPriorityFeaturesEXT {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              memoryPriority;
} VkPhysicalDeviceMemoryPriorityFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **memoryPriority** indicates that the implementation supports memory priorities specified at memory allocation time via [VkMemoryPriorityAllocateInfoEXT](#).

If the [VkPhysicalDeviceMemoryPriorityFeaturesEXT](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. [VkPhysicalDeviceMemoryPriorityFeaturesEXT](#) can also be used in the **pNext** chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryPriorityFeaturesEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PRIORITY_FEATURES_EXT

The [VkPhysicalDeviceBufferDeviceAddressFeatures](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceBufferDeviceAddressFeatures {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              bufferDeviceAddress;
    VkBool32              bufferDeviceAddressCaptureReplay;
    VkBool32              bufferDeviceAddressMultiDevice;
} VkPhysicalDeviceBufferDeviceAddressFeatures;
```

or the equivalent

```
// Provided by VK_KHR_buffer_device_address
typedef VkPhysicalDeviceBufferDeviceAddressFeatures
VkPhysicalDeviceBufferDeviceAddressFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `bufferDeviceAddress` indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from [vkGetBufferDeviceAddress](#).
- `bufferDeviceAddressCaptureReplay` indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.
- `bufferDeviceAddressMultiDevice` indicates that the implementation supports the `bufferDeviceAddress`, `rayTracingPipeline` and `rayQuery` features for logical devices created with multiple physical devices. If this feature is not supported, buffer and acceleration structure addresses **must** not be queried on a logical device created with more than one physical device.

Note

`bufferDeviceAddressMultiDevice` exists to allow certain legacy platforms to be able to support `bufferDeviceAddress` without needing to support shared GPU virtual addresses for multi-device configurations.

See [vkGetBufferDeviceAddress](#) for more information.

If the `VkPhysicalDeviceBufferDeviceAddressFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBufferDeviceAddressFeatures` can also be used in the `pNext` chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBufferDeviceAddressFeatures-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES`

The `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_buffer_device_address
typedef struct VkPhysicalDeviceBufferDeviceAddressFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 bufferDeviceAddress;
    VkBool32 bufferDeviceAddressCaptureReplay;
    VkBool32 bufferDeviceAddressMultiDevice;
} VkPhysicalDeviceBufferDeviceAddressFeaturesEXT;
```

```
// Provided by VK_EXT_buffer_device_address
typedef VkPhysicalDeviceBufferDeviceAddressFeaturesEXT
VkPhysicalDeviceBufferAddressFeaturesEXT;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **bufferDeviceAddress** indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from [vkGetBufferDeviceAddressEXT](#).
- **bufferDeviceAddressCaptureReplay** indicates that the implementation supports saving and reusing buffer addresses, e.g. for trace capture and replay.
- **bufferDeviceAddressMultiDevice** indicates that the implementation supports the **bufferDeviceAddress** feature for logical devices created with multiple physical devices. If this feature is not supported, buffer addresses **must** not be queried on a logical device created with more than one physical device.

If the **VkPhysicalDeviceBufferDeviceAddressFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceBufferDeviceAddressFeaturesEXT** can also be used in the **pNext** chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Note

The **VkPhysicalDeviceBufferDeviceAddressFeaturesEXT** structure has the same members as the **VkPhysicalDeviceBufferDeviceAddressFeatures** structure, but the functionality indicated by the members is expressed differently. The features indicated by the **VkPhysicalDeviceBufferDeviceAddressFeatures** structure requires additional flags to be passed at memory allocation time, and the capture and replay mechanism is built around opaque capture addresses for buffer and memory objects.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBufferDeviceAddressFeaturesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES_EXT`

The `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV` structure is defined as:

```
// Provided by VK_NV_dedicated_allocation_image_aliasing
typedef struct VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             dedicatedAllocationImageAliasing;
} VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dedicatedAllocationImageAliasing` indicates that the implementation supports aliasing of compatible image objects on a dedicated allocation.

If the `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEDICATED_ALLOCATION_IMAGE_ALIASING_FEATURES_NV`

The `VkPhysicalDeviceImagelessFramebufferFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceImagelessFramebufferFeatures {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             imagelessFramebuffer;
} VkPhysicalDeviceImagelessFramebufferFeatures;
```

or the equivalent

```
// Provided by VK_KHR_imageless_framebuffer
typedef VkPhysicalDeviceImagelessFramebufferFeatures
VkPhysicalDeviceImagelessFramebufferFeaturesKHR;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **imagelessFramebuffer** indicates that the implementation supports specifying the image view for attachments at render pass begin time via [VkRenderPassAttachmentBeginInfo](#).

If the **VkPhysicalDeviceImagelessFramebufferFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceImagelessFramebufferFeatures** can also be used in the **pNext** chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImagelessFramebufferFeatures-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGELESS_FRAMEBUFFER_FEATURES**

The **VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT** structure is defined as:

```
// Provided by VK_EXT_fragment_shader_interlock
typedef struct VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              fragmentShaderSampleInterlock;
    VkBool32              fragmentShaderPixelInterlock;
    VkBool32              fragmentShaderShadingRateInterlock;
} VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **fragmentShaderSampleInterlock** indicates that the implementation supports the **FragmentShaderSampleInterlockEXT** SPIR-V capability.
- **fragmentShaderPixelInterlock** indicates that the implementation supports the **FragmentShaderPixelInterlockEXT** SPIR-V capability.
- **fragmentShaderShadingRateInterlock** indicates that the implementation supports the **FragmentShaderShadingRateInterlockEXT** SPIR-V capability.

If the `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_INTERLOCK_FEATURES_EXT`

The `VkPhysicalDeviceCooperativeMatrixFeaturesNV` structure is defined as:

```
// Provided by VK_NV_cooperative_matrix
typedef struct VkPhysicalDeviceCooperativeMatrixFeaturesNV {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            cooperativeMatrix;
    VkBool32            cooperativeMatrixRobustBufferAccess;
} VkPhysicalDeviceCooperativeMatrixFeaturesNV;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `cooperativeMatrix` indicates that the implementation supports the `CooperativeMatrixNV` SPIR-V capability.
- `cooperativeMatrixRobustBufferAccess` indicates that the implementation supports robust buffer access for SPIR-V `OpCooperativeMatrixLoadNV` and `OpCooperativeMatrixStoreNV` instructions.

If the `VkPhysicalDeviceCooperativeMatrixFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCooperativeMatrixFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCooperativeMatrixFeaturesNV-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_FEATURES_NV`

The `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_ycbcr_image_arrays
typedef struct VkPhysicalDeviceYcbcrImageArraysFeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           ycbcrImageArrays;
} VkPhysicalDeviceYcbcrImageArraysFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **ycbcrImageArrays** indicates that the implementation supports creating images with a format that requires **Y'CbCr conversion** and has multiple array layers.

If the **VkPhysicalDeviceYcbcrImageArraysFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceYcbcrImageArraysFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceYcbcrImageArraysFeaturesEXT-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_IMAGE_ARRAYS_FEATURES_EXT**

The **VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           shaderSubgroupExtendedTypes;
} VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures;
```

or the equivalent

```
// Provided by VK_KHR_shader_subgroup_extended_types
typedef VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures
VkPhysicalDeviceShaderSubgroupExtendedTypesFeaturesKHR;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `shaderSubgroupExtendedTypes` is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in `group operations` with `subgroup scope`, if the implementation supports the types.

If the `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures-sType-sType`
`sType` must be
`VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SUBGROUP_EXTENDED_TYPES_FEATURES`

The `VkPhysicalDeviceHostQueryResetFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceHostQueryResetFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 hostQueryReset;
} VkPhysicalDeviceHostQueryResetFeatures;
```

or the equivalent

```
// Provided by VK_EXT_host_query_reset
typedef VkPhysicalDeviceHostQueryResetFeatures
VkPhysicalDeviceHostQueryResetFeaturesEXT;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hostQueryReset` indicates that the implementation supports resetting queries from the host with `vkResetQueryPool`.

If the `VkPhysicalDeviceHostQueryResetFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceHostQueryResetFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceHostQueryResetFeatures-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_QUERY_RESET_FEATURES`

The `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL` structure is defined as:

```
// Provided by VK_INTEL_shader_integer_functions2
typedef struct VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             shaderIntegerFunctions2;
} VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderIntegerFunctions2` indicates that the implementation supports the `IntegerFunctions2INTEL` SPIR-V capability.

If the `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTELfeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTELfeatures`. **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_FUNCTIONS_2_FEATURES_INTEL`

The `VkPhysicalDeviceCoverageReductionModeFeaturesNV` structure is defined as:

```
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkPhysicalDeviceCoverageReductionModeFeaturesNV {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             coverageReductionMode;
} VkPhysicalDeviceCoverageReductionModeFeaturesNV;
```

This structure describes the following feature:

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `coverageReductionMode` indicates whether the implementation supports coverage reduction modes. See [Coverage Reduction](#).

If the `VkPhysicalDeviceCoverageReductionModeFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCoverageReductionModeFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCoverageReductionModeFeaturesNV-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COVERAGE_REDUCTION_MODE_FEATURES_NV`

The `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceTimelineSemaphoreFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            timelineSemaphore;
} VkPhysicalDeviceTimelineSemaphoreFeatures;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkPhysicalDeviceTimelineSemaphoreFeatures
VkPhysicalDeviceTimelineSemaphoreFeaturesKHR;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `timelineSemaphore` indicates whether semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.

If the `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTimelineSemaphoreFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTimelineSemaphoreFeatures-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_FEATURES`

The `VkPhysicalDeviceIndexTypeUInt8FeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_index_type_uint8
typedef struct VkPhysicalDeviceIndexTypeUInt8FeaturesEXT {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             indexTypeUInt8;
} VkPhysicalDeviceIndexTypeUInt8FeaturesEXT;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `indexTypeUInt8` indicates that `VK_INDEX_TYPE_UINT8_EXT` can be used with `vkCmdBindIndexBuffer`.

If the `VkPhysicalDeviceIndexTypeUInt8FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceIndexTypeUInt8FeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INDEX_TYPE_UINT8_FEATURES_EXT`

The `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_primitive_topology_list_restart
typedef struct VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             primitiveTopologyListRestart;
    VkBool32             primitiveTopologyPatchListRestart;
} VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT;
```

The members of the `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` structure describe the following features:

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `primitiveTopologyListRestart` indicates that list type primitives, `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, **can** use the primitive restart index value in index buffers.
- `primitiveTopologyPatchListRestart` indicates that the `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` topology **can** use the primitive restart index value in index buffers.

If the `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT-sType-sType`
`sType` **must** be
`VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIMITIVE_TOPOLOGY_LIST_RESTART_FEATURES_EXT`

The `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV` structure is defined as:

```
// Provided by VK_NV_shader_sm_builtins
typedef struct VkPhysicalDeviceShaderSMBuiltinsFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSMBuiltins;
} VkPhysicalDeviceShaderSMBuiltinsFeaturesNV;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderSMBuiltins` indicates whether the implementation supports the SPIR-V `ShaderSMBuiltinsNV` capability.

If the `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderSMBuiltinsFeaturesNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SM_BUILTINS_FEATURES_NV`

The `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              separateDepthStencilLayouts;
} VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures;
```

or the equivalent

```
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures
VkPhysicalDeviceSeparateDepthStencilLayoutsFeaturesKHR;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `separateDepthStencilLayouts` indicates whether the implementation supports a `VkImageMemoryBarrier` for a depth/stencil image with only one of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` set, and whether `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` can be used.

If the `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SEPARATE_DEPTH_STENCIL_LAYOUTS_FEATURES`

The `VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             pipelineExecutableInfo;
} VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pipelineExecutableInfo** indicates that the implementation supports reporting properties and statistics about the pipeline executables associated with a compiled pipeline.

If the **VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- **VUID-VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR-sType-sType**
sType **must** **be**
VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_EXECUTABLE_PROPERTIES_FEATURES_KHR

The **VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures** structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             shaderDemoteToHelperInvocation;
} VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures;
```

or the equivalent

```
// Provided by VK_EXT_shader_demote_to_helper_invocation
typedef VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures
VkPhysicalDeviceShaderDemoteToHelperInvocationFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `shaderDemoteToHelperInvocation` indicates whether the implementation supports the SPIR-V `DemoteToHelperInvocationEXT` capability.

If the `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DEMOTE_TO_HELPER_INVOCATION_FEATURES`

The `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_texel_buffer_alignment
typedef struct VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            texelBufferAlignment;
} VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `texelBufferAlignment` indicates whether the implementation uses more specific alignment requirements advertised in `VkPhysicalDeviceTexelBufferAlignmentProperties` rather than `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`.

If the `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_FEATURES_EXT`

The `VkPhysicalDeviceTextureCompressionASTCHDRFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceTextureCompressionASTCHDRFeatures {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           textureCompressionASTC_HDR;
} VkPhysicalDeviceTextureCompressionASTCHDRFeatures;
```

or the equivalent

```
// Provided by VK_EXT_texture_compression_astc_hdr
typedef VkPhysicalDeviceTextureCompressionASTCHDRFeatures
VkPhysicalDeviceTextureCompressionASTCHDRFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **textureCompressionASTC_HDR** indicates whether all of the ASTC HDR compressed texture formats are supported. If this feature is enabled, then the **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**, **VK_FORMAT_FEATURE_BLIT_SRC_BIT** and **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT** features **must** be supported in **optimalTilingFeatures** for the following formats:
 - **VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK**
 - **VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK**

To query for additional properties, or if the feature is not enabled, **vkGetPhysicalDeviceFormatProperties** and **vkGetPhysicalDeviceImageFormatProperties** can be used to check for supported properties of individual formats as normal.

If the `VkPhysicalDeviceTextureCompressionASTCHDRFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTextureCompressionASTCHDRFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTextureCompressionASTCHDRFeatures-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXTURE_COMPRESSION_ASTC_HDR_FEATURES`

The `VkPhysicalDeviceLineRasterizationFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_line_rasterization
typedef struct VkPhysicalDeviceLineRasterizationFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            rectangularLines;
    VkBool32            bresenhamLines;
    VkBool32            smoothLines;
    VkBool32            stippledRectangularLines;
    VkBool32            stippledBresenhamLines;
    VkBool32            stippledSmoothLines;
} VkPhysicalDeviceLineRasterizationFeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rectangularLines` indicates whether the implementation supports `rectangular` line rasterization.
- `bresenhamLines` indicates whether the implementation supports `Bresenham-style` line rasterization.
- `smoothLines` indicates whether the implementation supports `smooth` line rasterization.
- `stippledRectangularLines` indicates whether the implementation supports `stippled` line rasterization with `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` lines, or with `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT` lines if `VkPhysicalDeviceLimits::strictLines` is `VK_TRUE`.
- `stippledBresenhamLines` indicates whether the implementation supports `stippled` line rasterization with `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT` lines.
- `stippledSmoothLines` indicates whether the implementation supports `stippled` line rasterization with `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT` lines.

If the `VkPhysicalDeviceLineRasterizationFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported.

`VkPhysicalDeviceLineRasterizationFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLineRasterizationFeaturesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_EXT`

The `VkPhysicalDeviceSubgroupSizeControlFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceSubgroupSizeControlFeatures {
    VkStructureType    sType;
    void*            pNext;
    VkBool32          subgroupSizeControl;
    VkBool32          computeFullSubgroups;
} VkPhysicalDeviceSubgroupSizeControlFeatures;
```

or the equivalent

```
// Provided by VK_EXT_subgroup_size_control
typedef VkPhysicalDeviceSubgroupSizeControlFeatures
VkPhysicalDeviceSubgroupSizeControlFeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subgroupSizeControl` indicates whether the implementation supports controlling shader subgroup sizes via the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag and the `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure.
- `computeFullSubgroups` indicates whether the implementation supports requiring full subgroups in compute shaders via the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag.

If the `VkPhysicalDeviceSubgroupSizeControlFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSubgroupSizeControlFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Note

The `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT` structure was added in version 2 of the `VK_EXT_subgroup_size_control` extension. Version 1 implementations of this extension will not fill out the features structure but applications may assume that both `subgroupSizeControl` and `computeFullSubgroups` are supported if the extension is supported. (See also the [Feature Requirements](#) section.) Applications are advised to add a `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT` structure to the `pNext` chain of `VkDeviceCreateInfo` to enable the features regardless of the version of the extension supported by the implementation. If the implementation only supports version 1, it will safely ignore the `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT` structure.

Vulkan 1.3 implementations always support the features structure.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupSizeControlFeatures-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_FEATURES`

The `VkPhysicalDeviceCoherentMemoryFeaturesAMD` structure is defined as:

```
// Provided by VK_AMD_device_coherent_memory
typedef struct VkPhysicalDeviceCoherentMemoryFeaturesAMD {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            deviceCoherentMemory;
} VkPhysicalDeviceCoherentMemoryFeaturesAMD;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceCoherentMemory` indicates that the implementation supports [device coherent memory](#).

If the `VkPhysicalDeviceCoherentMemoryFeaturesAMD` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCoherentMemoryFeaturesAMD` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceCoherentMemoryFeaturesAMD-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COHERENT_MEMORY_FEATURES_AMD`

The `VkPhysicalDeviceAccelerationStructureFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkPhysicalDeviceAccelerationStructureFeaturesKHR {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             accelerationStructure;
    VkBool32             accelerationStructureCaptureReplay;
    VkBool32             accelerationStructureIndirectBuild;
    VkBool32             accelerationStructureHostCommands;
    VkBool32             descriptorBindingAccelerationStructureUpdateAfterBind;
} VkPhysicalDeviceAccelerationStructureFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructure` indicates whether the implementation supports the acceleration structure functionality. See [Acceleration Structures](#).
- `accelerationStructureCaptureReplay` indicates whether the implementation supports saving and reusing acceleration structure device addresses, e.g. for trace capture and replay.
- `accelerationStructureIndirectBuild` indicates whether the implementation supports indirect acceleration structure build commands, e.g. [vkCmdBuildAccelerationStructuresIndirectKHR](#).
- `accelerationStructureHostCommands` indicates whether the implementation supports host side acceleration structure commands, e.g. [vkBuildAccelerationStructuresKHR](#), [vkCopyAccelerationStructureKHR](#), [vkCopyAccelerationStructureToMemoryKHR](#), [vkCopyMemoryToAccelerationStructureKHR](#), [vkWriteAccelerationStructuresPropertiesKHR](#).
- `descriptorBindingAccelerationStructureUpdateAfterBind` indicates whether the implementation supports updating acceleration structure descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` **must** not be used with `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR`.

If the `VkPhysicalDeviceAccelerationStructureFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceAccelerationStructureFeaturesKHR` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceAccelerationStructureFeaturesKHR-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ACCELERATION_STRUCTURE_FEATURES_KHR`

The `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkPhysicalDeviceRayTracingPipelineFeaturesKHR {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             rayTracingPipeline;
    VkBool32             rayTracingPipelineShaderGroupHandleCaptureReplay;
    VkBool32             rayTracingPipelineShaderGroupHandleCaptureReplayMixed;
    VkBool32             rayTracingPipelineTraceRaysIndirect;
    VkBool32             rayTraversalPrimitiveCulling;
} VkPhysicalDeviceRayTracingPipelineFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rayTracingPipeline` indicates whether the implementation supports the ray tracing pipeline functionality. See [Ray Tracing](#).
- `rayTracingPipelineShaderGroupHandleCaptureReplay` indicates whether the implementation supports saving and reusing shader group handles, e.g. for trace capture and replay.
- `rayTracingPipelineShaderGroupHandleCaptureReplayMixed` indicates whether the implementation supports reuse of shader group handles being arbitrarily mixed with creation of non-reused shader group handles. If this is `VK_FALSE`, all reused shader group handles **must** be specified before any non-reused handles **may** be created.
- `rayTracingPipelineTraceRaysIndirect` indicates whether the implementation supports indirect ray tracing commands, e.g. [vkCmdTraceRaysIndirectKHR](#).
- `rayTraversalPrimitiveCulling` indicates whether the implementation supports primitive culling during ray traversal.

If the `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage

- VUID-VkPhysicalDeviceRayTracingPipelineFeaturesKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03575
If `rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is `VK_TRUE`,
`rayTracingPipelineShaderGroupHandleCaptureReplay` must also be `VK_TRUE`

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingPipelineFeaturesKHR-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PIPELINE_FEATURES_KHR`

The `VkPhysicalDeviceRayQueryFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_ray_query
typedef struct VkPhysicalDeviceRayQueryFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayQuery;
} VkPhysicalDeviceRayQueryFeaturesKHR;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rayQuery` indicates whether the implementation supports ray query (`OpRayQueryProceedKHR`) functionality.

If the `VkPhysicalDeviceRayQueryFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayQueryFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayQueryFeaturesKHR-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_QUERY_FEATURES_KHR`

The `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_extended_dynamic_state
typedef struct VkPhysicalDeviceExtendedDynamicStateFeaturesEXT {
    VkStructureType      sType;
    void*                pNext;
    VkBool32              extendedDynamicState;
} VkPhysicalDeviceExtendedDynamicStateFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **extendedDynamicState** indicates that the implementation supports the following dynamic states:
 - **VK_DYNAMIC_STATE_CULL_MODE**
 - **VK_DYNAMIC_STATE_FRONT_FACE**
 - **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY**
 - **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT**
 - **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT**
 - **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE**
 - **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE**
 - **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE**
 - **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP**
 - **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE**
 - **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE**
 - **VK_DYNAMIC_STATE_STENCIL_OP**

If the **VkPhysicalDeviceExtendedDynamicStateFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceExtendedDynamicStateFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExtendedDynamicStateFeaturesEXT-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_FEATURES_EXT**

The **VkPhysicalDeviceExtendedDynamicState2FeaturesEXT** structure is defined as:

```

// Provided by VK_EXT_extended_dynamic_state2
typedef struct VkPhysicalDeviceExtendedDynamicState2FeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           extendedDynamicState2;
    VkBool32           extendedDynamicState2LogicOp;
    VkBool32           extendedDynamicState2PatchControlPoints;
} VkPhysicalDeviceExtendedDynamicState2FeaturesEXT;

```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **extendedDynamicState2** indicates that the implementation supports the following dynamic states:
 - **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE**
 - **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE**
 - **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE**
- **extendedDynamicState2LogicOp** indicates that the implementation supports the following dynamic state:
 - **VK_DYNAMIC_STATE_LOGIC_OP_EXT**
- **extendedDynamicState2PatchControlPoints** indicates that the implementation supports the following dynamic state:
 - **VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT**

If the **VkPhysicalDeviceExtendedDynamicState2FeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceExtendedDynamicState2FeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExtendedDynamicState2FeaturesEXT-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_2_FEATURES_EXT**

The **VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV** structure is defined as:

```
// Provided by VK_NV_device_generated_commands
typedef struct VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           deviceGeneratedCommands;
} VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **deviceGeneratedCommands** indicates whether the implementation supports functionality to generate commands on the device. See [Device-Generated Commands](#).

If the **VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV** can also be used in the **pNext** chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_GENERATED_COMMANDS_FEATURES_NV**

The **VkPhysicalDeviceDiagnosticsConfigFeaturesNV** structure is defined as:

```
// Provided by VK_NV_device_diagnostics_config
typedef struct VkPhysicalDeviceDiagnosticsConfigFeaturesNV {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           diagnosticsConfig;
} VkPhysicalDeviceDiagnosticsConfigFeaturesNV;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **diagnosticsConfig** indicates whether the implementation supports the ability to configure diagnostic tools.

If the **VkPhysicalDeviceDiagnosticsConfigFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceDiagnosticsConfigFeaturesNV** can also be used in the **pNext** chain of

[VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDiagnosticsConfigFeaturesNV-sType-sType
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DIAGNOSTICS_CONFIG_FEATURES_NV

The [VkPhysicalDeviceDeviceMemoryReportFeaturesEXT](#) structure is defined as:

```
// Provided by VK_EXT_device_memory_report
typedef struct VkPhysicalDeviceDeviceMemoryReportFeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32          deviceMemoryReport;
} VkPhysicalDeviceDeviceMemoryReportFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **deviceMemoryReport** indicates whether the implementation supports the ability to register device memory report callbacks.

If the [VkPhysicalDeviceDeviceMemoryReportFeaturesEXT](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. [VkPhysicalDeviceDeviceMemoryReportFeaturesEXT](#) can also be used in the **pNext** chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDeviceMemoryReportFeaturesEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_REPORT_FEATURES_EXT

The [VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR](#) structure is defined as:

```
// Provided by VK_KHR_global_priority
typedef struct VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR {
    VkStructureType    sType;
    void*             pNext;
    VkBool32          globalPriorityQuery;
} VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR;
```

or the equivalent

```
// Provided by VK_EXT_global_priority_query
typedef VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR
VkPhysicalDeviceGlobalPriorityQueryFeaturesEXT;
```

The members of the `VkPhysicalDeviceGlobalPriorityQueryFeaturesEXT` structure describe the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `globalPriorityQuery` indicates whether the implementation supports the ability to query global queue priorities.

If the `VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GLOBAL_PRIORITY_QUERY_FEATURES_KHR`

The `VkPhysicalDevicePipelineCreationCacheControlFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDevicePipelineCreationCacheControlFeatures {
    VkStructureType    sType;
    void*            pNext;
    VkBool32          pipelineCreationCacheControl;
} VkPhysicalDevicePipelineCreationCacheControlFeatures;
```

or the equivalent

```
// Provided by VK_EXT_pipeline_creation_cache_control
typedef VkPhysicalDevicePipelineCreationCacheControlFeatures
VkPhysicalDevicePipelineCreationCacheControlFeaturesEXT;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineCreationCacheControl` indicates that the implementation supports:

- The following **can** be used in `VkPipelineCreateInfo::flags`:
 - `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT`
 - `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`
- The following **can** be used in `VkPipelineCacheCreateInfo::flags`:
 - `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`

If the `VkPhysicalDevicePipelineCreationCacheControlFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelineCreationCacheControlFeatures` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDevicePipelineCreationCacheControlFeatures-sType-sType`
`sType` must be
`VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_CREATION_CACHE_CONTROL_FEATURES`

The `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderZeroInitializeWorkgroupMemory;
} VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures;
```

or the equivalent

```
// Provided by VK_KHR_zero_initialize_workgroup_memory
typedef VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures
VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeaturesKHR;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderZeroInitializeWorkgroupMemory` specifies whether the implementation supports initializing a variable in Workgroup storage class.

If the `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` **can** also be used in the `pNext` chain of

`VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures-sType-sType
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ZERO_INITIALIZE_WORKGROUP_MEMORY_FEATURES` **be**

The `VkPhysicalDevicePrivateDataFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDevicePrivateDataFeatures {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              privateData;
} VkPhysicalDevicePrivateDataFeatures;
```

or the equivalent

```
// Provided by VK_EXT_private_data
typedef VkPhysicalDevicePrivateDataFeatures VkPhysicalDevicePrivateDataFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **privateData** indicates whether the implementation supports private data. See [Private Data](#).

If the `VkPhysicalDevicePrivateDataFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePrivateDataFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePrivateDataFeatures-sType-sType
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIVATE_DATA_FEATURES`

The `VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_shader_subgroup_uniform_control_flow
typedef struct VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR {
    VkStructureType      sType;
    void*                pNext;
    VkBool32              shaderSubgroupUniformControlFlow;
} VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR;
```

This structure describes the following feature:

- `shaderSubgroupUniformControlFlow` specifies whether the implementation supports the shader execution mode `SubgroupUniformControlFlowKHR`

If the `VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SUBGROUP_UNIFORM_CONTROL_FLOW_FEATURES_KHR`

The `VkPhysicalDeviceRobustness2FeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_robustness2
typedef struct VkPhysicalDeviceRobustness2FeaturesEXT {
    VkStructureType      sType;
    void*                pNext;
    VkBool32              robustBufferAccess2;
    VkBool32              robustImageAccess2;
    VkBool32              nullDescriptor;
} VkPhysicalDeviceRobustness2FeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `robustBufferAccess2` indicates whether buffer accesses are tightly bounds-checked against the range of the descriptor. Uniform buffers **must** be bounds-checked to the range of the descriptor, where the range is rounded up to a multiple of `robustUniformBufferSizeAlignment`. Storage buffers **must** be bounds-checked to the range of the descriptor, where the range is rounded up to a multiple of `robustStorageBufferSizeAlignment`. Out of bounds buffer loads will return zero values, and formatted loads will have (0,0,1) values inserted for missing G, B, or A components based on the format.

- `robustImageAccess2` indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. Out of bounds image loads will return zero values, with (0,0,1) values [inserted for missing G, B, or A components](#) based on the format.
- `nullDescriptor` indicates whether descriptors `can` be written with a `VK_NULL_HANDLE` resource or view, which are considered valid to access and act as if the descriptor were bound to nothing.

If the `VkPhysicalDeviceRobustness2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRobustness2FeaturesEXT` [can](#) also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage

- VUID-VkPhysicalDeviceRobustness2FeaturesEXT-robustBufferAccess2-04000
If `robustBufferAccess2` is enabled then `robustBufferAccess` [must](#) also be enabled

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRobustness2FeaturesEXT-sType-sType
`sType` [must](#) be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_FEATURES_EXT`

The `VkPhysicalDeviceImageRobustnessFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceImageRobustnessFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            robustImageAccess;
} VkPhysicalDeviceImageRobustnessFeatures;
```

or the equivalent

```
// Provided by VK_EXT_image_robustness
typedef VkPhysicalDeviceImageRobustnessFeatures
VkPhysicalDeviceImageRobustnessFeaturesEXT;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `robustImageAccess` indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. [Invalid texels](#) resulting from out of bounds image loads will be

replaced as described in [Texel Replacement](#), with either (0,0,1) or (0,0,0) values inserted for missing G, B, or A components based on the format.

If the `VkPhysicalDeviceImageRobustnessFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceImageRobustnessFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageRobustnessFeatures-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ROBUSTNESS_FEATURES`

The `VkPhysicalDeviceShaderTerminateInvocationFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderTerminateInvocationFeatures {
    VkStructureType    sType;
    void*            pNext;
    VkBool32          shaderTerminateInvocation;
} VkPhysicalDeviceShaderTerminateInvocationFeatures;
```

or the equivalent

```
// Provided by VK_KHR_shader_terminate_invocation
typedef VkPhysicalDeviceShaderTerminateInvocationFeatures
VkPhysicalDeviceShaderTerminateInvocationFeaturesKHR;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderTerminateInvocation` specifies whether the implementation supports SPIR-V modules that use the `SPV_KHR_terminate_invocation` extension.

If the `VkPhysicalDeviceShaderTerminateInvocationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderTerminateInvocationFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderTerminateInvocationFeatures-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TERMINATE_INVOCATION_FEATURES`

The `VkPhysicalDeviceCustomBorderColorFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_custom_border_color
typedef struct VkPhysicalDeviceCustomBorderColorFeaturesEXT {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              customBorderColors;
    VkBool32              customBorderColorWithoutFormat;
} VkPhysicalDeviceCustomBorderColorFeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `customBorderColors` indicates that the implementation supports providing a `borderColor` value with one of the following values at sampler creation time:
 - `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
 - `VK_BORDER_COLOR_INT_CUSTOM_EXT`
- `customBorderColorWithoutFormat` indicates that explicit formats are not required for custom border colors and the value of the `format` member of the `VkSamplerCustomBorderColorCreateInfoEXT` structure **may** be `VK_FORMAT_UNDEFINED`. If this feature bit is not set, applications **must** provide the `VkFormat` of the image view(s) being sampled by this sampler in the `format` member of the `VkSamplerCustomBorderColorCreateInfoEXT` structure.

If the `VkPhysicalDeviceCustomBorderColorFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCustomBorderColorFeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCustomBorderColorFeaturesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT`

The `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT` structure is defined as:

```

// Provided by VK_EXT_border_color_swizzle
typedef struct VkPhysicalDeviceBorderColorSwizzleFeaturesEXT {
    VkStructureType      sType;
    void*                pNext;
    VkBool32              borderColorSwizzle;
    VkBool32              borderColorSwizzleFromImage;
} VkPhysicalDeviceBorderColorSwizzleFeaturesEXT;

```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **borderColorSwizzle** indicates that defined values are returned by sampled image operations when used with a sampler that uses a **VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK**, **VK_BORDER_COLOR_INT_OPAQUE_BLACK**, **VK_BORDER_COLOR_FLOAT_CUSTOM_EXT**, or **VK_BORDER_COLOR_INT_CUSTOM_EXT** **borderColor** and an image view that uses a non-**identity component mapping**, when either **borderColorSwizzleFromImage** is enabled or the **VkSamplerBorderColorComponentMappingCreateInfoEXT** is specified.
- **borderColorSwizzleFromImage** indicates that the implementation will return the correct border color values from sampled image operations under the conditions expressed above, without the application having to specify the border color component mapping when creating the sampler object. If this feature bit is not set, applications **can** chain a **VkSamplerBorderColorComponentMappingCreateInfoEXT** structure when creating samplers for use with image views that do not have an **identity swizzle** and, when those samplers are combined with image views using the same component mapping, sampled image operations that use opaque black or custom border colors will return the correct border color values.

If the **VkPhysicalDeviceBorderColorSwizzleFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceBorderColorSwizzleFeaturesEXT** **can** also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBorderColorSwizzleFeaturesEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BORDER_COLOR_SWIZZLE_FEATURES_EXT**

The **VkPhysicalDevicePortabilitySubsetFeaturesKHR** structure is defined as:

```

// Provided by VK_KHR_portability_subset
typedef struct VkPhysicalDevicePortabilitySubsetFeaturesKHR {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           constantAlphaColorBlendFactors;
    VkBool32           events;
    VkBool32           imageViewFormatReinterpretation;
    VkBool32           imageViewFormatSwizzle;
    VkBool32           imageView2DOn3DImage;
    VkBool32           multisampleArrayImage;
    VkBool32           mutableComparisonSamplers;
    VkBool32           pointPolygons;
    VkBool32           samplerMipLodBias;
    VkBool32           separateStencilMaskRef;
    VkBool32           shaderSampleRateInterpolationFunctions;
    VkBool32           tessellationIsolines;
    VkBool32           tessellationPointMode;
    VkBool32           triangleFans;
    VkBool32           vertexAttributeAccessBeyondStride;
} VkPhysicalDevicePortabilitySubsetFeaturesKHR;

```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **constantAlphaColorBlendFactors** indicates whether this implementation supports constant *alpha Blend Factors* used as source or destination *color Blending*.
- **events** indicates whether this implementation supports synchronization using [Events](#).
- **imageViewFormatReinterpretation** indicates whether this implementation supports a [VkImageView](#) being created with a texel format containing a different number of components, or a different number of bits in each component, than the texel format of the underlying [VkImage](#).
- **imageViewFormatSwizzle** indicates whether this implementation supports remapping format components using [VkImageViewCreateInfo::components](#).
- **imageView2DOn3DImage** indicates whether this implementation supports a [VkImage](#) being created with the **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** flag set, permitting a 2D or 2D array image view to be created on a 3D [VkImage](#).
- **multisampleArrayImage** indicates whether this implementation supports a [VkImage](#) being created as a 2D array with multiple samples per texel.
- **mutableComparisonSamplers** indicates whether this implementation allows descriptors with comparison samplers to be [updated](#).
- **pointPolygons** indicates whether this implementation supports [Rasterization](#) using a *point Polygon Mode*.
- **samplerMipLodBias** indicates whether this implementation supports setting a [mipmap LOD bias value](#) when [creating a sampler](#).

- `separateStencilMaskRef` indicates whether this implementation supports separate front and back `Stencil Test` reference values.
- `shaderSampleRateInterpolationFunctions` indicates whether this implementation supports fragment shaders which use the `InterpolationFunction` capability and the extended instructions `InterpolateAtCentroid`, `InterpolateAtOffset`, and `InterpolateAtSample` from the `GLSL.std.450` extended instruction set. This member is only meaningful if the `sampleRateShading` feature is supported.
- `tessellationIsolines` indicates whether this implementation supports `isoline` output from the `Tessellation` stage of a graphics pipeline. This member is only meaningful if `tessellation shaders` are supported.
- `tessellationPointMode` indicates whether this implementation supports `point` output from the `Tessellation` stage of a graphics pipeline. This member is only meaningful if `tessellation shaders` are supported.
- `triangleFans` indicates whether this implementation supports `Triangle Fans` primitive topology.
- `vertexAttributeAccessBeyondStride` indicates whether this implementation supports accessing a vertex input attribute beyond the stride of the corresponding vertex input binding.

If the `VkPhysicalDevicePortabilitySubsetFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePortabilitySubsetFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePortabilitySubsetFeaturesKHR-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PORTABILITY_SUBSET_FEATURES_KHR`

The `VkPhysicalDevicePerformanceQueryFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPhysicalDevicePerformanceQueryFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            performanceCounterQueryPools;
    VkBool32            performanceCounterMultipleQueryPools;
} VkPhysicalDevicePerformanceQueryFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `performanceCounterQueryPools` indicates whether the implementation supports performance counter query pools.

- `performanceCounterMultipleQueryPools` indicates whether the implementation supports using multiple performance query pools in a primary command buffer and secondary command buffers executed within it.

If the `VkPhysicalDevicePerformanceQueryFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePerformanceQueryFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePerformanceQueryFeaturesKHR-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_FEATURES_KHR`

The `VkPhysicalDevice4444FormatsFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_4444_formats
typedef struct VkPhysicalDevice4444FormatsFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            formatA4R4G4B4;
    VkBool32            formatA4B4G4R4;
} VkPhysicalDevice4444FormatsFeaturesEXT;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `formatA4R4G4B4` indicates that the implementation must support using a `VkFormat` of `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT` with at least the following `VkFormatFeatureFlagBits`:
 - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`
 - `VK_FORMAT_FEATURE_BLIT_SRC_BIT`
 - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- `formatA4B4G4R4` indicates that the implementation must support using a `VkFormat` of `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT` with at least the following `VkFormatFeatureFlagBits`:
 - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`
 - `VK_FORMAT_FEATURE_BLIT_SRC_BIT`
 - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

If the `VkPhysicalDevice4444FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice4444FormatsFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDevice4444FormatsFeaturesEXT-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT`

Note

Although the formats defined by the `VK_EXT_4444_formats` extension were promoted to Vulkan 1.3 as optional formats, the `VkPhysicalDevice4444FormatsFeaturesEXT` structure was not promoted to Vulkan 1.3.

The `VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE` structure is defined as:

```
// Provided by VK_VALVE MutableDescriptorType
typedef struct VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             mutableDescriptorType;
} VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mutableDescriptorType` indicates that the implementation **must** support using the `VkDescriptorType` of `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE` with at least the following descriptor types, where any combination of the types **must** be supported:
 - `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`
 - `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`
 - `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`
 - `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`
 - `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`
 - `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`
- Additionally, `mutableDescriptorType` indicates that:
 - Non-uniform descriptor indexing **must** be supported if all descriptor types in a `VkMutableDescriptorTypeListVALVE` for `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE` have the corresponding non-uniform indexing features enabled in `VkPhysicalDeviceDescriptorIndexingFeatures`.
 - `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` with `descriptorType` of `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE` relaxes the list of required descriptor types to the descriptor types which have the corresponding update-after-bind feature enabled in `VkPhysicalDeviceDescriptorIndexingFeatures`.

- Dynamically uniform descriptor indexing **must** be supported if all descriptor types in a `VkMutableDescriptorTypeListVALVE` for `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE` have the corresponding dynamic indexing features enabled.
- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE` **must** be supported.
- `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE` **must** be supported.

If the `VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MUTABLE_DESCRIPTOR_TYPE_FEATURES_VALVE`

The `VkPhysicalDeviceDepthClipControlFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_depth_clip_control
typedef struct VkPhysicalDeviceDepthClipControlFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            depthClipControl;
} VkPhysicalDeviceDepthClipControlFeaturesEXT;
```

The members of the `VkPhysicalDeviceDepthClipControlFeaturesEXT` structure describe the following features:

- `depthClipControl` indicates that the implementation supports setting `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` to `VK_TRUE`.

If the `VkPhysicalDeviceDepthClipControlFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDepthClipControlFeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDepthClipControlFeaturesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_CONTROL_FEATURES_EXT`

The `VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR` structure is defined as:

```

// Provided by VK_KHR_workgroup_memory_explicit_layout
typedef struct VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR {
    VkStructureType      sType;
    void*                pNext;
    VkBool32              workgroupMemoryExplicitLayout;
    VkBool32              workgroupMemoryExplicitLayoutScalarBlockLayout;
    VkBool32              workgroupMemoryExplicitLayout8BitAccess;
    VkBool32              workgroupMemoryExplicitLayout16BitAccess;
} VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR;

```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **workgroupMemoryExplicitLayout** indicates whether the implementation supports the SPIR-V **WorkgroupMemoryExplicitLayoutKHR** capability.
- **workgroupMemoryExplicitLayoutScalarBlockLayout** indicates whether the implementation supports scalar alignment for laying out Workgroup Blocks.
- **workgroupMemoryExplicitLayout8BitAccess** indicates whether objects in the **Workgroup** storage class with the **Block** decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the **WorkgroupMemoryExplicitLayout8BitAccessKHR** capability.
- **workgroupMemoryExplicitLayout16BitAccess** indicates whether objects in the **Workgroup** storage class with the **Block** decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also indicates whether shader modules **can** declare the **WorkgroupMemoryExplicitLayout16BitAccessKHR** capability.

If the **VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR** **can** also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_FEATURES_KHR**

The **VkPhysicalDeviceSynchronization2Features** structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceSynchronization2Features {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           synchronization2;
} VkPhysicalDeviceSynchronization2Features;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkPhysicalDeviceSynchronization2Features
VkPhysicalDeviceSynchronization2FeaturesKHR;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **synchronization2** indicates whether the implementation supports the new set of synchronization commands introduced in [VK_KHR_synchronization2](#).

If the **VkPhysicalDeviceSynchronization2Features** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceSynchronization2Features** can also be used in the **pNext** chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSynchronization2Features-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SYNCHRONIZATION_2_FEATURES**

The **VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT** structure is defined as:

```
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           vertexInputDynamicState;
} VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `vertexInputDynamicState` indicates that the implementation supports the following dynamic states:

- `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT`

If the `VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT-sType-sType`
`sType` must be
`VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_INPUT_DYNAMIC_STATE_FEATURES_EXT`

The `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            pipelineFragmentShadingRate;
    VkBool32            primitiveFragmentShadingRate;
    VkBool32            attachmentFragmentShadingRate;
} VkPhysicalDeviceFragmentShadingRateFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineFragmentShadingRate` indicates that the implementation supports the [pipeline fragment shading rate](#).
- `primitiveFragmentShadingRate` indicates that the implementation supports the [primitive fragment shading rate](#).
- `attachmentFragmentShadingRate` indicates that the implementation supports the [attachment fragment shading rate](#).

If the `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateFeaturesKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_FEATURES_KHR`

The `VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV` structure is defined as:

```
// Provided by VK_NV_fragment_shading_rate_enums
typedef struct VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             fragmentShadingRateEnums;
    VkBool32             supersampleFragmentShadingRates;
    VkBool32             noInvocationFragmentShadingRates;
} VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentShadingRateEnums` indicates that the implementation supports specifying fragment shading rates using the `VkFragmentShadingRateNV` enumerated type.
- `supersampleFragmentShadingRates` indicates that the implementation supports fragment shading rate enum values indicating more than one invocation per fragment.
- `noInvocationFragmentShadingRates` indicates that the implementation supports a fragment shading rate enum value indicating that no fragment shaders should be invoked when that shading rate is used.

If the `VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_ENUMS_FEATURES_NV`

The `VkPhysicalDeviceInheritedViewportScissorFeaturesNV` structure is defined as:

```
// Provided by VK_NV_inherited_viewport_scissor
typedef struct VkPhysicalDeviceInheritedViewportScissorFeaturesNV {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           inheritedViewportScissor2D;
} VkPhysicalDeviceInheritedViewportScissorFeaturesNV;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **inheritedViewportScissor2D** indicates whether secondary command buffers can inherit most of the dynamic state affected by **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT**, **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT**, **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT**, **VK_DYNAMIC_STATE_VIEWPORT** or **VK_DYNAMIC_STATE_SCISSOR**, from a primary command buffer.

If the **VkPhysicalDeviceInheritedViewportScissorFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceInheritedViewportScissorFeaturesNV** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceInheritedViewportScissorFeaturesNV-sType-sType**
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INHERITED_VIEWPORT_SCISSOR_FEATURES_NV**

The **VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT** structure is defined as:

```
// Provided by VK_EXT_ycbcr_2plane_444_formats
typedef struct VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           ycbcr2plane444Formats;
} VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **ycbcr2plane444Formats** indicates that the implementation supports the following 2-plane 444 Y'CbCr formats:
 - **VK_FORMAT_G8_B8R8_2PLANE_444_UNORM**

- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16
- VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16
- VK_FORMAT_G16_B16R16_2PLANE_444_UNORM

If the `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_2_PLANE_444_FORMATS_FEATURES_EXT`

Note

 Although the formats defined by the `VK_EXT_ycbcr_2plane_444_formats` were promoted to Vulkan 1.3 as optional formats, the `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure was not promoted to Vulkan 1.3.

The `VkPhysicalDeviceColorWriteEnableFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_color_write_enable
typedef struct VkPhysicalDeviceColorWriteEnableFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 colorWriteEnable;
} VkPhysicalDeviceColorWriteEnableFeaturesEXT;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `colorWriteEnable` indicates that the implementation supports the dynamic state `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT`.

If the `VkPhysicalDeviceColorWriteEnableFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceColorWriteEnableFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceColorWriteEnableFeaturesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COLOR_WRITE_ENABLE_FEATURES_EXT`

The `VkPhysicalDeviceProvokingVertexFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_provoking_vertex
typedef struct VkPhysicalDeviceProvokingVertexFeaturesEXT {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              provokingVertexLast;
    VkBool32              transformFeedbackPreservesProvokingVertex;
} VkPhysicalDeviceProvokingVertexFeaturesEXT;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `provokingVertexLast` indicates whether the implementation supports the `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT` `provoking vertex mode` for flat shading.
- `transformFeedbackPreservesProvokingVertex` indicates that the order of vertices within each primitive written by transform feedback will preserve the provoking vertex. This does not apply to triangle fan primitives when `transformFeedbackPreservesTriangleFanProvokingVertex` is `VK_FALSE`. `transformFeedbackPreservesProvokingVertex` **must** be `VK_FALSE` when the `VK_EXT_transform_feedback` extension is not supported.

If the `VkPhysicalDeviceProvokingVertexFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceProvokingVertexFeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

When `VkPhysicalDeviceProvokingVertexFeaturesEXT` is in the `pNext` chain of `VkDeviceCreateInfo` but the `transform feedback feature` is not enabled, the value of `transformFeedbackPreservesProvokingVertex` is ignored.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProvokingVertexFeaturesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROVOKING_VERTEX_FEATURES_EXT`

The `VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_pageable_device_local_memory
typedef struct VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           pageableDeviceLocalMemory;
} VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pageableDeviceLocalMemory** indicates that the implementation supports pageable device-local memory and **may** transparently move device-local memory allocations to host-local memory to better share device-local memory with other applications.

If the **VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT-sType-sType

sType	must	be
VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PAGEABLE_DEVICE_LOCAL_MEMORY_FEATURES_EXT		

The **VkPhysicalDeviceMultiDrawFeaturesEXT** structure is defined as:

```
// Provided by VK_EXT_multi_draw
typedef struct VkPhysicalDeviceMultiDrawFeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           multiDraw;
} VkPhysicalDeviceMultiDrawFeaturesEXT;
```

The members of the **VkPhysicalDeviceMultiDrawFeaturesEXT** structure describe the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **multiDraw** indicates that the implementation supports **vkCmdDrawMultiEXT** and **vkCmdDrawMultiIndexedEXT**.

If the **VkPhysicalDeviceMultiDrawFeaturesEXT** structure is included in the **pNext** chain of the

`VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMultiDrawFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiDrawFeaturesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTI_DRAW_FEATURES_EXT`

The `VkPhysicalDeviceRayTracingMotionBlurFeaturesNV` structure is defined as:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkPhysicalDeviceRayTracingMotionBlurFeaturesNV {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            rayTracingMotionBlur;
    VkBool32            rayTracingMotionBlurPipelineTraceRaysIndirect;
} VkPhysicalDeviceRayTracingMotionBlurFeaturesNV;
```

This structure describes the following feature:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rayTracingMotionBlur` indicates whether the implementation supports the motion blur feature.
- `rayTracingMotionBlurPipelineTraceRaysIndirect` indicates whether the implementation supports indirect ray tracing commands with the motion blur feature enabled.

If the `VkPhysicalDeviceRayTracingMotionBlurFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayTracingMotionBlurFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingMotionBlurFeaturesNV-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_MOTION_BLUR_FEATURES_NV`

The `VkPhysicalDeviceSubpassShadingFeaturesHUAWEI` structure is defined as:

```
// Provided by VK_HUAWEI_subpass_shading
typedef struct VkPhysicalDeviceSubpassShadingFeaturesHUAWEI {
    VkStructureType    sType;
    void*            pNext;
    VkBool32           subpassShading;
} VkPhysicalDeviceSubpassShadingFeaturesHUAWEI;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **subpassShading** specifies whether subpass shading is supported.

If the **VkPhysicalDeviceSubpassShadingFeaturesHUAWEI** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceSubpassShadingFeaturesHUAWEI** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubpassShadingFeaturesHUAWEI-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBPASS_SHADING_FEATURES_HUAWEI**

The **VkPhysicalDeviceExternalMemoryRDMAFeaturesNV** structure is defined as:

```
// Provided by VK_NV_external_memory_rdma
typedef struct VkPhysicalDeviceExternalMemoryRDMAFeaturesNV {
    VkStructureType    sType;
    void*            pNext;
    VkBool32           externalMemoryRDMA;
} VkPhysicalDeviceExternalMemoryRDMAFeaturesNV;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **externalMemoryRDMA** indicates whether the implementation has support for the **VK_MEMORY_PROPERTY_RDMA_CAPABLE_BIT_NV** memory property and the **VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV** external memory handle type.

If the **VkPhysicalDeviceExternalMemoryRDMAFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceExternalMemoryRDMAFeaturesNV** can also be used in the **pNext** chain of

[VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalMemoryRDMAFeaturesNV-sType-sType
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_RDMA_FEATURES_NV

The [VkPhysicalDevicePresentIdFeaturesKHR](#) structure is defined as:

```
// Provided by VK_KHR_present_id
typedef struct VkPhysicalDevicePresentIdFeaturesKHR {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              presentId;
} VkPhysicalDevicePresentIdFeaturesKHR;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **presentId** indicates that the implementation supports specifying present ID values in the [VkPresentIdKHR](#) extension to the [VkPresentInfoKHR](#) struct.

If the [VkPhysicalDevicePresentIdFeaturesKHR](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](#) structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. [VkPhysicalDevicePresentIdFeaturesKHR](#) can also be used in the **pNext** chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePresentIdFeaturesKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_ID_FEATURES_KHR

The [VkPhysicalDevicePresentWaitFeaturesKHR](#) structure is defined as:

```
// Provided by VK_KHR_present_wait
typedef struct VkPhysicalDevicePresentWaitFeaturesKHR {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              presentWait;
} VkPhysicalDevicePresentWaitFeaturesKHR;
```

This structure describes the following feature:

- **sType** is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentWait` indicates that the implementation supports `vkWaitForPresentKHR`.

If the `VkPhysicalDevicePresentWaitFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePresentWaitFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePresentWaitFeaturesKHR-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_WAIT_FEATURES_KHR`

The `VkPhysicalDeviceShaderIntegerDotProductFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderIntegerDotProductFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderIntegerDotProduct;
} VkPhysicalDeviceShaderIntegerDotProductFeatures;
```

or the equivalent

```
// Provided by VK_KHR_shader_integer_dot_product
typedef VkPhysicalDeviceShaderIntegerDotProductFeatures
VkPhysicalDeviceShaderIntegerDotProductFeaturesKHR;
```

The members of the `VkPhysicalDeviceShaderIntegerDotProductFeatures` structure describe the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderIntegerDotProduct` specifies whether shader modules can declare the `DotProductInputAllKHR`, `DotProductInput4x8BitKHR`, `DotProductInput4x8BitPackedKHR` and `DotProductKHR` capabilities.

If the `VkPhysicalDeviceShaderIntegerDotProductFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderIntegerDotProductFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderIntegerDotProductFeatures-sType-sType
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_FEATURES`

The `VkPhysicalDeviceMaintenance4Features` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceMaintenance4Features {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           maintenance4;
} VkPhysicalDeviceMaintenance4Features;
```

or the equivalent

```
// Provided by VK_KHR_maintenance4
typedef VkPhysicalDeviceMaintenance4Features VkPhysicalDeviceMaintenance4FeaturesKHR;
```

This structure describes the following features:

- `maintenance4` indicates that the implementation supports the following:
 - The application **may** destroy a `VkPipelineLayout` object immediately after using it to create another object.
 - `LocalSizeId` **can** be used as an alternative to `LocalSize` to specify the local workgroup size with specialization constants.
 - Images created with identical creation parameters will always have the same alignment requirements.
 - The size memory requirement of a buffer or image is never greater than that of another buffer or image created with a greater or equal size.
 - Push constants do not have to be initialized before they are dynamically accessed.
 - The interface matching rules allow a larger output vector to match with a smaller input vector, with additional values being discarded.

If the `VkPhysicalDeviceMaintenance4Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMaintenance4Features` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMaintenance4Features-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_4_FEATURES`

The `VkPhysicalDeviceDynamicRenderingFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceDynamicRenderingFeatures {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           dynamicRendering;
} VkPhysicalDeviceDynamicRenderingFeatures;
```

or the equivalent

```
// Provided by VK_KHR_dynamic_rendering
typedef VkPhysicalDeviceDynamicRenderingFeatures
VkPhysicalDeviceDynamicRenderingFeaturesKHR;
```

The members of the `VkPhysicalDeviceDynamicRenderingFeatures` structure describe the following features:

- `dynamicRendering` specifies that the implementation supports dynamic render pass instances using the `vkCmdBeginRendering` command.

If the `VkPhysicalDeviceDynamicRenderingFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDynamicRenderingFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDynamicRenderingFeatures-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DYNAMIC_RENDERING_FEATURES`

The `VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_rgba10x6_formats
typedef struct VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           formatRgba10x6WithoutYCbCrSampler;
} VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT;
```

The members of the `VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT` structure describe the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `formatRgba10x6WithoutYCbCrSampler` indicates that `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16` can be used with a `VkImageView` with `subresourceRange.aspectMask` equal to `VK_IMAGE_ASPECT_COLOR_BIT` without a sampler $Y'C_BC_R$ conversion enabled.

If the `VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RGBA10X6_FORMATS_FEATURES_EXT`

The `VkPhysicalDeviceImageViewMinLodFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_image_view_min_lod
typedef struct VkPhysicalDeviceImageViewMinLodFeaturesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           minLod;
} VkPhysicalDeviceImageViewMinLodFeaturesEXT;
```

This structure describes the following features:

- `minLod` indicates whether the implementation supports clamping the minimum LOD value during `Image Level(s) Selection` and `Integer Texel Coordinate Operations` with a given `VkImageView` by `VkImageViewMinLodCreateInfoEXT::minLod`.

If the `VkPhysicalDeviceImageViewMinLodFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceImageViewMinLodFeaturesEXT` can also be used in the `pNext` chain of

`VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageViewMinLodFeaturesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_VIEW_MIN_LOD_FEATURES_EXT`

The `VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM` structure is defined as:

```
// Provided by VK_ARM_rasterization_order_attachment_access
typedef struct VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             rasterizationOrderColorAttachmentAccess;
    VkBool32             rasterizationOrderDepthAttachmentAccess;
    VkBool32             rasterizationOrderStencilAttachmentAccess;
} VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM;
```

The members of the `VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM` structure describe the following features:

- `rasterizationOrderColorAttachmentAccess` indicates that rasterization order access to color and input attachments is supported by the implementation.
- `rasterizationOrderDepthAttachmentAccess` indicates that rasterization order access to the depth aspect of depth/stencil and input attachments is supported by the implementation.
- `rasterizationOrderStencilAttachmentAccess` indicates that rasterization order access to the stencil aspect of depth/stencil and input attachments is supported by the implementation.

If the `VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM` structure is included in the `pNext` chain of `VkPhysicalDeviceFeatures2`, it is filled with values indicating whether the feature is supported. `VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to enable features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_FEATURES_ARM`

The `VkPhysicalDeviceLinearColorAttachmentFeaturesNV` structure is defined as:

```
// Provided by VK_NV_linear_color_attachment
typedef struct VkPhysicalDeviceLinearColorAttachmentFeaturesNV {
    VkStructureType      sType;
    void*                pNext;
    VkBool32              linearColorAttachment;
} VkPhysicalDeviceLinearColorAttachmentFeaturesNV;
```

This structure describes the following features:

- **linearColorAttachment** indicates whether the implementation supports renderable [Linear Color Attachment](#)

If the **VkPhysicalDeviceLinearColorAttachmentFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to [vkGetPhysicalDeviceFeatures2](#), it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceLinearColorAttachmentFeaturesNV** can also be used in the **pNext** chain of [VkDeviceCreateInfo](#) to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLinearColorAttachmentFeaturesNV-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINEAR_COLOR_ATTACHMENT_FEATURES_NV**

41.1. Feature Requirements

All Vulkan graphics implementations **must** support the following features:

- **robustBufferAccess**, unless the [VK_KHR_portability_subset](#) extension is enabled.
- **multiview**, if Vulkan 1.1 is supported.
- **shaderDrawParameters**, if the [VK_KHR_shader_draw_parameters](#) extension is supported.
- **uniformBufferStandardLayout**, if Vulkan 1.2 or the [VK_KHR_uniform_buffer_standard_layout](#) extension is supported.
- **variablePointersStorageBuffer**, if the [VK_KHR_variable_pointers](#) extension is supported.
- **storageBuffer8BitAccess**, if the [VK_KHR_8bit_storage](#) extension is supported.
- **storageBuffer8BitAccess**, if **uniformAndStorageBuffer8BitAccess** is enabled.
- If the **descriptorIndexing** feature is supported, or if the [VK_EXT_descriptor_indexing](#) extension is supported:
 - **shaderSampledImageArrayDynamicIndexing**
 - **shaderStorageBufferArrayDynamicIndexing**
 - **shaderUniformTexelBufferArrayDynamicIndexing**
 - **shaderStorageTexelBufferArrayDynamicIndexing**
 - **shaderSampledImageArrayNonUniformIndexing**

- `shaderStorageBufferArrayNonUniformIndexing`
 - `shaderUniformTexelBufferArrayNonUniformIndexing`
 - `descriptorBindingSampledImageUpdateAfterBind`
 - `descriptorBindingStorageImageUpdateAfterBind`
 - `descriptorBindingStorageBufferUpdateAfterBind` (see also `robustBufferAccessUpdateAfterBind`)
 - `descriptorBindingUniformTexelBufferUpdateAfterBind` (see also `robustBufferAccessUpdateAfterBind`)
 - `descriptorBindingStorageTexelBufferUpdateAfterBind` (see also `robustBufferAccessUpdateAfterBind`)
 - `descriptorBindingUpdateUnusedWhilePending`
 - `descriptorBindingPartiallyBound`
 - `runtimeDescriptorArray`
- If Vulkan 1.3 is supported:
 - `vulkanMemoryModel`
 - `vulkanMemoryModelDeviceScope`
 - `inlineUniformBlock`, if Vulkan 1.3 or the `VK_EXT_inline_uniform_block` extension is supported.
 - `descriptorBindingInlineUniformBlockUpdateAfterBind`, if Vulkan 1.3 or the `VK_EXT_inline_uniform_block` extension is supported; and if the `descriptorIndexing` feature is supported, or the `VK_EXT_descriptor_indexing` extension is supported.
 - `scalarBlockLayout`, if the `VK_EXT_scalar_block_layout` extension is supported.
 - `subgroupBroadcastDynamicId`, if Vulkan 1.2 is supported.
 - `samplerMirrorClampToEdge`, if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is supported.
 - `drawIndirectCount`, if the `VK_KHR_draw_indirect_count` extension is supported.
 - `samplerFilterMinmax`, if the `VK_EXT_sampler_filter_minmax` extension is supported.
 - `shaderOutputViewportIndex`, if the `VK_EXT_shader_viewport_index_layer` extension is supported.
 - `shaderOutputLayer`, if the `VK_EXT_shader_viewport_index_layer` extension is supported.
 - `subgroupSizeControl`, if Vulkan 1.3 or the `VK_EXT_subgroup_size_control` extension is supported.
 - `computeFullSubgroups`, if Vulkan 1.3 or the `VK_EXT_subgroup_size_control` extension is supported.
 - `deviceMemoryReport`, if the `VK_EXT_device_memory_report` extension is supported.
 - `globalPriorityQuery`, if the `VK_EXT_global_priority_query` extension is supported.
 - `globalPriorityQuery`, if the `VK_KHR_global_priority` extension is supported.
 - `imagelessFramebuffer`, if Vulkan 1.2 or the `VK_KHR_imageless_framebuffer` extension is supported.
 - `separateDepthStencilLayouts`, if Vulkan 1.2 or the `VK_KHR_separate_depth_stencil_layouts` extension is supported.
 - `hostQueryReset`, if Vulkan 1.2 or the `VK_EXT_host_query_reset` extension is supported.
 - `timelineSemaphore`, if Vulkan 1.2 or the `VK_KHR_timeline_semaphore` extension is supported.

- If the `VK_KHR_acceleration_structure` extension is supported:
 - `accelerationStructure`
 - All the features required by the `descriptorIndexing` feature if Vulkan 1.2 is supported, or the `VK_EXT_descriptor_indexing` extension.
 - `descriptorBindingAccelerationStructureUpdateAfterBind`
 - `bufferDeviceAddress` from Vulkan 1.2 or the `VK_KHR_buffer_device_address` extension.
- If the `VK_KHR_ray_tracing_pipeline` extension is supported:
 - `accelerationStructure` from `VK_KHR_acceleration_structure`
 - `rayTracingPipeline`
 - `rayTracingPipelineTraceRaysIndirect`
 - `rayTraversalPrimitiveCulling`, if `rayQuery` is supported from `VK_KHR_ray_query`
 - the `VK_KHR_pipeline_library` extension.
- If the `VK_KHR_ray_query` extension is supported:
 - `accelerationStructure` from `VK_KHR_acceleration_structure`
 - `rayQuery`
- `pipelineCreationCacheControl`, if Vulkan 1.3 or the `VK_EXT_pipeline_creation_cache_control` extension is supported.
- `shaderSubgroupExtendedTypes`, if Vulkan 1.2 or the `VK_KHR_shader_subgroup_extended_types` extension is supported.
- `samplerYcbcrConversion`, if the `VK_KHR_sampler_ycbcr_conversion` extension is supported.
- `pipelineExecutableInfo`, if the `VK_KHR_pipeline_executable_properties` extension is supported.
- `textureCompressionASTC_HDR`, if the `VK_EXT_texture_compression_astc_hdr` extension is supported.
- `depthClipEnable`, if the `VK_EXT_depth_clip_enable` extension is supported.
- `memoryPriority`, if the `VK_EXT_memory_priority` extension is supported.
- `ycbcrImageArrays`, if the `VK_EXT_ycbcr_image_arrays` extension is supported.
- `indexTypeUInt8`, if the `VK_EXT_index_type_uint8` extension is supported.
- `primitiveTopologyListRestart`, if the `VK_EXT_primitive_topology_list_restart` extension is supported.
- `shaderDemoteToHelperInvocation`, if Vulkan 1.3 or the `VK_EXT_shader_demote_to_helper_invocation` extension is supported.
- `texelBufferAlignment`, if Vulkan 1.3 or the `VK_EXT_texel_buffer_alignment` extension is supported.
- `vulkanMemoryModel`, if the `VK_KHR_vulkan_memory_model` extension is supported.
- `bufferDeviceAddress`, if Vulkan 1.3 or the `VK_KHR_buffer_device_address` extension is supported.
- `performanceCounterQueryPools`, if the `VK_KHR_performance_query` extension is supported.
- `transformFeedback`, if the `VK_EXT_transform_feedback` extension is supported.
- `conditionalRendering`, if the `VK_EXT_conditional_rendering` extension is supported.

- `vertexAttributeInstanceRateDivisor`, if the `VK_EXT_vertex_attribute_divisor` extension is supported.
- `fragmentDensityMap`, if the `VK_EXT_fragment_density_map` extension is supported.
- `shaderSubgroupClock`, if the `VK_KHR_shader_clock` extension is supported.
- `shaderBufferInt64Atomics`, if the `VK_KHR_shader_atomic_int64` extension is supported.
- `shaderInt64`, if the `shaderSharedInt64Atomics` or `shaderBufferInt64Atomics` features are supported.
- `shaderFloat16` or `shaderInt8`, if the `VK_KHR_shader_float16_int8` extension is supported.
- `fragmentShaderSampleInterlock` or `fragmentShaderPixelInterlock` or `fragmentShaderShadingRateInterlock`, if the `VK_EXT_fragment_shader_interlock` extension is supported.
- `rectangularLines` or `bresenhamLines` or `smoothLines` or `stippledRectangularLines` or `stippledBresenhamLines` or `stippledSmoothLines`, if the `VK_EXT_line_rasterization` extension is supported.
- `storageBuffer16BitAccess`, if the `VK_KHR_16bit_storage` extension is supported.
- `storageBuffer16BitAccess`, if `uniformAndStorageBuffer16BitAccess` is enabled.
- `robustImageAccess`, if Vulkan 1.3 or the `VK_EXT_image_robustness` extension is supported.
- `formatA4R4G4B4`, if the `VK_EXT_4444_formats` extension is supported.
- `mutableDescriptorType`, if the `VK_VALVE_mutable_descriptor_type` extension is supported.
- `shaderInt64` and `shaderImageInt64Atomics`, if the `VK_EXT_shader_image_atomic_int64` extension is supported.
- `shaderImageInt64Atomics`, if the `sparseImageInt64Atomics` feature is supported.
- `shaderImageFloat32Atomics`, if the `sparseImageFloat32Atomics` feature is supported.
- `shaderImageFloat32AtomicAdd`, if the `sparseImageFloat32AtomicAdd` feature is supported.
- `pipelineFragmentShadingRate`, if the `VK_KHR_fragment_shading_rate` extension is supported.
- `shaderTerminateInvocation` if Vulkan 1.3 or the `VK_KHR_shader_terminate_invocation` extension is supported.
- `shaderZeroInitializeWorkgroupMemory`, if Vulkan 1.3 or the `VK_KHR_zero_initialize_workgroup_memory` extension is supported.
- `workgroupMemoryExplicitLayout`, if the `VK_KHR_workgroup_memory_explicit_layout` extension is supported.
- `vertexInputDynamicState`, if the `VK_EXT_vertex_input_dynamic_state` extension is supported.
- `synchronization2` if Vulkan 1.3 or the `VK_KHR_synchronization2` extension is supported.
- `provokingVertexLast`, if the `VK_EXT_provoking_vertex` extension is supported.
- `shaderSubgroupUniformControlFlow`, if the `VK_KHR_shader_subgroup_uniform_control_flow` extension is supported.
- `borderColorSwizzle` if the `VK_EXT_border_color_swizzle` extension is supported.
- `multiDraw`, if the `VK_EXT_multi_draw` extension is supported.

- `shaderImageFloat32AtomicMinMax`, if the `sparseImageFloat32AtomicMinMax` feature is supported.
- `presentId`, if the `VK_KHR_present_id` extension is supported.
- `presentWait`, if the `VK_KHR_present_wait` extension is supported.
- `shaderIntegerDotProduct` if Vulkan 1.3 or the `VK_KHR_shader_integer_dot_product` extension is supported.
- `maintenance4`, if Vulkan 1.3 or the `VK_KHR_maintenance4` extension is supported.
- `privateData`, if Vulkan 1.3 or the `VK_EXT_private_data` extension is supported.
- `extendedDynamicState`, if the `VK_EXT_extended_dynamic_state` extension is supported.
- `extendedDynamicState2`, if the `VK_EXT_extended_dynamic_state2` extension is supported.
- `depthClipControl`, if the `VK_EXT_depth_clip_control` extension is supported.
- `minLod`, if the `VK_EXT_image_view_min_lod` extension is supported.
- `linearColorAttachment`, if the `VK_NV_linear_color_attachment` extension is supported.
- `dynamicRendering`, if Vulkan 1.3 or the `VK_KHR_dynamic_rendering` extension is supported.

All other features defined in the Specification are **optional**.

41.2. Profile Features

41.2.1. Roadmap 2022

Implementations that claim support for the `Roadmap 2022` profile **must** support the following features:

- `fullDrawIndexUint32`
- `imageCubeArray`
- `independentBlend`
- `sampleRateShading`
- `drawIndirectFirstInstance`
- `depthClamp`
- `depthBiasClamp`
- `samplerAnisotropy`
- `occlusionQueryPrecise`
- `fragmentStoresAndAtomics`
- `shaderStorageImageExtendedFormats`
- `shaderUniformBufferArrayDynamicIndexing`
- `shaderSampledImageArrayDynamicIndexing`
- `shaderStorageBufferArrayDynamicIndexing`
- `shaderStorageImageArrayDynamicIndexing`

- `samplerYcbcrConversion`
- `samplerMirrorClampToEdge`
- `descriptorIndexing`
- `shaderUniformTexelBufferArrayDynamicIndexing`
- `shaderStorageTexelBufferArrayDynamicIndexing`
- `shaderUniformBufferArrayNonUniformIndexing`
- `shaderSampledImageArrayNonUniformIndexing`
- `shaderStorageBufferArrayNonUniformIndexing`
- `shaderStorageImageArrayNonUniformIndexing`
- `shaderUniformTexelBufferArrayNonUniformIndexing`
- `shaderStorageTexelBufferArrayNonUniformIndexing`
- `descriptorBindingSampledImageUpdateAfterBind`
- `descriptorBindingStorageImageUpdateAfterBind`
- `descriptorBindingStorageBufferUpdateAfterBind`
- `descriptorBindingUniformTexelBufferUpdateAfterBind`
- `descriptorBindingStorageTexelBufferUpdateAfterBind`
- `descriptorBindingUpdateUnusedWhilePending`
- `descriptorBindingPartiallyBound`
- `descriptorBindingVariableDescriptorCount`
- `runtimeDescriptorArray`
- `scalarBlockLayout`

Chapter 42. Limits

Limits are implementation-dependent minimums, maximums, and other device characteristics that an application **may** need to be aware of.

Note

Limits are reported via the basic `VkPhysicalDeviceLimits` structure as well as the extensible structure `VkPhysicalDeviceProperties2`, which was added in `VK_KHR_get_physical_device_properties2` and included in Vulkan 1.1. When limits are added in future Vulkan versions or extensions, each extension **should** introduce one new limit structure, if needed. This structure **can** be added to the `pNext` chain of the `VkPhysicalDeviceProperties2` structure.

The `VkPhysicalDeviceLimits` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceLimits {
    uint32_t          maxImageDimension1D;
    uint32_t          maxImageDimension2D;
    uint32_t          maxImageDimension3D;
    uint32_t          maxImageDimensionCube;
    uint32_t          maxImageArrayLayers;
    uint32_t          maxTexelBufferElements;
    uint32_t          maxUniformBufferRange;
    uint32_t          maxStorageBufferRange;
    uint32_t          maxPushConstantsSize;
    uint32_t          maxMemoryAllocationCount;
    uint32_t          maxSamplerAllocationCount;
    VkDeviceSize      bufferImageGranularity;
    VkDeviceSize      sparseAddressSpaceSize;
    uint32_t          maxBoundDescriptorSets;
    uint32_t          maxPerStageDescriptorSamplers;
    uint32_t          maxPerStageDescriptorUniformBuffers;
    uint32_t          maxPerStageDescriptorStorageBuffers;
    uint32_t          maxPerStageDescriptorSampledImages;
    uint32_t          maxPerStageDescriptorStorageImages;
    uint32_t          maxPerStageDescriptorInputAttachments;
    uint32_t          maxPerStageResources;
    uint32_t          maxDescriptorSetSamplers;
    uint32_t          maxDescriptorSetUniformBuffers;
    uint32_t          maxDescriptorSetUniformBuffersDynamic;
    uint32_t          maxDescriptorSetStorageBuffers;
    uint32_t          maxDescriptorSetStorageBuffersDynamic;
    uint32_t          maxDescriptorSetSampledImages;
    uint32_t          maxDescriptorSetStorageImages;
    uint32_t          maxDescriptorSetInputAttachments;
    uint32_t          maxVertexInputAttributes;
    uint32_t          maxVertexInputBindings;
    uint32_t          maxVertexInputAttributeOffset;
```

```
uint32_t          maxVertexInputBindingStride;
uint32_t          maxVertexOutputComponents;
uint32_t          maxTessellationGenerationLevel;
uint32_t          maxTessellationPatchSize;
uint32_t          maxTessellationControlPerVertexInputComponents;
uint32_t          maxTessellationControlPerVertexOutputComponents;
uint32_t          maxTessellationControlPerPatchOutputComponents;
uint32_t          maxTessellationControlTotalOutputComponents;
uint32_t          maxTessellationEvaluationInputComponents;
uint32_t          maxTessellationEvaluationOutputComponents;
uint32_t          maxGeometryShaderInvocations;
uint32_t          maxGeometryInputComponents;
uint32_t          maxGeometryOutputComponents;
uint32_t          maxGeometryOutputVertices;
uint32_t          maxGeometryTotalOutputComponents;
uint32_t          maxFragmentInputComponents;
uint32_t          maxFragmentOutputAttachments;
uint32_t          maxFragmentDualSrcAttachments;
uint32_t          maxFragmentCombinedOutputResources;
uint32_t          maxComputeSharedMemorySize;
uint32_t          maxComputeWorkGroupCount[3];
uint32_t          maxComputeWorkGroupInvocations;
uint32_t          maxComputeWorkGroupSize[3];
uint32_t          subPixelPrecisionBits;
uint32_t          subTexelPrecisionBits;
uint32_t          mipmapPrecisionBits;
uint32_t          maxDrawIndexedIndexValue;
uint32_t          maxDrawIndirectCount;
float             maxSamplerLodBias;
float             maxSamplerAnisotropy;
uint32_t          maxViewports;
uint32_t          maxViewportDimensions[2];
float             viewportBoundsRange[2];
uint32_t          viewportSubPixelBits;
size_t            minMemoryMapAlignment;
VkDeviceSize      minTexelBufferOffsetAlignment;
VkDeviceSize      minUniformBufferOffsetAlignment;
VkDeviceSize      minStorageBufferOffsetAlignment;
int32_t           minTexelOffset;
uint32_t          maxTexelOffset;
int32_t           minTexelGatherOffset;
uint32_t          maxTexelGatherOffset;
float             minInterpolationOffset;
float             maxInterpolationOffset;
uint32_t          subPixelInterpolationOffsetBits;
uint32_t          maxFrameBufferSize;
uint32_t          maxFramebufferHeight;
uint32_t          maxFramebufferLayers;
VkSampleCountFlags framebufferColorSampleCounts;
VkSampleCountFlags framebufferDepthSampleCounts;
VkSampleCountFlags framebufferStencilSampleCounts;
```

```

VkSampleCountFlags    framebufferNoAttachmentsSampleCounts;
uint32_t              maxColorAttachments;
VkSampleCountFlags    sampledImageColorSampleCounts;
VkSampleCountFlags    sampledImageIntegerSampleCounts;
VkSampleCountFlags    sampledImageDepthSampleCounts;
VkSampleCountFlags    sampledImageStencilSampleCounts;
VkSampleCountFlags    storageImageSampleCounts;
uint32_t              maxSampleMaskWords;
VkBool32              timestampComputeAndGraphics;
float                timestampPeriod;
uint32_t              maxClipDistances;
uint32_t              maxCullDistances;
uint32_t              maxCombinedClipAndCullDistances;
uint32_t              discreteQueuePriorities;
float                pointSizeRange[2];
float                lineWidthRange[2];
float                pointSizeGranularity;
float                lineWidthGranularity;
VkBool32              strictLines;
VkBool32              standardSampleLocations;
VkDeviceSize           optimalBufferCopyOffsetAlignment;
VkDeviceSize           optimalBufferCopyRowPitchAlignment;
VkDeviceSize           nonCoherentAtomSize;
} VKPhysicalDeviceLimits;

```

The `VkPhysicalDeviceLimits` are properties of the physical device. These are available in the `limits` member of the `VkPhysicalDeviceProperties` structure which is returned from `vkGetPhysicalDeviceProperties`.

- `maxImageDimension1D` is the largest dimension (`width`) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_1D`. Some combinations of image parameters (format, usage, etc.) **may** allow support for larger dimensions, which **can** be queried using `vkGetPhysicalDeviceImageFormatProperties`.
- `maxImageDimension2D` is the largest dimension (`width` or `height`) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_2D` and without `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` set in `flags`. Some combinations of image parameters (format, usage, etc.) **may** allow support for larger dimensions, which **can** be queried using `vkGetPhysicalDeviceImageFormatProperties`.
- `maxImageDimension3D` is the largest dimension (`width`, `height`, or `depth`) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_3D`. Some combinations of image parameters (format, usage, etc.) **may** allow support for larger dimensions, which **can** be queried using `vkGetPhysicalDeviceImageFormatProperties`.
- `maxImageDimensionCube` is the largest dimension (`width` or `height`) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_2D` and with `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` set in `flags`. Some combinations of image parameters (format, usage, etc.) **may** allow support for larger dimensions, which **can** be queried using `vkGetPhysicalDeviceImageFormatProperties`.
- `maxImageArrayLayers` is the maximum number of layers (`arrayLayers`) for an image.

- `maxTexelBufferElements` is the maximum number of addressable texels for a buffer view created on a buffer which was created with the `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` set in the `usage` member of the `VkBufferCreateInfo` structure.
- `maxUniformBufferRange` is the maximum value that **can** be specified in the `range` member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`.
- `maxStorageBufferRange` is the maximum value that **can** be specified in the `range` member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.
- `maxPushConstantsSize` is the maximum size, in bytes, of the pool of push constant memory. For each of the push constant ranges indicated by the `pPushConstantRanges` member of the `VkPipelineLayoutCreateInfo` structure, `(offset + size)` **must** be less than or equal to this limit.
- `maxMemoryAllocationCount` is the maximum number of device memory allocations, as created by `vkAllocateMemory`, which **can** simultaneously exist.
- `maxSamplerAllocationCount` is the maximum number of sampler objects, as created by `vkCreateSampler`, which **can** simultaneously exist on a device.
- `bufferImageGranularity` is the granularity, in bytes, at which buffer or linear image resources, and optimal image resources **can** be bound to adjacent offsets in the same `VkDeviceMemory` object without aliasing. See [Buffer-Image Granularity](#) for more details.
- `sparseAddressSpaceSize` is the total amount of address space available, in bytes, for sparse memory resources. This is an upper bound on the sum of the sizes of all sparse resources, regardless of whether any memory is bound to them.
- `maxBoundDescriptorSets` is the maximum number of descriptor sets that **can** be simultaneously used by a pipeline. All `DescriptorSet` decorations in shader modules **must** have a value less than `maxBoundDescriptorSets`. See [Descriptor Sets](#).
- `maxPerStageDescriptorSamplers` is the maximum number of samplers that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Sampler](#) and [Combined Image Sampler](#).
- `maxPerStageDescriptorUniformBuffers` is the maximum number of uniform buffers that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Uniform Buffer](#) and [Dynamic Uniform Buffer](#).
- `maxPerStageDescriptorStorageBuffers` is the maximum number of storage buffers that **can** be

accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Storage Buffer](#) and [Dynamic Storage Buffer](#).

- `maxPerStageDescriptorSampledImages` is the maximum number of sampled images that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Combined Image Sampler](#), [Sampled Image](#), and [Uniform Texel Buffer](#).
- `maxPerStageDescriptorStorageImages` is the maximum number of storage images that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See [Storage Image](#), and [Storage Texel Buffer](#).
- `maxPerStageDescriptorInputAttachments` is the maximum number of input attachments that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. These are only supported for the fragment stage. See [Input Attachment](#).
- `maxPerStageResources` is the maximum number of resources that **can** be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. For the fragment shader stage the framebuffer color attachments also count against this limit.
- `maxDescriptorSetSamplers` is the maximum number of samplers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Sampler](#) and [Combined Image Sampler](#).

- `maxDescriptorSetUniformBuffers` is the maximum number of uniform buffers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Uniform Buffer](#) and [Dynamic Uniform Buffer](#).
- `maxDescriptorSetUniformBuffersDynamic` is the maximum number of dynamic uniform buffers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Dynamic Uniform Buffer](#).
- `maxDescriptorSetStorageBuffers` is the maximum number of storage buffers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Storage Buffer](#) and [Dynamic Storage Buffer](#).
- `maxDescriptorSetStorageBuffersDynamic` is the maximum number of dynamic storage buffers that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Dynamic Storage Buffer](#).
- `maxDescriptorSetSampledImages` is the maximum number of sampled images that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Combined Image Sampler](#), [Sampled Image](#), and [Uniform Texel Buffer](#).
- `maxDescriptorSetStorageImages` is the maximum number of storage images that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Storage Image](#), and [Storage Texel Buffer](#).
- `maxDescriptorSetInputAttachments` is the maximum number of input attachments that **can** be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See [Input Attachment](#).
- `maxVertexInputAttributes` is the maximum number of vertex input attributes that **can** be specified for a graphics pipeline. These are described in the array of `VkVertexInputAttributeDescription` structures that are provided at graphics pipeline creation time via the `pVertexAttributeDescriptions` member of the `VkPipelineVertexInputStateCreateInfo` structure. See [Vertex Attributes](#) and [Vertex Input Description](#).

- `maxVertexInputBindings` is the maximum number of vertex buffers that **can** be specified for providing vertex attributes to a graphics pipeline. These are described in the array of `VkVertexInputBindingDescription` structures that are provided at graphics pipeline creation time via the `pVertexBindingDescriptions` member of the `VkPipelineVertexInputStateCreateInfo` structure. The `binding` member of `VkVertexInputBindingDescription` **must** be less than this limit. See [Vertex Input Description](#).
- `maxVertexInputAttributeOffset` is the maximum vertex input attribute offset that **can** be added to the vertex input binding stride. The `offset` member of the `VkVertexInputAttributeDescription` structure **must** be less than or equal to this limit. See [Vertex Input Description](#).
- `maxVertexInputBindingStride` is the maximum vertex input binding stride that **can** be specified in a vertex input binding. The `stride` member of the `VkVertexInputBindingDescription` structure **must** be less than or equal to this limit. See [Vertex Input Description](#).
- `maxVertexOutputComponents` is the maximum number of components of output variables which **can** be output by a vertex shader. See [Vertex Shaders](#).
- `maxTessellationGenerationLevel` is the maximum tessellation generation level supported by the fixed-function tessellation primitive generator. See [Tessellation](#).
- `maxTessellationPatchSize` is the maximum patch size, in vertices, of patches that **can** be processed by the tessellation control shader and tessellation primitive generator. The `patchControlPoints` member of the `VkPipelineTessellationStateCreateInfo` structure specified at pipeline creation time and the value provided in the `OutputVertices` execution mode of shader modules **must** be less than or equal to this limit. See [Tessellation](#).
- `maxTessellationControlPerVertexInputComponents` is the maximum number of components of input variables which **can** be provided as per-vertex inputs to the tessellation control shader stage.
- `maxTessellationControlPerVertexOutputComponents` is the maximum number of components of per-vertex output variables which **can** be output from the tessellation control shader stage.
- `maxTessellationControlPerPatchOutputComponents` is the maximum number of components of per-patch output variables which **can** be output from the tessellation control shader stage.
- `maxTessellationControlTotalOutputComponents` is the maximum total number of components of per-vertex and per-patch output variables which **can** be output from the tessellation control shader stage.
- `maxTessellationEvaluationInputComponents` is the maximum number of components of input variables which **can** be provided as per-vertex inputs to the tessellation evaluation shader stage.
- `maxTessellationEvaluationOutputComponents` is the maximum number of components of per-vertex output variables which **can** be output from the tessellation evaluation shader stage.
- `maxGeometryShaderInvocations` is the maximum invocation count supported for instanced geometry shaders. The value provided in the `Invocations` execution mode of shader modules **must** be less than or equal to this limit. See [Geometry Shading](#).
- `maxGeometryInputComponents` is the maximum number of components of input variables which **can** be provided as inputs to the geometry shader stage.
- `maxGeometryOutputComponents` is the maximum number of components of output variables which

can be output from the geometry shader stage.

- `maxGeometryOutputVertices` is the maximum number of vertices which can be emitted by any geometry shader.
- `maxGeometryTotalOutputComponents` is the maximum total number of components of output variables, across all emitted vertices, which can be output from the geometry shader stage.
- `maxFragmentInputComponents` is the maximum number of components of input variables which can be provided as inputs to the fragment shader stage.
- `maxFragmentOutputAttachments` is the maximum number of output attachments which can be written to by the fragment shader stage.
- `maxFragmentDualSrcAttachments` is the maximum number of output attachments which can be written to by the fragment shader stage when blending is enabled and one of the dual source blend modes is in use. See [Dual-Source Blending](#) and `dualSrcBlend`.
- `maxFragmentCombinedOutputResources` is the total number of storage buffers, storage images, and output [Location](#) decorated color attachments (described in [Fragment Output Interface](#)) which can be used in the fragment shader stage.
- `maxComputeSharedMemorySize` is the maximum total storage size, in bytes, available for variables declared with the `Workgroup` storage class in shader modules (or with the `shared` storage qualifier in GLSL) in the compute shader stage. When variables declared with the `Workgroup` storage class are explicitly laid out (hence they are also decorated with `Block`), the amount of storage consumed is the size of the largest Block variable, not counting any padding at the end. The amount of storage consumed by the non-Block variables declared with the `Workgroup` storage class is implementation-dependent. However, the amount of storage consumed may not exceed the largest block size that would be obtained if all active non-Block variables declared with `Workgroup` storage class were assigned offsets in an arbitrary order by successively taking the smallest valid offset according to the [Standard Storage Buffer Layout](#) rules. (This is equivalent to using the GLSL `std430` layout rules.)
- `maxComputeWorkGroupCount`[3] is the maximum number of local workgroups that can be dispatched by a single dispatching command. These three values represent the maximum number of local workgroups for the X, Y, and Z dimensions, respectively. The workgroup count parameters to the dispatching commands must be less than or equal to the corresponding limit. See [Dispatching Commands](#).
- `maxComputeWorkGroupInvocations` is the maximum total number of compute shader invocations in a single local workgroup. The product of the X, Y, and Z sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode in shader modules or by the object decorated by the `WorkgroupSize` decoration, must be less than or equal to this limit.
- `maxComputeWorkGroupSize`[3] is the maximum size of a local compute workgroup, per dimension. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The `x`, `y`, and `z` sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode or by the object decorated by the `WorkgroupSize` decoration in shader modules, must be less than or equal to the corresponding limit.
- `subPixelPrecisionBits` is the number of bits of subpixel precision in framebuffer coordinates x_f and y_f . See [Rasterization](#).
- `subTexelPrecisionBits` is the number of bits of precision in the division along an axis of an

image used for minification and magnification filters. $2^{\text{subTexelPrecisionBits}}$ is the actual number of divisions along each axis of the image represented. Sub-texel values calculated during image sampling will snap to these locations when generating the filtered results.

- **mipmapPrecisionBits** is the number of bits of division that the LOD calculation for mipmap fetching get snapped to when determining the contribution from each mip level to the mip filtered results. $2^{\text{mipmapPrecisionBits}}$ is the actual number of divisions.
- **maxDrawIndexedIndexValue** is the maximum index value that **can** be used for indexed draw calls when using 32-bit indices. This excludes the primitive restart index value of 0xFFFFFFFF. See [fullDrawIndexUInt32](#).
- **maxDrawIndirectCount** is the maximum draw count that is supported for indirect drawing calls. See [multiDrawIndirect](#).
- **maxSamplerLodBias** is the maximum absolute sampler LOD bias. The sum of the **mipLodBias** member of the [VkSamplerCreateInfo](#) structure and the **Bias** operand of image sampling operations in shader modules (or 0 if no **Bias** operand is provided to an image sampling operation) are clamped to the range $[-\text{maxSamplerLodBias}, +\text{maxSamplerLodBias}]$. See [\[samplers-mipLodBias\]](#).
- **maxSamplerAnisotropy** is the maximum degree of sampler anisotropy. The maximum degree of anisotropic filtering used for an image sampling operation is the minimum of the **maxAnisotropy** member of the [VkSamplerCreateInfo](#) structure and this limit. See [\[samplers-maxAnisotropy\]](#).
- **maxViewports** is the maximum number of active viewports. The **viewportCount** member of the [VkPipelineViewportStateCreateInfo](#) structure that is provided at pipeline creation **must** be less than or equal to this limit.
- **maxViewportDimensions[2]** are the maximum viewport dimensions in the X (width) and Y (height) dimensions, respectively. The maximum viewport dimensions **must** be greater than or equal to the largest image which **can** be created and used as a framebuffer attachment. See [Controlling the Viewport](#).
- **viewportBoundsRange[2]** is the [minimum, maximum] range that the corners of a viewport **must** be contained in. This range **must** be at least $[-2 \times \text{size}, 2 \times \text{size} - 1]$, where **size** = $\max(\text{maxViewportDimensions}[0], \text{maxViewportDimensions}[1])$. See [Controlling the Viewport](#).

Note

The intent of the **viewportBoundsRange** limit is to allow a maximum sized viewport to be arbitrarily shifted relative to the output target as long as at least some portion intersects. This would give a bounds limit of $[-\text{size} + 1, 2 \times \text{size} - 1]$ which would allow all possible non-empty-set intersections of the output target and the viewport. Since these numbers are typically powers of two, picking the signed number range using the smallest possible number of bits ends up with the specified range.

- **viewportSubPixelBits** is the number of bits of subpixel precision for viewport bounds. The subpixel precision that floating-point viewport bounds are interpreted at is given by this limit.
- **minMemoryMapAlignment** is the minimum **required** alignment, in bytes, of host visible memory allocations within the host address space. When mapping a memory allocation with [vkMapMemory](#), subtracting **offset** bytes from the returned pointer will always produce an

integer multiple of this limit. See [Host Access to Device Memory Objects](#). The value **must** be a power of two.

- `minTexelBufferOffsetAlignment` is the minimum **required** alignment, in bytes, for the `offset` member of the `VkBufferViewCreateInfo` structure for texel buffers. The value **must** be a power of two. If `texelBufferAlignment` is enabled, this limit is equivalent to the maximum of the `uniformTexelBufferOffsetAlignmentBytes` and `storageTexelBufferOffsetAlignmentBytes` members of `VkPhysicalDeviceTexelBufferAlignmentProperties`, but smaller alignment is **optionally allowed** by `storageTexelBufferOffsetSingleTexelAlignment` and `uniformTexelBufferOffsetSingleTexelAlignment`. If `texelBufferAlignment` is not enabled, `VkBufferViewCreateInfo::offset` **must** be a multiple of this value.
- `minUniformBufferOffsetAlignment` is the minimum **required** alignment, in bytes, for the `offset` member of the `VkDescriptorBufferInfo` structure for uniform buffers. When a descriptor of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` is updated, the `offset` **must** be an integer multiple of this limit. Similarly, dynamic offsets for uniform buffers **must** be multiples of this limit. The value **must** be a power of two.
- `minStorageBufferOffsetAlignment` is the minimum **required** alignment, in bytes, for the `offset` member of the `VkDescriptorBufferInfo` structure for storage buffers. When a descriptor of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` is updated, the `offset` **must** be an integer multiple of this limit. Similarly, dynamic offsets for storage buffers **must** be multiples of this limit. The value **must** be a power of two.
- `minTexelOffset` is the minimum offset value for the `ConstOffset` image operand of any of the `OpImageSample*` or `OpImageFetch*` image instructions.
- `maxTexelOffset` is the maximum offset value for the `ConstOffset` image operand of any of the `OpImageSample*` or `OpImageFetch*` image instructions.
- `minTexelGatherOffset` is the minimum offset value for the `Offset`, `ConstOffset`, or `ConstOffsets` image operands of any of the `OpImage*Gather` image instructions.
- `maxTexelGatherOffset` is the maximum offset value for the `Offset`, `ConstOffset`, or `ConstOffsets` image operands of any of the `OpImage*Gather` image instructions.
- `minInterpolationOffset` is the base minimum (inclusive) negative offset value for the `Offset` operand of the `InterpolateAtOffset` extended instruction.
- `maxInterpolationOffset` is the base maximum (inclusive) positive offset value for the `Offset` operand of the `InterpolateAtOffset` extended instruction.
- `subPixelInterpolationOffsetBits` is the number of fractional bits that the `x` and `y` offsets to the `InterpolateAtOffset` extended instruction **may** be rounded to as fixed-point values.
- `maxFramebufferWidth` is the maximum width for a framebuffer. The `width` member of the `VkFramebufferCreateInfo` structure **must** be less than or equal to this limit.
- `maxFramebufferHeight` is the maximum height for a framebuffer. The `height` member of the `VkFramebufferCreateInfo` structure **must** be less than or equal to this limit.
- `maxFramebufferLayers` is the maximum layer count for a layered framebuffer. The `layers` member of the `VkFramebufferCreateInfo` structure **must** be less than or equal to this limit.
- `framebufferColorSampleCounts` is a bitmask¹ of `VkSampleCountFlagBits` indicating the color sample counts that are supported for all framebuffer color attachments with floating- or fixed-

point formats. For color attachments with integer formats, see [framebufferIntegerColorSampleCounts](#).

- [framebufferDepthSampleCounts](#) is a bitmask¹ of [VkSampleCountFlagBits](#) indicating the supported depth sample counts for all framebuffer depth/stencil attachments, when the format includes a depth component.
- [framebufferStencilSampleCounts](#) is a bitmask¹ of [VkSampleCountFlagBits](#) indicating the supported stencil sample counts for all framebuffer depth/stencil attachments, when the format includes a stencil component.
- [framebufferNoAttachmentsSampleCounts](#) is a bitmask¹ of [VkSampleCountFlagBits](#) indicating the supported sample counts for a [subpass which uses no attachments](#).
- [maxColorAttachments](#) is the maximum number of color attachments that **can** be used by a subpass in a render pass. The [colorAttachmentCount](#) member of the [VkSubpassDescription](#) or [VkSubpassDescription2](#) structure **must** be less than or equal to this limit.
- [sampledImageColorSampleCounts](#) is a bitmask¹ of [VkSampleCountFlagBits](#) indicating the sample counts supported for all 2D images created with [VK_IMAGE_TILING_OPTIMAL](#), [usage](#) containing [VK_IMAGE_USAGE_SAMPLED_BIT](#), and a non-integer color format.
- [sampledImageIntegerSampleCounts](#) is a bitmask¹ of [VkSampleCountFlagBits](#) indicating the sample counts supported for all 2D images created with [VK_IMAGE_TILING_OPTIMAL](#), [usage](#) containing [VK_IMAGE_USAGE_SAMPLED_BIT](#), and an integer color format.
- [sampledImageDepthSampleCounts](#) is a bitmask¹ of [VkSampleCountFlagBits](#) indicating the sample counts supported for all 2D images created with [VK_IMAGE_TILING_OPTIMAL](#), [usage](#) containing [VK_IMAGE_USAGE_SAMPLED_BIT](#), and a depth format.
- [sampledImageStencilSampleCounts](#) is a bitmask¹ of [VkSampleCountFlagBits](#) indicating the sample counts supported for all 2D images created with [VK_IMAGE_TILING_OPTIMAL](#), [usage](#) containing [VK_IMAGE_USAGE_SAMPLED_BIT](#), and a stencil format.
- [storageImageSampleCounts](#) is a bitmask¹ of [VkSampleCountFlagBits](#) indicating the sample counts supported for all 2D images created with [VK_IMAGE_TILING_OPTIMAL](#), and [usage](#) containing [VK_IMAGE_USAGE_STORAGE_BIT](#).
- [maxSampleMaskWords](#) is the maximum number of array elements of a variable decorated with the [SampleMask](#) built-in decoration.
- [timestampComputeAndGraphics](#) specifies support for timestamps on all graphics and compute queues. If this limit is set to [VK_TRUE](#), all queues that advertise the [VK_QUEUE_GRAPHICS_BIT](#) or [VK_QUEUE_COMPUTE_BIT](#) in the [VkQueueFamilyProperties::queueFlags](#) support [VkQueueFamilyProperties::timestampValidBits](#) of at least 36. See [Timestamp Queries](#).
- [timestampPeriod](#) is the number of nanoseconds **required** for a timestamp query to be incremented by 1. See [Timestamp Queries](#).
- [maxClipDistances](#) is the maximum number of clip distances that **can** be used in a single shader stage. The size of any array declared with the [ClipDistance](#) built-in decoration in a shader module **must** be less than or equal to this limit.
- [maxCullDistances](#) is the maximum number of cull distances that **can** be used in a single shader stage. The size of any array declared with the [CullDistance](#) built-in decoration in a shader module **must** be less than or equal to this limit.

- `maxCombinedClipAndCullDistances` is the maximum combined number of clip and cull distances that **can** be used in a single shader stage. The sum of the sizes of any pair of arrays declared with the `ClipDistance` and `CullDistance` built-in decoration used by a single shader stage in a shader module **must** be less than or equal to this limit.
- `discreteQueuePriorities` is the number of discrete priorities that **can** be assigned to a queue based on the value of each member of `VkDeviceQueueCreateInfo::pQueuePriorities`. This **must** be at least 2, and levels **must** be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See [Queue Priority](#).
- `pointSizeRange[2]` is the range [`minimum,maximum`] of supported sizes for points. Values written to variables decorated with the `PointSize` built-in decoration are clamped to this range.
- `lineWidthRange[2]` is the range [`minimum,maximum`] of supported widths for lines. Values specified by the `lineWidth` member of the `VkPipelineRasterizationStateCreateInfo` or the `lineWidth` parameter to `vkCmdSetLineWidth` are clamped to this range.
- `pointSizeGranularity` is the granularity of supported point sizes. Not all point sizes in the range defined by `pointSizeRange` are supported. This limit specifies the granularity (or increment) between successive supported point sizes.
- `lineWidthGranularity` is the granularity of supported line widths. Not all line widths in the range defined by `lineWidthRange` are supported. This limit specifies the granularity (or increment) between successive supported line widths.
- `strictLines` specifies whether lines are rasterized according to the preferred method of rasterization. If set to `VK_FALSE`, lines **may** be rasterized under a relaxed set of rules. If set to `VK_TRUE`, lines are rasterized as per the strict definition. See [Basic Line Segment Rasterization](#).
- `standardSampleLocations` specifies whether rasterization uses the standard sample locations as documented in [Multisampling](#). If set to `VK_TRUE`, the implementation uses the documented sample locations. If set to `VK_FALSE`, the implementation **may** use different sample locations.
- `optimalBufferCopyOffsetAlignment` is the optimal buffer offset alignment in bytes for `vkCmdCopyBufferToImage2`, `vkCmdCopyBufferToImage`, `vkCmdCopyImageToBuffer2`, and `vkCmdCopyImageToBuffer`. The per texel alignment requirements are enforced, but applications **should** use the optimal alignment for optimal performance and power use. The value **must** be a power of two.
- `optimalBufferCopyRowPitchAlignment` is the optimal buffer row pitch alignment in bytes for `vkCmdCopyBufferToImage2`, `vkCmdCopyBufferToImage`, `vkCmdCopyImageToBuffer2`, and `vkCmdCopyImageToBuffer`. Row pitch is the number of bytes between texels with the same X coordinate in adjacent rows (Y coordinates differ by one). The per texel alignment requirements are enforced, but applications **should** use the optimal alignment for optimal performance and power use. The value **must** be a power of two.
- `nonCoherentAtomSize` is the size and alignment in bytes that bounds concurrent access to [host-mapped device memory](#). The value **must** be a power of two.

1

For all bitmasks of `VkSampleCountFlagBits`, the sample count limits defined above represent the minimum supported sample counts for each image type. Individual images **may** support additional sample counts, which are queried using `vkGetPhysicalDeviceImageFormatProperties` as described in [Supported Sample Counts](#).

Bits which **may** be set in the sample count limits returned by [VkPhysicalDeviceLimits](#), as well as in other queries and structures representing image sample counts, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSampleCountFlagBits {
    VK_SAMPLE_COUNT_1_BIT = 0x00000001,
    VK_SAMPLE_COUNT_2_BIT = 0x00000002,
    VK_SAMPLE_COUNT_4_BIT = 0x00000004,
    VK_SAMPLE_COUNT_8_BIT = 0x00000008,
    VK_SAMPLE_COUNT_16_BIT = 0x00000010,
    VK_SAMPLE_COUNT_32_BIT = 0x00000020,
    VK_SAMPLE_COUNT_64_BIT = 0x00000040,
} VkSampleCountFlagBits;
```

- `VK_SAMPLE_COUNT_1_BIT` specifies an image with one sample per pixel.
- `VK_SAMPLE_COUNT_2_BIT` specifies an image with 2 samples per pixel.
- `VK_SAMPLE_COUNT_4_BIT` specifies an image with 4 samples per pixel.
- `VK_SAMPLE_COUNT_8_BIT` specifies an image with 8 samples per pixel.
- `VK_SAMPLE_COUNT_16_BIT` specifies an image with 16 samples per pixel.
- `VK_SAMPLE_COUNT_32_BIT` specifies an image with 32 samples per pixel.
- `VK_SAMPLE_COUNT_64_BIT` specifies an image with 64 samples per pixel.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSampleCountFlags;
```

`VkSampleCountFlags` is a bitmask type for setting a mask of zero or more [VkSampleCountFlagBits](#).

The [VkPhysicalDevicePushDescriptorPropertiesKHR](#) structure is defined as:

```
// Provided by VK_KHR_push_descriptor
typedef struct VkPhysicalDevicePushDescriptorPropertiesKHR {
    VkStructureType    sType;
    void*            pNext;
    uint32_t         maxPushDescriptors;
} VkPhysicalDevicePushDescriptorPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxPushDescriptors` is the maximum number of descriptors that **can** be used in a descriptor set created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set.

If the [VkPhysicalDevicePushDescriptorPropertiesKHR](#) structure is included in the `pNext` chain of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with

each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePushDescriptorPropertiesKHR-sType-sType
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PUSH_DESCRIPTOR_PROPERTIES_KHR`

The `VkPhysicalDeviceMultiviewProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMultiviewProperties {
    VkStructureType      sType;
    void*               pNext;
    uint32_t            maxMultiviewViewCount;
    uint32_t            maxMultiviewInstanceIndex;
} VkPhysicalDeviceMultiviewProperties;
```

or the equivalent

```
// Provided by VK_KHR_multiview
typedef VkPhysicalDeviceMultiviewProperties VkPhysicalDeviceMultiviewPropertiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxMultiviewViewCount** is one greater than the maximum view index that **can** be used in a subpass.
- **maxMultiviewInstanceIndex** is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.

If the `VkPhysicalDeviceMultiviewProperties` structure is included in the **pNext** chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiviewProperties-sType-sType
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PROPERTIES`

The `VkPhysicalDeviceFloatControlsProperties` structure is defined as:

```

// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceFloatControlsProperties {
    VkStructureType sType;
    void* pNext;
    VkShaderFloatControlsIndependence denormBehaviorIndependence;
    VkShaderFloatControlsIndependence roundingModeIndependence;
    VkBool32 shaderSignedZeroInfNanPreserveFloat16;
    VkBool32 shaderSignedZeroInfNanPreserveFloat32;
    VkBool32 shaderSignedZeroInfNanPreserveFloat64;
    VkBool32 shaderDenormPreserveFloat16;
    VkBool32 shaderDenormPreserveFloat32;
    VkBool32 shaderDenormPreserveFloat64;
    VkBool32 shaderDenormFlushToZeroFloat16;
    VkBool32 shaderDenormFlushToZeroFloat32;
    VkBool32 shaderDenormFlushToZeroFloat64;
    VkBool32 shaderRoundingModeRTEFloat16;
    VkBool32 shaderRoundingModeRTEFloat32;
    VkBool32 shaderRoundingModeRTEFloat64;
    VkBool32 shaderRoundingModeRTZFloat16;
    VkBool32 shaderRoundingModeRTZFloat32;
    VkBool32 shaderRoundingModeRTZFloat64;
} VkPhysicalDeviceFloatControlsProperties;

```

or the equivalent

```

// Provided by VK_KHR_shader_float_controls
typedef VkPhysicalDeviceFloatControlsProperties
VkPhysicalDeviceFloatControlsPropertiesKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **denormBehaviorIndependence** is a **VkShaderFloatControlsIndependence** value indicating whether, and how, denorm behavior can be set independently for different bit widths.
- **roundingModeIndependence** is a **VkShaderFloatControlsIndependence** value indicating whether, and how, rounding modes can be set independently for different bit widths.
- **shaderSignedZeroInfNanPreserveFloat16** is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 16-bit floating-point computations. It also indicates whether the **SignedZeroInfNanPreserve** execution mode **can** be used for 16-bit floating-point types.
- **shaderSignedZeroInfNanPreserveFloat32** is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 32-bit floating-point computations. It also indicates whether the **SignedZeroInfNanPreserve** execution mode **can** be used for 32-bit floating-point types.
- **shaderSignedZeroInfNanPreserveFloat64** is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 64-bit floating-point computations. It also indicates whether the **SignedZeroInfNanPreserve** execution mode **can** be used for 64-bit floating-point types.

- `shaderDenormPreserveFloat16` is a boolean value indicating whether denormals **can** be preserved in 16-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 16-bit floating-point types.
- `shaderDenormPreserveFloat32` is a boolean value indicating whether denormals **can** be preserved in 32-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 32-bit floating-point types.
- `shaderDenormPreserveFloat64` is a boolean value indicating whether denormals **can** be preserved in 64-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 64-bit floating-point types.
- `shaderDenormFlushToZeroFloat16` is a boolean value indicating whether denormals **can** be flushed to zero in 16-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 16-bit floating-point types.
- `shaderDenormFlushToZeroFloat32` is a boolean value indicating whether denormals **can** be flushed to zero in 32-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 32-bit floating-point types.
- `shaderDenormFlushToZeroFloat64` is a boolean value indicating whether denormals **can** be flushed to zero in 64-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTEFloat16` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 16-bit floating-point types.
- `shaderRoundingModeRTEFloat32` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 32-bit floating-point types.
- `shaderRoundingModeRTEFloat64` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTZFloat16` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 16-bit floating-point types.
- `shaderRoundingModeRTZFloat32` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 32-bit floating-point types.
- `shaderRoundingModeRTZFloat64` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 64-bit floating-point types.

If the `VkPhysicalDeviceFloatControlsProperties` structure is included in the `pNext` chain of the

`VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFloatControlsProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FLOAT_CONTROLS_PROPERTIES`

Values which **may** be returned in the `denormBehaviorIndependence` and `roundingModeIndependence` fields of `VkPhysicalDeviceFloatControlsProperties` are:

```
// Provided by VK_VERSION_1_2
typedef enum VkShaderFloatControlsIndependence {
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY = 0,
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL = 1,
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE = 2,
// Provided by VK_KHR_shader_float_controls
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY_KHR =
VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY,
// Provided by VK_KHR_shader_float_controls
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL_KHR =
VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL,
// Provided by VK_KHR_shader_float_controls
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE_KHR =
VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE,
} VkShaderFloatControlsIndependence;
```

or the equivalent

```
// Provided by VK_KHR_shader_float_controls
typedef VkShaderFloatControlsIndependence VkShaderFloatControlsIndependenceKHR;
```

- `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY` specifies that shader float controls for 32-bit floating point **can** be set independently; other bit widths **must** be set identically to each other.
- `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL` specifies that shader float controls for all bit widths **can** be set independently.
- `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE` specifies that shader float controls for all bit widths **must** be set identically.

The `VkPhysicalDeviceDiscardRectanglePropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_discard_rectangles
typedef struct VkPhysicalDeviceDiscardRectanglePropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxDiscardRectangles;
} VkPhysicalDeviceDiscardRectanglePropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxDiscardRectangles** is the maximum number of active discard rectangles that **can** be specified.

If the **VkPhysicalDeviceDiscardRectanglePropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDiscardRectanglePropertiesEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DISCARD_RECTANGLE_PROPERTIES_EXT**

The **VkPhysicalDeviceSampleLocationsPropertiesEXT** structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkPhysicalDeviceSampleLocationsPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleLocationSampleCounts;
    VkExtent2D maxSampleLocationGridSize;
    float sampleLocationCoordinateRange[2];
    uint32_t sampleLocationSubPixelBits;
    VkBool32 variableSampleLocations;
} VkPhysicalDeviceSampleLocationsPropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **sampleLocationSampleCounts** is a bitmask of **VkSampleCountFlagBits** indicating the sample counts supporting custom sample locations.
- **maxSampleLocationGridSize** is the maximum size of the pixel grid in which sample locations **can** vary that is supported for all sample counts in **sampleLocationSampleCounts**.
- **sampleLocationCoordinateRange[2]** is the range of supported sample location coordinates.
- **sampleLocationSubPixelBits** is the number of bits of subpixel precision for sample locations.
- **variableSampleLocations** specifies whether the sample locations used by all pipelines that will be bound to a command buffer during a subpass **must** match. If set to **VK_TRUE**, the implementation

supports variable sample locations in a subpass. If set to `VK_FALSE`, then the sample locations **must** stay constant in each subpass.

If the `VkPhysicalDeviceSampleLocationsPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSampleLocationsPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLE_LOCATIONS_PROPERTIES_EXT`

The `VkPhysicalDeviceExternalMemoryHostPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_external_memory_host
typedef struct VkPhysicalDeviceExternalMemoryHostPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize        minImportedHostPointerAlignment;
} VkPhysicalDeviceExternalMemoryHostPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minImportedHostPointerAlignment` is the minimum **required** alignment, in bytes, for the base address and size of host pointers that **can** be imported to a Vulkan memory object. The value **must** be a power of two.

If the `VkPhysicalDeviceExternalMemoryHostPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalMemoryHostPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_HOST_PROPERTIES_EXT`

The `VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX` structure is defined as:

```
// Provided by VK_NVX_multiview_per_view_attributes
typedef struct VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            perViewPositionAllComponents;
} VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `perViewPositionAllComponents` is `VK_TRUE` if the implementation supports per-view position values that differ in components other than the X component.

If the `VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER_VIEW_ATTRIBUTES_PROPERTIES_NVX`

The `VkPhysicalDevicePointClippingProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDevicePointClippingProperties {
    VkStructureType           sType;
    void*                     pNext;
    VkPointClippingBehavior   pointClippingBehavior;
} VkPhysicalDevicePointClippingProperties;
```

or the equivalent

```
// Provided by VK_KHR_maintenance2
typedef VkPhysicalDevicePointClippingProperties
VkPhysicalDevicePointClippingPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pointClippingBehavior` is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.

If the `VkPhysicalDevicePointClippingProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePointClippingProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_POINT_CLIPPING_PROPERTIES`

The `VkPhysicalDeviceSubgroupProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSubgroupProperties {
    VkStructureType          sType;
    void*                    pNext;
    uint32_t                 subgroupSize;
    VkShaderStageFlags       supportedStages;
    VkSubgroupFeatureFlags   supportedOperations;
    VkBool32                 quadOperationsInAllStages;
} VkPhysicalDeviceSubgroupProperties;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subgroupSize` is the default number of invocations in each subgroup. `subgroupSize` is at least 1 if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `subgroupSize` is a power-of-two.
- `supportedStages` is a bitfield of `VkShaderStageFlagBits` describing the shader stages that `group operations` with `subgroup` scope are supported in. `supportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device's queues support `VK_QUEUE_COMPUTE_BIT`.
- `supportedOperations` is a bitmask of `VkSubgroupFeatureFlagBits` specifying the sets of `group operations` with `subgroup` scope supported on this device. `supportedOperations` will have the `VK_SUBGROUP_FEATURE_BASIC_BIT` bit set if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`.
- `quadOperationsInAllStages` is a boolean specifying whether `quad group operations` are available in all stages, or are restricted to fragment and compute stages.

If the `VkPhysicalDeviceSubgroupProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `supportedOperations` includes `VK_SUBGROUP_FEATURE_QUAD_BIT`, or `shaderSubgroupUniformControlFlow` is enabled, `subgroupSize` **must** be greater than or equal to 4.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_PROPERTIES`

Bits which **can** be set in `VkPhysicalDeviceSubgroupProperties::supportedOperations` and `VkPhysicalDeviceVulkan11Properties::subgroupSupportedOperations` to specify supported `group operations` with `subgroup` scope are:

```

// Provided by VK_VERSION_1_1
typedef enum VkSubgroupFeatureFlagBits {
    VK_SUBGROUP_FEATURE_BASIC_BIT = 0x00000001,
    VK_SUBGROUP_FEATURE_VOTE_BIT = 0x00000002,
    VK_SUBGROUP_FEATURE_ARITHMETIC_BIT = 0x00000004,
    VK_SUBGROUP_FEATURE_BALLOT_BIT = 0x00000008,
    VK_SUBGROUP_FEATURE_SHUFFLE_BIT = 0x00000010,
    VK_SUBGROUP_FEATURE_SHUFFLE_RELATIVE_BIT = 0x00000020,
    VK_SUBGROUP_FEATURE_CLUSTERED_BIT = 0x00000040,
    VK_SUBGROUP_FEATURE_QUAD_BIT = 0x00000080,
    // Provided by VK_NV_shader_subgroup_partitioned
    VK_SUBGROUP_FEATURE_PARTITIONED_BIT_NV = 0x00000100,
} VkSubgroupFeatureFlagBits;

```

- **VK_SUBGROUP_FEATURE_BASIC_BIT** specifies the device will accept SPIR-V shader modules containing the **GroupNonUniform** capability.
- **VK_SUBGROUP_FEATURE_VOTE_BIT** specifies the device will accept SPIR-V shader modules containing the **GroupNonUniformVote** capability.
- **VK_SUBGROUP_FEATURE_ARITHMETIC_BIT** specifies the device will accept SPIR-V shader modules containing the **GroupNonUniformArithmetic** capability.
- **VK_SUBGROUP_FEATURE_BALLOT_BIT** specifies the device will accept SPIR-V shader modules containing the **GroupNonUniformBallot** capability.
- **VK_SUBGROUP_FEATURE_SHUFFLE_BIT** specifies the device will accept SPIR-V shader modules containing the **GroupNonUniformShuffle** capability.
- **VK_SUBGROUP_FEATURE_SHUFFLE_RELATIVE_BIT** specifies the device will accept SPIR-V shader modules containing the **GroupNonUniformShuffleRelative** capability.
- **VK_SUBGROUP_FEATURE_CLUSTERED_BIT** specifies the device will accept SPIR-V shader modules containing the **GroupNonUniformClustered** capability.
- **VK_SUBGROUP_FEATURE_QUAD_BIT** specifies the device will accept SPIR-V shader modules containing the **GroupNonUniformQuad** capability.
- **VK_SUBGROUP_FEATURE_PARTITIONED_BIT_NV** specifies the device will accept SPIR-V shader modules containing the **GroupNonUniformPartitionedNV** capability.

```

// Provided by VK_VERSION_1_1
typedef VkFlags VkSubgroupFeatureFlags;

```

VkSubgroupFeatureFlags is a bitmask type for setting a mask of zero or more **VkSubgroupFeatureFlagBits**.

The **VkPhysicalDeviceSubgroupSizeControlProperties** structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceSubgroupSizeControlProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t minSubgroupSize;
    uint32_t maxSubgroupSize;
    uint32_t maxComputeWorkgroupSubgroups;
    VkShaderStageFlags requiredSubgroupSizeStages;
} VkPhysicalDeviceSubgroupSizeControlProperties;
```

or the equivalent

```
// Provided by VK_EXT_subgroup_size_control
typedef VkPhysicalDeviceSubgroupSizeControlProperties
VkPhysicalDeviceSubgroupSizeControlPropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **minSubgroupSize** is the minimum subgroup size supported by this device. **minSubgroupSize** is at least one if any of the physical device's queues support **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**. **minSubgroupSize** is a power-of-two. **minSubgroupSize** is less than or equal to **maxSubgroupSize**. **minSubgroupSize** is less than or equal to **subgroupSize**.
- **maxSubgroupSize** is the maximum subgroup size supported by this device. **maxSubgroupSize** is at least one if any of the physical device's queues support **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**. **maxSubgroupSize** is a power-of-two. **maxSubgroupSize** is greater than or equal to **minSubgroupSize**. **maxSubgroupSize** is greater than or equal to **subgroupSize**.
- **maxComputeWorkgroupSubgroups** is the maximum number of subgroups supported by the implementation within a workgroup.
- **requiredSubgroupSizeStages** is a bitfield of what shader stages support having a required subgroup size specified.

If the **VkPhysicalDeviceSubgroupSizeControlProperties** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

If **VkPhysicalDeviceSubgroupProperties::supportedOperations** includes **VK_SUBGROUP_FEATURE_QUAD_BIT**, **minSubgroupSize** **must** be greater than or equal to 4.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupSizeControlProperties-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_PROPERTIES**

The **VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT** structure is defined as:

```

// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t advancedBlendMaxColorAttachments;
    VkBool32 advancedBlendIndependentBlend;
    VkBool32 advancedBlendNonPremultipliedSrcColor;
    VkBool32 advancedBlendNonPremultipliedDstColor;
    VkBool32 advancedBlendCorrelatedOverlap;
    VkBool32 advancedBlendAllOperations;
} VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **advancedBlendMaxColorAttachments** is one greater than the highest color attachment index that **can** be used in a subpass, for a pipeline that uses an **advanced blend operation**.
- **advancedBlendIndependentBlend** specifies whether advanced blend operations **can** vary per-attachment.
- **advancedBlendNonPremultipliedSrcColor** specifies whether the source color **can** be treated as non-premultiplied. If this is **VK_FALSE**, then **VkPipelineColorBlendAdvancedStateCreateInfoEXT ::srcPremultiplied** **must** be **VK_TRUE**.
- **advancedBlendNonPremultipliedDstColor** specifies whether the destination color **can** be treated as non-premultiplied. If this is **VK_FALSE**, then **VkPipelineColorBlendAdvancedStateCreateInfoEXT ::dstPremultiplied** **must** be **VK_TRUE**.
- **advancedBlendCorrelatedOverlap** specifies whether the overlap mode **can** be treated as correlated. If this is **VK_FALSE**, then **VkPipelineColorBlendAdvancedStateCreateInfoEXT ::blendOverlap** **must** be **VK_BLEND_OVERLAP_UNCORRELATED_EXT**.
- **advancedBlendAllOperations** specifies whether all advanced blend operation enums are supported. See the valid usage of **VkPipelineColorBlendAttachmentState**.

If the **VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT-sType-sType**
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BLEND_OPERATION_ADVANCED_PROPERTIES_EXT**

The **VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT** structure is defined as:

```
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT {
    VkStructureType    sType;
    void*             pNext;
    uint32_t          maxVertexAttribDivisor;
} VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxVertexAttribDivisor** is the maximum value of the number of instances that will repeat the value of vertex attribute data when instanced rendering is enabled.

If the **VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT-sType-sType
sType **must** **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_PROPERTIES_EXT** **be**

The **VkPhysicalDeviceSamplerFilterMinmaxProperties** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceSamplerFilterMinmaxProperties {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           filterMinmaxSingleComponentFormats;
    VkBool32           filterMinmaxImageComponentMapping;
} VkPhysicalDeviceSamplerFilterMinmaxProperties;
```

or the equivalent

```
// Provided by VK_EXT_sampler_filter_minmax
typedef VkPhysicalDeviceSamplerFilterMinmaxProperties
VkPhysicalDeviceSamplerFilterMinmaxPropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **filterMinmaxSingleComponentFormats** is a boolean value indicating whether a minimum set of required formats support min/max filtering.
- **filterMinmaxImageComponentMapping** is a boolean value indicating whether the implementation

supports non-identity component mapping of the image when doing min/max filtering.

If the `VkPhysicalDeviceSamplerFilterMinmaxProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `filterMinmaxSingleComponentFormats` is `VK_TRUE`, the following formats **must** support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT` feature with `VK_IMAGE_TILING_OPTIMAL`, if they support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`:

- `VK_FORMAT_R8_UNORM`
- `VK_FORMAT_R8_SNORM`
- `VK_FORMAT_R16_UNORM`
- `VK_FORMAT_R16_SNORM`
- `VK_FORMAT_R16_SFLOAT`
- `VK_FORMAT_R32_SFLOAT`
- `VK_FORMAT_D16_UNORM`
- `VK_FORMAT_X8_D24_UNORM_PACK32`
- `VK_FORMAT_D32_SFLOAT`
- `VK_FORMAT_D16_UNORM_S8_UINT`
- `VK_FORMAT_D24_UNORM_S8_UINT`
- `VK_FORMAT_D32_SFLOAT_S8_UINT`

If the format is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports min/max filtering, and that min/max filtering of the depth aspect is supported when depth compare is disabled in the sampler.

If `filterMinmaxImageComponentMapping` is `VK_FALSE` the component mapping of the image view used with min/max filtering **must** have been created with the `r` component set to the `identity swizzle`. Only the `r` component of the sampled image value is defined and the other component values are undefined. If `filterMinmaxImageComponentMapping` is `VK_TRUE` this restriction does not apply and image component mapping works as normal.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSamplerFilterMinmaxProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_FILTER_MINMAX_PROPERTIES`

The `VkPhysicalDeviceProtectedMemoryProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryProperties {
    VkStructureType    sType;
    void*             pNext;
    VkBool32           protectedNoFault;
} VkPhysicalDeviceProtectedMemoryProperties;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **protectedNoFault** specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is **VK_TRUE**, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is **VK_FALSE**, applications **must** not perform these operations. See [Protected Memory Access Rules](#) for more information.

If the **VkPhysicalDeviceProtectedMemoryProperties** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProtectedMemoryProperties-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROTECTED_MEMORY_PROPERTIES**

The **VkPhysicalDeviceMaintenance3Properties** structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMaintenance3Properties {
    VkStructureType    sType;
    void*             pNext;
    uint32_t          maxPerSetDescriptors;
    VkDeviceSize        maxMemoryAllocationSize;
} VkPhysicalDeviceMaintenance3Properties;
```

or the equivalent

```
// Provided by VK_KHR_maintenance3
typedef VkPhysicalDeviceMaintenance3Properties
VkPhysicalDeviceMaintenance3PropertiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `maxPerSetDescriptors` is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications **can** query whether a descriptor set that goes beyond this limit is supported using `vkGetDescriptorSetLayoutSupport`.
- `maxMemoryAllocationSize` is the maximum size of a memory allocation that **can** be created, even if there is more space available in the heap.

If the `VkPhysicalDeviceMaintenance3Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMaintenance3Properties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_3_PROPERTIES`

The `VkPhysicalDeviceMaintenance4Properties` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceMaintenance4Properties {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize        maxBufferSize;
} VkPhysicalDeviceMaintenance4Properties;
```

or the equivalent

```
// Provided by VK_KHR_maintenance4
typedef VkPhysicalDeviceMaintenance4Properties
VkPhysicalDeviceMaintenance4PropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxBufferSize` is the maximum size `VkBuffer` that **can** be created.

If the `VkPhysicalDeviceMaintenance4Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMaintenance4Properties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_4_PROPERTIES`

The `VkPhysicalDeviceMeshShaderPropertiesNV` structure is defined as:

```
// Provided by VK_NV_mesh_shader
typedef struct VkPhysicalDeviceMeshShaderPropertiesNV {
    VkStructureType      sType;
    void*                pNext;
    uint32_t              maxDrawMeshTasksCount;
    uint32_t              maxTaskWorkGroupInvocations;
    uint32_t              maxTaskWorkGroupSize[3];
    uint32_t              maxTaskTotalMemorySize;
    uint32_t              maxTaskOutputCount;
    uint32_t              maxMeshWorkGroupInvocations;
    uint32_t              maxMeshWorkGroupSize[3];
    uint32_t              maxMeshTotalMemorySize;
    uint32_t              maxMeshOutputVertices;
    uint32_t              maxMeshOutputPrimitives;
    uint32_t              maxMeshMultiviewViewCount;
    uint32_t              meshOutputPerVertexGranularity;
    uint32_t              meshOutputPerPrimitiveGranularity;
} VkPhysicalDeviceMeshShaderPropertiesNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxDrawMeshTasksCount` is the maximum number of local workgroups that **can** be launched by a single draw mesh tasks command. See [Programmable Mesh Shading](#).
- `maxTaskWorkGroupInvocations` is the maximum total number of task shader invocations in a single local workgroup. The product of the X, Y, and Z sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode in shader modules or by the object decorated by the `WorkgroupSize` decoration, **must** be less than or equal to this limit.
- `maxTaskWorkGroupSize[3]` is the maximum size of a local task workgroup. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The `x`, `y`, and `z` sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode or by the object decorated by the `WorkgroupSize` decoration in shader modules, **must** be less than or equal to the corresponding limit.
- `maxTaskTotalMemorySize` is the maximum number of bytes that the task shader can use in total for shared and output memory combined.
- `maxTaskOutputCount` is the maximum number of output tasks a single task shader workgroup can emit.
- `maxMeshWorkGroupInvocations` is the maximum total number of mesh shader invocations in a single local workgroup. The product of the X, Y, and Z sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode in shader modules or by the object decorated by the `WorkgroupSize` decoration, **must** be less than or equal to this limit.
- `maxMeshWorkGroupSize[3]` is the maximum size of a local mesh workgroup. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The `x`, `y`, and `z` sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode or by the object

decorated by the `WorkgroupSize` decoration in shader modules, **must** be less than or equal to the corresponding limit.

- `maxMeshTotalMemorySize` is the maximum number of bytes that the mesh shader can use in total for shared and output memory combined.
- `maxMeshOutputVertices` is the maximum number of vertices a mesh shader output can store.
- `maxMeshOutputPrimitives` is the maximum number of primitives a mesh shader output can store.
- `maxMeshMultiviewViewCount` is the maximum number of multi-view views a mesh shader can use.
- `meshOutputPerVertexGranularity` is the granularity with which mesh vertex outputs are allocated. The value can be used to compute the memory size used by the mesh shader, which must be less than or equal to `maxMeshTotalMemorySize`.
- `meshOutputPerPrimitiveGranularity` is the granularity with which mesh outputs qualified as per-primitive are allocated. The value can be used to compute the memory size used by the mesh shader, which must be less than or equal to `maxMeshTotalMemorySize`.

If the `VkPhysicalDeviceMeshShaderPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMeshShaderPropertiesNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_PROPERTIES_NV`

The `VkPhysicalDeviceDescriptorIndexingProperties` structure is defined as:

```

// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDescriptorIndexingProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t maxUpdateAfterBindDescriptorsInAllPools;
    VkBool32 shaderUniformBufferArrayNonUniformIndexingNative;
    VkBool32 shaderSampledImageArrayNonUniformIndexingNative;
    VkBool32 shaderStorageBufferArrayNonUniformIndexingNative;
    VkBool32 shaderStorageImageArrayNonUniformIndexingNative;
    VkBool32 shaderInputAttachmentArrayNonUniformIndexingNative;
    VkBool32 robustBufferAccessUpdateAfterBind;
    VkBool32 quadDivergentImplicitLod;
    uint32_t maxPerStageDescriptorUpdateAfterBindSamplers;
    uint32_t maxPerStageDescriptorUpdateAfterBindUniformBuffers;
    uint32_t maxPerStageDescriptorUpdateAfterBindStorageBuffers;
    uint32_t maxPerStageDescriptorUpdateAfterBindSampledImages;
    uint32_t maxPerStageDescriptorUpdateAfterBindStorageImages;
    uint32_t maxPerStageDescriptorUpdateAfterBindInputAttachments;
    uint32_t maxPerStageUpdateAfterBindResources;
    uint32_t maxDescriptorSetUpdateAfterBindSamplers;
    uint32_t maxDescriptorSetUpdateAfterBindUniformBuffers;
    uint32_t maxDescriptorSetUpdateAfterBindUniformBuffersDynamic;
    uint32_t maxDescriptorSetUpdateAfterBindStorageBuffers;
    uint32_t maxDescriptorSetUpdateAfterBindStorageBuffersDynamic;
    uint32_t maxDescriptorSetUpdateAfterBindSampledImages;
    uint32_t maxDescriptorSetUpdateAfterBindStorageImages;
    uint32_t maxDescriptorSetUpdateAfterBindInputAttachments;
} VkPhysicalDeviceDescriptorIndexingProperties;

```

or the equivalent

```

// Provided by VK_EXT_descriptor_indexing
typedef VkPhysicalDeviceDescriptorIndexingProperties
VkPhysicalDeviceDescriptorIndexingPropertiesEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxUpdateAfterBindDescriptorsInAllPools** is the maximum number of descriptors (summed over all descriptor types) that **can** be created across all pools that are created with the **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** bit set. Pool creation **may** fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.
- **shaderUniformBufferArrayNonUniformIndexingNative** is a boolean value indicating whether uniform buffer descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of uniform buffers **may** execute multiple times in order to access all the descriptors.

- `shaderSampledImageArrayNonUniformIndexingNative` is a boolean value indicating whether sampler and image descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of samplers or images **may** execute multiple times in order to access all the descriptors.
- `shaderStorageBufferArrayNonUniformIndexingNative` is a boolean value indicating whether storage buffer descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage buffers **may** execute multiple times in order to access all the descriptors.
- `shaderStorageImageArrayNonUniformIndexingNative` is a boolean value indicating whether storage image descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage images **may** execute multiple times in order to access all the descriptors.
- `shaderInputAttachmentArrayNonUniformIndexingNative` is a boolean value indicating whether input attachment descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of input attachments **may** execute multiple times in order to access all the descriptors.
- `robustBufferAccessUpdateAfterBind` is a boolean value indicating whether `robustBufferAccess` **can** be enabled in a device simultaneously with `descriptorBindingUniformBufferUpdateAfterBind`, `descriptorBindingStorageBufferUpdateAfterBind`,
`descriptorBindingUniformTexelBufferUpdateAfterBind`, and/or
`descriptorBindingStorageTexelBufferUpdateAfterBind`. If this is `VK_FALSE`, then either `robustBufferAccess` **must** be disabled or all of these update-after-bind features **must** be disabled.
- `quadDivergentImplicitLod` is a boolean value indicating whether implicit level of detail calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See [Derivative Image Operations](#).
- `maxPerStageDescriptorUpdateAfterBindSamplers` is similar to `maxPerStageDescriptorSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindUniformBuffers` is similar to `maxPerStageDescriptorUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindStorageBuffers` is similar to `maxPerStageDescriptorStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindSampledImages` is similar to `maxPerStageDescriptorSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindStorageImages` is similar to `maxPerStageDescriptorStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindInputAttachments` is similar to `maxPerStageDescriptorInputAttachments` but counts descriptors from descriptor sets created with

or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- `maxPerStageUpdateAfterBindResources` is similar to `maxPerStageResources` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindSamplers` is similar to `maxDescriptorSetSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindUniformBuffers` is similar to `maxDescriptorSetUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindUniformBuffersDynamic` is similar to `maxDescriptorSetUniformBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application **can** allocate dynamic uniform buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.
- `maxDescriptorSetUpdateAfterBindStorageBuffers` is similar to `maxDescriptorSetStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindStorageBuffersDynamic` is similar to `maxDescriptorSetStorageBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application **can** allocate dynamic storage buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.
- `maxDescriptorSetUpdateAfterBindSampledImages` is similar to `maxDescriptorSetSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindStorageImages` is similar to `maxDescriptorSetStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindInputAttachments` is similar to `maxDescriptorSetInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

If the `VkPhysicalDeviceDescriptorIndexingProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceDescriptorIndexingProperties-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_PROPERTIES`

The `VkPhysicalDeviceInlineUniformBlockProperties` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceInlineUniformBlockProperties {
    VkStructureType      sType;
    void*               pNext;
    uint32_t            maxInlineUniformBlockSize;
    uint32_t            maxPerStageDescriptorInlineUniformBlocks;
    uint32_t            maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks;
    uint32_t            maxDescriptorSetInlineUniformBlocks;
    uint32_t            maxDescriptorSetUpdateAfterBindInlineUniformBlocks;
} VkPhysicalDeviceInlineUniformBlockProperties;
```

or the equivalent

```
// Provided by VK_EXT_inline_uniform_block
typedef VkPhysicalDeviceInlineUniformBlockProperties
VkPhysicalDeviceInlineUniformBlockPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxInlineUniformBlockSize` is the maximum size in bytes of an `inline uniform block` binding.
- `maxPerStageDescriptorInlineUniformBlock` is the maximum number of inline uniform block bindings that **can** be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.
- `maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks` is similar to `maxPerStageDescriptorInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetInlineUniformBlocks` is the maximum number of inline uniform block bindings that **can** be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.
- `maxDescriptorSetUpdateAfterBindInlineUniformBlocks` is similar to `maxDescriptorSetInlineUniformBlocks` but counts descriptor bindings from descriptor sets

created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

If the `VkPhysicalDeviceInlineUniformBlockProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceInlineUniformBlockProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_PROPERTIES`

The `VkPhysicalDeviceConservativeRasterizationPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPhysicalDeviceConservativeRasterizationPropertiesEXT {
    VkStructureType      sType;
    void*              pNext;
    float              primitiveOverestimationSize;
    float              maxExtraPrimitiveOverestimationSize;
    float              extraPrimitiveOverestimationSizeGranularity;
    VkBool32           primitiveUnderestimation;
    VkBool32           conservativePointAndLineRasterization;
    VkBool32           degenerateTrianglesRasterized;
    VkBool32           degenerateLinesRasterized;
    VkBool32           fullyCoveredFragmentShaderInputVariable;
    VkBool32           conservativeRasterizationPostDepthCoverage;
} VkPhysicalDeviceConservativeRasterizationPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `primitiveOverestimationSize` is the size in pixels the generating primitive is increased at each of its edges during conservative rasterization overestimation mode. Even with a size of 0.0, conservative rasterization overestimation rules still apply and if any part of the pixel rectangle is covered by the generating primitive, fragments are generated for the entire pixel. However implementations **may** make the pixel coverage area even more conservative by increasing the size of the generating primitive.
- `maxExtraPrimitiveOverestimationSize` is the maximum size in pixels of extra overestimation the implementation supports in the pipeline state. A value of 0.0 means the implementation does not support any additional overestimation of the generating primitive during conservative rasterization. A value above 0.0 allows the application to further increase the size of the generating primitive during conservative rasterization overestimation.
- `extraPrimitiveOverestimationSizeGranularity` is the granularity of extra overestimation that can be specified in the pipeline state between 0.0 and `maxExtraPrimitiveOverestimationSize` inclusive. A value of 0.0 means the implementation can use the smallest representable non-zero value in the screen space pixel fixed-point grid.

- `primitiveUnderestimation` is `VK_TRUE` if the implementation supports the `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` conservative rasterization mode in addition to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`. Otherwise the implementation only supports `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`.
- `conservativePointAndLineRasterization` is `VK_TRUE` if the implementation supports conservative rasterization of point and line primitives as well as triangle primitives. Otherwise the implementation only supports triangle primitives.
- `degenerateTrianglesRasterized` is `VK_FALSE` if the implementation culls primitives generated from triangles that become zero area after they are quantized to the fixed-point rasterization pixel grid. `degenerateTrianglesRasterized` is `VK_TRUE` if these primitives are not culled and the provoking vertex attributes and depth value are used for the fragments. The primitive area calculation is done on the primitive generated from the clipped triangle if applicable. Zero area primitives are backfacing and the application **can** enable backface culling if desired.
- `degenerateLinesRasterized` is `VK_FALSE` if the implementation culls lines that become zero length after they are quantized to the fixed-point rasterization pixel grid. `degenerateLinesRasterized` is `VK_TRUE` if zero length lines are not culled and the provoking vertex attributes and depth value are used for the fragments.
- `fullyCoveredFragmentShaderInputVariable` is `VK_TRUE` if the implementation supports the SPIR-V builtin fragment shader input variable `FullyCoveredEXT` specifying that conservative rasterization is enabled and the fragment area is fully covered by the generating primitive.
- `conservativeRasterizationPostDepthCoverage` is `VK_TRUE` if the implementation supports conservative rasterization with the `PostDepthCoverage` execution mode enabled. Otherwise the `PostDepthCoverage` execution mode **must** not be used when conservative rasterization is enabled.

If the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceConservativeRasterizationPropertiesEXT-sType-sType`
`sType` **must** be
`VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONSERVATIVE_RASTERIZATION_PROPERTIES_EXT`

The `VkPhysicalDeviceFragmentDensityMapPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_fragment_density_map
typedef struct VkPhysicalDeviceFragmentDensityMapPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkExtent2D minFragmentDensityTexelSize;
    VkExtent2D maxFragmentDensityTexelSize;
    VkBool32 fragmentDensityInvocations;
} VkPhysicalDeviceFragmentDensityMapPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minFragmentDensityTexelSize` is the minimum fragment density texel size.
- `maxFragmentDensityTexelSize` is the maximum fragment density texel size.
- `fragmentDensityInvocations` specifies whether the implementation `may` invoke additional fragment shader invocations for each covered sample.

If the `VkPhysicalDeviceFragmentDensityMapPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMapPropertiesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_PROPERTIES_EXT`

The `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_fragment_density_map2
typedef struct VkPhysicalDeviceFragmentDensityMap2PropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            subsampledLoads;
    VkBool32            subsampledCoarseReconstructionEarlyAccess;
    uint32_t           maxSubsampledArrayLayers;
    uint32_t           maxDescriptorSetSubsampledSamplers;
} VkPhysicalDeviceFragmentDensityMap2PropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subsampledLoads` specifies if performing image data read with load operations on subsampled attachments will be resampled to the fragment density of the render pass
- `subsampledCoarseReconstructionEarlyAccess` specifies if performing image data read with samplers created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT` in fragment shader will trigger additional reads during `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT`
- `maxSubsampledArrayLayers` is the maximum number of `VkImageView` array layers for usages supporting subsampled samplers
- `maxDescriptorSetSubsampledSamplers` is the maximum number of subsampled samplers that `can` be included in a `VkPipelineLayout`

If the `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in

with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMap2PropertiesEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_2_PROPERTIES_EXT`

The `VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM` structure is defined as:

```
// Provided by VK_QCOM_fragment_density_map_offset
typedef struct VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM {
    VkStructureType      sType;
    void*               pNext;
    VkExtent2D           fragmentDensityOffsetGranularity;
} VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fragmentDensityOffsetGranularity** is the granularity for **fragment density offsets**.

If the `VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM` structure is included in the **pNext** chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM-sType-sType
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_OFFSET_PROPERTIES_QCOM`

The `VkPhysicalDeviceShaderCorePropertiesAMD` structure is defined as:

```

// Provided by VK_AMD_shader_core_properties
typedef struct VkPhysicalDeviceShaderCorePropertiesAMD {
    VkStructureType sType;
    void* pNext;
    uint32_t shaderEngineCount;
    uint32_t shaderArraysPerEngineCount;
    uint32_t computeUnitsPerShaderArray;
    uint32_t simdPerComputeUnit;
    uint32_t wavefrontsPerSimd;
    uint32_t wavefrontSize;
    uint32_t sgprsPerSimd;
    uint32_t minSgprAllocation;
    uint32_t maxSgprAllocation;
    uint32_t sgprAllocationGranularity;
    uint32_t vgprsPerSimd;
    uint32_t minVgprAllocation;
    uint32_t maxVgprAllocation;
    uint32_t vgprAllocationGranularity;
} VkPhysicalDeviceShaderCorePropertiesAMD;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderEngineCount** is an unsigned integer value indicating the number of shader engines found inside the shader core of the physical device.
- **shaderArraysPerEngineCount** is an unsigned integer value indicating the number of shader arrays inside a shader engine. Each shader array has its own scan converter, set of compute units, and a render back end (color and depth attachments). Shader arrays within a shader engine share shader processor input (wave launcher) and shader export (export buffer) units. Currently, a shader engine can have one or two shader arrays.
- **computeUnitsPerShaderArray** is an unsigned integer value indicating the physical number of compute units within a shader array. The active number of compute units in a shader array **may** be lower. A compute unit houses a set of SIMDs along with a sequencer module and a local data store.
- **simdPerComputeUnit** is an unsigned integer value indicating the number of SIMDs inside a compute unit. Each SIMD processes a single instruction at a time.
- **wavefrontSize** is an unsigned integer value indicating the maximum size of a subgroup.
- **sgprsPerSimd** is an unsigned integer value indicating the number of physical Scalar General Purpose Registers (SGPRs) per SIMD.
- **minSgprAllocation** is an unsigned integer value indicating the minimum number of SGPRs allocated for a wave.
- **maxSgprAllocation** is an unsigned integer value indicating the maximum number of SGPRs allocated for a wave.
- **sgprAllocationGranularity** is an unsigned integer value indicating the granularity of SGPR allocation for a wave.

- `vgprsPerSimd` is an unsigned integer value indicating the number of physical Vector General Purpose Registers (VGPRs) per SIMD.
- `minVgprAllocation` is an unsigned integer value indicating the minimum number of VGPRs allocated for a wave.
- `maxVgprAllocation` is an unsigned integer value indicating the maximum number of VGPRs allocated for a wave.
- `vgrAllocationGranularity` is an unsigned integer value indicating the granularity of VGPR allocation for a wave.

If the `VkPhysicalDeviceShaderCorePropertiesAMD` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderCorePropertiesAMD-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_AMD`

The `VkPhysicalDeviceShaderCoreProperties2AMD` structure is defined as:

```
// Provided by VK_AMD_shader_core_properties2
typedef struct VkPhysicalDeviceShaderCoreProperties2AMD {
    VkStructureType          sType;
    void*                  pNext;
    VkShaderCorePropertiesFlagsAMD shaderCoreFeatures;
    uint32_t                activeComputeUnitCount;
} VkPhysicalDeviceShaderCoreProperties2AMD;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderCoreFeatures` is a bitmask of `VkShaderCorePropertiesFlagBitsAMD` indicating the set of features supported by the shader core.
- `activeComputeUnitCount` is an unsigned integer value indicating the number of compute units that have been enabled.

If the `VkPhysicalDeviceShaderCoreProperties2AMD` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderCoreProperties2AMD-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_2_AMD`

Bits for this type **may** be defined by future extensions, or new versions of the [VK_AMD_shader_core_properties2](#) extension. Possible values of the `flags` member of [VkShaderCorePropertiesFlagsAMD](#) are:

```
// Provided by VK_AMD_shader_core_properties2
typedef enum VkShaderCorePropertiesFlagBitsAMD {
} VkShaderCorePropertiesFlagBitsAMD;
```

```
// Provided by VK_AMD_shader_core_properties2
typedef VkFlags VkShaderCorePropertiesFlagsAMD;
```

[VkShaderCorePropertiesFlagsAMD](#) is a bitmask type for providing zero or more [VkShaderCorePropertiesFlagBitsAMD](#).

The [VkPhysicalDeviceDepthStencilResolveProperties](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDepthStencilResolveProperties {
    VkStructureType      sType;
    void*               pNext;
    VkResolveModeFlags   supportedDepthResolveModes;
    VkResolveModeFlags   supportedStencilResolveModes;
    VkBool32             independentResolveNone;
    VkBool32             independentResolve;
} VkPhysicalDeviceDepthStencilResolveProperties;
```

or the equivalent

```
// Provided by VK_KHR_depth_stencil_resolve
typedef VkPhysicalDeviceDepthStencilResolveProperties
VkPhysicalDeviceDepthStencilResolvePropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportedDepthResolveModes` is a bitmask of [VkResolveModeFlagBits](#) indicating the set of supported depth resolve modes. [VK_RESOLVE_MODE_SAMPLE_ZERO_BIT](#) **must** be included in the set but implementations **may** support additional modes.
- `supportedStencilResolveModes` is a bitmask of [VkResolveModeFlagBits](#) indicating the set of supported stencil resolve modes. [VK_RESOLVE_MODE_SAMPLE_ZERO_BIT](#) **must** be included in the set but implementations **may** support additional modes. [VK_RESOLVE_MODE_AVERAGE_BIT](#) **must** not be included in the set.
- `independentResolveNone` is [VK_TRUE](#) if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is [VK_RESOLVE_MODE_NONE](#). Otherwise

the implementation only supports setting both modes to the same value.

- `independentResolve` is `VK_TRUE` if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to `VK_RESOLVE_MODE_NONE`. An implementation that supports `independentResolve` **must** also support `independentResolveNone`.

If the `VkPhysicalDeviceDepthStencilResolveProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDepthStencilResolveProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_STENCIL_RESOLVE_PROPERTIES`

The `VkPhysicalDevicePerformanceQueryPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPhysicalDevicePerformanceQueryPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            allowCommandBufferQueryCopies;
} VkPhysicalDevicePerformanceQueryPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allowCommandBufferQueryCopies` is `VK_TRUE` if the performance query pools are allowed to be used with `vkCmdCopyQueryPoolResults`.

If the `VkPhysicalDevicePerformanceQueryPropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePerformanceQueryPropertiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_PROPERTIES_KHR`

The `VkPhysicalDeviceShadingRateImagePropertiesNV` structure is defined as:

```

// Provided by VK_NV_shading_rate_image
typedef struct VkPhysicalDeviceShadingRateImagePropertiesNV {
    VkStructureType      sType;
    void*                pNext;
    VkExtent2D           shadingRateTexelSize;
    uint32_t              shadingRatePaletteSize;
    uint32_t              shadingRateMaxCoarseSamples;
} VkPhysicalDeviceShadingRateImagePropertiesNV;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shadingRateTexelSize** indicates the width and height of the portion of the framebuffer corresponding to each texel in the shading rate image.
- **shadingRatePaletteSize** indicates the maximum number of palette entries supported for the shading rate image.
- **shadingRateMaxCoarseSamples** specifies the maximum number of coverage samples supported in a single fragment. If the product of the fragment size derived from the base shading rate and the number of coverage samples per pixel exceeds this limit, the final shading rate will be adjusted so that its product does not exceed the limit.

If the **VkPhysicalDeviceShadingRateImagePropertiesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These properties are related to the **shading rate image** feature.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShadingRateImagePropertiesNV-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADING_RATE_IMAGE_PROPERTIES_NV**

The **VkPhysicalDeviceTransformFeedbackPropertiesEXT** structure is defined as:

```

// Provided by VK_EXT_transform_feedback
typedef struct VkPhysicalDeviceTransformFeedbackPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxTransformFeedbackStreams;
    uint32_t maxTransformFeedbackBuffers;
    VkDeviceSize maxTransformFeedbackBufferSize;
    uint32_t maxTransformFeedbackStreamDataSize;
    uint32_t maxTransformFeedbackBufferDataSize;
    uint32_t maxTransformFeedbackBufferDataStride;
    VkBool32 transformFeedbackQueries;
    VkBool32 transformFeedbackStreamsLinesTriangles;
    VkBool32 transformFeedbackRasterizationStreamSelect;
    VkBool32 transformFeedbackDraw;
} VkPhysicalDeviceTransformFeedbackPropertiesEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxTransformFeedbackStreams** is the maximum number of vertex streams that can be output from geometry shaders declared with the **GeometryStreams** capability. If the implementation does not support **VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams** then **maxTransformFeedbackStreams** **must** be set to **1**.
- **maxTransformFeedbackBuffers** is the maximum number of transform feedback buffers that can be bound for capturing shader outputs from the last **pre-rasterization shader** stage.
- **maxTransformFeedbackBufferSize** is the maximum size that can be specified when binding a buffer for transform feedback in **vkCmdBindTransformFeedbackBuffersEXT**.
- **maxTransformFeedbackStreamDataSize** is the maximum amount of data in bytes for each vertex that captured to one or more transform feedback buffers associated with a specific vertex stream.
- **maxTransformFeedbackBufferDataSize** is the maximum amount of data in bytes for each vertex that can be captured to a specific transform feedback buffer.
- **maxTransformFeedbackBufferDataStride** is the maximum stride between each capture of vertex data to the buffer.
- **transformFeedbackQueries** is **VK_TRUE** if the implementation supports the **VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT** query type. **transformFeedbackQueries** is **VK_FALSE** if queries of this type **cannot** be created.
- **transformFeedbackStreamsLinesTriangles** is **VK_TRUE** if the implementation supports the geometry shader **OpExecutionMode** of **OutputLineStrip** and **OutputTriangleStrip** in addition to **OutputPoints** when more than one vertex stream is output. If **transformFeedbackStreamsLinesTriangles** is **VK_FALSE** the implementation only supports an **OpExecutionMode** of **OutputPoints** when more than one vertex stream is output from the geometry shader.
- **transformFeedbackRasterizationStreamSelect** is **VK_TRUE** if the implementation supports the **GeometryStreams** SPIR-V capability and the application can use **VkPipelineRasterizationStateCreateInfoEXT** to modify which vertex stream output is

used for rasterization. Otherwise vertex stream 0 must always be used for rasterization.

- `transformFeedbackDraw` is `VK_TRUE` if the implementation supports the `vkCmdDrawIndirectByteCountEXT` function otherwise the function must not be called.

If the `VkPhysicalDeviceTransformFeedbackPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTransformFeedbackPropertiesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_PROPERTIES_EXT`

The `VkPhysicalDeviceRayTracingPropertiesNV` structure is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkPhysicalDeviceRayTracingPropertiesNV {
    VkStructureType sType;
    void* pNext;
    uint32_t shaderGroupHandleSize;
    uint32_t maxRecursionDepth;
    uint32_t maxShaderGroupStride;
    uint32_t shaderGroupBaseAlignment;
    uint64_t maxGeometryCount;
    uint64_t maxInstanceCount;
    uint64_t maxTriangleCount;
    uint32_t maxDescriptorSetAccelerationStructures;
} VkPhysicalDeviceRayTracingPropertiesNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderGroupHandleSize` is the size in bytes of the shader header.
- `maxRecursionDepth` is the maximum number of levels of recursion allowed in a trace command.
- `maxShaderGroupStride` is the maximum stride in bytes allowed between shader groups in the shader binding table.
- `shaderGroupBaseAlignment` is the **required** alignment in bytes for the base of the shader binding table.
- `maxGeometryCount` is the maximum number of geometries in the bottom level acceleration structure.
- `maxInstanceCount` is the maximum number of instances in the top level acceleration structure.
- `maxTriangleCount` is the maximum number of triangles in all geometries in the bottom level acceleration structure.
- `maxDescriptorSetAccelerationStructures` is the maximum number of acceleration structure

descriptors that are allowed in a descriptor set.

Due to the fact that the geometry, instance, and triangle counts are specified at acceleration structure creation as 32-bit values, `maxGeometryCount`, `maxInstanceCount`, and `maxTriangleCount` **must** not exceed $2^{32}-1$.

If the `VkPhysicalDeviceRayTracingPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Limits specified by this structure **must** match those specified with the same name in `VkPhysicalDeviceAccelerationStructurePropertiesKHR` and `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingPropertiesNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PROPERTIES_NV`

The `VkPhysicalDeviceAccelerationStructurePropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkPhysicalDeviceAccelerationStructurePropertiesKHR {
    VkStructureType      sType;
    void*                pNext;
    uint64_t            maxGeometryCount;
    uint64_t            maxInstanceCount;
    uint64_t            maxPrimitiveCount;
    uint32_t            maxPerStageDescriptorAccelerationStructures;
    uint32_t            maxPerStageDescriptorUpdateAfterBindAccelerationStructures;
    uint32_t            maxDescriptorSetAccelerationStructures;
    uint32_t            maxDescriptorSetUpdateAfterBindAccelerationStructures;
    uint32_t            minAccelerationStructureScratchOffsetAlignment;
} VkPhysicalDeviceAccelerationStructurePropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxGeometryCount` is the maximum number of geometries in the bottom level acceleration structure.
- `maxInstanceCount` is the maximum number of instances in the top level acceleration structure.
- `maxPrimitiveCount` is the maximum number of triangles or AABBs in all geometries in the bottom level acceleration structure.
- `maxPerStageDescriptorAccelerationStructures` is the maximum number of acceleration structure bindings that **can** be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` count against this limit. Only descriptor bindings in descriptor set layouts created without the

`VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.

- `maxPerStageDescriptorUpdateAfterBindAccelerationStructures` is similar to `maxPerStageDescriptorAccelerationStructures` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetAccelerationStructures` is the maximum number of acceleration structure descriptors that **can** be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.
- `maxDescriptorSetUpdateAfterBindAccelerationStructures` is similar to `maxDescriptorSetAccelerationStructures` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `minAccelerationStructureScratchOffsetAlignment` is the minimum **required** alignment, in bytes, for scratch data passed in to an acceleration structure build command. The value **must** be a power of two.

Due to the fact that the geometry, instance, and primitive counts are specified at acceleration structure creation as 32-bit values, `maxGeometryCount`, `maxInstanceCount`, and `maxPrimitiveCount` **must** not exceed $2^{32}-1$.

If the `VkPhysicalDeviceAccelerationStructurePropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Limits specified by this structure **must** match those specified with the same name in `VkPhysicalDeviceRayTracingPropertiesNV`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceAccelerationStructurePropertiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ACCELERATION_STRUCTURE_PROPERTIES_KHR`

The `VkPhysicalDeviceRayTracingPipelinePropertiesKHR` structure is defined as:

```

// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkPhysicalDeviceRayTracingPipelinePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t shaderGroupHandleSize;
    uint32_t maxRayRecursionDepth;
    uint32_t maxShaderGroupStride;
    uint32_t shaderGroupBaseAlignment;
    uint32_t shaderGroupHandleCaptureReplaySize;
    uint32_t maxRayDispatchInvocationCount;
    uint32_t shaderGroupHandleAlignment;
    uint32_t maxRayHitAttributeSize;
} VkPhysicalDeviceRayTracingPipelinePropertiesKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderGroupHandleSize** is the size in bytes of the shader header.
- **maxRayRecursionDepth** is the maximum number of levels of ray recursion allowed in a trace command.
- **maxShaderGroupStride** is the maximum stride in bytes allowed between shader groups in the shader binding table.
- **shaderGroupBaseAlignment** is the **required** alignment in bytes for the base of the shader binding table.
- **shaderGroupHandleCaptureReplaySize** is the number of bytes for the information required to do capture and replay for shader group handles.
- **maxRayDispatchInvocationCount** is the maximum number of ray generation shader invocations which **may** be produced by a single **vkCmdTraceRaysIndirectKHR** or **vkCmdTraceRaysKHR** command.
- **shaderGroupHandleAlignment** is the **required** alignment in bytes for each shader binding table entry. The value **must** be a power of two.
- **maxRayHitAttributeSize** is the maximum size in bytes for a ray attribute structure

If the **VkPhysicalDeviceRayTracingPipelinePropertiesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

Limits specified by this structure **must** match those specified with the same name in **VkPhysicalDeviceRayTracingPropertiesNV**.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingPipelinePropertiesKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PIPELINE_PROPERTIES_KHR**

The `VkPhysicalDeviceCooperativeMatrixPropertiesNV` structure is defined as:

```
// Provided by VK_NV_cooperative_matrix
typedef struct VkPhysicalDeviceCooperativeMatrixPropertiesNV {
    VkStructureType      sType;
    void*              pNext;
    VkShaderStageFlags   cooperativeMatrixSupportedStages;
} VkPhysicalDeviceCooperativeMatrixPropertiesNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `cooperativeMatrixSupportedStages` is a bitfield of `VkShaderStageFlagBits` describing the shader stages that cooperative matrix instructions are supported in. `cooperativeMatrixSupportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device's queues support `VK_QUEUE_COMPUTE_BIT`.

If the `VkPhysicalDeviceCooperativeMatrixPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCooperativeMatrixPropertiesNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_PROPERTIES_NV`

The `VkPhysicalDeviceShaderSMBuiltinsPropertiesNV` structure is defined as:

```
// Provided by VK_NV_shader_sm_builtin
typedef struct VkPhysicalDeviceShaderSMBuiltinsPropertiesNV {
    VkStructureType      sType;
    void*              pNext;
    uint32_t            shaderSMCount;
    uint32_t            shaderWarpsPerSM;
} VkPhysicalDeviceShaderSMBuiltinsPropertiesNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderSMCount` is the number of SMs on the device.
- `shaderWarpsPerSM` is the maximum number of simultaneously executing warps on an SM.

If the `VkPhysicalDeviceShaderSMBuiltinsPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderSMBuiltinsPropertiesNV-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SM_BUILTINS_PROPERTIES_NV`

The `VkPhysicalDeviceTexelBufferAlignmentProperties` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceTexelBufferAlignmentProperties {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize        storageTexelBufferOffsetAlignmentBytes;
    VkBool32            storageTexelBufferOffsetSingleTexelAlignment;
    VkDeviceSize        uniformTexelBufferOffsetAlignmentBytes;
    VkBool32            uniformTexelBufferOffsetSingleTexelAlignment;
} VkPhysicalDeviceTexelBufferAlignmentProperties;
```

or the equivalent

```
// Provided by VK_EXT_texel_buffer_alignment
typedef VkPhysicalDeviceTexelBufferAlignmentProperties
VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `storageTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a storage texel buffer of any format. The value **must** be a power of two.
- `storageTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a storage texel buffer of any format. The value **must** be a power of two.
- `uniformTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a uniform texel buffer of any format. The value **must** be a power of two.
- `uniformTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a uniform texel buffer of any format. The value **must** be a power of two.

If the `VkPhysicalDeviceTexelBufferAlignmentProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If the single texel alignment property is `VK_FALSE`, then the buffer view's offset **must** be aligned to the corresponding byte alignment value. If the single texel alignment property is `VK_TRUE`, then the buffer view's offset **must** be aligned to the lesser of the corresponding byte alignment value or the size of a single texel, based on `VkBufferViewCreateInfo::format`. If the size of a single texel is a multiple of three bytes, then the size of a single component of the format is used instead.

These limits **must** not advertise a larger alignment than the [required](#) maximum minimum value of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`, for any format that supports use as a texel buffer.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTexelBufferAlignmentProperties-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_PROPERTIES`

The `VkPhysicalDeviceTimelineSemaphoreProperties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceTimelineSemaphoreProperties {
    VkStructureType      sType;
    void*               pNext;
    uint64_t            maxTimelineSemaphoreValueDifference;
} VkPhysicalDeviceTimelineSemaphoreProperties;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkPhysicalDeviceTimelineSemaphoreProperties
VkPhysicalDeviceTimelineSemaphorePropertiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxTimelineSemaphoreValueDifference** indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

If the `VkPhysicalDeviceTimelineSemaphoreProperties` structure is included in the **pNext** chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTimelineSemaphoreProperties-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_PROPERTIES`

The `VkPhysicalDeviceLineRasterizationPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_line_rasterization
typedef struct VkPhysicalDeviceLineRasterizationPropertiesEXT {
    VkStructureType    sType;
    void*             pNext;
    uint32_t          lineSubPixelPrecisionBits;
} VkPhysicalDeviceLineRasterizationPropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **lineSubPixelPrecisionBits** is the number of bits of subpixel precision in framebuffer coordinates x_f and y_f when rasterizing [line segments](#).

If the [VkPhysicalDeviceLineRasterizationPropertiesEXT](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLineRasterizationPropertiesEXT-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_EXT](#)

The [VkPhysicalDeviceRobustness2PropertiesEXT](#) structure is defined as:

```
// Provided by VK_EXT_robustness2
typedef struct VkPhysicalDeviceRobustness2PropertiesEXT {
    VkStructureType    sType;
    void*             pNext;
    VkDeviceSize      robustStorageBufferAccessSizeAlignment;
    VkDeviceSize      robustUniformBufferAccessSizeAlignment;
} VkPhysicalDeviceRobustness2PropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **robustStorageBufferAccessSizeAlignment** is the number of bytes that the range of a storage buffer descriptor is rounded up to when used for bounds-checking when [robustBufferAccess2](#) is enabled. This value **must** be either 1 or 4.
- **robustUniformBufferAccessSizeAlignment** is the number of bytes that the range of a uniform buffer descriptor is rounded up to when used for bounds-checking when [robustBufferAccess2](#) is enabled. This value **must** be a power of two in the range [1, 256].

If the [VkPhysicalDeviceRobustness2PropertiesEXT](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceRobustness2PropertiesEXT-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_PROPERTIES_EXT`

The `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV` structure is defined as:

```
// Provided by VK_NV_device_generated_commands
typedef struct VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV {
    VkStructureType    sType;
    void*              pNext;
    uint32_t            maxGraphicsShaderGroupCount;
    uint32_t            maxIndirectSequenceCount;
    uint32_t            maxIndirectCommandsTokenCount;
    uint32_t            maxIndirectCommandsStreamCount;
    uint32_t            maxIndirectCommandsTokenOffset;
    uint32_t            maxIndirectCommandsStreamStride;
    uint32_t            minSequencesCountBufferOffsetAlignment;
    uint32_t            minSequencesIndexBufferOffsetAlignment;
    uint32_t            minIndirectCommandsBufferOffsetAlignment;
} VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxGraphicsShaderGroupCount` is the maximum number of shader groups in `VkGraphicsPipelineShaderGroupsCreateInfoNV`.
- `maxIndirectSequenceCount` is the maximum number of sequences in `VkGeneratedCommandsInfoNV` and in `VkGeneratedCommandsMemoryRequirementsInfoNV`.
- `maxIndirectCommandsTokenCount` is the maximum number of tokens in `VkIndirectCommandsLayoutCreateInfoNV`.
- `maxIndirectCommandsStreamCount` is the maximum number of streams in `VkIndirectCommandsLayoutCreateInfoNV`.
- `maxIndirectCommandsTokenOffset` is the maximum offset in `VkIndirectCommandsLayoutTokenNV`.
- `maxIndirectCommandsStreamStride` is the maximum stream stride in `VkIndirectCommandsLayoutCreateInfoNV`.
- `minSequencesCountBufferOffsetAlignment` is the minimum alignment for memory addresses which can be used in `VkGeneratedCommandsInfoNV`.
- `minSequencesIndexBufferOffsetAlignment` is the minimum alignment for memory addresses which can be used in `VkGeneratedCommandsInfoNV`.
- `minIndirectCommandsBufferOffsetAlignment` is the minimum alignment for memory addresses used in `VkIndirectCommandsStreamNV`, and as preprocess buffer in `VkGeneratedCommandsInfoNV`.

If the `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV` structure is included in the `pNext` chain

of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_GENERATED_COMMANDS_PROPERTIES_NV`

The [VkPhysicalDevicePortabilitySubsetPropertiesKHR](#) structure is defined as:

```
// Provided by VK_KHR_portability_subset
typedef struct VkPhysicalDevicePortabilitySubsetPropertiesKHR {
    VkStructureType      sType;
    void*                pNext;
    uint32\_t             minVertexInputBindingStrideAlignment;
} VkPhysicalDevicePortabilitySubsetPropertiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **minVertexInputBindingStrideAlignment** indicates the minimum alignment for vertex input strides. [VkVertexInputBindingDescription::stride](#) **must** be a multiple of, and at least as large as, this value. The value **must** be a power of two.

If the [VkPhysicalDevicePortabilitySubsetPropertiesKHR](#) structure is included in the **pNext** chain of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePortabilitySubsetPropertiesKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PORTABILITY_SUBSET_PROPERTIES_KHR`

The [VkPhysicalDeviceFragmentShadingRatePropertiesKHR](#) structure is defined as:

```

// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRatePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkExtent2D minFragmentShadingRateAttachmentTexelSize;
    VkExtent2D maxFragmentShadingRateAttachmentTexelSize;
    uint32_t maxFragmentShadingRateAttachmentTexelSizeAspectRatio;
    VkBool32 primitiveFragmentShadingRateWithMultipleViewports;
    VkBool32 layeredShadingRateAttachments;
    VkBool32 fragmentShadingRateNonTrivialCombinerOps;
    VkExtent2D maxFragmentSize;
    uint32_t maxFragmentSizeAspectRatio;
    uint32_t maxFragmentShadingRateCoverageSamples;
    VkSampleCountFlagBits maxFragmentShadingRateRasterizationSamples;
    VkBool32 fragmentShadingRateWithShaderDepthStencilWrites;
    VkBool32 fragmentShadingRateWithSampleMask;
    VkBool32 fragmentShadingRateWithShaderSampleMask;
    VkBool32 fragmentShadingRateWithConservativeRasterization;
    VkBool32 fragmentShadingRateWithFragmentShaderInterlock;
    VkBool32 fragmentShadingRateWithCustomSampleLocations;
    VkBool32 fragmentShadingRateStrictMultiplyCombiner;
} VkPhysicalDeviceFragmentShadingRatePropertiesKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **minFragmentShadingRateAttachmentTexelSize** indicates minimum supported width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. Each value **must** be less than or equal to the values in **maxFragmentShadingRateAttachmentTexelSize**. Each value **must** be a power-of-two. It **must** be (0,0) if the **attachmentFragmentShadingRate** feature is not supported.
- **maxFragmentShadingRateAttachmentTexelSize** indicates maximum supported width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. Each value **must** be greater than or equal to the values in **minFragmentShadingRateAttachmentTexelSize**. Each value **must** be a power-of-two. It **must** be (0,0) if the **attachmentFragmentShadingRate** feature is not supported.
- **maxFragmentShadingRateAttachmentTexelSizeAspectRatio** indicates the maximum ratio between the width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. **maxFragmentShadingRateAttachmentTexelSizeAspectRatio** **must** be a power-of-two value, and **must** be less than or equal to $\max(\text{maxFragmentShadingRateAttachmentTexelSize.width} / \text{minFragmentShadingRateAttachmentTexelSize.height}, \text{maxFragmentShadingRateAttachmentTexelSize.height} / \text{minFragmentShadingRateAttachmentTexelSize.width})$. It **must** be 0 if the **attachmentFragmentShadingRate** feature is not supported.
- **primitiveFragmentShadingRateWithMultipleViewports** specifies whether the **primitive fragment shading rate** **can** be used when multiple viewports are used. If this value is **VK_FALSE**, only a

single viewport **must** be used, and applications **must** not write to the `ViewportMaskNV` or `ViewportIndex` built-in when setting `PrimitiveShadingRateKHR`. It **must** be `VK_FALSE` if the `shaderOutputViewportIndex` feature, the `VK_EXT_shader_viewport_index_layer` extension, or the `geometryShader` feature is not supported, or if the `primitiveFragmentShadingRate` feature is not supported.

- `layeredShadingRateAttachments` specifies whether a shading rate attachment image view **can** be created with multiple layers. If this value is `VK_FALSE`, when creating an image view with a `usage` that includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, `layerCount` **must** be `1`. It **must** be `VK_FALSE` if the `multiview` feature, the `shaderOutputViewportIndex` feature, the `VK_EXT_shader_viewport_index_layer` extension, or the `geometryShader` feature is not supported, or if the `attachmentFragmentShadingRate` feature is not supported.

- `fragmentShadingRateNonTrivialCombinerOps` specifies whether `VkFragmentShadingRateCombinerOpKHR` enums other than `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` **can** be used. It **must** be `VK_FALSE` unless either the `primitiveFragmentShadingRate` or `attachmentFragmentShadingRate` feature is supported.
- `maxFragmentSize` indicates the maximum supported width and height of a fragment. Its `width` and `height` members **must** both be power-of-two values. This limit is purely informational, and is not validated.
- `maxFragmentSizeAspectRatio` indicates the maximum ratio between the width and height of a fragment. `maxFragmentSizeAspectRatio` **must** be a power-of-two value, and **must** be less than or equal to the maximum of the `width` and `height` members of `maxFragmentSize`. This limit is purely informational, and is not validated.
- `maxFragmentShadingRateCoverageSamples` specifies the maximum number of coverage samples supported in a single fragment. `maxFragmentShadingRateCoverageSamples` **must** be less than or equal to the product of the `width` and `height` members of `maxFragmentSize`, and the sample count reported by `maxFragmentShadingRateRasterizationSamples`. `maxFragmentShadingRateCoverageSamples` **must** be less than or equal to `maxSampleMaskWords` × `32` if `fragmentShadingRateWithShaderSampleMask` is supported. This limit is purely informational, and is not validated.
- `maxFragmentShadingRateRasterizationSamples` is a `VkSampleCountFlagBits` value specifying the maximum sample rate supported when a fragment covers multiple pixels. This limit is purely informational, and is not validated.
- `fragmentShadingRateWithShaderDepthStencilWrites` specifies whether the implementation supports writing `FragDepth` or `FragStencilRefEXT` from a fragment shader for multi-pixel fragments. If this value is `VK_FALSE`, writing to those built-ins will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateWithSampleMask` specifies whether the the implementation supports setting valid bits of `VkPipelineMultisampleStateCreateInfo::pSampleMask` to `0` for multi-pixel fragments. If this value is `VK_FALSE`, zeroing valid bits in the sample mask will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateWithShaderSampleMask` specifies whether the implementation supports reading or writing `SampleMask` for multi-pixel fragments. If this value is `VK_FALSE`, using that built-in will clamp the fragment shading rate to (1,1).

- `fragmentShadingRateWithConservativeRasterization` specifies whether conservative rasterization is supported for multi-pixel fragments. It **must** be `VK_FALSE` if `VK_EXT_conservative_rasterization` is not supported. If this value is `VK_FALSE`, using `conservative rasterization` will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateWithFragmentShaderInterlock` specifies whether `fragment shader interlock` is supported for multi-pixel fragments. It **must** be `VK_FALSE` if `VK_EXT_fragment_shader_interlock` is not supported. If this value is `VK_FALSE`, using `fragment shader interlock` will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateWithCustomSampleLocations` specifies whether `custom sample locations` are supported for multi-pixel fragments. It **must** be `VK_FALSE` if `VK_EXT_sample_locations` is not supported. If this value is `VK_FALSE`, using `custom sample locations` will clamp the fragment shading rate to (1,1).
- `fragmentShadingRateStrictMultiplyCombiner` specifies whether `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` accurately performs a multiplication or not. Implementations where this value is `VK_FALSE` will instead combine rates with an addition. If `fragmentShadingRateNonTrivialCombinerOps` is `VK_FALSE`, implementations **must** report this as `VK_FALSE`. If `fragmentShadingRateNonTrivialCombinerOps` is `VK_TRUE`, implementations **should** report this as `VK_TRUE`.

Note

Multiplication of the combiner rates using the fragment width/height in linear space is equivalent to an addition of those values in log2 space. Some implementations inadvertently implemented an addition in linear space due to unclear requirements originating outside of this specification. This resulted in `fragmentShadingRateStrictMultiplyCombiner` being added. Fortunately, this only affects situations where a rate of 1 in either dimension is combined with another rate of 1. All other combinations result in the exact same result as if multiplication was performed in linear space due to the clamping logic, and the fact that both the sum and product of 2 and 2 are equal. In many cases, this limit will not affect the correct operation of applications.

If the `VkPhysicalDeviceFragmentShadingRatePropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties are related to `fragment shading rates`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRatePropertiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_PROPERTIES_KHR`

The `VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV` structure is defined as:

```
// Provided by VK_NV_fragment_shading_rate_enums
typedef struct VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV {
    VkStructureType      sType;
    void*              pNext;
    VkSampleCountFlagBits maxFragmentShadingRateInvocationCount;
} VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxFragmentShadingRateInvocationCount** is a **VkSampleCountFlagBits** value indicating the maximum number of fragment shader invocations per fragment supported in pipeline, primitive, and attachment fragment shading rates.

If the **VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These properties are related to **fragment shading rates**.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_ENUMS_PROPERTIES_NV**
- VUID-VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV-maxFragmentShadingRateInvocationCount-parameter
maxFragmentShadingRateInvocationCount **must** be a valid **VkSampleCountFlagBits** value

The **VkPhysicalDeviceCustomBorderColorPropertiesEXT** structure is defined as:

```
// Provided by VK_EXT_custom_border_color
typedef struct VkPhysicalDeviceCustomBorderColorPropertiesEXT {
    VkStructureType      sType;
    void*              pNext;
    uint32_t           maxCustomBorderColorSamplers;
} VkPhysicalDeviceCustomBorderColorPropertiesEXT;
```

- **maxCustomBorderColorSamplers** indicates the maximum number of samplers with custom border colors which **can** simultaneously exist on a device.

If the **VkPhysicalDeviceCustomBorderColorPropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCustomBorderColorPropertiesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_PROPERTIES_EXT`

The `VkPhysicalDeviceProvokingVertexPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_provoking_vertex
typedef struct VkPhysicalDeviceProvokingVertexPropertiesEXT {
    VkStructureType      sType;
    void*              pNext;
    VkBool32             provokingVertexModePerPipeline;
    VkBool32             transformFeedbackPreservesTriangleFanProvokingVertex;
} VkPhysicalDeviceProvokingVertexPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `provokingVertexModePerPipeline` indicates whether the implementation supports graphics pipelines with different provoking vertex modes within the same render pass instance.
- `transformFeedbackPreservesTriangleFanProvokingVertex` indicates whether the implementation can preserve the provoking vertex order when writing triangle fan vertices to transform feedback.

If the `VkPhysicalDeviceProvokingVertexPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProvokingVertexPropertiesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROVOKING_VERTEX_PROPERTIES_EXT`

The `VkPhysicalDeviceSubpassShadingPropertiesHUAWEI` structure is defined as:

```
// Provided by VK_HUAWEI_subpass_shading
typedef struct VkPhysicalDeviceSubpassShadingPropertiesHUAWEI {
    VkStructureType      sType;
    void*              pNext;
    uint32_t            maxSubpassShadingWorkgroupSizeAspectRatio;
} VkPhysicalDeviceSubpassShadingPropertiesHUAWEI;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `maxSubpassShadingWorkgroupSizeAspectRatio` indicates the maximum ratio between the width and height of the portion of the subpass shading shader workgroup size. `maxSubpassShadingWorkgroupSizeAspectRatio` **must** be a power-of-two value, and **must** be less than or equal to `max(WorkgroupSize.x / WorkgroupSize.y, WorkgroupSize.y / WorkgroupSize.x)`.

If the `VkPhysicalDeviceSubpassShadingPropertiesHUAWEI` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubpassShadingPropertiesHUAWEI-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBPASS_SHADING_PROPERTIES_HUAWEI`

The `VkPhysicalDeviceMultiDrawPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_multi_draw
typedef struct VkPhysicalDeviceMultiDrawPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxMultiDrawCount;
} VkPhysicalDeviceMultiDrawPropertiesEXT;
```

The members of the `VkPhysicalDeviceMultiDrawPropertiesEXT` structure describe the following features:

- `maxMultiDrawCount` indicates the maximum number of draw calls which **can** be batched into a single multidraw.

If the `VkPhysicalDeviceMultiDrawPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiDrawPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTI_DRAW_PROPERTIES_EXT`

42.1. Limit Requirements

The following table specifies the **required** minimum/maximum for all Vulkan graphics implementations. Where a limit corresponds to a fine-grained device feature which is **optional**, the feature name is listed with two **required** limits, one when the feature is supported and one when it is not supported. If an implementation supports a feature, the limits reported are the same whether or not the feature is enabled.

Table 52. Required Limit Types

Type	Limit	Feature
uint32_t	maxImageDimension1D	-
uint32_t	maxImageDimension2D	-
uint32_t	maxImageDimension3D	-
uint32_t	maxImageDimensionCube	-
uint32_t	maxImageArrayLayers	-
uint32_t	maxTexelBufferElements	-
uint32_t	maxUniformBufferRange	-
uint32_t	maxStorageBufferRange	-
uint32_t	maxPushConstantsSize	-
uint32_t	maxMemoryAllocationCount	-
uint32_t	maxSamplerAllocationCount	-
VkDeviceSize	bufferImageGranularity	-
VkDeviceSize	sparseAddressSpaceSize	sparseBinding
uint32_t	maxBoundDescriptorSets	-
uint32_t	maxPerStageDescriptorSamplers	-
uint32_t	maxPerStageDescriptorUniformBuffers	-
uint32_t	maxPerStageDescriptorStorageBuffers	-
uint32_t	maxPerStageDescriptorSampledImages	-
uint32_t	maxPerStageDescriptorStorageImages	-
uint32_t	maxPerStageDescriptorInputAttachments	-
uint32_t	maxPerStageResources	-
uint32_t	maxDescriptorSetSamplers	-
uint32_t	maxDescriptorSetUniformBuffers	-
uint32_t	maxDescriptorSetUniformBuffersDynamic	-
uint32_t	maxDescriptorSetStorageBuffers	-
uint32_t	maxDescriptorSetStorageBuffersDynamic	-
uint32_t	maxDescriptorSetSampledImages	-
uint32_t	maxDescriptorSetStorageImages	-
uint32_t	maxDescriptorSetInputAttachments	-
uint32_t	maxVertexInputAttributes	-
uint32_t	maxVertexInputBindings	-
uint32_t	maxVertexInputAttributeOffset	-
uint32_t	maxVertexInputBindingStride	-

Type	Limit	Feature
uint32_t	maxVertexOutputComponents	-
uint32_t	maxTessellationGenerationLevel	tessellationShader
uint32_t	maxTessellationPatchSize	tessellationShader
uint32_t	maxTessellationControlPerVertexInputComponents	tessellationShader
uint32_t	maxTessellationControlPerVertexOutputComponents	tessellationShader
uint32_t	maxTessellationControlPerPatchOutputComponents	tessellationShader
uint32_t	maxTessellationControlTotalOutputComponents	tessellationShader

1

The **Limit Type** column specifies the limit is either the minimum limit all implementations **must** support, the maximum limit all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum limit is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

2

The `maxPerStageResources` **must** be at least the smallest of the following:

- the sum of the `maxPerStageDescriptorUniformBuffers`, `maxPerStageDescriptorStorageBuffers`, `maxPerStageDescriptorSampledImages`, `maxPerStageDescriptorStorageImages`, `maxPerStageDescriptorInputAttachments`, `maxColorAttachments` limits, or
- 128.

It **may** not be possible to reach this limit in every stage.

3

See `maxViewportDimensions` for the **required** relationship to other limits.

4

See `viewportBoundsRange` for the **required** relationship to other limits.

5

The values `minInterpolationOffset` and `maxInterpolationOffset` describe the closed interval of supported interpolation offsets: $[\text{minInterpolationOffset}, \text{maxInterpolationOffset}]$. The ULP is determined by `subPixelInterpolationOffsetBits`. If `subPixelInterpolationOffsetBits` is 4, this provides increments of $(1/2^4) = 0.0625$, and thus the range of supported interpolation offsets would be $[-0.5, 0.4375]$.

6

The point size ULP is determined by `pointSizeGranularity`. If the `pointSizeGranularity` is 0.125, the range of supported point sizes **must** be at least $[1.0, 63.875]$.

7

The line width ULP is determined by `lineWidthGranularity`. If the `lineWidthGranularity` is 0.0625,

the range of supported line widths **must** be at least [1.0, 7.9375].

8

The minimum `maxDescriptorSet*` limit is n times the corresponding *specification* minimum `maxPerStageDescriptor*` limit, where n is the number of shader stages supported by the `VkPhysicalDevice`. If all shader stages are supported, $n = 6$ (vertex, tessellation control, tessellation evaluation, geometry, fragment, compute).

9

The `UpdateAfterBind` descriptor limits **must** each be greater than or equal to the corresponding `non-UpdateAfterBind` limit.

10

If the `VK_KHR_portability_subset` extension is enabled, the required minimum value of `maxVertexInputBindings` is 8.

42.2. Additional Multisampling Capabilities

To query additional multisampling capabilities which **may** be supported for a specific sample count, beyond the minimum capabilities described for [Limits](#) above, call:

```
// Provided by VK_EXT_sample_locations
void vkGetPhysicalDeviceMultisamplePropertiesEXT(
    VkPhysicalDevice physicalDevice,  

    VkSampleCountFlagBits samples,  

    VkMultisamplePropertiesEXT* pMultisampleProperties);
```

- `physicalDevice` is the physical device from which to query the additional multisampling capabilities.
- `samples` is a `VkSampleCountFlagBits` value specifying the sample count to query capabilities for.
- `pMultisampleProperties` is a pointer to a `VkMultisamplePropertiesEXT` structure in which information about additional multisampling capabilities specific to the sample count is returned.

Valid Usage (Implicit)

- VUID-`vkGetPhysicalDeviceMultisamplePropertiesEXT-physicalDevice-parameter`
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-`vkGetPhysicalDeviceMultisamplePropertiesEXT-samples-parameter`
`samples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-`vkGetPhysicalDeviceMultisamplePropertiesEXT-pMultisampleProperties-parameter`
`pMultisampleProperties` **must** be a valid pointer to a `VkMultisamplePropertiesEXT` structure

The `VkMultisamplePropertiesEXT` structure is defined as

```
// Provided by VK_EXT_sample_locations
typedef struct VkMultisamplePropertiesEXT {
    VkStructureType      sType;
    void*                pNext;
    VkExtent2D           maxSampleLocationGridSize;
} VkMultisamplePropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxSampleLocationGridSize** is the maximum size of the pixel grid in which sample locations **can** vary.

Valid Usage (Implicit)

- VUID-VkMultisamplePropertiesEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_MULTISAMPLE_PROPERTIES_EXT**
- VUID-VkMultisamplePropertiesEXT-pNext-pNext
pNext **must** be **NULL**

If the sample count for which additional multisampling capabilities are requested using `vkGetPhysicalDeviceMultisamplePropertiesEXT` is set in `VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts` the `width` and `height` members of `VkMultisamplePropertiesEXT::maxSampleLocationGridSize` **must** be greater than or equal to the corresponding members of `VkPhysicalDeviceSampleLocationsPropertiesEXT::maxSampleLocationGridSize`, respectively, otherwise both members **must** be `0`.

42.3. Profile Limits

42.3.1. Roadmap 2022

Implementations that claim support for the [Roadmap 2022](#) profile **must** satisfy the following additional limit requirements:

Limit	Supported Limit	Limit Type ¹
<code>maxImageDimension1D</code>	8192	min
<code>maxImageDimension2D</code>	8192	min
<code>maxImageDimensionCube</code>	8192	min
<code>maxImageArrayLayers</code>	2048	min
<code>maxUniformBufferRange</code>	65536	min
<code>bufferImageGranularity</code>	4096	max
<code>maxPerStageDescriptorSamplers</code>	64	min

shaderSignedZeroInfNanPreserveFloat32	VK_TRUE	Boolean
maxSubgroupSize	4	min
maxPerStageDescriptorUpdateAfterBindInputAttachments	7	min

Chapter 43. Formats

Supported buffer and image formats **may** vary across implementations. A minimum set of format features are guaranteed, but others **must** be explicitly queried before use to ensure they are supported by the implementation.

The features for the set of formats ([VkFormat](#)) supported by the implementation are queried individually using the [vkGetPhysicalDeviceFormatProperties](#) command.

43.1. Format Definition

The following image formats **can** be passed to, and **may** be returned from Vulkan commands. The memory required to store each format is discussed with that format, and also summarized in the [Representation and Texel Block Size](#) section and the [Compatible formats](#) table.

```
// Provided by VK_VERSION_1_0
typedef enum VkFormat {
    VK_FORMAT_UNDEFINED = 0,
    VK_FORMAT_R4G4_UNORM_PACK8 = 1,
    VK_FORMAT_R4G4B4A4_UNORM_PACK16 = 2,
    VK_FORMAT_B4G4R4A4_UNORM_PACK16 = 3,
    VK_FORMAT_R5G6B5_UNORM_PACK16 = 4,
    VK_FORMAT_B5G6R5_UNORM_PACK16 = 5,
    VK_FORMAT_R5G5B5A1_UNORM_PACK16 = 6,
    VK_FORMAT_B5G5R5A1_UNORM_PACK16 = 7,
    VK_FORMAT_A1R5G5B5_UNORM_PACK16 = 8,
    VK_FORMAT_R8_UNORM = 9,

```

- `VK_FORMAT_UNDEFINED` specifies that the format is not specified.
- `VK_FORMAT_R4G4_UNORM_PACK8` specifies a two-component, 8-bit packed unsigned normalized format that has a 4-bit R component in bits 4..7, and a 4-bit G component in bits 0..3.
- `VK_FORMAT_R4G4B4A4_UNORM_PACK16` specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit R component in bits 12..15, a 4-bit G component in bits 8..11, a 4-bit B component in bits 4..7, and a 4-bit A component in bits 0..3.
- `VK_FORMAT_B4G4R4A4_UNORM_PACK16` specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit B component in bits 12..15, a 4-bit G component in bits 8..11, a 4-bit R component in bits 4..7, and a 4-bit A component in bits 0..3.
- `VK_FORMAT_A4R4G4B4_UNORM_PACK16` specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit A component in bits 12..15, a 4-bit R component in bits 8..11, a 4-bit G component in bits 4..7, and a 4-bit B component in bits 0..3.
- `VK_FORMAT_A4B4G4R4_UNORM_PACK16` specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit A component in bits 12..15, a 4-bit B component in bits 8..11, a 4-bit G component in bits 4..7, and a 4-bit R component in bits 0..3.
- `VK_FORMAT_R5G6B5_UNORM_PACK16` specifies a three-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 6-bit G component in bits 5..10, and a 5-bit B component in bits 0..4.
- `VK_FORMAT_B5G6R5_UNORM_PACK16` specifies a three-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 6-bit G component in bits 5..10, and a 5-bit R component in bits 0..4.
- `VK_FORMAT_R5G5B5A1_UNORM_PACK16` specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 5-bit G component in bits 6..10, a 5-bit B component in bits 1..5, and a 1-bit A component in bit 0.
- `VK_FORMAT_B5G5R5A1_UNORM_PACK16` specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 5-bit G component in bits 6..10, a 5-bit R component in bits 1..5, and a 1-bit A component in bit 0.
- `VK_FORMAT_A1R5G5B5_UNORM_PACK16` specifies a four-component, 16-bit packed unsigned normalized format that has a 1-bit A component in bit 15, a 5-bit R component in bits 10..14, a 5-bit G component in bits 5..9, and a 5-bit B component in bits 0..4.
- `VK_FORMAT_R8_UNORM` specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component.
- `VK_FORMAT_R8_SNORM` specifies a one-component, 8-bit signed normalized format that has a single 8-bit R component.
- `VK_FORMAT_R8_USCALED` specifies a one-component, 8-bit unsigned scaled integer format that has a single 8-bit R component.
- `VK_FORMAT_R8_SSACLED` specifies a one-component, 8-bit signed scaled integer format that has a single 8-bit R component.
- `VK_FORMAT_R8_UINT` specifies a one-component, 8-bit unsigned integer format that has a single 8-bit R component.
- `VK_FORMAT_R8_SINT` specifies a one-component, 8-bit signed integer format that has a single 8-bit R component.

R component.

- **VK_FORMAT_R8_SRGB** specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component stored with sRGB nonlinear encoding.
- **VK_FORMAT_R8G8_UNORM** specifies a two-component, 16-bit unsigned normalized format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_SNORM** specifies a two-component, 16-bit signed normalized format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_USCALED** specifies a two-component, 16-bit unsigned scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_SSACLED** specifies a two-component, 16-bit signed scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_UINT** specifies a two-component, 16-bit unsigned integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_SINT** specifies a two-component, 16-bit signed integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- **VK_FORMAT_R8G8_SRGB** specifies a two-component, 16-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, and an 8-bit G component stored with sRGB nonlinear encoding in byte 1.
- **VK_FORMAT_R8G8B8_UNORM** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_SNORM** specifies a three-component, 24-bit signed normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_USCALED** specifies a three-component, 24-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_SSACLED** specifies a three-component, 24-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_UINT** specifies a three-component, 24-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_SINT** specifies a three-component, 24-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_SRGB** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit B component stored with sRGB nonlinear encoding in byte 2.
- **VK_FORMAT_B8G8R8_UNORM** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_SNORM** specifies a three-component, 24-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in

byte 2.

- **VK_FORMAT_B8G8R8_USCALED** specifies a three-component, 24-bit unsigned scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_SSACLED** specifies a three-component, 24-bit signed scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_UINT** specifies a three-component, 24-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_SINT** specifies a three-component, 24-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- **VK_FORMAT_B8G8R8_SRGB** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit R component stored with sRGB nonlinear encoding in byte 2.
- **VK_FORMAT_R8G8B8A8_UNORM** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_SNORM** specifies a four-component, 32-bit signed normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_USCALED** specifies a four-component, 32-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_SSACLED** specifies a four-component, 32-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_UINT** specifies a four-component, 32-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_SINT** specifies a four-component, 32-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_R8G8B8A8_SRGB** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit B component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_UNORM** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_SNORM** specifies a four-component, 32-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_USCALED** specifies a four-component, 32-bit unsigned scaled format that has

an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_B8G8R8A8_SSACLED** specifies a four-component, 32-bit signed scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_UINT** specifies a four-component, 32-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_SINT** specifies a four-component, 32-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_B8G8R8A8_SRGB** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit R component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.
- **VK_FORMAT_A8B8G8R8_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_USACLED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_SSACLED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- **VK_FORMAT_A8B8G8R8_SRGB_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component stored with sRGB nonlinear encoding in bits 16..23, an 8-bit G component stored with sRGB nonlinear encoding in bits 8..15, and an 8-bit R component stored with sRGB nonlinear encoding in bits 0..7.
- **VK_FORMAT_A2R10G10B10_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- **VK_FORMAT_A2R10G10B10_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

- `VK_FORMAT_A2R10G10B10_USCALED_PACK32` specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- `VK_FORMAT_A2R10G10B10_SSACLED_PACK32` specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- `VK_FORMAT_A2R10G10B10_UINT_PACK32` specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- `VK_FORMAT_A2R10G10B10_SINT_PACK32` specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- `VK_FORMAT_A2B10G10R10_UNORM_PACK32` specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- `VK_FORMAT_A2B10G10R10_SNORM_PACK32` specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- `VK_FORMAT_A2B10G10R10_USCALED_PACK32` specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- `VK_FORMAT_A2B10G10R10_SSACLED_PACK32` specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- `VK_FORMAT_A2B10G10R10_UINT_PACK32` specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- `VK_FORMAT_A2B10G10R10_SINT_PACK32` specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- `VK_FORMAT_R16_UNORM` specifies a one-component, 16-bit unsigned normalized format that has a single 16-bit R component.
- `VK_FORMAT_R16_SNORM` specifies a one-component, 16-bit signed normalized format that has a single 16-bit R component.
- `VK_FORMAT_R16_USCALED` specifies a one-component, 16-bit unsigned scaled integer format that has a single 16-bit R component.
- `VK_FORMAT_R16_SSACLED` specifies a one-component, 16-bit signed scaled integer format that has a single 16-bit R component.
- `VK_FORMAT_R16_UINT` specifies a one-component, 16-bit unsigned integer format that has a single 16-bit R component.
- `VK_FORMAT_R16_SINT` specifies a one-component, 16-bit signed integer format that has a single 16-bit R component.

- **VK_FORMAT_R16_SFLOAT** specifies a one-component, 16-bit signed floating-point format that has a single 16-bit R component.
- **VK_FORMAT_R16G16_UNORM** specifies a two-component, 32-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SNORM** specifies a two-component, 32-bit signed normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_USCALED** specifies a two-component, 32-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SSCALED** specifies a two-component, 32-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_UINT** specifies a two-component, 32-bit unsigned integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SINT** specifies a two-component, 32-bit signed integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SFLOAT** specifies a two-component, 32-bit signed floating-point format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16B16_UNORM** specifies a three-component, 48-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SNORM** specifies a three-component, 48-bit signed normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_USCALED** specifies a three-component, 48-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SSCALED** specifies a three-component, 48-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_UINT** specifies a three-component, 48-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SINT** specifies a three-component, 48-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SFLOAT** specifies a three-component, 48-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16A16_UNORM** specifies a four-component, 64-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SNORM** specifies a four-component, 64-bit signed normalized format that

has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.

- **VK_FORMAT_R16G16B16A16_USCALED** specifies a four-component, 64-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SSACLED** specifies a four-component, 64-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_UINT** specifies a four-component, 64-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SINT** specifies a four-component, 64-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SFLOAT** specifies a four-component, 64-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R32_UINT** specifies a one-component, 32-bit unsigned integer format that has a single 32-bit R component.
- **VK_FORMAT_R32_SINT** specifies a one-component, 32-bit signed integer format that has a single 32-bit R component.
- **VK_FORMAT_R32_SFLOAT** specifies a one-component, 32-bit signed floating-point format that has a single 32-bit R component.
- **VK_FORMAT_R32G32_UINT** specifies a two-component, 64-bit unsigned integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.
- **VK_FORMAT_R32G32_SINT** specifies a two-component, 64-bit signed integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.
- **VK_FORMAT_R32G32_SFLOAT** specifies a two-component, 64-bit signed floating-point format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.
- **VK_FORMAT_R32G32B32_UINT** specifies a three-component, 96-bit unsigned integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.
- **VK_FORMAT_R32G32B32_SINT** specifies a three-component, 96-bit signed integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.
- **VK_FORMAT_R32G32B32_SFLOAT** specifies a three-component, 96-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.
- **VK_FORMAT_R32G32B32A32_UINT** specifies a four-component, 128-bit unsigned integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.
- **VK_FORMAT_R32G32B32A32_SINT** specifies a four-component, 128-bit signed integer format that has

a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.

- **VK_FORMAT_R32G32B32A32_SFLOAT** specifies a four-component, 128-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.
- **VK_FORMAT_R64_UINT** specifies a one-component, 64-bit unsigned integer format that has a single 64-bit R component.
- **VK_FORMAT_R64_SINT** specifies a one-component, 64-bit signed integer format that has a single 64-bit R component.
- **VK_FORMAT_R64_SFLOAT** specifies a one-component, 64-bit signed floating-point format that has a single 64-bit R component.
- **VK_FORMAT_R64G64_UINT** specifies a two-component, 128-bit unsigned integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.
- **VK_FORMAT_R64G64_SINT** specifies a two-component, 128-bit signed integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.
- **VK_FORMAT_R64G64_SFLOAT** specifies a two-component, 128-bit signed floating-point format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.
- **VK_FORMAT_R64G64B64_UINT** specifies a three-component, 192-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.
- **VK_FORMAT_R64G64B64_SINT** specifies a three-component, 192-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.
- **VK_FORMAT_R64G64B64_SFLOAT** specifies a three-component, 192-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.
- **VK_FORMAT_R64G64B64A64_UINT** specifies a four-component, 256-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
- **VK_FORMAT_R64G64B64A64_SINT** specifies a four-component, 256-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
- **VK_FORMAT_R64G64B64A64_SFLOAT** specifies a four-component, 256-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
- **VK_FORMAT_B10G11R11_UFLOAT_PACK32** specifies a three-component, 32-bit packed unsigned floating-point format that has a 10-bit B component in bits 22..31, an 11-bit G component in bits 11..21, an 11-bit R component in bits 0..10. See [Unsigned 10-Bit Floating-Point Numbers](#) and [Unsigned 11-Bit Floating-Point Numbers](#).
- **VK_FORMAT_E5B9G9R9_UFLOAT_PACK32** specifies a three-component, 32-bit packed unsigned floating-point format that has a 5-bit shared exponent in bits 27..31, a 9-bit B component mantissa in bits 18..26, a 9-bit G component mantissa in bits 9..17, and a 9-bit R component mantissa in bits 0..8.

- `VK_FORMAT_D16_UNORM` specifies a one-component, 16-bit unsigned normalized format that has a single 16-bit depth component.
- `VK_FORMAT_X8_D24_UNORM_PACK32` specifies a two-component, 32-bit format that has 24 unsigned normalized bits in the depth component and, **optionally**, 8 bits that are unused.
- `VK_FORMAT_D32_SFLOAT` specifies a one-component, 32-bit signed floating-point format that has 32 bits in the depth component.
- `VK_FORMAT_S8_UINT` specifies a one-component, 8-bit unsigned integer format that has 8 bits in the stencil component.
- `VK_FORMAT_D16_UNORM_S8_UINT` specifies a two-component, 24-bit format that has 16 unsigned normalized bits in the depth component and 8 unsigned integer bits in the stencil component.
- `VK_FORMAT_D24_UNORM_S8_UINT` specifies a two-component, 32-bit packed format that has 8 unsigned integer bits in the stencil component, and 24 unsigned normalized bits in the depth component.
- `VK_FORMAT_D32_SFLOAT_S8_UINT` specifies a two-component format that has 32 signed float bits in the depth component and 8 unsigned integer bits in the stencil component. There are **optionally** 24 bits that are unused.
- `VK_FORMAT_BC1_RGB_UNORM_BLOCK` specifies a three-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.
- `VK_FORMAT_BC1_RGB_SRGB_BLOCK` specifies a three-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.
- `VK_FORMAT_BC1_RGBA_UNORM_BLOCK` specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data, and provides 1 bit of alpha.
- `VK_FORMAT_BC1_RGBA_SRGB_BLOCK` specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.
- `VK_FORMAT_BC2_UNORM_BLOCK` specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.
- `VK_FORMAT_BC2_SRGB_BLOCK` specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.
- `VK_FORMAT_BC3_UNORM_BLOCK` specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.
- `VK_FORMAT_BC3_SRGB_BLOCK` specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.

- `VK_FORMAT_BC4_UNORM_BLOCK` specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.
- `VK_FORMAT_BC4_SNORM_BLOCK` specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.
- `VK_FORMAT_BC5_UNORM_BLOCK` specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- `VK_FORMAT_BC5_SNORM_BLOCK` specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- `VK_FORMAT_BC6H_UFLOAT_BLOCK` specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned floating-point RGB texel data.
- `VK_FORMAT_BC6H_SFLOAT_BLOCK` specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGB texel data.
- `VK_FORMAT_BC7_UNORM_BLOCK` specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_BC7_SRGB_BLOCK` specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK` specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.
- `VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK` specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.
- `VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK` specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data, and provides 1 bit of alpha.
- `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK` specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.
- `VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK` specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.
- `VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK` specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding applied.
- `VK_FORMAT_EAC_R11_UNORM_BLOCK` specifies a one-component, ETC2 compressed format where each

64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.

- **VK_FORMAT_EAC_R11_SNORM_BLOCK** specifies a one-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.
- **VK_FORMAT_EAC_R11G11_UNORM_BLOCK** specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- **VK_FORMAT_EAC_R11G11_SNORM_BLOCK** specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- **VK_FORMAT_ASTC_4x4_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_4x4_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_5x4_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_5x4_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_5x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_5x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_ASTC_6x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_6x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- `VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of signed floating-point RGBA texel data.
- `VK_FORMAT_ASTC_6x6_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_ASTC_6x6_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of signed floating-point RGBA texel data.
- `VK_FORMAT_ASTC_8x5_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×5 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_ASTC_8x5_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×5 rectangle of signed floating-point RGBA texel data.
- `VK_FORMAT_ASTC_8x6_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×6 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_ASTC_8x6_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×6 rectangle of signed floating-point RGBA texel data.
- `VK_FORMAT_ASTC_8x8_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_ASTC_8x8_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of signed floating-point RGBA texel data.
- `VK_FORMAT_ASTC_10x5_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA texel data.

- `VK_FORMAT_ASTC_10x5_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of signed floating-point RGBA texel data.
- `VK_FORMAT_ASTC_10x6_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_ASTC_10x6_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of signed floating-point RGBA texel data.
- `VK_FORMAT_ASTC_10x8_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_ASTC_10x8_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of signed floating-point RGBA texel data.
- `VK_FORMAT_ASTC_10x10_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_ASTC_10x10_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of signed floating-point RGBA texel data.
- `VK_FORMAT_ASTC_12x10_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_ASTC_12x10_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_12x12_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA texel data.
- **VK_FORMAT_ASTC_12x12_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- **VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of signed floating-point RGBA texel data.
- **VK_FORMAT_G8B8G8R8_422_UNORM** specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit G component for the even i coordinate in byte 0, an 8-bit B component in byte 1, an 8-bit G component for the odd i coordinate in byte 2, and an 8-bit R component in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- **VK_FORMAT_B8G8R8G8_422_UNORM** specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit B component in byte 0, an 8-bit G component for the even i coordinate in byte 1, an 8-bit R component in byte 2, and an 8-bit G component for the odd i coordinate in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- **VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$ and $|j_G \times 0.5| = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G8_B8R8_2PLANE_420_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$ and $|j_G \times 0.5| = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G8_B8_R8_3PLANE_422_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width that is a multiple of two.
- **VK_FORMAT_G8_B8R8_2PLANE_422_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width that is a multiple of two.
- **VK_FORMAT_G8_B8_R8_3PLANE_444_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane.
- **VK_FORMAT_R10X6_UNORM_PACK16** specifies a one-component, 16-bit unsigned normalized format that has a single 10-bit R component in the top 10 bits of a 16-bit word, with the bottom 6 bits unused.
- **VK_FORMAT_R10X6G10X6_UNORM_2PACK16** specifies a two-component, 32-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, and a 10-bit G component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused.
- **VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16** specifies a four-component, 64-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, a 10-bit G component in the top 10 bits of the word in bytes 2..3, a 10-bit B component in the top 10 bits of the word in bytes 4..5, and a 10-bit A component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused.
- **VK_FORMAT_G10X6B10X6G10X6R10X6_422_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 0..1, a 10-bit B component in the top 10 bits of the word in bytes 2..3, a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 4..5, and a 10-bit R component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_B10X6G10X6R10X6G10X6_422_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit B component in the top 10 bits of the word in bytes 0..1, a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 2..3, a 10-bit R component in the top 10 bits of the word in bytes 4..5, and a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- **VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_422_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width that is a multiple of two.
- **VK_FORMAT_G10X6_B10X6R10X6_2PLANE_422_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with

the bottom 6 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width that is a multiple of two.

- `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_444_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.
- `VK_FORMAT_R12X4_UNORM_PACK16` specifies a one-component, 16-bit unsigned normalized format that has a single 12-bit R component in the top 12 bits of a 16-bit word, with the bottom 4 bits unused.
- `VK_FORMAT_R12X4G12X4_UNORM_2PACK16` specifies a two-component, 32-bit unsigned normalized format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, and a 12-bit G component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused.
- `VK_FORMAT_R12X4G12X4B12X4A12X4_UNORM_4PACK16` specifies a four-component, 64-bit unsigned normalized format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, a 12-bit G component in the top 12 bits of the word in bytes 2..3, a 12-bit B component in the top 12 bits of the word in bytes 4..5, and a 12-bit A component in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused.
- `VK_FORMAT_G12X4B12X4G12X4R12X4_422_UNORM_4PACK16` specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 12-bit G component for the even i coordinate in the top 12 bits of the word in bytes 0..1, a 12-bit B component in the top 12 bits of the word in bytes 2..3, a 12-bit G component for the odd i coordinate in the top 12 bits of the word in bytes 4..5, and a 12-bit R component in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- `VK_FORMAT_B12X4G12X4R12X4G12X4_422_UNORM_4PACK16` specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 12-bit B component in the top 12 bits of the word in bytes 0..1, a 12-bit G component for the even i coordinate in the top 12 bits of the word in bytes 2..3, a 12-bit R component in the top 12 bits of the word in bytes 4..5, and a 12-bit G component for the odd i coordinate in the top 12 bits of the word in bytes 6..7, with the bottom 4

bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_420_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_420_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width and height that is a multiple of two.
- **VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_422_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width that is a multiple of two.
- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_422_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width that is a multiple of two.
- **VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_444_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a

12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.

- `VK_FORMAT_G16B16G16R16_422_UNORM` specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 16-bit G component for the even i coordinate in the word in bytes 0..1, a 16-bit B component in the word in bytes 2..3, a 16-bit G component for the odd i coordinate in the word in bytes 4..5, and a 16-bit R component in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- `VK_FORMAT_B16G16R16G16_422_UNORM` specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 16-bit B component in the word in bytes 0..1, a 16-bit G component for the even i coordinate in the word in bytes 2..3, a 16-bit R component in the word in bytes 4..5, and a 16-bit G component for the odd i coordinate in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- `VK_FORMAT_G16_B16_R16_3PLANE_420_UNORM` specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$ and $|j_G \times 0.5| = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width and height that is a multiple of two.
- `VK_FORMAT_G16_B16R16_2PLANE_420_UNORM` specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$ and $|j_G \times 0.5| = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width and height that is a multiple of two.
- `VK_FORMAT_G16_B16_R16_3PLANE_422_UNORM` specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B

value is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width that is a multiple of two.

- `VK_FORMAT_G16_B16R16_2PLANE_422_UNORM` specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width that is a multiple of two.
- `VK_FORMAT_G16_B16_R16_3PLANE_444_UNORM` specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.
- `VK_FORMAT_G8_B8R8_2PLANE_444_UNORM` specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.
- `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, the bottom 6 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.
- `VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16` specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, the bottom 4 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.
- `VK_FORMAT_G16_B16R16_2PLANE_444_UNORM` specifies an unsigned normalized *multi-planar format*

that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via [vkGetImageSubresourceLayout](#), using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.

- `VK_FORMAT_PVRTC1_2BPP_UNORM_BLOCK_IMG` specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_PVRTC1_4BPP_UNORM_BLOCK_IMG` specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_PVRTC2_2BPP_UNORM_BLOCK_IMG` specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data.
- `VK_FORMAT_PVRTC2_4BPP_UNORM_BLOCK_IMG` specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_PVRTC1_2BPP_SRGB_BLOCK_IMG` specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_PVRTC1_4BPP_SRGB_BLOCK_IMG` specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_PVRTC2_2BPP_SRGB_BLOCK_IMG` specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- `VK_FORMAT_PVRTC2_4BPP_SRGB_BLOCK_IMG` specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

43.1.1. Compatible formats of planes of multi-planar formats

Individual planes of multi-planar formats are *compatible* with single-plane formats if they occupy the same number of bits per texel block. In the following table, individual planes of a *multi-planar* format are compatible with the format listed against the relevant plane index for that multi-planar format, and any format compatible with the listed single-plane format according to [Format Compatibility Classes](#).

Table 54. Plane Format Compatibility Table

Plane	Compatible format for plane	Width relative to the width w of the plane with the largest dimensions	Height relative to the height h of the plane with the largest dimensions
VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8_UNORM	w/2	h/2
2	VK_FORMAT_R8_UNORM	w/2	h/2
VK_FORMAT_G8_B8R8_2PLANE_420_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8G8_UNORM	w/2	h/2

43.1.2. Packed Formats

For the purposes of address alignment when accessing buffer memory containing vertex attribute or texel data, the following formats are considered *packed* - components of the texels or attributes are stored in bitfields packed into one or more 8-, 16-, or 32-bit fundamental data type.

- **Packed into 8-bit data types:**
 - VK_FORMAT_R4G4_UNORM_PACK8
- **Packed into 16-bit data types:**
 - VK_FORMAT_R4G4B4A4_UNORM_PACK16
 - VK_FORMAT_B4G4R4A4_UNORM_PACK16
 - VK_FORMAT_A4R4G4B4_UNORM_PACK16
 - VK_FORMAT_A4B4G4R4_UNORM_PACK16

- VK_FORMAT_R5G6B5_UNORM_PACK16
- VK_FORMAT_B5G6R5_UNORM_PACK16
- VK_FORMAT_R5G5B5A1_UNORM_PACK16
- VK_FORMAT_B5G5R5A1_UNORM_PACK16
- VK_FORMAT_A1R5G5B5_UNORM_PACK16
- VK_FORMAT_R10X6_UNORM_PACK16
- VK_FORMAT_R12X4_UNORM_PACK16
- VK_FORMAT_R10X6G10X6_UNORM_2PACK16
- VK_FORMAT_R12X4G12X4_UNORM_2PACK16
- VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_422_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_422_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_444_UNORM_3PACK16
- VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_420_UNORM_3PACK16
- VK_FORMAT_G12X4_B12X4R12X4_2PLANE_420_UNORM_3PACK16
- VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_422_UNORM_3PACK16
- VK_FORMAT_G12X4_B12X4R12X4_2PLANE_422_UNORM_3PACK16
- VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_444_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16_EXT
- VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16_EXT
- VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16
- VK_FORMAT_G10X6B10X6G10X6R10X6_422_UNORM_4PACK16
- VK_FORMAT_B10X6G10X6R10X6G10X6_422_UNORM_4PACK16
- VK_FORMAT_R12X4G12X4B12X4A12X4_UNORM_4PACK16
- VK_FORMAT_G12X4B12X4G12X4R12X4_422_UNORM_4PACK16
- VK_FORMAT_B12X4G12X4R12X4G12X4_422_UNORM_4PACK16

- **Packed into 32-bit data types:**

- VK_FORMAT_A8B8G8R8_UNORM_PACK32
- VK_FORMAT_A8B8G8R8_SNORM_PACK32
- VK_FORMAT_A8B8G8R8_USCALED_PACK32
- VK_FORMAT_A8B8G8R8_SSACLED_PACK32
- VK_FORMAT_A8B8G8R8_UINT_PACK32
- VK_FORMAT_A8B8G8R8_SINT_PACK32
- VK_FORMAT_A8B8G8R8_SRGB_PACK32

- VK_FORMAT_A2R10G10B10_UNORM_PACK32
- VK_FORMAT_A2R10G10B10_SNORM_PACK32
- VK_FORMAT_A2R10G10B10_USCALED_PACK32
- VK_FORMAT_A2R10G10B10_SSACLED_PACK32
- VK_FORMAT_A2R10G10B10_UINT_PACK32
- VK_FORMAT_A2R10G10B10_SINT_PACK32
- VK_FORMAT_A2B10G10R10_UNORM_PACK32
- VK_FORMAT_A2B10G10R10_SNORM_PACK32
- VK_FORMAT_A2B10G10R10_USCALED_PACK32
- VK_FORMAT_A2B10G10R10_SSACLED_PACK32
- VK_FORMAT_A2B10G10R10_UINT_PACK32
- VK_FORMAT_A2B10G10R10_SINT_PACK32
- VK_FORMAT_B10G11R11_UFLOAT_PACK32
- VK_FORMAT_E5B9G9R9_UFLOAT_PACK32
- VK_FORMAT_X8_D24_UNORM_PACK32

43.1.3. Identification of Formats

A “format” is represented by a single enum value. The name of a format is usually built up by using the following pattern:

`VK_FORMAT_{component-format|compression-scheme}_{numeric-format}`

The component-format indicates either the size of the R, G, B, and A components (if they are present) in the case of a color format, or the size of the depth (D) and stencil (S) components (if they are present) in the case of a depth/stencil format (see below). An X indicates a component that is unused, but **may** be present for padding.

Table 55. Interpretation of Numeric Format

Numeric format	SPIR-V Sampled Type	Description
UNORM	OpTypeFloat	The components are unsigned normalized values in the range [0,1]
SNORM	OpTypeFloat	The components are signed normalized values in the range [-1,1]
USCALED	OpTypeFloat	The components are unsigned integer values that get converted to floating-point in the range $[0, 2^n - 1]$
SSCALED	OpTypeFloat	The components are signed integer values that get converted to floating-point in the range $[-2^{n-1}, 2^{n-1} - 1]$
UINT	OpTypeInt	The components are unsigned integer values in the range $[0, 2^n - 1]$
SINT	OpTypeInt	The components are signed integer values in the range $[-2^{n-1}, 2^{n-1} - 1]$
UFLOAT	OpTypeFloat	The components are unsigned floating-point numbers (used by packed, shared exponent, and some compressed formats)
SFLOAT	OpTypeFloat	The components are signed floating-point numbers
SRGB	OpTypeFloat	The R, G, and B components are unsigned normalized values that represent values using sRGB nonlinear encoding, while the A component (if one exists) is a regular unsigned normalized value
n is the number of bits in the component.		

The suffix `_PACKnn` indicates that the format is packed into an underlying type with `nn` bits. The suffix `_mPACKnn` is a short-hand that indicates that the format has `m` groups of components (which may or may not be stored in separate *planes*) that are each packed into an underlying type with `nn` bits.

The suffix `_BLOCK` indicates that the format is a block-compressed format, with the representation of multiple pixels encoded interdependently within a region.

Table 56. Interpretation of Compression Scheme

Compression scheme	Description
BC	Block Compression. See Block-Compressed Image Formats .
ETC2	Ericsson Texture Compression. See ETC Compressed Image Formats .
EAC	ETC2 Alpha Compression. See ETC Compressed Image Formats .
ASTC	Adaptive Scalable Texture Compression (LDR Profile). See ASTC Compressed Image Formats .

For *multi-planar* images, the components in separate *planes* are separated by underscores, and the

number of planes is indicated by the addition of a `_2PLANE` or `_3PLANE` suffix. Similarly, the separate aspects of depth-stencil formats are separated by underscores, although these are not considered separate planes. Formats are suffixed by `_422` to indicate that planes other than the first are reduced in size by a factor of two horizontally or that the R and B values appear at half the horizontal frequency of the G values, `_420` to indicate that planes other than the first are reduced in size by a factor of two both horizontally and vertically, and `_444` for consistency to indicate that all three planes of a three-planar image are the same size.

Note

No common format has a single plane containing both R and B components but does not store these components at reduced horizontal resolution.

43.1.4. Representation and Texel Block Size

Color formats **must** be represented in memory in exactly the form indicated by the format's name. This means that promoting one format to another with more bits per component and/or additional components **must** not occur for color formats. Depth/stencil formats have more relaxed requirements as discussed [below](#).

Each format has a *texel block size*, the number of bytes used to store one *texel block* (a single addressable element of an uncompressed image, or a single compressed block of a compressed image). The texel block size for each format is shown in the [Compatible formats](#) table.

The representation of non-packed formats is that the first component specified in the name of the format is in the lowest memory addresses and the last component specified is in the highest memory addresses. See [Byte mappings for non-packed/compressed color formats](#). The in-memory ordering of bytes within a component is determined by the host endianness.

Table 57. Byte mappings for non-packed/compressed color formats

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	← Byte

VK_FORMAT_R64G64B64A64_* as VK_FORMAT_R64G64B64_* but with A in bytes 24-31																

Packed formats store multiple components within one underlying type. The bit representation is that the first component specified in the name of the format is in the most-significant bits and the last component specified is in the least-significant bits of the underlying type. The in-memory ordering of bytes comprising the underlying type is determined by the host endianness.

43.1.5. Depth/Stencil Formats

Depth/stencil formats are considered opaque and need not be stored in the exact number of bits per texel or component ordering indicated by the format enum. However, implementations **must** not substitute a different depth or stencil precision than is described in the format (e.g. D16 **must** not be implemented as D24 or D32).

43.1.6. Format Compatibility Classes

Uncompressed color formats are *compatible* with each other if they occupy the same number of bits per texel block. Compressed color formats are compatible with each other if the only difference between them is the numerical type of the uncompressed pixels (e.g. signed vs. unsigned, or SRGB vs. UNORM encoding). Each depth/stencil format is only compatible with itself. In the [following](#) table, all the formats in the same row are compatible.

43.2. Format Properties

To query supported format features which are properties of the physical device, call:

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFormatProperties(
    VkPhysicalDevice           physicalDevice,
    VkFormat                   format,
    VkFormatProperties*        pFormatProperties);
```

- `physicalDevice` is the physical device from which to query the format properties.
- `format` is the format whose properties are queried.
- `pFormatProperties` is a pointer to a `VkFormatProperties` structure in which physical device properties for `format` are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFormatProperties-format-parameter
`format` **must** be a valid `VkFormat` value
- VUID-vkGetPhysicalDeviceFormatProperties-pFormatProperties-parameter
`pFormatProperties` **must** be a valid pointer to a `VkFormatProperties` structure

The `VkFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkFormatProperties {
    VkFormatFeatureFlags linearTilingFeatures;
    VkFormatFeatureFlags optimalTilingFeatures;
    VkFormatFeatureFlags bufferFeatures;
} VkFormatProperties;
```

- `linearTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_LINEAR`.
- `optimalTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported

by images created with a `tiling` parameter of `VK_IMAGE_TILING_OPTIMAL`.

- `bufferFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by buffers.

Note

If no format feature flags are supported, the format itself is not supported, and images of that format cannot be created.

If `format` is a block-compressed format, then `bufferFeatures` **must** not support any features for the format.

If `format` is not a multi-plane format then `linearTilingFeatures` and `optimalTilingFeatures` **must** not contain `VK_FORMAT_FEATURE_DISJOINT_BIT`.

Bits which **can** be set in the `VkFormatProperties` features `linearTilingFeatures`, `optimalTilingFeatures`, `VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures`, and `bufferFeatures` are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFormatFeatureFlagBits {
    VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT = 0x00000001,
    VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT = 0x00000002,
    VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT = 0x00000004,
    VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000008,
    VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT = 0x00000010,
    VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT = 0x00000020,
    VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT = 0x00000040,
    VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT = 0x00000080,

VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_FORMAT_FEATURE_DISJOINT_BIT_KHR = VK_FORMAT_FEATURE_DISJOINT_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT_KHR =
VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT,
    // Provided by VK_EXT_filter_cubic
    VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT =
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_IMG,
} VkFormatFeatureFlagBits;

```

These values all have the same meaning as the equivalently named values for `VkFormatFeatureFlags2` and `may` be set in `linearTilingFeatures`, `optimalTilingFeatures`, and `VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures`, specifying that the features are supported by `images` or `image views` or `sampler Y'CBCR` conversion objects created with the queried `vkGetPhysicalDeviceFormatProperties::format`:

- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` specifies that an image view `can` be `sampled from`.
- `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` specifies that an image view `can` be used as a `storage image`.
- `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT` specifies that an image view `can` be used as storage image that supports atomic operations.
- `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` specifies that an image view `can` be used as a framebuffer color attachment and as an input attachment.
- `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT` specifies that an image view `can` be used as a framebuffer color attachment that supports blending and as an input attachment.
- `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT` specifies that an image view `can` be used as a framebuffer depth/stencil attachment and as an input attachment.
- `VK_FORMAT_FEATURE_BLIT_SRC_BIT` specifies that an image `can` be used as `srcImage` for the `vkCmdBlitImage2` and `vkCmdBlitImage` commands.
- `VK_FORMAT_FEATURE_BLIT_DST_BIT` specifies that an image `can` be used as `dstImage` for the `vkCmdBlitImage2` and `vkCmdBlitImage` commands.
- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` specifies that if `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` is also set, an image view `can` be used with a sampler that has either of `magFilter` or `minFilter` set to `VK_FILTER_LINEAR`, or `mipmapMode` set to

`VK_SAMPLER_MIPMAP_MODE_LINEAR`. If `VK_FORMAT_FEATURE_BLIT_SRC_BIT` is also set, an image can be used as the `srcImage` to `vkCmdBlitImage2` and `vkCmdBlitImage` with a `filter` of `VK_FILTER_LINEAR`. This bit **must** only be exposed for formats that also support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` or `VK_FORMAT_FEATURE_BLIT_SRC_BIT`.

If the format being queried is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports linear filtering, and that linear filtering of the depth aspect is supported whether depth compare is enabled in the sampler or not. Where depth comparison is supported it **may** be linear filtered whether this bit is present or not, but where this bit is not present the filtered value **may** be computed in an implementation-dependent manner which differs from the normal rules of linear filtering. The resulting value **must** be in the range [0,1] and **should** be proportional to, or a weighted average of, the number of comparison passes or failures.

- `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` specifies that an image **can** be used as a source image for `copy commands`.
- `VK_FORMAT_FEATURE_TRANSFER_DST_BIT` specifies that an image **can** be used as a destination image for `copy commands` and `clear commands`.
- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT` specifies `VkImage` **can** be used as a sampled image with a min or max `VkSamplerReductionMode`. This bit **must** only be exposed for formats that also support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`.
- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT` specifies that `VkImage` **can** be used with a sampler that has either of `magFilter` or `minFilter` set to `VK_FILTER_CUBIC_EXT`, or be the source image for a blit with `filter` set to `VK_FILTER_CUBIC_EXT`. This bit **must** only be exposed for formats that also support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`. If the format being queried is a depth/stencil format, this only specifies that the depth aspect is cubic filterable.
- `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT` specifies that an application **can** define a sampler `Y'CBCR` `conversion` using this format as a source, and that an image of this format **can** be used with a `VkSamplerYcbcrConversionCreateInfo` `xChromaOffset` and/or `yChromaOffset` of `VK_CHROMA_LOCATION_MIDPOINT`. Otherwise both `xChromaOffset` and `yChromaOffset` **must** be `VK_CHROMA_LOCATION_COSITED_EVEN`. If a format does not incorporate chroma downsampling (it is not a “422” or “420” format) but the implementation supports sampler `Y'CBCR` `conversion` for this format, the implementation **must** set `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT`.
- `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT` specifies that an application **can** define a sampler `Y'CBCR` `conversion` using this format as a source, and that an image of this format **can** be used with a `VkSamplerYcbcrConversionCreateInfo` `xChromaOffset` and/or `yChromaOffset` of `VK_CHROMA_LOCATION_COSITED_EVEN`. Otherwise both `xChromaOffset` and `yChromaOffset` **must** be `VK_CHROMA_LOCATION_MIDPOINT`. If neither `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT` nor `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT` is set, the application **must** not define a sampler `Y'CBCR` `conversion` using this format as a source.
- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT` specifies that an application **can** define a sampler `Y'CBCR` `conversion` using this format as a source with `chromaFilter` set to `VK_FILTER_LINEAR`.
- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT` specifies that the format can have different chroma, min, and mag filters.

- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` specifies that reconstruction is explicit, as described in [Chroma Reconstruction](#). If this bit is not present, reconstruction is implicit by default.
- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT` specifies that reconstruction **can** be forcibly made explicit by setting `VkSamplerYcbcrConversionCreateInfo::forceExplicitReconstruction` to `VK_TRUE`. If the format being queried supports `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` it **must** also support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT`.
- `VK_FORMAT_FEATURE_DISJOINT_BIT` specifies that a multi-planar image **can** have the `VK_IMAGE_CREATE_DISJOINT_BIT` set during image creation. An implementation **must** not set `VK_FORMAT_FEATURE_DISJOINT_BIT` for *single-plane formats*.
- `VK_FORMAT_FEATURE_FRAGMENT_DENSITY_MAP_BIT_EXT` specifies that an image view **can** be used as a [fragment density map attachment](#).
- `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that an image view **can** be used as a [fragment shading rate attachment](#). An implementation **must** not set this feature for formats with numeric type other than `*UINT`, or set it as a buffer feature.
- `VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR` specifies that an image view with this format **can** be used as an output for [video decode operations](#)
- `VK_FORMAT_FEATURE_VIDEO_DECODE_DPB_BIT_KHR` specifies that an image view with this format **can** be used as a DPB for [video decode operations](#)
- `VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR` specifies that an image view with this format **can** be used as an input to [video encode operations](#)
- `VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR` specifies that an image view with this format **can** be used as a DPB for [video encode operations](#)

The following bits **may** be set in `bufferFeatures`, specifying that the features are supported by buffers or [buffer views](#) created with the queried `vkGetPhysicalDeviceFormatProperties::format`:

- `VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT` specifies that the format **can** be used to create a buffer view that **can** be bound to a `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` descriptor.
- `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT` specifies that the format **can** be used to create a buffer view that **can** be bound to a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor.
- `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT` specifies that atomic operations are supported on `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` with this format.
- `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` specifies that the format **can** be used as a vertex attribute format (`VkVertexInputAttributeDescription::format`).
- `VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR` specifies that the format **can** be used as the vertex format when creating an [acceleration structure](#) (`VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat`). This format **can** also be used as the vertex format in host memory when doing [host acceleration structure](#) builds.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFormatFeatureFlags;
```

`VkFormatFeatureFlags` is a bitmask type for setting a mask of zero or more `VkFormatFeatureFlagBits`.

To query supported format features which are properties of the physical device, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceFormatProperties2(
    VkPhysicalDevice           physicalDevice,
    VkFormat                   format,
    VkFormatProperties2*       pFormatProperties);
```

or the equivalent command

```
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceFormatProperties2KHR(
    VkPhysicalDevice           physicalDevice,
    VkFormat                   format,
    VkFormatProperties2*       pFormatProperties);
```

- `physicalDevice` is the physical device from which to query the format properties.
- `format` is the format whose properties are queried.
- `pFormatProperties` is a pointer to a `VkFormatProperties2` structure in which physical device properties for `format` are returned.

`vkGetPhysicalDeviceFormatProperties2` behaves similarly to `vkGetPhysicalDeviceFormatProperties`, with the ability to return extended information in a `pNext` chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties2-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFormatProperties2-format-parameter
`format` **must** be a valid `VkFormat` value
- VUID-vkGetPhysicalDeviceFormatProperties2-pFormatProperties-parameter
`pFormatProperties` **must** be a valid pointer to a `VkFormatProperties2` structure

The `VkFormatProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkFormatProperties2 {
    VkStructureType      sType;
    void*               pNext;
    VkFormatProperties   formatProperties;
} VkFormatProperties2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkFormatProperties2 VkFormatProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **formatProperties** is a [VkFormatProperties](#) structure describing features supported by the requested format.

Valid Usage (Implicit)

- VUID-VkFormatProperties2-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_2](#)
- VUID-VkFormatProperties2-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of [VkDrmFormatModifierPropertiesList2EXT](#), [VkDrmFormatModifierPropertiesListEXT](#), [VkFormatProperties3](#), [VkVideoDecodeH264ProfileEXT](#), [VkVideoDecodeH265ProfileEXT](#), [VkVideoEncodeH264ProfileEXT](#), [VkVideoEncodeH265ProfileEXT](#), [VkVideoProfileKHR](#), or [VkVideoProfilesKHR](#)
- VUID-VkFormatProperties2-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique

To obtain the list of [Linux DRM format modifiers](#) compatible with a [VkFormat](#), add a [VkDrmFormatModifierPropertiesListEXT](#) structure to the **pNext** chain of [VkFormatProperties2](#).

The [VkDrmFormatModifierPropertiesListEXT](#) structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesListEXT {
    VkStructureType          sType;
    void*                  pNext;
    uint32_t                drmFormatModifierCount;
    VkDrmFormatModifierPropertiesEXT* pDrmFormatModifierProperties;
} VkDrmFormatModifierPropertiesListEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifierCount` is an inout parameter related to the number of modifiers compatible with the `format`, as described below.
- `pDrmFormatModifierProperties` is either `NULL` or a pointer to an array of `VkDrmFormatModifierPropertiesEXT` structures.

If `pDrmFormatModifierProperties` is `NULL`, then the function returns in `drmFormatModifierCount` the number of modifiers compatible with the queried `format`. Otherwise, the application **must** set `drmFormatModifierCount` to the length of the array `pDrmFormatModifierProperties`; the function will write at most `drmFormatModifierCount` elements to the array, and will return in `drmFormatModifierCount` the number of elements written.

Among the elements in array `pDrmFormatModifierProperties`, each returned `drmFormatModifier` **must** be unique.

Valid Usage (Implicit)

- VUID-VkDrmFormatModifierPropertiesListEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_EXT`

The `VkDrmFormatModifierPropertiesEXT` structure describes properties of a `VkFormat` when that format is combined with a `Linux DRM format modifier`. These properties, like those of `VkFormatProperties2`, are independent of any particular image.

The `VkDrmFormatModifierPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesEXT {
    uint64_t          drmFormatModifier;
    uint32_t          drmFormatModifierPlaneCount;
    VkFormatFeatureFlags  drmFormatModifierTilingFeatures;
} VkDrmFormatModifierPropertiesEXT;
```

- `drmFormatModifier` is a *Linux DRM format modifier*.
- `drmFormatModifierPlaneCount` is the number of *memory planes* in any image created with `format` and `drmFormatModifier`. An image's *memory planecount* is distinct from its *format planecount*, as explained below.
- `drmFormatModifierTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` that are supported by any image created with `format` and `drmFormatModifier`.

The returned `drmFormatModifierTilingFeatures` **must** contain at least one bit.

The implementation **must** not return `DRM_FORMAT_MOD_INVALID` in `drmFormatModifier`.

An image's *memory planecount* (as returned by `drmFormatModifierPlaneCount`) is distinct from its

format *planeCount* (in the sense of multi-planar Y'C_BC_R formats). In [VkImageAspectFlags](#), each [VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT](#) represents a *memory plane* and each [VK_IMAGE_ASPECT_PLANE_i_BIT](#) a *format plane*.

An image's set of *format planes* is an ordered partition of the image's **content** into separable groups of format components. The ordered partition is encoded in the name of each [VkFormat](#). For example, [VK_FORMAT_G8_B8R8_2PLANE_420_UNORM](#) contains two *format planes*; the first plane contains the green component and the second plane contains the blue component and red component. If the format name does not contain [PLANE](#), then the format contains a single plane; for example, [VK_FORMAT_R8G8B8A8_UNORM](#). Some commands, such as [vkCmdCopyBufferToImage](#), do not operate on all format components in the image, but instead operate only on the *format planes* explicitly chosen by the application and operate on each *format plane* independently.

An image's set of *memory planes* is an ordered partition of the image's **memory** rather than the image's **content**. Each *memory plane* is a contiguous range of memory. The union of an image's *memory planes* is not necessarily contiguous.

If an image is [linear](#), then the partition is the same for *memory planes* and for *format planes*. Therefore, if the returned [drmFormatModifier](#) is [DRM_FORMAT_MOD_LINEAR](#), then [drmFormatModifierPlaneCount](#) **must** equal the *format planeCount*, and [drmFormatModifierTilingFeatures](#) **must** be identical to the [VkFormatProperties2::linearTilingFeatures](#) returned in the same [pNext](#) chain.

If an image is [non-linear](#), then the partition of the image's **memory** into *memory planes* is implementation-specific and **may** be unrelated to the partition of the image's **content** into *format planes*. For example, consider an image whose *format* is [VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM](#), *tiling* is [VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT](#), whose [drmFormatModifier](#) is not [DRM_FORMAT_MOD_LINEAR](#), and *flags* lacks [VK_IMAGE_CREATE_DISJOINT_BIT](#). The image has 3 *format planes*, and commands such [vkCmdCopyBufferToImage](#) act on each *format plane* independently as if the data of each *format plane* were separable from the data of the other planes. In a straightforward implementation, the implementation **may** store the image's content in 3 adjacent *memory planes* where each *memory plane* corresponds exactly to a *format plane*. However, the implementation **may** also store the image's content in a single *memory plane* where all format components are combined using an implementation-private block-compressed format; or the implementation **may** store the image's content in a collection of 7 adjacent *memory planes* using an implementation-private sharding technique. Because the image is non-linear and non-disjoint, the implementation has much freedom when choosing the image's placement in memory.

The *memory planeCount* applies to function parameters and structures only when the API specifies an explicit requirement on [drmFormatModifierPlaneCount](#). In all other cases, the *memory planeCount* is ignored.

The list of [Linux DRM](#) format modifiers compatible with a [VkFormat](#) **can** be obtained by adding a [VkDrmFormatModifierPropertiesList2EXT](#) structure to the [pNext](#) chain of [VkFormatProperties2](#).

The [VkDrmFormatModifierPropertiesList2EXT](#) structure is defined as:

```
// Provided by VK_KHR_format_feature_flags2 with VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesList2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t drmFormatModifierCount;
    VkDrmFormatModifierProperties2EXT* pDrmFormatModifierProperties;
} VkDrmFormatModifierPropertiesList2EXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **drmFormatModifierCount** is an inout parameter related to the number of modifiers compatible with the **format**, as described below.
- **pDrmFormatModifierProperties** is either **NULL** or a pointer to an array of **VkDrmFormatModifierProperties2EXT** structures.

If **pDrmFormatModifierProperties** is **NULL**, the number of modifiers compatible with the queried **format** is returned in **drmFormatModifierCount**. Otherwise, the application **must** set **drmFormatModifierCount** to the length of the array **pDrmFormatModifierProperties**; the function will write at most **drmFormatModifierCount** elements to the array, and will return in **drmFormatModifierCount** the number of elements written.

Among the elements in array **pDrmFormatModifierProperties**, each returned **drmFormatModifier** **must** be unique.

Among the elements in array **pDrmFormatModifierProperties**, the bits reported in **drmFormatModifierTilingFeatures** **must** include the bits reported in the corresponding element of **VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties**.

Valid Usage (Implicit)

- VUID-VkDrmFormatModifierPropertiesList2EXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_2_EXT**

The **VkDrmFormatModifierProperties2EXT** structure describes properties of a **VkFormat** when that format is combined with a **Linux DRM format modifier**. These properties, like those of **VkFormatProperties2**, are independent of any particular image.

The **VkDrmFormatModifierPropertiesEXT** structure is defined as:

```
// Provided by VK_KHR_format_feature_flags2 with VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierProperties2EXT {
    uint64_t drmFormatModifier;
    uint32_t drmFormatModifierPlaneCount;
    VkFormatFeatureFlags2 drmFormatModifierTilingFeatures;
} VkDrmFormatModifierProperties2EXT;
```

- `drmFormatModifier` is a *Linux DRM format modifier*.
- `drmFormatModifierPlaneCount` is the number of *memory planes* in any image created with `format` and `drmFormatModifier`. An image's *memory planecount* is distinct from its *format planecount*, as explained below.
- `drmFormatModifierTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits2` that are supported by any image created with `format` and `drmFormatModifier`.

To query supported format extended features which are properties of the physical device, add `VkFormatProperties3` structure to the `pNext` chain of `VkFormatProperties2`.

The `VkFormatProperties3` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkFormatProperties3 {
    VkStructureType          sType;
    void*                    pNext;
    VkFormatFeatureFlags2    linearTilingFeatures;
    VkFormatFeatureFlags2    optimalTilingFeatures;
    VkFormatFeatureFlags2    bufferFeatures;
} VkFormatProperties3;
```

or the equivalent

```
// Provided by VK_KHR_format_feature_flags2
typedef VkFormatProperties3 VkFormatProperties3KHR;
```

- `linearTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits2` specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_LINEAR`.
- `optimalTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits2` specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_OPTIMAL`.
- `bufferFeatures` is a bitmask of `VkFormatFeatureFlagBits2` specifying features supported by buffers.

The bits reported in `linearTilingFeatures`, `optimalTilingFeatures` and `bufferFeatures` **must** include the bits reported in the corresponding fields of `VkFormatProperties2::formatProperties`.

Valid Usage (Implicit)

- VUID-VkFormatProperties3-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_3`

Bits which **can** be set in the `VkFormatProperties3` features `linearTilingFeatures`, `optimalTilingFeatures`, and `bufferFeatures` are:

```

// Provided by VK_VERSION_1_3
// Flag bits for VkFormatFeatureFlagBits2
typedef VkFlags64 VkFormatFeatureFlagBits2;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT =

```
// Provided by VK_KHR_format_feature_flags2
typedef VkFormatFeatureFlagBits2 VkFormatFeatureFlagBits2KHR;
```

The following bits **may** be set in `linearTilingFeatures` and `optimalTilingFeatures`, specifying that the features are supported by `images` or `image views` or `sampler Y'CBCR conversion objects` created with the queried `vkGetPhysicalDeviceFormatProperties2::format`:

- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT` specifies that an image view **can** be `sampled from`.
- `VK_FORMAT_FEATURE_2_STORAGE_IMAGE_BIT` specifies that an image view **can** be used as a `storage image`.
- `VK_FORMAT_FEATURE_2_STORAGE_IMAGE_ATOMIC_BIT` specifies that an image view **can** be used as storage image that supports atomic operations.
- `VK_FORMAT_FEATURE_2_COLOR_ATTACHMENT_BIT` specifies that an image view **can** be used as a framebuffer color attachment and as an input attachment.
- `VK_FORMAT_FEATURE_2_COLOR_ATTACHMENT_BLEND_BIT` specifies that an image view **can** be used as a framebuffer color attachment that supports blending and as an input attachment.
- `VK_FORMAT_FEATURE_2_DEPTH_STENCIL_ATTACHMENT_BIT` specifies that an image view **can** be used as a framebuffer depth/stencil attachment and as an input attachment.
- `VK_FORMAT_FEATURE_2_BLIT_SRC_BIT` specifies that an image **can** be used as the `srcImage` for `vkCmdBlitImage2` and `vkCmdBlitImage`.
- `VK_FORMAT_FEATURE_2_BLIT_DST_BIT` specifies that an image **can** be used as the `dstImage` for `vkCmdBlitImage2` and `vkCmdBlitImage`.
- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_LINEAR_BIT` specifies that if `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT` is also set, an image view **can** be used with a sampler that has either of `magFilter` or `minFilter` set to `VK_FILTER_LINEAR`, or `mipMapMode` set to `VK_SAMPLER_MIPMAP_MODE_LINEAR`. If `VK_FORMAT_FEATURE_2_BLIT_SRC_BIT` is also set, an image can be used as the `srcImage` for `vkCmdBlitImage2` and `vkCmdBlitImage` with a `filter` of `VK_FILTER_LINEAR`. This bit **must** only be exposed for formats that also support the `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT` or `VK_FORMAT_FEATURE_2_BLIT_SRC_BIT`.

If the format being queried is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports linear filtering. Where depth comparison is supported it **may** be linear filtered whether this bit is present or not, but where this bit is not present the filtered value **may** be computed in an implementation-dependent manner which differs from the normal rules of linear filtering. The resulting value **must** be in the range [0,1] and **should** be proportional to, or a weighted average of, the number of comparison passes or failures.

- `VK_FORMAT_FEATURE_2_TRANSFER_SRC_BIT` specifies that an image **can** be used as a source image for `copy commands`.
- `VK_FORMAT_FEATURE_2_TRANSFER_DST_BIT` specifies that an image **can** be used as a destination image for `copy commands` and `clear commands`.
- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_MINMAX_BIT` specifies `VkImage` **can** be used as a

sampled image with a min or max `VkSamplerReductionMode`. This bit **must** only be exposed for formats that also support the `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT`.

- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_CUBIC_BIT` specifies that `VkImage` **can** be used with a sampler that has either of `magFilter` or `minFilter` set to `VK_FILTER_CUBIC_EXT`, or be the source image for a blit with `filter` set to `VK_FILTER_CUBIC_EXT`. This bit **must** only be exposed for formats that also support the `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT`. If the format being queried is a depth/stencil format, this only specifies that the depth aspect is cubic filterable.
- `VK_FORMAT_FEATURE_2_MIDPOINT_CHROMA_SAMPLES_BIT` specifies that an application **can** define a sampler `Y'CbCr` conversion using this format as a source, and that an image of this format **can** be used with a `VkSamplerYcbcrConversionCreateInfo` `xChromaOffset` and/or `yChromaOffset` of `VK_CHROMA_LOCATION_MIDPOINT`. Otherwise both `xChromaOffset` and `yChromaOffset` **must** be `VK_CHROMA_LOCATION_COSITED_EVEN`. If a format does not incorporate chroma downsampling (it is not a “422” or “420” format) but the implementation supports sampler `Y'CbCr` conversion for this format, the implementation **must** set `VK_FORMAT_FEATURE_2_MIDPOINT_CHROMA_SAMPLES_BIT`.
- `VK_FORMAT_FEATURE_2_COSITED_CHROMA_SAMPLES_BIT` specifies that an application **can** define a sampler `Y'CbCr` conversion using this format as a source, and that an image of this format **can** be used with a `VkSamplerYcbcrConversionCreateInfo` `xChromaOffset` and/or `yChromaOffset` of `VK_CHROMA_LOCATION_COSITED_EVEN`. Otherwise both `xChromaOffset` and `yChromaOffset` **must** be `VK_CHROMA_LOCATION_MIDPOINT`. If neither `VK_FORMAT_FEATURE_2_COSITED_CHROMA_SAMPLES_BIT` nor `VK_FORMAT_FEATURE_2_MIDPOINT_CHROMA_SAMPLES_BIT` is set, the application **must** not define a sampler `Y'CbCr` conversion using this format as a source.
- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT` specifies that an application **can** define a sampler `Y'CbCr` conversion using this format as a source with `chromaFilter` set to `VK_FILTER_LINEAR`.
- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT` specifies that the format can have different chroma, min, and mag filters.
- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` specifies that reconstruction is explicit, as described in [Chroma Reconstruction](#). If this bit is not present, reconstruction is implicit by default.
- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT` specifies that reconstruction **can** be forcibly made explicit by setting `VkSamplerYcbcrConversionCreateInfo::forceExplicitReconstruction` to `VK_TRUE`. If the format being queried supports `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` it **must** also support `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT`.
- `VK_FORMAT_FEATURE_2_DISJOINT_BIT` specifies that a multi-planar image **can** have the `VK_IMAGE_CREATE_DISJOINT_BIT` set during image creation. An implementation **must** not set `VK_FORMAT_FEATURE_2_DISJOINT_BIT` for *single-plane formats*.
- `VK_FORMAT_FEATURE_2_FRAGMENT_DENSITY_MAP_BIT_EXT` specifies that an image view **can** be used as a [fragment density map attachment](#).
- `VK_FORMAT_FEATURE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that an image view **can** be used as a [fragment shading rate attachment](#). An implementation **must** not set this feature for

formats with numeric type other than `*UINT`, or set it as a buffer feature.

- `VK_FORMAT_FEATURE_2_VIDEO_DECODE_OUTPUT_BIT_KHR` specifies that an image view with this format **can** be used as an output for [video decode operations](#)
- `VK_FORMAT_FEATURE_2_VIDEO_DECODE_DBP_BIT_KHR` specifies that an image view with this format **can** be used as a DPB for [video decode operations](#)
- `VK_FORMAT_FEATURE_2_VIDEO_ENCODE_INPUT_BIT_KHR` specifies that an image view with this format **can** be used as an input to [video encode operations](#)
- `VK_FORMAT_FEATURE_2_VIDEO_ENCODE_DBP_BIT_KHR` specifies that an image view with this format **can** be used as a DPB for [video encode operations](#)
- `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT` specifies that image views created with this format **can** be used as [storage images](#) for read operations without specifying a format.
- `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT` specifies that image views created with this format **can** be used as [storage images](#) for write operations without specifying a format.
- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT` specifies that image views created with this format **can** be used for depth comparison performed by `OpImage*Dref` instructions.
- `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` specifies that the format is supported as a renderable [Linear Color Attachment](#). This bit will be set for renderable color formats in the `linearTilingFeatures`. This **must** not be set in the `optimalTilingFeatures` or `bufferFeatures` members.

The following bits **may** be set in `bufferFeatures`, specifying that the features are supported by buffers or [buffer views](#) created with the queried `vkGetPhysicalDeviceFormatProperties2::format`:

- `VK_FORMAT_FEATURE_2_UNIFORM_TEXEL_BUFFER_BIT` specifies that the format **can** be used to create a buffer view that **can** be bound to a `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` descriptor.
- `VK_FORMAT_FEATURE_2_STORAGE_TEXEL_BUFFER_BIT` specifies that the format **can** be used to create a buffer view that **can** be bound to a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor.
- `VK_FORMAT_FEATURE_2_STORAGE_TEXEL_BUFFER_ATOMIC_BIT` specifies that atomic operations are supported on `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` with this format.
- `VK_FORMAT_FEATURE_2_VERTEX_BUFFER_BIT` specifies that the format **can** be used as a vertex attribute format (`VkVertexInputAttributeDescription::format`).
- `VK_FORMAT_FEATURE_2_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR` specifies that the format **can** be used as the vertex format when creating an [acceleration structure](#) (`VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat`). This format **can** also be used as the vertex format in host memory when doing [host acceleration structure](#) builds.

```
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkFormatFeatureFlags2;
```

or the equivalent

```
// Provided by VK_KHR_format_feature_flags2
typedef VkFormatFeatureFlags2 VkFormatFeatureFlags2KHR;
```

`VkFormatFeatureFlags2` is a bitmask type for setting a mask of zero or more `VkFormatFeatureFlagBits2`.

43.2.1. Potential Format Features

Some [valid usage conditions](#) depend on the format features supported by an `VkImage` whose `VkImageTiling` is unknown. In such cases the exact `VkFormatFeatureFlagBits` supported by the `VkImage` cannot be determined, so the valid usage conditions are expressed in terms of the *potential format features* of the `VkImage` format.

The *potential format features* of a `VkFormat` are defined as follows:

- The union of `VkFormatFeatureFlagBits` and `VkFormatFeatureFlagBits2`, supported when the `VkImageTiling` is `VK_IMAGE_TILING_OPTIMAL`, `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, or `VK_IMAGE_TILING_LINEAR` if `VkFormat` is not `VK_FORMAT_UNDEFINED`
- `VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures` and `VkAndroidHardwareBufferFormatProperties2ANDROID::formatFeatures` of a valid external format if `VkFormat` is `VK_FORMAT_UNDEFINED`

43.3. Required Format Support

Implementations **must** support at least the following set of features on the listed formats. For images, these features **must** be supported for every `VkImageType` (including arrayed and cube variants) unless otherwise noted. These features are supported on existing formats without needing to advertise an extension or needing to explicitly enable them. Support for additional functionality beyond the requirements listed here is queried using the `vkGetPhysicalDeviceFormatProperties` command.

Note

Unless otherwise excluded below, the required formats are supported for all `VkImageCreateFlags` values as long as those flag values are otherwise allowed.

The following tables show which feature bits **must** be supported for each format. Formats that are required to support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` **must** also support `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` and `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

Table 62. Key for format feature tables

✓	This feature must be supported on the named format
†	This feature must be supported on at least some of the named formats, with more information in the table where the symbol appears

‡	This feature must be supported with some caveats or preconditions, with more information in the table where the symbol appears
---	---

The `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for all the formats in at least one of: this table, [Mandatory format support: BC compressed formats with VkImageType VK_IMAGE_TYPE_2D and VK_IMAGE_TYPE_3D](#), or [Mandatory format support: ETC2 and EAC compressed formats with VkImageType VK_IMAGE_TYPE_2D](#).

If cubic filtering is supported, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT` **must** be supported for the following image view types:

- `VK_IMAGE_VIEW_TYPE_2D`
- `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

for the following formats:

- `VK_FORMAT_R4G4_UNORM_PACK8`
- `VK_FORMAT_R4G4B4A4_UNORM_PACK16`
- `VK_FORMAT_B4G4R4A4_UNORM_PACK16`
- `VK_FORMAT_R5G6B5_UNORM_PACK16`
- `VK_FORMAT_B5G6R5_UNORM_PACK16`
- `VK_FORMAT_R5G5B5A1_UNORM_PACK16`
- `VK_FORMAT_B5G5R5A1_UNORM_PACK16`
- `VK_FORMAT_A1R5G5B5_UNORM_PACK16`
- `VK_FORMAT_R8_UNORM`
- `VK_FORMAT_R8_SNORM`
- `VK_FORMAT_R8_SRGB`
- `VK_FORMAT_R8G8_UNORM`
- `VK_FORMAT_R8G8_SNORM`
- `VK_FORMAT_R8G8_SRGB`
- `VK_FORMAT_R8G8B8_UNORM`
- `VK_FORMAT_R8G8B8_SNORM`
- `VK_FORMAT_R8G8B8_SRGB`
- `VK_FORMAT_B8G8R8_UNORM`

- `VK_FORMAT_B8G8R8_SNORM`
- `VK_FORMAT_B8G8R8_SRGB`
- `VK_FORMAT_R8G8B8A8_UNORM`
- `VK_FORMAT_R8G8B8A8_SNORM`
- `VK_FORMAT_R8G8B8A8_SRGB`
- `VK_FORMAT_B8G8R8A8_UNORM`
- `VK_FORMAT_B8G8R8A8_SNORM`
- `VK_FORMAT_B8G8R8A8_SRGB`
- `VK_FORMAT_A8B8G8R8_UNORM_PACK32`
- `VK_FORMAT_A8B8G8R8_SNORM_PACK32`
- `VK_FORMAT_A8B8G8R8_SRGB_PACK32`

If ETC compressed formats are supported, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT` **must** be supported for the following image view types:

- `VK_IMAGE_VIEW_TYPE_2D`
- `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

for the following additional formats:

- `VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK`
- `VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK`

If cubic filtering is supported for any other formats, the following image view types **must** be supported for those formats:

- `VK_IMAGE_VIEW_TYPE_2D`
- `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

To be used with `VkImageView` with `subresourceRange.aspectMask` equal to `VK_IMAGE_ASPECT_COLOR_BIT`, `sampler Y'CBCR conversion` **must** be enabled for the following formats:

Table 76. Formats requiring sampler Y'C_BC_R conversion for VK_IMAGE_ASPECT_COLOR_BIT image views

Format features marked † **must** be supported for `optimalTilingFeatures` with `VkImageTypeVK_IMAGE_TYPE_2D` if the `VkPhysicalDevice` supports the `VkPhysicalDeviceSamplerYcbcrConversionFeatures` feature.

Formats marked ‡ do not require a sampler Y'C_BC_R conversion for `VK_IMAGE_ASPECT_COLOR_BIT` image views if the `VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT::formatRgba10x6WithoutYCbCrSampler` feature is enabled.

Implementations are not required to support the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` `VkImageCreateFlags` for the above formats that require sampler Y'C_BC_R conversion. To determine whether the implementation supports sparse image creation flags with these formats use `vkGetPhysicalDeviceImageFormatProperties` or `vkGetPhysicalDeviceImageFormatProperties2`.

`VK_FORMAT_FEATURE_FRAGMENT_DENSITY_MAP_BIT_EXT` **must** be supported for the following formats if the `fragment density map feature` is enabled:

- `VK_FORMAT_R8G8_UNORM`

`VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR` **must** be supported in `bufferFeatures` for the following formats if the `accelerationStructure` feature is supported:

- `VK_FORMAT_R32G32_SFLOAT`
- `VK_FORMAT_R32G32B32_SFLOAT`
- `VK_FORMAT_R16G16_SFLOAT`
- `VK_FORMAT_R16G16B16A16_SFLOAT`
- `VK_FORMAT_R16G16_SNORM`
- `VK_FORMAT_R16G16B16A16_SNORM`

`VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` **must** be supported for the following formats if the `attachmentFragmentShadingRate` feature is supported:

- `VK_FORMAT_R8_UINT`

43.3.1. Formats without shader storage format

The device-level features for using a storage image with an image format of `Unknown`, `shaderStorageImageReadWithoutFormat` and `shaderStorageImageWriteWithoutFormat`, only apply to the following formats:

- `VK_FORMAT_R8G8B8A8_UNORM`
- `VK_FORMAT_R8G8B8A8_SNORM`
- `VK_FORMAT_R8G8B8A8_UINT`
- `VK_FORMAT_R8G8B8A8_SINT`
- `VK_FORMAT_R32_UINT`
- `VK_FORMAT_R32_SINT`
- `VK_FORMAT_R32_SFLOAT`
- `VK_FORMAT_R32G32_UINT`
- `VK_FORMAT_R32G32_SINT`
- `VK_FORMAT_R32G32_SFLOAT`
- `VK_FORMAT_R32G32B32A32_UINT`
- `VK_FORMAT_R32G32B32A32_SINT`
- `VK_FORMAT_R32G32B32A32_SFLOAT`
- `VK_FORMAT_R16G16B16A16_UINT`
- `VK_FORMAT_R16G16B16A16_SINT`
- `VK_FORMAT_R16G16B16A16_SFLOAT`
- `VK_FORMAT_R16G16_SFLOAT`
- `VK_FORMAT_B10G11R11_UFLOAT_PACK32`
- `VK_FORMAT_R16_SFLOAT`
- `VK_FORMAT_R16G16B16A16_UNORM`
- `VK_FORMAT_A2B10G10R10_UNORM_PACK32`
- `VK_FORMAT_R16G16_UNORM`
- `VK_FORMAT_R8G8_UNORM`
- `VK_FORMAT_R16_UNORM`
- `VK_FORMAT_R8_UNORM`
- `VK_FORMAT_R16G16B16A16_SNORM`
- `VK_FORMAT_R16G16_SNORM`
- `VK_FORMAT_R8_SFLOAT`
- `VK_FORMAT_R16_SNORM`
- `VK_FORMAT_R8_SNORM`
- `VK_FORMAT_R16G16_SINT`

- `VK_FORMAT_R8G8_SINT`
- `VK_FORMAT_R16_SINT`
- `VK_FORMAT_R8_SINT`
- `VK_FORMAT_A2B10G10R10_UINT_PACK32`
- `VK_FORMAT_R16G16_UINT`
- `VK_FORMAT_R8G8_UINT`
- `VK_FORMAT_R16_UINT`
- `VK_FORMAT_R8_UINT`

Note

This list of formats is the union of required storage formats from [Required Format Support](#) section and formats listed in [shaderStorageImageExtendedFormats](#).

An implementation that supports `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` for any format from the given list of formats and supports `shaderStorageImageReadWithoutFormat` **must** support `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT` for that same format if Vulkan 1.3 or the `VK_KHR_format_feature_flags2` extension is supported.

An implementation that supports `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` for any format from the given list of formats and supports `shaderStorageImageWriteWithoutFormat` **must** support `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT` for that same format if Vulkan 1.3 or the `VK_KHR_format_feature_flags2` extension is supported.

43.3.2. Depth comparison format support

If Vulkan 1.3 or the `VK_KHR_format_feature_flags2` extension is supported, a depth/stencil format with a depth component supporting `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` **must** support `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

Chapter 44. Additional Capabilities

This chapter describes additional capabilities beyond the minimum capabilities described in the [Limits](#) and [Formats](#) chapters, including:

- [Additional Image Capabilities](#)
- [Additional Buffer Capabilities](#)
- [Optional Semaphore Capabilities](#)
- [Optional Fence Capabilities](#)
- [Timestamp Calibration Capabilities](#)

44.1. Additional Image Capabilities

Additional image capabilities, such as larger dimensions or additional sample counts for certain image types, or additional capabilities for *linear* tiling format images, are described in this section.

To query additional capabilities specific to image types, call:

```
// Provided by VK_VERSION_1_0
VkResult vkGetPhysicalDeviceImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkImageTiling tiling,
    VkImageUsageFlags usage,
    VkImageCreateFlags flags,
    VkImageFormatProperties* pImageFormatProperties);
```

- `physicalDevice` is the physical device from which to query the image capabilities.
- `format` is a `VkFormat` value specifying the image format, corresponding to `VkImageCreateInfo::format`.
- `type` is a `VkImageType` value specifying the image type, corresponding to `VkImageCreateInfo::imageType`.
- `tiling` is a `VkImageTiling` value specifying the image tiling, corresponding to `VkImageCreateInfo::tiling`.
- `usage` is a bitmask of `VkImageUsageFlagBits` specifying the intended usage of the image, corresponding to `VkImageCreateInfo::usage`.
- `flags` is a bitmask of `VkImageCreateFlagBits` specifying additional parameters of the image, corresponding to `VkImageCreateInfo::flags`.
- `pImageFormatProperties` is a pointer to a `VkImageFormatProperties` structure in which capabilities are returned.

The `format`, `type`, `tiling`, `usage`, and `flags` parameters correspond to parameters that would be

consumed by `vkCreateImage` (as members of `VkImageCreateInfo`).

If `format` is not a supported image format, or if the combination of `format`, `type`, `tiling`, `usage`, and `flags` is not supported for images, then `vkGetPhysicalDeviceImageFormatProperties` returns `VK_ERROR_FORMAT_NOT_SUPPORTED`.

The limitations on an image format that are reported by `vkGetPhysicalDeviceImageFormatProperties` have the following property: if `usage1` and `usage2` of type `VkImageUsageFlags` are such that the bits set in `usage1` are a subset of the bits set in `usage2`, and `flags1` and `flags2` of type `VkImageCreateFlags` are such that the bits set in `flags1` are a subset of the bits set in `flags2`, then the limitations for `usage1` and `flags1` **must** be no more strict than the limitations for `usage2` and `flags2`, for all values of `format`, `type`, and `tiling`.

Valid Usage

- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-02248
`tiling` **must** not be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`. (Use `vkGetPhysicalDeviceImageFormatProperties2` instead)

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceImageFormatProperties-format-parameter
`format` **must** be a valid `VkFormat` value
- VUID-vkGetPhysicalDeviceImageFormatProperties-type-parameter
`type` **must** be a valid `VkImageType` value
- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-parameter
`tiling` **must** be a valid `VkImageTiling` value
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-parameter
`usage` **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-requiredbitmask
`usage` **must** not be `0`
- VUID-vkGetPhysicalDeviceImageFormatProperties-flags-parameter
`flags` **must** be a valid combination of `VkImageCreateFlagBits` values
- VUID-vkGetPhysicalDeviceImageFormatProperties-pImageFormatProperties-parameter
`pImageFormatProperties` **must** be a valid pointer to a `VkImageFormatProperties` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_FORMAT_NOT_SUPPORTED`

The `VkImageFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageFormatProperties {
    VkExtent3D          maxExtent;
    uint32_t             maxMipLevels;
    uint32_t             maxArrayLayers;
    VkSampleCountFlags   sampleCounts;
    VkDeviceSize          maxResourceSize;
} VkImageFormatProperties;
```

- `maxExtent` are the maximum image dimensions. See the [Allowed Extent Values](#) section below for how these values are constrained by `type`.
- `maxMipLevels` is the maximum number of mipmap levels. `maxMipLevels` **must** be equal to the number of levels in the complete mipmap chain based on the `maxExtent.width`, `maxExtent.height`, and `maxExtent.depth`, except when one of the following conditions is true, in which case it **may** instead be 1:
 - `vkGetPhysicalDeviceImageFormatProperties::tiling` was `VK_IMAGE_TILING_LINEAR`
 - `VkPhysicalDeviceImageFormatInfo2::tiling` was `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`
 - the `VkPhysicalDeviceImageFormatInfo2::pNext` chain included a `VkPhysicalDeviceExternalImageFormatInfo` structure with a handle type included in the `handleTypes` member for which mipmap image support is not required
 - `image format` is one of the [formats that require a sampler Y'C_BC_R conversion](#)
 - `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`
- `maxArrayLayers` is the maximum number of array layers. `maxArrayLayers` **must** be no less than `VkPhysicalDeviceLimits::maxImageArrayLayers`, except when one of the following conditions is true, in which case it **may** instead be 1:
 - `tiling` is `VK_IMAGE_TILING_LINEAR`
 - `tiling` is `VK_IMAGE_TILING_OPTIMAL` and `type` is `VK_IMAGE_TYPE_3D`
 - `format` is one of the [formats that require a sampler Y'C_BC_R conversion](#)
- If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `maxArrayLayers` **must** not be 0.

- `sampleCounts` is a bitmask of `VkSampleCountFlagBits` specifying all the supported sample counts for this image as described [below](#).
- `maxResourceSize` is an upper bound on the total image size in bytes, inclusive of all image subresources. Implementations **may** have an address space limit on total size of a resource, which is advertised by this property. `maxResourceSize` **must** be at least 2^{31} .

Note

There is no mechanism to query the size of an image before creating it, to compare that size against `maxResourceSize`. If an application attempts to create an image that exceeds this limit, the creation will fail and `vkCreateImage` will return `VK_ERROR_OUT_OF_DEVICE_MEMORY`. While the advertised limit **must** be at least 2^{31} , it **may** not be possible to create an image that approaches that size, particularly for `VK_IMAGE_TYPE_1D`.

If the combination of parameters to `vkGetPhysicalDeviceImageFormatProperties` is not supported by the implementation for use in `vkCreateImage`, then all members of `VkImageFormatProperties` will be filled with zero.

Note

Filling `VkImageFormatProperties` with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility.

To determine the image capabilities compatible with an external memory handle type, call:

```
// Provided by VK_NV_external_memory_capabilities
VkResult vkGetPhysicalDeviceExternalImageFormatPropertiesNV(
    VkPhysicalDevice                      physicalDevice,
    VkFormat                             format,
    VkImageType                          type,
    VkImageTiling                        tiling,
    VkImageUsageFlags                   usage,
    VkImageCreateFlags                  flags,
    VkExternalMemoryHandleTypeFlagsNV   externalHandleType,
    VkExternalImageFormatPropertiesNV*   pExternalImageFormatProperties);
```

- `physicalDevice` is the physical device from which to query the image capabilities
- `format` is the image format, corresponding to `VkImageCreateInfo::format`.
- `type` is the image type, corresponding to `VkImageCreateInfo::imageType`.
- `tiling` is the image tiling, corresponding to `VkImageCreateInfo::tiling`.
- `usage` is the intended usage of the image, corresponding to `VkImageCreateInfo::usage`.
- `flags` is a bitmask describing additional parameters of the image, corresponding to `VkImageCreateInfo::flags`.
- `externalHandleType` is either one of the bits from `VkExternalMemoryHandleTypeFlagBitsNV`, or

0.

- `pExternalImageFormatProperties` is a pointer to a `VkExternalImageFormatPropertiesNV` structure in which capabilities are returned.

If `externalHandleType` is 0, `pExternalImageFormatProperties->imageFormatProperties` will return the same values as a call to `vkGetPhysicalDeviceImageFormatProperties`, and the other members of `pExternalImageFormatProperties` will all be 0. Otherwise, they are filled in as described for `VkExternalImageFormatPropertiesNV`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-format-parameter
`format` **must** be a valid `VkFormat` value
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-type-parameter
`type` **must** be a valid `VkImageType` value
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-tiling-parameter
`tiling` **must** be a valid `VkImageTiling` value
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-usage-parameter
`usage` **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-usage-requiredbitmask
`usage` **must** not be 0
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-flags-parameter
`flags` **must** be a valid combination of `VkImageCreateFlagBits` values
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-externalHandleType-parameter
`externalHandleType` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-pExternalImageFormatProperties-parameter
`pExternalImageFormatProperties` **must** be a valid pointer to a `VkExternalImageFormatPropertiesNV` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_FORMAT_NOT_SUPPORTED`

The `VkExternalImageFormatPropertiesNV` structure is defined as:

```
// Provided by VK_NV_external_memory_capabilities
typedef struct VkExternalImageFormatPropertiesNV {
    VkImageFormatProperties           imageFormatProperties;
    VkExternalMemoryFeatureFlagsNV   externalMemoryFeatures;
    VkExternalMemoryHandleTypeFlagsNV exportFromImportedHandleTypes;
    VkExternalMemoryHandleTypeFlagsNV compatibleHandleTypes;
} VKExternalImageFormatPropertiesNV;
```

- `imageFormatProperties` will be filled in as when calling `vkGetPhysicalDeviceImageFormatProperties`, but the values returned **may** vary depending on the external handle type requested.
- `externalMemoryFeatures` is a bitmask of `VkExternalMemoryFeatureFlagBitsNV`, indicating properties of the external memory handle type (`vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType`) being queried, or 0 if the external memory handle type is 0.
- `exportFromImportedHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBitsNV` containing a bit set for every external handle type that **may** be used to create memory from which the handles of the type specified in `vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType` **can** be exported, or 0 if the external memory handle type is 0.
- `compatibleHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBitsNV` containing a bit set for every external handle type that **may** be specified simultaneously with the handle type specified by `vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType` when calling `vkAllocateMemory`, or 0 if the external memory handle type is 0. `compatibleHandleTypes` will always contain `vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType`

Bits which **can** be set in `VkExternalImageFormatPropertiesNV::externalMemoryFeatures`, indicating properties of the external memory handle type, are:

```
// Provided by VK_NV_external_memory_capabilities
typedef enum VkExternalMemoryFeatureFlagBitsNV {
    VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT_NV = 0x00000001,
    VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT_NV = 0x00000002,
    VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT_NV = 0x00000004,
} VkExternalMemoryFeatureFlagBitsNV;
```

- `VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT_NV` specifies that external memory of the specified type **must** be created as a dedicated allocation when used in the manner specified.
- `VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT_NV` specifies that the implementation supports exporting handles of the specified type.
- `VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT_NV` specifies that the implementation supports importing handles of the specified type.

```
// Provided by VK_NV_external_memory_capabilities
typedef VkFlags VkExternalMemoryFeatureFlagsNV;
```

`VkExternalMemoryFeatureFlagsNV` is a bitmask type for setting a mask of zero or more `VkExternalMemoryFeatureFlagBitsNV`.

To query additional capabilities specific to image types, call:

```
// Provided by VK_VERSION_1_1
VkResult vkGetPhysicalDeviceImageFormatProperties2(  
    VkPhysicalDevice                                physicalDevice,  
    const VkPhysicalDeviceImageFormatInfo2*      pImageFormatInfo,  
    VkImageFormatProperties2*                      pImageFormatProperties);
```

or the equivalent command

```
// Provided by VK_KHR_get_physical_device_properties2
VkResult vkGetPhysicalDeviceImageFormatProperties2KHR(  
    VkPhysicalDevice                                physicalDevice,  
    const VkPhysicalDeviceImageFormatInfo2*      pImageFormatInfo,  
    VkImageFormatProperties2*                      pImageFormatProperties);
```

- `physicalDevice` is the physical device from which to query the image capabilities.
- `pImageFormatInfo` is a pointer to a `VkPhysicalDeviceImageFormatInfo2` structure describing the parameters that would be consumed by `vkCreateImage`.
- `pImageFormatProperties` is a pointer to a `VkImageFormatProperties2` structure in which capabilities are returned.

`vkGetPhysicalDeviceImageFormatProperties2` behaves similarly to `vkGetPhysicalDeviceImageFormatProperties`, with the ability to return extended information in a `pNext` chain of output structures.

Valid Usage

- VUID-vkGetPhysicalDeviceImageFormatProperties2-pNext-01868
If the `pNext` chain of `pImageFormatProperties` includes a `VkAndroidHardwareBufferUsageANDROID` structure, the `pNext` chain of `pImageFormatInfo` **must** include a `VkPhysicalDeviceExternalImageFormatInfo` structure with `handleType` set to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties2-physicalDevice-parameter
physicalDevice **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceImageFormatProperties2-pImageFormatInfo-parameter
pImageFormatInfo **must** be a valid pointer to a valid [VkPhysicalDeviceImageFormatInfo2](#) structure
- VUID-vkGetPhysicalDeviceImageFormatProperties2-pImageFormatProperties-parameter
pImageFormatProperties **must** be a valid pointer to a [VkImageFormatProperties2](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_FORMAT_NOT_SUPPORTED](#)

The [VkPhysicalDeviceImageFormatInfo2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceImageFormatInfo2 {
    VkStructureType      sType;
    const void*          pNext;
    VkFormat              format;
    VkImageType           type;
    VkImageTiling         tiling;
    VkImageUsageFlags     usage;
    VkImageCreateFlags    flags;
} VkPhysicalDeviceImageFormatInfo2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceImageFormatInfo2 VkPhysicalDeviceImageFormatInfo2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure. The **pNext** chain of [VkPhysicalDeviceImageFormatInfo2](#) is used to provide additional image parameters to [vkGetPhysicalDeviceImageFormatProperties2](#).

- `format` is a `VkFormat` value indicating the image format, corresponding to `VkImageCreateInfo`
::`format`.
- `type` is a `VkImageType` value indicating the image type, corresponding to `VkImageCreateInfo`
::`imageType`.
- `tiling` is a `VkImageTiling` value indicating the image tiling, corresponding to
`VkImageCreateInfo`::`tiling`.
- `usage` is a bitmask of `VkImageUsageFlagBits` indicating the intended usage of the image,
corresponding to `VkImageCreateInfo`::`usage`.
- `flags` is a bitmask of `VkImageCreateFlagBits` indicating additional parameters of the image,
corresponding to `VkImageCreateInfo`::`flags`.

The members of `VkPhysicalDeviceImageFormatInfo2` correspond to the arguments to `vkGetPhysicalDeviceImageFormatProperties`, with `sType` and `pNext` added for extensibility.

Valid Usage

- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-02249
`tiling` **must** be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` if and only if the `pNext` chain
includes `VkPhysicalDeviceDrmFormatModifierInfoEXT`
- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-02313
If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and `flags` contains
`VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `pNext` chain **must** include a
`VkImageFormatListCreateInfo` structure with non-zero `viewFormatCount`

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageFormatInfo2-sType-sType
 sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_FORMAT_INFO_2`
- VUID-VkPhysicalDeviceImageFormatInfo2-pNext-pNext
 Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either `NULL` or a pointer to a valid instance of `VkImageFormatListCreateInfo`, `VkImageStencilUsageCreateInfo`, `VkPhysicalDeviceExternalImageFormatInfo`, `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`, or `VkPhysicalDeviceImageViewImageFormatInfoEXT`
- VUID-VkPhysicalDeviceImageFormatInfo2-sType-unique
 The **sType** value of each struct in the **pNext** chain **must** be unique
- VUID-VkPhysicalDeviceImageFormatInfo2-format-parameter
 format **must** be a valid `VkFormat` value
- VUID-VkPhysicalDeviceImageFormatInfo2-type-parameter
 type **must** be a valid `VkImageType` value
- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-parameter
 tiling **must** be a valid `VkImageTiling` value
- VUID-VkPhysicalDeviceImageFormatInfo2-usage-parameter
 usage **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkPhysicalDeviceImageFormatInfo2-usage-requiredbitmask
 usage **must** not be `0`
- VUID-VkPhysicalDeviceImageFormatInfo2-flags-parameter
 flags **must** be a valid combination of `VkImageCreateFlagBits` values

The `VkImageFormatProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageFormatProperties2 {
    VkStructureType          sType;
    void*                   pNext;
    VkImageFormatProperties imageFormatProperties;
} VkImageFormatProperties2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkImageFormatProperties2 VkImageFormatProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure. The **pNext** chain of `VkImageFormatProperties2` is used to allow the specification of additional capabilities to be

returned from `vkGetPhysicalDeviceImageFormatProperties2`.

- `imageFormatProperties` is a `VkImageFormatProperties` structure in which capabilities are returned.

If the combination of parameters to `vkGetPhysicalDeviceImageFormatProperties2` is not supported by the implementation for use in `vkCreateImage`, then all members of `imageFormatProperties` will be filled with zero.

Note

Filling `imageFormatProperties` with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility. This exception only applies to `imageFormatProperties`, not `sType`, `pNext`, or any structures chained from `pNext`.

Valid Usage (Implicit)

- VUID-VkImageFormatProperties2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_FORMAT_PROPERTIES_2`
- VUID-VkImageFormatProperties2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkAndroidHardwareBufferUsageANDROID`, `VkExternalImageFormatProperties`, `VkFilterCubicImageViewImageFormatPropertiesEXT`, `VkSamplerYcbcrConversionImageFormatProperties`, or `VkTextureLODGatherFormatPropertiesAMD`
- VUID-VkImageFormatProperties2-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique

To determine if texture gather functions that take explicit LOD and/or bias argument values **can** be used with a given image format, add a `VkTextureLODGatherFormatPropertiesAMD` structure to the `pNext` chain of the `VkImageFormatProperties2` structure in a call to `vkGetPhysicalDeviceImageFormatProperties2`.

The `VkTextureLODGatherFormatPropertiesAMD` structure is defined as:

```
// Provided by VK_AMD_texture_gather_bias_lod
typedef struct VkTextureLODGatherFormatPropertiesAMD {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           supportsTextureGatherLODBiasAMD;
} VkTextureLODGatherFormatPropertiesAMD;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `supportsTextureGatherLODBiasAMD` tells if the image format can be used with texture gather bias/LOD functions, as introduced by the `VK_AMD_texture_gather_bias_lod` extension. This field is set by the implementation. User-specified value is ignored.

Valid Usage (Implicit)

- VUID-VkTextureLODGatherFormatPropertiesAMD-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_TEXTURE_LOD_GATHER_FORMAT_PROPERTIES_AMD`

To determine the image capabilities compatible with an external memory handle type, add a `VkPhysicalDeviceExternalImageFormatInfo` structure to the `pNext` chain of the `VkPhysicalDeviceImageFormatInfo2` structure and a `VkExternalImageFormatProperties` structure to the `pNext` chain of the `VkImageFormatProperties2` structure.

The `VkPhysicalDeviceExternalImageFormatInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalImageFormatInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkExternalMemoryHandleTypeFlagBits   handleType;
} VkPhysicalDeviceExternalImageFormatInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkPhysicalDeviceExternalImageFormatInfo
VkPhysicalDeviceExternalImageFormatInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the memory handle type that will be used with the memory associated with the image.

If `handleType` is 0, `vkGetPhysicalDeviceImageFormatProperties2` will behave as if `VkPhysicalDeviceExternalImageFormatInfo` was not present, and `VkExternalImageFormatProperties` will be ignored.

If `handleType` is not compatible with the `format`, `type`, `tiling`, `usage`, and `flags` specified in `VkPhysicalDeviceImageFormatInfo2`, then `vkGetPhysicalDeviceImageFormatProperties2` returns `VK_ERROR_FORMAT_NOT_SUPPORTED`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalImageFormatInfo-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_IMAGE_FORMAT_INFO`
- VUID-VkPhysicalDeviceExternalImageFormatInfo-handleType-parameter
If **handleType** is not `0`, **handleType** **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

Possible values of `VkPhysicalDeviceExternalImageFormatInfo::handleType`, specifying an external memory handle type, are:

```

// Provided by VK_VERSION_1_1
typedef enum VkExternalMemoryHandleTypeFlagBits {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT = 0x00000008,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT = 0x00000010,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT = 0x00000020,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT = 0x00000040,
    // Provided by VK_EXT_external_memory_dma_buf
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT = 0x00000200,
    // Provided by VK_ANDROID_external_memory_android_hardware_buffer
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID = 0x00000400,
    // Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT = 0x00000100,
    // Provided by VK_FUCHSIA_external_memory
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA = 0x00000800,
    // Provided by VK_NV_external_memory_rdma
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV = 0x00001000,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT,
} VkExternalMemoryHandleTypeFlagBits;

```

or the equivalent

```

// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryHandleTypeFlagBits VkExternalMemoryHandleTypeFlagBitsKHR;

```

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT` specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls `dup`, `dup2`, `close`, and the non-standard system call `dup3`. Additionally, it **must** be transportable over a socket using an `SCM_RIGHTS` control message. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT` specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the functions `DuplicateHandle`, `CloseHandle`, `CompareObjectHandles`, `GetHandleInformation`, and `SetHandleInformation`. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT` specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying memory resource represented by its Vulkan memory object, and will therefore become invalid when all Vulkan memory objects associated with it are destroyed.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT` specifies an NT handle returned by `IDXGIResource1::CreateSharedHandle` referring to a Direct3D 10 or 11 texture resource. It owns a reference to the memory used by the Direct3D resource.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT` specifies a global share handle returned by `IDXGIResource::GetSharedHandle` referring to a Direct3D 10 or 11 texture resource. It does not own a reference to the underlying Direct3D resource, and will therefore become invalid when all Vulkan memory objects and Direct3D resources associated with it are destroyed.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT` specifies an NT handle returned by `ID3D12Device::CreateSharedHandle` referring to a Direct3D 12 heap resource. It owns a reference to the resources used by the Direct3D heap.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT` specifies an NT handle returned by `ID3D12Device::CreateSharedHandle` referring to a Direct3D 12 committed resource. It owns a reference to the memory used by the Direct3D resource.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` specifies a host pointer returned by a host memory allocation command. It does not own a reference to the underlying memory resource, and will therefore become invalid if the host memory is freed.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT` specifies a host pointer to *host mapped foreign memory*. It does not own a reference to the underlying memory resource, and will therefore become invalid if the foreign memory is unmapped or otherwise becomes no longer available.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT` is a file descriptor for a Linux `dma_buf`. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` specifies an `AHardwareBuffer` object defined by the Android NDK. See [Android Hardware Buffers](#) for more details of this handle type.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA` is a Zircon handle to a virtual memory object.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV` is a handle to an allocation accessible by

remote devices. It owns a reference to the underlying memory resource represented by its Vulkan memory object.

Some external memory handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

Table 77. External memory handle types compatibility

Handle type	VkPhysicalDeviceIDProperties::deviceUUID	VkPhysicalDeviceIDProperties::deviceUUID
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV	No restriction	No restriction

Note

The above table does not restrict the drivers and devices with which `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` and `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT` **may** be shared, as these handle types inherently mean memory that does not come from the same device, as they import memory from the host or a foreign device, respectively.

Note

Even though the above table does not restrict the drivers and devices with which `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT` may be shared, query mechanisms exist in the Vulkan API that prevent the import of incompatible dma-bufs (such as `vkGetMemoryFdPropertiesKHR`) and that prevent incompatible usage of dma-bufs (such as `VkPhysicalDeviceExternalBufferInfo` and `VkPhysicalDeviceExternalImageFormatInfo`).

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryHandleTypeFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryHandleTypeFlags VkExternalMemoryHandleTypeFlagsKHR;
```

`VkExternalMemoryHandleTypeFlags` is a bitmask type for setting a mask of zero or more `VkExternalMemoryHandleTypeFlagBits`.

The `VkExternalImageFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalImageFormatProperties {
    VkStructureType          sType;
    void*                   pNext;
    VkExternalMemoryProperties externalMemoryProperties;
} VkExternalImageFormatProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalImageFormatProperties VkExternalImageFormatPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalMemoryProperties` is a `VkExternalMemoryProperties` structure specifying various capabilities of the external handle type when used with the specified image creation parameters.

Valid Usage (Implicit)

- VUID-VkExternalImageFormatProperties-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_EXTERNAL_IMAGE_FORMAT_PROPERTIES`

The `VkExternalMemoryProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryProperties {
    VkExternalMemoryFeatureFlags      externalMemoryFeatures;
    VkExternalMemoryHandleTypeFlags   exportFromImportedHandleTypes;
    VkExternalMemoryHandleTypeFlags   compatibleHandleTypes;
} VkExternalMemoryProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryProperties VkExternalMemoryPropertiesKHR;
```

- `externalMemoryFeatures` is a bitmask of `VkExternalMemoryFeatureFlagBits` specifying the features of `handleType`.
- `exportFromImportedHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying which types of imported handle `handleType` **can** be exported from.
- `compatibleHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying handle types which **can** be specified at the same time as `handleType` when creating an image compatible with external memory.

`compatibleHandleTypes` **must** include at least `handleType`. Inclusion of a handle type in `compatibleHandleTypes` does not imply the values returned in `VkImageFormatProperties2` will be the same when `VkPhysicalDeviceExternalImageFormatInfo::handleType` is set to that type. The application is responsible for querying the capabilities of all handle types intended for concurrent use in a single image and intersecting them to obtain the compatible set of capabilities.

Bits which **may** be set in `VkExternalMemoryProperties::externalMemoryFeatures`, specifying features of an external memory handle type, are:

```

// Provided by VK_VERSION_1_1
typedef enum VkExternalMemoryFeatureFlagBits {
    VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT = 0x00000001,
    VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT = 0x00000002,
    VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT = 0x00000004,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT_KHR =
VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT_KHR =
VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT_KHR =
VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT,
} VkExternalMemoryFeatureFlagBits;

```

or the equivalent

```

// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryFeatureFlagBits VkExternalMemoryFeatureFlagBitsKHR;

```

- **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** specifies that images or buffers created with the specified parameters and handle type **must** use the mechanisms defined by [VkMemoryDedicatedRequirements](#) and [VkMemoryDedicatedAllocateInfo](#) to create (or import) a dedicated allocation for the image or buffer.
- **VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT** specifies that handles of this type **can** be exported from Vulkan memory objects.
- **VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT** specifies that handles of this type **can** be imported as Vulkan memory objects.

Because their semantics in external APIs roughly align with that of an image or buffer with a dedicated allocation in Vulkan, implementations are **required** to report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for the following external handle types:

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT**
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT**
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT**
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID** for images only

Implementations **must** not report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for buffers with external handle type **VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID**. Implementations **must** not report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for images or buffers with external handle type **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT**, or **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT**.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryFeatureFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryFeatureFlags VkExternalMemoryFeatureFlagsKHR;
```

`VkExternalMemoryFeatureFlags` is a bitmask type for setting a mask of zero or more `VkExternalMemoryFeatureFlagBits`.

To query the image capabilities that are compatible with a [Linux DRM format modifier](#), set `VkPhysicalDeviceImageFormatInfo2::tiling` to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and add a `VkPhysicalDeviceImageDrmFormatModifierCreateInfoEXT` structure to the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2`.

The `VkPhysicalDeviceImageDrmFormatModifierCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkPhysicalDeviceImageDrmFormatModifierCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint64_t drmFormatModifier;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
} VkPhysicalDeviceImageDrmFormatModifierCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifier` is the image's [Linux DRM format modifier](#), corresponding to `VkImageDrmFormatModifierExplicitCreateInfoEXT::modifier` or to `VkImageDrmFormatModifierListCreateInfoEXT::pModifiers`.
- `sharingMode` specifies how the image will be accessed by multiple queue families.
- `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
- `pQueueFamilyIndices` is a pointer to an array of queue families that will access the image. It is ignored if `sharingMode` is not `VK_SHARING_MODE_CONCURRENT`.

If the `drmFormatModifier` is incompatible with the parameters specified in `VkPhysicalDeviceImageFormatInfo2` and its `pNext` chain, then `vkGetPhysicalDeviceImageFormatProperties2` returns `VK_ERROR_FORMAT_NOT_SUPPORTED`. The implementation **must** support the query of any `drmFormatModifier`, including unknown and invalid modifier values.

Valid Usage

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02314
If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `pQueueFamilyIndices` **must** be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values
- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02315
If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `queueFamilyIndexCount` **must** be greater than 1
- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02316
If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` **must** be unique and **must** be less than the `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create `device`

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_DRM_FORMAT_MODIFIER_INFO_EXT`
- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-parameter
`sharingMode` **must** be a valid `VkSharingMode` value

To determine the number of combined image samplers required to support a multi-planar format, add `VkSamplerYcbcrConversionImageFormatProperties` to the `pNext` chain of the `VkImageFormatProperties2` structure in a call to `vkGetPhysicalDeviceImageFormatProperties2`.

The `VkSamplerYcbcrConversionImageFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionImageFormatProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           combinedImageSamplerDescriptorCount;
} VkSamplerYcbcrConversionImageFormatProperties;
```

or the equivalent

```
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionImageFormatProperties
VkSamplerYcbcrConversionImageFormatPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `combinedImageSamplerDescriptorCount` is the number of combined image sampler descriptors that the implementation uses to access the format.

Valid Usage (Implicit)

- `VUID-VkSamplerYcbcrConversionImageFormatProperties-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_IMAGE_FORMAT_PROPERTIES`

`combinedImageSamplerDescriptorCount` is a number between 1 and the number of planes in the format. A descriptor set layout binding with immutable Y'CbCr conversion samplers will have a maximum `combinedImageSamplerDescriptorCount` which is the maximum across all formats supported by its samplers of the `combinedImageSamplerDescriptorCount` for each format. Descriptor sets with that layout will internally use that maximum `combinedImageSamplerDescriptorCount` descriptors for each descriptor in the binding. This expanded number of descriptors will be consumed from the descriptor pool when a descriptor set is allocated, and counts towards the `maxDescriptorSetSamplers`, `maxDescriptorSetSampledImages`, `maxPerStageDescriptorSamplers`, and `maxPerStageDescriptorSampledImages` limits.

Note

All descriptors in a binding use the same maximum `combinedImageSamplerDescriptorCount` descriptors to allow implementations to use a uniform stride for dynamic indexing of the descriptors in the binding.

For example, consider a descriptor set layout binding with two descriptors and immutable samplers for multi-planar formats that have `VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount` values of 2 and 3 respectively. There are two descriptors in the binding and the maximum `combinedImageSamplerDescriptorCount` is 3, so descriptor sets with this layout consume 6 descriptors from the descriptor pool. To create a descriptor pool that allows allocating four descriptor sets with this layout, `descriptorCount` must be at least 24.

To obtain optimal Android hardware buffer usage flags for specific image creation parameters, add a `VkAndroidHardwareBufferUsageANDROID` structure to the `pNext` chain of a `VkImageFormatProperties2` structure passed to `vkGetPhysicalDeviceImageFormatProperties2`. This structure is defined as:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkAndroidHardwareBufferUsageANDROID {
    VkStructureType sType;
    void* pNext;
    uint64_t androidHardwareBufferUsage;
} VkAndroidHardwareBufferUsageANDROID;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `androidHardwareBufferUsage` returns the Android hardware buffer usage flags.

The `androidHardwareBufferUsage` field **must** include Android hardware buffer usage flags listed in the [AHardwareBuffer Usage Equivalence](#) table when the corresponding Vulkan image usage or image creation flags are included in the `usage` or `flags` fields of `VkPhysicalDeviceImageFormatInfo2`. It **must** include at least one GPU usage flag (`AHARDWAREBUFFER_USAGE_GPU_*`), even if none of the corresponding Vulkan usages or flags are requested.

Note

Requiring at least one GPU usage flag ensures that Android hardware buffer memory will be allocated in a memory pool accessible to the Vulkan implementation, and that specializing the memory layout based on usage flags does not prevent it from being compatible with Vulkan. Implementations **may** avoid unnecessary restrictions caused by this requirement by using vendor usage flags to indicate that only the Vulkan uses indicated in `VkImageFormatProperties2` are required.

Valid Usage (Implicit)

- VUID-VkAndroidHardwareBufferUsageANDROID-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_USAGE_ANDROID`

To determine if cubic filtering can be used with a given image format and a given image view type add a `VkPhysicalDeviceImageViewImageFormatInfoEXT` structure to the `pNext` chain of the `VkPhysicalDeviceImageFormatInfo2` structure, and a `VkFilterCubicImageViewImageFormatPropertiesEXT` structure to the `pNext` chain of the `VkImageFormatProperties2` structure.

The `VkPhysicalDeviceImageViewImageFormatInfoEXT` structure is defined as:

```
// Provided by VK_EXT_filter_cubic
typedef struct VkPhysicalDeviceImageViewImageFormatInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    VkImageViewType    imageViewType;
} VkPhysicalDeviceImageViewImageFormatInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageViewType` is a `VkImageViewType` value specifying the type of the image view.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_VIEW_IMAGE_FORMAT_INFO_EXT`
- VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-imageViewType-parameter
`imageViewType` **must** be a valid `VkImageViewType` value

The `VkFilterCubicImageViewImageFormatPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_filter_cubic
typedef struct VkFilterCubicImageViewImageFormatPropertiesEXT {
    VkStructureType      sType;
    void*               pNext;
    VkBool32              filterCubic;
    VkBool32              filterCubicMinmax;
} VkFilterCubicImageViewImageFormatPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `filterCubic` tells if image format, image type and image view type **can** be used with cubic filtering. This field is set by the implementation. User-specified value is ignored.
- `filterCubicMinmax` tells if image format, image type and image view type **can** be used with cubic filtering and minmax filtering. This field is set by the implementation. User-specified value is ignored.

Valid Usage (Implicit)

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_FILTER_CUBIC_IMAGE_VIEW_IMAGE_FORMAT_PROPERTIES_EXT`

Valid Usage

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-pNext-02627
If the `pNext` chain of the `VkImageFormatProperties2` structure includes a `VkFilterCubicImageViewImageFormatPropertiesEXT` structure, the `pNext` chain of the `VkPhysicalDeviceImageFormatInfo2` structure **must** include a `VkPhysicalDeviceImageViewImageFormatInfoEXT` structure with an `imageViewType` that is compatible with `imageType`

44.1.1. Supported Sample Counts

`vkGetPhysicalDeviceImageFormatProperties` returns a bitmask of `VkSampleCountFlagBits` in

`sampleCounts` specifying the supported sample counts for the image parameters.

`sampleCounts` will be set to `VK_SAMPLE_COUNT_1_BIT` if at least one of the following conditions is true:

- `tiling` is `VK_IMAGE_TILING_LINEAR`
- `type` is not `VK_IMAGE_TYPE_2D`
- `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`
- Neither the `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` flag nor the `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT` flag in `VkFormatProperties::optimalTilingFeatures` returned by `vkGetPhysicalDeviceFormatProperties` is set
- `VkPhysicalDeviceExternalImageFormatInfo::handleType` is an external handle type for which multisampled image support is not required.
- `format` is one of the formats that require a sampler Y'C_BC_R conversion
- `usage` contains `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `usage` contains `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`

Otherwise, the bits set in `sampleCounts` will be the sample counts supported for the specified values of `usage` and `format`. For each bit set in `usage`, the supported sample counts relate to the limits in `VkPhysicalDeviceLimits` as follows:

- If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` and `format` is a floating- or fixed-point color format, a superset of `VkPhysicalDeviceLimits::framebufferColorSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` and `format` is an integer format, a superset of `VkPhysicalDeviceVulkan12Properties::framebufferIntegerColorSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and `format` includes a depth aspect, a superset of `VkPhysicalDeviceLimits::framebufferDepthSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and `format` includes a stencil aspect, a superset of `VkPhysicalDeviceLimits::framebufferStencilSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_SAMPLED_BIT`, and `format` includes a color aspect, a superset of `VkPhysicalDeviceLimits::sampledImageColorSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_SAMPLED_BIT`, and `format` includes a depth aspect, a superset of `VkPhysicalDeviceLimits::sampledImageDepthSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_SAMPLED_BIT`, and `format` is an integer format, a superset of `VkPhysicalDeviceLimits::sampledImageIntegerSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_STORAGE_BIT`, a superset of `VkPhysicalDeviceLimits::storageImageSampleCounts`

If multiple bits are set in `usage`, `sampleCounts` will be the intersection of the per-usage values described above.

If none of the bits described above are set in `usage`, then there is no corresponding limit in `VkPhysicalDeviceLimits`. In this case, `sampleCounts` **must** include at least `VK_SAMPLE_COUNT_1_BIT`.

44.1.2. Allowed Extent Values Based On Image Type

Implementations **may** support extent values larger than the [required minimum/maximum values](#) for certain types of images. `VkImageFormatProperties::maxExtent` for each type is subject to the constraints below.

Note

Implementations **must** support images with dimensions up to the [required minimum/maximum values](#) for all types of images. It follows that the query for additional capabilities **must** return extent values that are at least as large as the required values.

For `VK_IMAGE_TYPE_1D`:

- `maxExtent.width` \geq `VkPhysicalDeviceLimits::maxImageDimension1D`
- `maxExtent.height` = 1
- `maxExtent.depth` = 1

For `VK_IMAGE_TYPE_2D` when `flags` does not contain `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`:

- `maxExtent.width` \geq `VkPhysicalDeviceLimits::maxImageDimension2D`
- `maxExtent.height` \geq `VkPhysicalDeviceLimits::maxImageDimension2D`
- `maxExtent.depth` = 1

For `VK_IMAGE_TYPE_2D` when `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`:

- `maxExtent.width` \geq `VkPhysicalDeviceLimits::maxImageDimensionCube`
- `maxExtent.height` \geq `VkPhysicalDeviceLimits::maxImageDimensionCube`
- `maxExtent.depth` = 1

For `VK_IMAGE_TYPE_3D`:

- `maxExtent.width` \geq `VkPhysicalDeviceLimits::maxImageDimension3D`
- `maxExtent.height` \geq `VkPhysicalDeviceLimits::maxImageDimension3D`
- `maxExtent.depth` \geq `VkPhysicalDeviceLimits::maxImageDimension3D`

44.2. Additional Buffer Capabilities

To query the external handle types supported by buffers, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalBufferProperties(
    VkPhysicalDevice                  physicalDevice,
    const VkPhysicalDeviceExternalBufferCreateInfo* pExternalBufferCreateInfo,
    const VkExternalBufferProperties*    pExternalBufferProperties);
```

or the equivalent command

```
// Provided by VK_KHR_external_memory_capabilities
void vkGetPhysicalDeviceExternalBufferPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalBufferInfo* pExternalBufferInfo,
    VkExternalBufferProperties* pExternalBufferProperties);
```

- **physicalDevice** is the physical device from which to query the buffer capabilities.
- **pExternalBufferInfo** is a pointer to a **VkPhysicalDeviceExternalBufferInfo** structure describing the parameters that would be consumed by **vkCreateBuffer**.
- **pExternalBufferProperties** is a pointer to a **VkExternalBufferProperties** structure in which capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalBufferProperties-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferInfo-parameter
pExternalBufferInfo **must** be a valid pointer to a **VkPhysicalDeviceExternalBufferInfo** structure
- VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferProperties-parameter
pExternalBufferProperties **must** be a valid pointer to a **VkExternalBufferProperties** structure

The **VkPhysicalDeviceExternalBufferInfo** structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalBufferInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateFlags flags;
    VkBufferUsageFlags usage;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalBufferInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkPhysicalDeviceExternalBufferInfo VkPhysicalDeviceExternalBufferInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **flags** is a bitmask of `VkBufferCreateFlagBits` describing additional parameters of the buffer, corresponding to `VkBufferCreateInfo::flags`.
- **usage** is a bitmask of `VkBufferUsageFlagBits` describing the intended usage of the buffer, corresponding to `VkBufferCreateInfo::usage`.
- **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the memory handle type that will be used with the memory associated with the buffer.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalBufferCreateInfo-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_BUFFER_INFO`
- VUID-VkPhysicalDeviceExternalBufferCreateInfo-pNext-pNext
pNext **must** be `NULL`
- VUID-VkPhysicalDeviceExternalBufferCreateInfo-flags-parameter
flags **must** be a valid combination of `VkBufferCreateFlagBits` values
- VUID-VkPhysicalDeviceExternalBufferCreateInfo-usage-parameter
usage **must** be a valid combination of `VkBufferUsageFlagBits` values
- VUID-VkPhysicalDeviceExternalBufferCreateInfo-usage-requiredbitmask
usage **must** not be `0`
- VUID-VkPhysicalDeviceExternalBufferCreateInfo-handleType-parameter
handleType **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

The `VkExternalBufferProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalBufferProperties {
    VkStructureType          sType;
    void*                  pNext;
    VkExternalMemoryProperties externalMemoryProperties;
} VkExternalBufferProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalBufferProperties VkExternalBufferPropertiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **externalMemoryProperties** is a `VkExternalMemoryProperties` structure specifying various capabilities of the external handle type when used with the specified buffer creation parameters.

Valid Usage (Implicit)

- VUID-VkExternalBufferProperties-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_EXTERNAL_BUFFER_PROPERTIES`
- VUID-VkExternalBufferProperties-pNext-pNext
pNext **must** be `NULL`

44.3. Optional Semaphore Capabilities

Semaphores **may** support import and export of their [payload](#) to external handles. To query the external handle types supported by semaphores, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalSemaphoreProperties(
    VkPhysicalDevice                                physicalDevice,
    const VkPhysicalDeviceExternalSemaphoreInfo* pExternalSemaphoreInfo,
    VkExternalSemaphoreProperties*                  pExternalSemaphoreProperties);
```

or the equivalent command

```
// Provided by VK_KHR_external_semaphore_capabilities
void vkGetPhysicalDeviceExternalSemaphorePropertiesKHR(
    VkPhysicalDevice                                physicalDevice,
    const VkPhysicalDeviceExternalSemaphoreInfo* pExternalSemaphoreInfo,
    VkExternalSemaphoreProperties*                  pExternalSemaphoreProperties);
```

- **physicalDevice** is the physical device from which to query the semaphore capabilities.
- **pExternalSemaphoreInfo** is a pointer to a [VkPhysicalDeviceExternalSemaphoreInfo](#) structure describing the parameters that would be consumed by [vkCreateSemaphore](#).
- **pExternalSemaphoreProperties** is a pointer to a [VkExternalSemaphoreProperties](#) structure in which capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-physicalDevice-parameter
physicalDevice **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreInfo-parameter
pExternalSemaphoreInfo **must** be a valid pointer to a valid [VkPhysicalDeviceExternalSemaphoreInfo](#) structure
- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreProperties-parameter
pExternalSemaphoreProperties **must** be a valid pointer to a [VkExternalSemaphoreProperties](#) structure

The `VkPhysicalDeviceExternalSemaphoreInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalSemaphoreInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalSemaphoreInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkPhysicalDeviceExternalSemaphoreInfo
VkPhysicalDeviceExternalSemaphoreInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the external semaphore handle type for which capabilities will be returned.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SEMAPHORE_INFO`
- VUID-VkPhysicalDeviceExternalSemaphoreInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkSemaphoreTypeCreateInfo`
- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkPhysicalDeviceExternalSemaphoreInfo-handleType-parameter
`handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

Bits which **may** be set in `VkPhysicalDeviceExternalSemaphoreInfo::handleType`, specifying an external semaphore handle type, are:

```

// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreHandleTypeFlagBits {
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT = 0x00000008,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT = 0x00000010,
    // Provided by VK_FUCHSIA_external_semaphore
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA = 0x00000080,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D11_FENCE_BIT =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT,
    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT,
    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT,
    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT,
    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT,
} VkExternalSemaphoreHandleTypeFlagBits;

```

or the equivalent

```

// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreHandleTypeFlagBits
VkExternalSemaphoreHandleTypeFlagBitsKHR;

```

- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT` specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls `dup`, `dup2`, `close`, and the non-standard system call `dup3`. Additionally, it **must** be transportable over a socket using an `SCM_RIGHTS` control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.
- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the functions `DuplicateHandle`, `CloseHandle`, `CompareObjectHandles`, `GetHandleInformation`, and `SetHandleInformation`. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.
- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT` specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive

represented by its Vulkan semaphore object, and will therefore become invalid when all Vulkan semaphore objects associated with it are destroyed.

- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` specifies an NT handle returned by `ID3D12Device::CreateSharedHandle` referring to a Direct3D 12 fence, or `ID3D11Device5::CreateFence` referring to a Direct3D 11 fence. It owns a reference to the underlying synchronization primitive associated with the Direct3D fence.
- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D11_FENCE_BIT` is an alias of `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` with the same meaning. It is provided for convenience and code clarity when interacting with D3D11 fences.
- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` specifies a POSIX file descriptor handle to a Linux Sync File or Android Fence object. It can be used with any native API accepting a valid sync file or fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type **must** accept any type of sync or fence FD supported by the native system they are running on.
- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA` specifies a handle to a Zircon event object. It can be used with any native API that accepts a Zircon event handle. Zircon event handles are created with `ZX_RIGHTS_BASIC` and `ZX_RIGHTS_SIGNAL` rights. Vulkan on Fuchsia uses only the `ZX_EVENT_SIGNALED` bit when signaling or waiting.

Note

Handles of type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` generated by the implementation may represent either Linux Sync Files or Android Fences at the implementation's discretion. Applications **should** only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.

Some external semaphore handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

Table 78. External semaphore handle types compatibility

Handle type	VkPhysicalDeviceIDProperties::deviceUUID	VkPhysicalDeviceIDProperties::deviceUUID
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT	No restriction	No restriction
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA	No restriction	No restriction

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalSemaphoreHandleTypeFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreHandleTypeFlags VkExternalSemaphoreHandleTypeFlagsKHR;
```

`VkExternalSemaphoreHandleTypeFlags` is a bitmask type for setting a mask of zero or more `VkExternalSemaphoreHandleTypeFlagBits`.

The `VkExternalSemaphoreProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalSemaphoreProperties {
    VkStructureType           sType;
    void*                     pNext;
    VkExternalSemaphoreHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalSemaphoreHandleTypeFlags compatibleHandleTypes;
    VkExternalSemaphoreFeatureFlags externalSemaphoreFeatures;
} VkExternalSemaphoreProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreProperties VkExternalSemaphorePropertiesKHR;
```

- `sType` is the type of this structure
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `exportFromImportedHandleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying which types of imported handle `handleType` **can** be exported from.
- `compatibleHandleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying handle types which **can** be specified at the same time as `handleType` when creating a semaphore.
- `externalSemaphoreFeatures` is a bitmask of `VkExternalSemaphoreFeatureFlagBits` describing the features of `handleType`.

If `handleType` is not supported by the implementation, then `VkExternalSemaphoreProperties::externalSemaphoreFeatures` will be set to zero.

Valid Usage (Implicit)

- VUID-VkExternalSemaphoreProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_SEMAPHORE_PROPERTIES`
- VUID-VkExternalSemaphoreProperties-pNext-pNext
`pNext` **must** be `NULL`

Bits which **may** be set in `VkExternalSemaphoreProperties::externalSemaphoreFeatures`, specifying the features of an external semaphore handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreFeatureFlagBits {
    VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT = 0x00000002,
    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT,
    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT,
} VkExternalSemaphoreFeatureFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreFeatureFlagBits VkExternalSemaphoreFeatureFlagBitsKHR;
```

- `VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT` specifies that handles of this type **can** be exported from Vulkan semaphore objects.
- `VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT` specifies that handles of this type **can** be imported as Vulkan semaphore objects.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalSemaphoreFeatureFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreFeatureFlags VkExternalSemaphoreFeatureFlagsKHR;
```

`VkExternalSemaphoreFeatureFlags` is a bitmask type for setting a mask of zero or more `VkExternalSemaphoreFeatureFlagBits`.

44.4. Optional Fence Capabilities

Fences **may** support import and export of their [payload](#) to external handles. To query the external handle types supported by fences, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalFenceProperties(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalFenceInfo* pExternalFenceInfo,
    VkExternalFenceProperties* pExternalFenceProperties);
```

or the equivalent command

```
// Provided by VK_KHR_external_fence_capabilities
void vkGetPhysicalDeviceExternalFencePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalFenceInfo* pExternalFenceInfo,
    VkExternalFenceProperties* pExternalFenceProperties);
```

- `physicalDevice` is the physical device from which to query the fence capabilities.
- `pExternalFenceInfo` is a pointer to a `VkPhysicalDeviceExternalFenceInfo` structure describing the parameters that would be consumed by [vkCreateFence](#).
- `pExternalFenceProperties` is a pointer to a `VkExternalFenceProperties` structure in which capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalFenceProperties-physicalDevice-parameter
physicalDevice **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceExternalFenceProperties-pExternalFenceInfo-parameter
pExternalFenceInfo **must** be a valid pointer to a valid `VkPhysicalDeviceExternalFenceInfo` structure
- VUID-vkGetPhysicalDeviceExternalFenceProperties-pExternalFenceProperties-parameter
pExternalFenceProperties **must** be a valid pointer to a `VkExternalFenceProperties` structure

The `VkPhysicalDeviceExternalFenceInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalFenceInfo {
    VkStructureType                      sType;
    const void*                           pNext;
    VkExternalFenceHandleTypeFlagBits   handleType;
} VkPhysicalDeviceExternalFenceInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkPhysicalDeviceExternalFenceInfo VkPhysicalDeviceExternalFenceInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **handleType** is a `VkExternalFenceHandleTypeFlagBits` value specifying an external fence handle type for which capabilities will be returned.

Note

Handles of type `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` generated by the implementation may represent either Linux Sync Files or Android Fences at the implementation's discretion. Applications **should** only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalFenceInfo-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_FENCE_INFO`
- VUID-VkPhysicalDeviceExternalFenceInfo-pNext-pNext
pNext **must** be `NULL`
- VUID-VkPhysicalDeviceExternalFenceInfo-handleType-parameter
handleType **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

Bits which **may** be set in * `VkPhysicalDeviceExternalFenceInfo::handleType` * `VkExternalFenceProperties::exportFromImportedHandleTypes` * `VkExternalFenceProperties::compatibleHandleTypes` indicate external fence handle types, and are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalFenceHandleTypeFlagBits {
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT = 0x00000008,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT_KHR =
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR =
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR =
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT_KHR =
VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT,
} VkExternalFenceHandleTypeFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceHandleTypeFlagBits VkExternalFenceHandleTypeFlagBitsKHR;
```

- `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT` specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls `dup`, `dup2`, `close`, and the non-standard system call `dup3`. Additionally, it **must** be transportable over a socket using an `SCM_RIGHTS` control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.
- `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT` specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the

functions `DuplicateHandle`, `CloseHandle`, `CompareObjectHandles`, `GetHandleInformation`, and `SetHandleInformation`. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.

- `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT` specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive represented by its Vulkan fence object, and will therefore become invalid when all Vulkan fence objects associated with it are destroyed.
- `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` specifies a POSIX file descriptor handle to a Linux Sync File or Android Fence. It can be used with any native API accepting a valid sync file or fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type **must** accept any type of sync or fence FD supported by the native system they are running on.

Some external fence handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

Table 79. External fence handle types compatibility

Handle type	VkPhysicalDeviceIDProperties::deviceUUID	VkPhysicalDeviceIDProperties::deviceUUID
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT	No restriction	No restriction

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalFenceHandleTypeFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceHandleTypeFlags VkExternalFenceHandleTypeFlagsKHR;
```

`VkExternalFenceHandleTypeFlags` is a bitmask type for setting a mask of zero or more `VkExternalFenceHandleTypeFlagBits`.

The `VkExternalFenceProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalFenceProperties {
    VkStructureType           sType;
    void*                     pNext;
    VkExternalFenceHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalFenceHandleTypeFlags compatibleHandleTypes;
    VkExternalFenceFeatureFlags externalFenceFeatures;
} VkExternalFenceProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceProperties VkExternalFencePropertiesKHR;
```

- `exportFromImportedHandleTypes` is a bitmask of `VkExternalFenceHandleTypeFlagBits` indicating which types of imported handle `handleType` **can** be exported from.

- `compatibleHandleTypes` is a bitmask of `VkExternalFenceHandleTypeFlagBits` specifying handle types which **can** be specified at the same time as `handleType` when creating a fence.
- `externalFenceFeatures` is a bitmask of `VkExternalFenceFeatureFlagBits` indicating the features of `handleType`.

If `handleType` is not supported by the implementation, then `VkExternalFenceProperties::externalFenceFeatures` will be set to zero.

Valid Usage (Implicit)

- VUID-VkExternalFenceProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_FENCE_PROPERTIES`
- VUID-VkExternalFenceProperties-pNext-pNext
`pNext` **must** be `NULL`

Bits which **may** be set in `VkExternalFenceProperties::externalFenceFeatures`, indicating features of a fence external handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalFenceFeatureFlagBits {
    VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT = 0x00000002,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT_KHR =
VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT_KHR =
VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT,
} VkExternalFenceFeatureFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceFeatureFlagBits VkExternalFenceFeatureFlagBitsKHR;
```

- `VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT` specifies handles of this type **can** be exported from Vulkan fence objects.
- `VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT` specifies handles of this type **can** be imported to Vulkan fence objects.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalFenceFeatureFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceFeatureFlags VkExternalFenceFeatureFlagsKHR;
```

`VkExternalFenceFeatureFlags` is a bitmask type for setting a mask of zero or more `VkExternalFenceFeatureFlagBits`.

44.5. Timestamp Calibration Capabilities

To query the set of time domains for which a physical device supports timestamp calibration, call:

```
// Provided by VK_EXT_calibrated_timestamps
VkResult vkGetPhysicalDeviceCalibrateableTimeDomainsEXT(  
    VkPhysicalDevice physicalDevice,  
    uint32_t* pTimeDomainCount,  
    VkTimeDomainEXT** pTimeDomains);
```

- `physicalDevice` is the physical device from which to query the set of calibrateable time domains.
- `pTimeDomainCount` is a pointer to an integer related to the number of calibrateable time domains available or queried, as described below.
- `pTimeDomains` is either `NULL` or a pointer to an array of `VkTimeDomainEXT` values, indicating the supported calibrateable time domains.

If `pTimeDomains` is `NULL`, then the number of calibrateable time domains supported for the given `physicalDevice` is returned in `pTimeDomainCount`. Otherwise, `pTimeDomainCount` **must** point to a variable set by the user to the number of elements in the `pTimeDomains` array, and on return the variable is overwritten with the number of values actually written to `pTimeDomains`. If the value of `pTimeDomainCount` is less than the number of calibrateable time domains supported, at most `pTimeDomainCount` values will be written to `pTimeDomains`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available time domains were returned.

Valid Usage (Implicit)

- VUID-`vkGetPhysicalDeviceCalibrateableTimeDomainsEXT-physicalDevice-parameter`
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-`vkGetPhysicalDeviceCalibrateableTimeDomainsEXT-pTimeDomainCount-parameter`
`pTimeDomainCount` **must** be a valid pointer to a `uint32_t` value
- VUID-`vkGetPhysicalDeviceCalibrateableTimeDomainsEXT-pTimeDomains-parameter`
If the value referenced by `pTimeDomainCount` is not `0`, and `pTimeDomains` is not `NULL`,
`pTimeDomains` **must** be a valid pointer to an array of `pTimeDomainCount` `VkTimeDomainEXT` values

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Chapter 45. Debugging

To aid developers in tracking down errors in the application's use of Vulkan, particularly in combination with an external debugger or profiler, *debugging extensions* may be available.

The `VkObjectType` enumeration defines values, each of which corresponds to a specific Vulkan handle type. These values **can** be used to associate debug information with a particular type of object through one or more extensions.

```
// Provided by VK_VERSION_1_0
typedef enum VkObjectType {
    VK_OBJECT_TYPE_UNKNOWN = 0,
    VK_OBJECT_TYPE_INSTANCE = 1,
    VK_OBJECT_TYPE_PHYSICAL_DEVICE = 2,
    VK_OBJECT_TYPE_DEVICE = 3,
    VK_OBJECT_TYPE_QUEUE = 4,
    VK_OBJECT_TYPE_SEMAPHORE = 5,
    VK_OBJECT_TYPE_COMMAND_BUFFER = 6,
    VK_OBJECT_TYPE_FENCE = 7,
    VK_OBJECT_TYPE_DEVICE_MEMORY = 8,
    VK_OBJECT_TYPE_BUFFER = 9,
    VK_OBJECT_TYPE_IMAGE = 10,
    VK_OBJECT_TYPE_EVENT = 11,
    VK_OBJECT_TYPE_QUERY_POOL = 12,
    VK_OBJECT_TYPE_BUFFER_VIEW = 13,
    VK_OBJECT_TYPE_IMAGE_VIEW = 14,
    VK_OBJECT_TYPE_SHADER_MODULE = 15,
    VK_OBJECT_TYPE_PIPELINE_CACHE = 16,
    VK_OBJECT_TYPE_PIPELINE_LAYOUT = 17,
    VK_OBJECT_TYPE_RENDER_PASS = 18,
    VK_OBJECT_TYPE_PIPELINE = 19,
    VK_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT = 20,
    VK_OBJECT_TYPE_SAMPLER = 21,
    VK_OBJECT_TYPE_DESCRIPTOR_POOL = 22,
    VK_OBJECT_TYPE_DESCRIPTOR_SET = 23,
    VK_OBJECT_TYPE_FRAMEBUFFER = 24,
    VK_OBJECT_TYPE_COMMAND_POOL = 25,
// Provided by VK_VERSION_1_1
    VK_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION = 1000156000,
// Provided by VK_VERSION_1_1
    VK_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE = 1000085000,
// Provided by VK_VERSION_1_3
    VK_OBJECT_TYPE_PRIVATE_DATA_SLOT = 1000295000,
// Provided by VK_KHR_surface
    VK_OBJECT_TYPE_SURFACE_KHR = 1000000000,
// Provided by VK_KHR_swapchain
    VK_OBJECT_TYPE_SWAPCHAIN_KHR = 1000001000,
// Provided by VK_KHR_display
    VK_OBJECT_TYPE_DISPLAY_KHR = 1000002000,
// Provided by VK_KHR_display
```

```

VK_OBJECT_TYPE_DISPLAY_MODE_KHR = 1000002001,
// Provided by VK_EXT_debug_report
VK_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT = 1000011000,
#ifndef VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_queue
VK_OBJECT_TYPE_VIDEO_SESSION_KHR = 1000023000,
#endif
#ifndef VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_queue
VK_OBJECT_TYPE_VIDEO_SESSION_PARAMETERS_KHR = 1000023001,
#endif
// Provided by VK_NVX_binary_import
VK_OBJECT_TYPE_CU_MODULE_NVX = 1000029000,
// Provided by VK_NVX_binary_import
VK_OBJECT_TYPE_CU_FUNCTION_NVX = 1000029001,
// Provided by VK_EXT_debug_utils
VK_OBJECT_TYPE_DEBUG_UTILS_MESSENGER_EXT = 1000128000,
// Provided by VK_KHR_acceleration_structure
VK_OBJECT_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
// Provided by VK_EXT_validation_cache
VK_OBJECT_TYPE_VALIDATION_CACHE_EXT = 1000160000,
// Provided by VK_NV_ray_tracing
VK_OBJECT_TYPE_ACCELERATION_STRUCTURE_NV = 1000165000,
// Provided by VK_INTEL_performance_query
VK_OBJECT_TYPE_PERFORMANCE_CONFIGURATION_INTEL = 1000210000,
// Provided by VK_KHR_deferred_host_operations
VK_OBJECT_TYPE_DEFERRED_OPERATION_KHR = 1000268000,
// Provided by VK_NV_device_generated_commands
VK_OBJECT_TYPE_INDIRECT_COMMANDS_LAYOUT_NV = 1000277000,
// Provided by VK_FUCHSIA_buffer_collection
VK_OBJECT_TYPE_BUFFER_COLLECTION_FUCHSIA = 1000366000,
// Provided by VK_KHR_descriptor_update_template
VK_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_KHR =
VK_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_KHR =
VK_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION,
// Provided by VK_EXT_private_data
VK_OBJECT_TYPE_PRIVATE_DATA_SLOT_EXT = VK_OBJECT_TYPE_PRIVATE_DATA_SLOT,
} VkObjectType;

```

Table 80. `VkObjectType` and Vulkan Handle Relationship

VkObjectType	Vulkan Handle Type
<code>VK_OBJECT_TYPE_UNKNOWN</code>	Unknown/Undefined Handle
<code>VK_OBJECT_TYPE_INSTANCE</code>	<code>VkInstance</code>
<code>VK_OBJECT_TYPE_PHYSICAL_DEVICE</code>	<code>VkPhysicalDevice</code>
<code>VK_OBJECT_TYPE_DEVICE</code>	<code>VkDevice</code>

VkObjectType	Vulkan Handle Type
VK_OBJECT_TYPE_QUEUE	VkQueue

VkObjectType	Vulkan Handle Type
VK_OBJECT_TYPE_ACCELERATION_STRUCTURE_KHR	VkAccelerationStructureKHR
VK_OBJECT_TYPE_PERFORMANCE_CONFIGURATION_INTEL	VkPerformanceConfigurationINTEL
VK_OBJECT_TYPE_DEFERRED_OPERATION_KHR	VkDeferredOperationKHR
VK_OBJECT_TYPE_PRIVATE_DATA_SLOT	VkPrivateDataSlot

If this Specification was generated with any such extensions included, they will be described in the remainder of this chapter.

45.1. Debug Utilities

Vulkan provides flexible debugging utilities for debugging an application.

The [Object Debug Annotation](#) section describes how to associate either a name or binary data with a specific Vulkan object.

The [Queue Labels](#) section describes how to annotate and group the work submitted to a queue.

The [Command Buffer Labels](#) section describes how to associate logical elements of the scene with commands in a [VkCommandBuffer](#).

The [Debug Messengers](#) section describes how to create debug messenger objects associated with an application supplied callback to capture debug messages from a variety of Vulkan components.

45.1.1. Object Debug Annotation

It can be useful for an application to provide its own content relative to a specific Vulkan object. The following commands allow application developers to associate user-defined information with Vulkan objects.

Object Naming

An object can be provided a user-defined name by calling [vkSetDebugUtilsObjectNameEXT](#) as defined below.

```
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectNameEXT(
    VkDevice device,
    const VkDebugUtilsObjectNameInfoEXT* pNameInfo);
```

- `device` is the device that created the object.
- `pNameInfo` is a pointer to a [VkDebugUtilsObjectNameInfoEXT](#) structure specifying parameters of the name to set on the object.

Valid Usage

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02587
`pNameInfo->objectType` **must** not be `VK_OBJECT_TYPE_UNKNOWN`
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02588
`pNameInfo->objectHandle` **must** not be `VK_NULL_HANDLE`

Valid Usage (Implicit)

- VUID-vkSetDebugUtilsObjectNameEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-parameter
`pNameInfo` **must** be a valid pointer to a valid `VkDebugUtilsObjectNameInfoEXT` structure

Host Synchronization

- Host access to `pNameInfo->objectHandle` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDebugUtilsObjectNameInfoEXT` structure is defined as:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsObjectNameInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkObjectType objectType;
    uint64_t objectHandle;
    const char* pObjectName;
} VkDebugUtilsObjectNameInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `objectType` is a `VkObjectType` specifying the type of the object to be named.

- `objectHandle` is the object to be named.
- `pObjectName` is either `NULL` or a null-terminated UTF-8 string specifying the name to apply to `objectHandle`.

Applications **may** change the name associated with an object simply by calling `vkSetDebugUtilsObjectNameEXT` again with a new string. If `pObjectName` is either `NULL` or an empty string, then any previously set name is removed.

Valid Usage

- VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02589
If `objectType` is `VK_OBJECT_TYPE_UNKNOWN`, `objectHandle` **must** not be `VK_NULL_HANDLE`
- VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02590
If `objectType` is not `VK_OBJECT_TYPE_UNKNOWN`, `objectHandle` **must** be `VK_NULL_HANDLE` or a valid Vulkan handle of the type associated with `objectType` as defined in the [VkObjectType and Vulkan Handle Relationship](#) table

Valid Usage (Implicit)

- VUID-VkDebugUtilsObjectNameInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT`
- VUID-VkDebugUtilsObjectNameInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDebugUtilsObjectNameInfoEXT-objectType-parameter
`objectType` **must** be a valid `VkObjectType` value
- VUID-VkDebugUtilsObjectNameInfoEXT-pObjectName-parameter
If `pObjectName` is not `NULL`, `pObjectName` **must** be a null-terminated UTF-8 string

Object Data Association

In addition to setting a name for an object, debugging and validation layers **may** have uses for additional binary data on a per-object basis that have no other place in the Vulkan API.

For example, a `VkShaderModule` could have additional debugging data attached to it to aid in offline shader tracing.

Additional data can be attached to an object by calling `vkSetDebugUtilsObjectTagEXT` as defined below.

```
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectTagEXT(
    VkDevice                                     device,
    const VkDebugUtilsObjectTagInfoEXT*          pTagInfo);
```

- `device` is the device that created the object.
- `pTagInfo` is a pointer to a `VkDebugUtilsObjectTagInfoEXT` structure specifying parameters of the tag to attach to the object.

Valid Usage (Implicit)

- VUID-vkSetDebugUtilsObjectTagEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkSetDebugUtilsObjectTagEXT-pTagInfo-parameter
`pTagInfo` **must** be a valid pointer to a valid `VkDebugUtilsObjectTagInfoEXT` structure

Host Synchronization

- Host access to `pTagInfo->objectHandle` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDebugUtilsObjectTagInfoEXT` structure is defined as:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsObjectTagInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkObjectType       objectType;
    uint64_t           objectHandle;
    uint64_t           tagName;
    size_t             tagSize;
    const void*        pTag;
} VkDebugUtilsObjectTagInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `objectType` is a `VkObjectType` specifying the type of the object to be named.
- `objectHandle` is the object to be tagged.

- `tagName` is a numerical identifier of the tag.
- `tagSize` is the number of bytes of data to attach to the object.
- `pTag` is a pointer to an array of `tagSize` bytes containing the data to be associated with the object.

The `tagName` parameter gives a name or identifier to the type of data being tagged. This can be used by debugging layers to easily filter for only data that can be used by that implementation.

Valid Usage

- VUID-VkDebugUtilsObjectTagInfoEXT-objectType-01908
`objectType` **must** not be `VK_OBJECT_TYPE_UNKNOWN`
- VUID-VkDebugUtilsObjectTagInfoEXT-objectHandle-01910
`objectHandle` **must** be a valid Vulkan handle of the type associated with `objectType` as defined in the [VkObjectType](#) and [Vulkan Handle Relationship](#) table

Valid Usage (Implicit)

- VUID-VkDebugUtilsObjectTagInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_TAG_INFO_EXT`
- VUID-VkDebugUtilsObjectTagInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDebugUtilsObjectTagInfoEXT-objectType-parameter
`objectType` **must** be a valid [VkObjectType](#) value
- VUID-VkDebugUtilsObjectTagInfoEXT-pTag-parameter
`pTag` **must** be a valid pointer to an array of `tagSize` bytes
- VUID-VkDebugUtilsObjectTagInfoEXT-tagSize-arraylength
`tagSize` **must** be greater than `0`

45.1.2. Queue Labels

All Vulkan work must be submitted using queues. It is possible for an application to use multiple queues, each containing multiple command buffers, when performing work. It can be useful to identify which queue, or even where in a queue, something has occurred.

To begin identifying a region using a debug label inside a queue, you may use the [vkQueueBeginDebugUtilsLabelEXT](#) command.

Then, when the region of interest has passed, you may end the label region using [vkQueueEndDebugUtilsLabelEXT](#).

Additionally, a single debug label may be inserted at any time using [vkQueueInsertDebugUtilsLabelEXT](#).

A queue debug label region is opened by calling:

```
// Provided by VK_EXT_debug_utils
void vkQueueBeginDebugUtilsLabelEXT(
    VkQueue queue,
    const VkDebugUtilsLabelEXT* pCreateInfo);
```

- `queue` is the queue in which to start a debug label region.
- `pCreateInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label region to open.

Valid Usage (Implicit)

- VUID-vkQueueBeginDebugUtilsLabelEXT-queue-parameter
`queue` **must** be a valid `VkQueue` handle
- VUID-vkQueueBeginDebugUtilsLabelEXT-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
-	-	Any

The `VkDebugUtilsLabelEXT` structure is defined as:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsLabelEXT {
    VkStructureType sType;
    const void* pNext;
    const char* pLabelName;
    float color[4];
} VkDebugUtilsLabelEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pLabelName` is a pointer to a null-terminated UTF-8 string containing the name of the label.
- `color` is an optional RGBA color value that can be associated with the label. A particular implementation **may** choose to ignore this color value. The values contain RGBA values in order, in the range 0.0 to 1.0. If all elements in `color` are set to 0.0 then it is ignored.

Valid Usage (Implicit)

- VUID-VkDebugUtilsLabelEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT`
- VUID-VkDebugUtilsLabelEXT-pNext-pNext
pNext **must** be `NULL`
- VUID-VkDebugUtilsLabelEXT-pLabelName-parameter
pLabelName **must** be a null-terminated UTF-8 string

A queue debug label region is closed by calling:

```
// Provided by VK_EXT_debug_utils
void vkQueueEndDebugUtilsLabelEXT(
    VkQueue queue);
```

- **queue** is the queue in which a debug label region should be closed.

The calls to `vkQueueBeginDebugUtilsLabelEXT` and `vkQueueEndDebugUtilsLabelEXT` **must** be matched and balanced.

Valid Usage

- VUID-vkQueueEndDebugUtilsLabelEXT-None-01911
There **must** be an outstanding `vkQueueBeginDebugUtilsLabelEXT` command prior to the `vkQueueEndDebugUtilsLabelEXT` on the queue

Valid Usage (Implicit)

- VUID-vkQueueEndDebugUtilsLabelEXT-queue-parameter
queue **must** be a valid `VkQueue` handle

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
-	-	Any

A single label can be inserted into a queue by calling:

```
// Provided by VK_EXT_debug_utils
void vkQueueInsertDebugUtilsLabelEXT(
    VkQueue queue,
    const VkDebugUtilsLabelEXT* pCreateInfo,
```

- `queue` is the queue into which a debug label will be inserted.
- `pCreateInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label to insert.

Valid Usage (Implicit)

- VUID-vkQueueInsertDebugUtilsLabelEXT-queue-parameter
`queue` **must** be a valid `VkQueue` handle
- VUID-vkQueueInsertDebugUtilsLabelEXT-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
-	-	Any

45.1.3. Command Buffer Labels

Typical Vulkan applications will submit many command buffers in each frame, with each command buffer containing a large number of individual commands. Being able to logically annotate regions of command buffers that belong together as well as hierarchically subdivide the frame is important to a developer's ability to navigate the commands viewed holistically.

To identify the beginning of a debug label region in a command buffer, `vkCmdBeginDebugUtilsLabelEXT` can be used as defined below.

To indicate the end of a debug label region in a command buffer, `vkCmdEndDebugUtilsLabelEXT` can be used.

To insert a single command buffer debug label inside of a command buffer, `vkCmdInsertDebugUtilsLabelEXT` can be used as defined below.

A command buffer debug label region can be opened by calling:

```
// Provided by VK_EXT_debug_utils
void vkCmdBeginDebugUtilsLabelEXT(
    VkCommandBuffer commandBuffer,
    const VkDebugUtilsLabelEXT* pCreateInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pLabelInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label region to open.

Valid Usage (Implicit)

- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginDebugUtilsLabelEXT-pLabelInfo-parameter
`pLabelInfo` **must** be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Both	Graphics
Secondary		Compute

A command buffer label region can be closed by calling:

```
// Provided by VK_EXT_debug_utils
void vkCmdEndDebugUtilsLabelEXT(
    VkCommandBuffer
        commandBuffer);
```

- `commandBuffer` is the command buffer into which the command is recorded.

An application **may** open a debug label region in one command buffer and close it in another, or otherwise split debug label regions across multiple command buffers or multiple queue submissions. When viewed from the linear series of submissions to a single queue, the calls to `vkCmdBeginDebugUtilsLabelEXT` and `vkCmdEndDebugUtilsLabelEXT` **must** be matched and balanced.

There **can** be problems reporting command buffer debug labels during the recording process because command buffers **may** be recorded out of sequence with the resulting execution order. Since the recording order **may** be different, a solitary command buffer **may** have an inconsistent view of the debug label regions by itself. Therefore, if an issue occurs during the recording of a command buffer, and the environment requires returning debug labels, the implementation **may** return only those labels it is aware of. This is true even if the implementation is aware of only the debug labels within the command buffer being actively recorded.

Valid Usage

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01912

There **must** be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command prior to the `vkCmdEndDebugUtilsLabelEXT` on the queue that `commandBuffer` is submitted to

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01913

If `commandBuffer` is a secondary command buffer, there **must** be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`

Valid Usage (Implicit)

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-recording

`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Both	Graphics
Secondary		Compute

A single debug label can be inserted into a command buffer by calling:

```
// Provided by VK_EXT_debug_utils
void vkCmdInsertDebugUtilsLabelEXT(
    VkCommandBuffer commandBuffer,
    const VkDebugUtilsLabelEXT* pLabelInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label to insert.

Valid Usage (Implicit)

- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdInsertDebugUtilsLabelEXT-pLabelInfo-parameter
`pLabelInfo` **must** be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure
- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Both	Graphics Compute

45.1.4. Debug Messengers

Vulkan allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application defined behavior. A primary producer of callback messages are the validation layers. An application **can** register callbacks even when no validation layers are enabled, but they will only be called for the Vulkan loader and, if implemented, other layer and driver events.

A `VkDebugUtilsMessengerEXT` is a messenger object which handles passing along debug messages to a provided debug callback.

```
// Provided by VK_EXT_debug_utils
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDebugUtilsMessengerEXT)
```

The debug messenger will provide detailed feedback on the application's use of Vulkan when events of interest occur. When an event of interest does occur, the debug messenger will submit a debug message to the debug callback that was provided during its creation. Additionally, the debug messenger is responsible with filtering out debug messages that the callback is not interested in and will only provide desired debug messages.

A debug messenger triggers a debug callback with a debug message when an event of interest occurs. To create a debug messenger which will trigger a debug callback, call:

```
// Provided by VK_EXT_debug_utils
VkResult vkCreateDebugUtilsMessengerEXT(
    VkInstance                                     instance,
    const VkDebugUtilsMessengerCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks*                  pAllocator,
    VkDebugUtilsMessengerEXT*                    pMessenger);
```

- `instance` is the instance the messenger will be used with.
- `pCreateInfo` is a pointer to a `VkDebugUtilsMessengerCreateInfoEXT` structure containing the callback pointer, as well as defining conditions under which this messenger will trigger the callback.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pMessenger` is a pointer to a `VkDebugUtilsMessengerEXT` handle in which the created object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDebugUtilsMessengerEXT-instance-parameter
instance **must** be a valid `VkInstance` handle
- VUID-vkCreateDebugUtilsMessengerEXT-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid `VkDebugUtilsMessengerCreateInfoEXT` structure
- VUID-vkCreateDebugUtilsMessengerEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDebugUtilsMessengerEXT-pMessenger-parameter
pMessenger **must** be a valid pointer to a `VkDebugUtilsMessengerEXT` handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY

The application **must** ensure that `vkCreateDebugUtilsMessengerEXT` is not executed in parallel with any Vulkan command that is also called with `instance` or child of `instance` as the dispatchable argument.

The definition of `VkDebugUtilsMessengerCreateInfoEXT` is:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsMessengerCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkDebugUtilsMessengerCreateFlagsEXT   flags;
    VkDebugUtilsMessageSeverityFlagsEXT   messageSeverity;
    VkDebugUtilsMessageTypeFlagsEXT       messageType;
    PFN_vkDebugUtilsMessengerCallbackEXT pfnUserCallback;
    void*                         pUserData;
} VkDebugUtilsMessengerCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is `0` and is reserved for future use.
- `messageSeverity` is a bitmask of `VkDebugUtilsMessageSeverityFlagBitsEXT` specifying which severity of event(s) will cause this callback to be called.
- `messageType` is a bitmask of `VkDebugUtilsMessageTypeFlagBitsEXT` specifying which type of event(s) will cause this callback to be called.
- `pfnUserCallback` is the application callback function to call.
- `pUserData` is user data to be passed to the callback.

For each `VkDebugUtilsMessengerEXT` that is created the `VkDebugUtilsMessengerCreateInfoEXT::messageSeverity` and `VkDebugUtilsMessengerCreateInfoEXT::messageType` determine when that `VkDebugUtilsMessengerCreateInfoEXT::pfnUserCallback` is called. The process to determine if the user's `pfnUserCallback` is triggered when an event occurs is as follows:

1. The implementation will perform a bitwise AND of the event's `VkDebugUtilsMessageSeverityFlagBitsEXT` with the `messageSeverity` provided during creation of the `VkDebugUtilsMessengerEXT` object.
 - a. If the value is 0, the message is skipped.

2. The implementation will perform bitwise AND of the event's `VkDebugUtilsMessageTypeFlagBitsEXT` with the `messageType` provided during the creation of the `VkDebugUtilsMessengerEXT` object.
 - a. If the value is 0, the message is skipped.
3. The callback will trigger a debug message for the current event

The callback will come directly from the component that detected the event, unless some other layer intercepts the calls for its own purposes (filter them in a different way, log to a system error log, etc.).

An application **can** receive multiple callbacks if multiple `VkDebugUtilsMessengerEXT` objects are created. A callback will always be executed in the same thread as the originating Vulkan call.

A callback **can** be called from multiple threads simultaneously (if the application is making Vulkan calls from multiple threads).

Valid Usage

- VUID-VkDebugUtilsMessengerCreateInfoEXT-pfnUserCallback-01914
`pfnUserCallback` **must** be a valid `PFN_vkDebugUtilsMessengerCallbackEXT`

Valid Usage (Implicit)

- VUID-VkDebugUtilsMessengerCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-flags-zeroitmask
`flags` **must** be `0`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageSeverity-parameter
`messageSeverity` **must** be a valid combination of `VkDebugUtilsMessageSeverityFlagBitsEXT` values
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageSeverity-requiredbitmask
`messageSeverity` **must** not be `0`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageType-parameter
`messageType` **must** be a valid combination of `VkDebugUtilsMessageTypeFlagBitsEXT` values
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageType-requiredbitmask
`messageType` **must** not be `0`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-pfnUserCallback-parameter
`pfnUserCallback` **must** be a valid `PFN_vkDebugUtilsMessengerCallbackEXT` value

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessengerCreateFlagsEXT;
```

`VkDebugUtilsMessengerCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which **can** be set in `VkDebugUtilsMessengerCreateInfoEXT::messageSeverity`, specifying event severities which cause a debug messenger to call the callback, are:

```
// Provided by VK_EXT_debug_utils
typedef enum VkDebugUtilsMessageSeverityFlagBitsEXT {
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_VERBOSE_BIT_EXT = 0x00000001,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_INFO_BIT_EXT = 0x00000010,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT = 0x00000100,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT = 0x00001000,
} VkDebugUtilsMessageSeverityFlagBitsEXT;
```

- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_VERBOSE_BIT_EXT` specifies the most verbose output indicating all diagnostic messages from the Vulkan loader, layers, and drivers should be captured.
- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_INFO_BIT_EXT` specifies an informational message such as resource details that may be handy when debugging an application.
- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT` specifies use of Vulkan that **may** expose an app bug. Such cases may not be immediately harmful, such as a fragment shader outputting to a location with no attachment. Other cases **may** point to behavior that is almost certainly bad when unintended such as using an image whose memory has not been filled. In general if you see a warning but you know that the behavior is intended/desired, then simply ignore the warning.
- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT` specifies that the application has violated a valid usage condition of the specification.

Note

The values of `VkDebugUtilsMessageSeverityFlagBitsEXT` are sorted based on severity. The higher the flag value, the more severe the message. This allows for simple boolean operation comparisons when looking at `VkDebugUtilsMessageSeverityFlagBitsEXT` values.

For example:

```
if (messageSeverity >=
VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT) {
    // Do something for warnings and errors
}
```

In addition, space has been left between the enums to allow for later addition of new severities in between the existing values.

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessageSeverityFlagsEXT;
```

`VkDebugUtilsMessageSeverityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkDebugUtilsMessageSeverityFlagBitsEXT`.

Bits which **can** be set in `VkDebugUtilsMessengerCreateInfoEXT::messageType`, specifying event types which cause a debug messenger to call the callback, are:

```
// Provided by VK_EXT_debug_utils
typedef enum VkDebugUtilsMessageTypeFlagBitsEXT {
    VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT = 0x00000001,
    VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT = 0x00000002,
    VK_DEBUG_UTILS_MESSAGE_TYPE_PERFORMANCE_BIT_EXT = 0x00000004,
} VkDebugUtilsMessageTypeFlagBitsEXT;
```

- `VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT` specifies that some general event has occurred. This is typically a non-specification, non-performance event.
- `VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT` specifies that something has occurred during validation against the Vulkan specification that may indicate invalid behavior.
- `VK_DEBUG_UTILS_MESSAGE_TYPE_PERFORMANCE_BIT_EXT` specifies a potentially non-optimal use of Vulkan, e.g. using `vkCmdClearColorImage` when setting `VkAttachmentDescription::loadOp` to `VK_ATTACHMENT_LOAD_OP_CLEAR` would have worked.

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessageTypeFlagsEXT;
```

`VkDebugUtilsMessageTypeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkDebugUtilsMessageTypeFlagBitsEXT`.

The prototype for the `VkDebugUtilsMessengerCreateInfoEXT::pfnUserCallback` function implemented by the application is:

```
// Provided by VK_EXT_debug_utils
typedef VkBool32 (VKAPI_PTR *PFN_vkDebugUtilsMessengerCallbackEXT)(
    VkDebugUtilsMessageSeverityFlagBitsEXT           messageSeverity,
    VkDebugUtilsMessageTypeFlagsEXT                 messageTypes,
    const VkDebugUtilsMessengerCallbackDataEXT* pCallbackData,
    void*                                         pUserData);
```

- `messageSeverity` specifies the `VkDebugUtilsMessageSeverityFlagBitsEXT` that triggered this callback.
- `messageTypes` is a bitmask of `VkDebugUtilsMessageTypeFlagBitsEXT` specifying which type of event(s) triggered this callback.

- `pCallbackData` contains all the callback related data in the `VkDebugUtilsMessengerCallbackDataEXT` structure.
- `pUserData` is the user data provided when the `VkDebugUtilsMessengerEXT` was created.

The callback returns a `VkBool32`, which is interpreted in a layer-specified manner. The application **should** always return `VK_FALSE`. The `VK_TRUE` value is reserved for use in layer development.

Valid Usage

- VUID-PFN_vkDebugUtilsMessengerCallbackEXT-None-04769
The callback **must** not make calls to any Vulkan commands

The definition of `VkDebugUtilsMessengerCallbackDataEXT` is:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsMessengerCallbackDataEXT {
    VkStructureType                                     sType;
    const void*                                       pNext;
    VkDebugUtilsMessengerCallbackDataFlagsEXT        flags;
    const char*                                       pMessageIdName;
    int32_t                                         messageIdNumber;
    const char*                                       pMessage;
    uint32_t                                        queueLabelCount;
    const VkDebugUtilsLabelEXT*                      pQueueLabels;
    uint32_t                                         cmdBufLabelCount;
    const VkDebugUtilsLabelEXT*                      pCmdBufLabels;
    uint32_t                                         objectCount;
    const VkDebugUtilsObjectNameInfoEXT*          pObjects;
} VkDebugUtilsMessengerCallbackDataEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is `0` and is reserved for future use.
- `pMessageIdName` is a null-terminated string that identifies the particular message ID that is associated with the provided message. If the message corresponds to a validation layer message, then this string may contain the portion of the Vulkan specification that is believed to have been violated.
- `messageIdNumber` is the ID number of the triggering message. If the message corresponds to a validation layer message, then this number is related to the internal number associated with the message being triggered.
- `pMessage` is a null-terminated string detailing the trigger conditions.
- `queueLabelCount` is a count of items contained in the `pQueueLabels` array.
- `pQueueLabels` is `NULL` or a pointer to an array of `VkDebugUtilsLabelEXT` active in the current `VkQueue` at the time the callback was triggered. Refer to `Queue Labels` for more information.

- `cmdBufLabelCount` is a count of items contained in the `pCmdBufLabels` array.
- `pCmdBufLabels` is `NULL` or a pointer to an array of `VkDebugUtilsLabelEXT` active in the current `VkCommandBuffer` at the time the callback was triggered. Refer to [Command Buffer Labels](#) for more information.
- `objectCount` is a count of items contained in the `pObjects` array.
- `pObjects` is a pointer to an array of `VkDebugUtilsObjectNameInfoEXT` objects related to the detected issue. The array is roughly in order of importance, but the 0th element is always guaranteed to be the most important object for this message.

Note

This structure should only be considered valid during the lifetime of the triggered callback.

Since adding queue and command buffer labels behaves like pushing and popping onto a stack, the order of both `pQueueLabels` and `pCmdBufLabels` is based on the order the labels were defined. The result is that the first label in either `pQueueLabels` or `pCmdBufLabels` will be the first defined (and therefore the oldest) while the last label in each list will be the most recent.

Note

`pQueueLabels` will only be non-`NULL` if one of the objects in `pObjects` can be related directly to a defined `VkQueue` which has had one or more labels associated with it.

Likewise, `pCmdBufLabels` will only be non-`NULL` if one of the objects in `pObjects` can be related directly to a defined `VkCommandBuffer` which has had one or more labels associated with it. Additionally, while command buffer labels allow for beginning and ending across different command buffers, the debug messaging framework **cannot** guarantee that labels in `pCmdBufLabels` will contain those defined outside of the associated command buffer. This is partially due to the fact that the association of one command buffer with another may not have been defined at the time the debug message is triggered.

Valid Usage (Implicit)

- VUID-VkDebugUtilsMessengerCallbackDataEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CALLBACK_DATA_EXT`
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pNext-pNext
pNext must be `NULL`
- VUID-VkDebugUtilsMessengerCallbackDataEXT-flags-zero bitmask
flags must be `0`
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pMessageIdName-parameter
If **pMessageIdName** is not `NULL`, **pMessageIdName** must be a null-terminated UTF-8 string
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pMessage-parameter
pMessage must be a null-terminated UTF-8 string
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pQueueLabels-parameter
If **queueLabelCount** is not `0`, **pQueueLabels** must be a valid pointer to an array of **queueLabelCount** valid `VkDebugUtilsLabelEXT` structures
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pCmdBufLabels-parameter
If **cmdBufLabelCount** is not `0`, **pCmdBufLabels** must be a valid pointer to an array of **cmdBufLabelCount** valid `VkDebugUtilsLabelEXT` structures
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pObjects-parameter
If **objectCount** is not `0`, **pObjects** must be a valid pointer to an array of **objectCount** valid `VkDebugUtilsObjectNameInfoEXT` structures

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessengerCallbackDataFlagsEXT;
```

`VkDebugUtilsMessengerCallbackDataFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

There may be times that a user wishes to intentionally submit a debug message. To do this, call:

```
// Provided by VK_EXT_debug_utils
void vkSubmitDebugUtilsMessageEXT(
    VkInstance instance,
    VkDebugUtilsMessageSeverityFlagBitsEXT messageSeverity,
    VkDebugUtilsMessageTypeFlagsEXT messageTypes,
    const VkDebugUtilsMessengerCallbackDataEXT* pCallbackData);
```

- **instance** is the debug stream's `VkInstance`.
- **messageSeverity** is a `VkDebugUtilsMessageSeverityFlagBitsEXT` value specifying the severity of this event/message.
- **messageTypes** is a bitmask of `VkDebugUtilsMessageTypeFlagBitsEXT` specifying which type of event(s) to identify with this message.

- `pCallbackData` contains all the callback related data in the `VkDebugUtilsMessengerCallbackDataEXT` structure.

The call will propagate through the layers and generate callback(s) as indicated by the message's flags. The parameters are passed on to the callback in addition to the `pUserData` value that was defined at the time the messenger was registered.

Valid Usage

- VUID-vkSubmitDebugUtilsMessageEXT-objectType-02591

The `objectType` member of each element of `pCallbackData->pObjects` **must** not be `VK_OBJECT_TYPE_UNKNOWN`

Valid Usage (Implicit)

- VUID-vkSubmitDebugUtilsMessageEXT-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkSubmitDebugUtilsMessageEXT-messageSeverity-parameter
`messageSeverity` **must** be a valid `VkDebugUtilsMessageSeverityFlagBitsEXT` value
- VUID-vkSubmitDebugUtilsMessageEXT-messageTypes-parameter
`messageTypes` **must** be a valid combination of `VkDebugUtilsMessageTypeFlagBitsEXT` values
- VUID-vkSubmitDebugUtilsMessageEXT-messageTypes-requiredbitmask
`messageTypes` **must** not be 0
- VUID-vkSubmitDebugUtilsMessageEXT-pCallbackData-parameter
`pCallbackData` **must** be a valid pointer to a valid `VkDebugUtilsMessengerCallbackDataEXT` structure

To destroy a `VkDebugUtilsMessengerEXT` object, call:

```
// Provided by VK_EXT_debug_utils
void vkDestroyDebugUtilsMessengerEXT(
    VkInstance                                     instance,
    VkDebugUtilsMessengerEXT                      messenger,
    const VkAllocationCallbacks*                  pAllocator);
```

- `instance` is the instance where the callback was created.
- `messenger` is the `VkDebugUtilsMessengerEXT` object to destroy. `messenger` is an externally synchronized object and **must** not be used on more than one thread at a time. This means that `vkDestroyDebugUtilsMessengerEXT` **must** not be called when a callback is active.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-01915
If `VkAllocationCallbacks` were provided when `messenger` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-01916
If no `VkAllocationCallbacks` were provided when `messenger` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyDebugUtilsMessengerEXT-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-parameter
If `messenger` is not `VK_NULL_HANDLE`, `messenger` **must** be a valid `VkDebugUtilsMessengerEXT` handle
- VUID-vkDestroyDebugUtilsMessengerEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-parent
If `messenger` is a valid handle, it **must** have been created, allocated, or retrieved from `instance`

Host Synchronization

- Host access to `messenger` **must** be externally synchronized

The application **must** ensure that `vkDestroyDebugUtilsMessengerEXT` is not executed in parallel with any Vulkan command that is also called with `instance` or child of `instance` as the dispatchable argument.

45.2. Debug Markers

Debug markers provide a flexible way for debugging and validation layers to receive annotation and debug information.

The [Object Annotation](#) section describes how to associate a name or binary data with a Vulkan object.

The [Command Buffer Markers](#) section describes how to associate logical elements of the scene with commands in the command buffer.

45.2.1. Object Annotation

The commands in this section allow application developers to associate user-defined information with Vulkan objects at will.

An object can be given a user-friendly name by calling:

```
// Provided by VK_EXT_debug_marker
VkResult vkDebugMarkerSetObjectNameEXT(
    VkDevice device,
    const VkDebugMarkerObjectNameInfoEXT* pNameInfo);
```

- `device` is the device that created the object.
- `pNameInfo` is a pointer to a `VkDebugMarkerObjectNameInfoEXT` structure specifying the parameters of the name to set on the object.

Valid Usage (Implicit)

- VUID-vkDebugMarkerSetObjectNameEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDebugMarkerSetObjectNameEXT-pNameInfo-parameter
`pNameInfo` **must** be a valid pointer to a valid `VkDebugMarkerObjectNameInfoEXT` structure

Host Synchronization

- Host access to `pNameInfo->object` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDebugMarkerObjectNameInfoEXT` structure is defined as:

```

// Provided by VK_EXT_debug_marker
typedef struct VkDebugMarkerObjectNameInfoEXT {
    VkStructureType          sType;
    const void*             pNext;
    VkDebugReportObjectTypeEXT objectType;
    uint64_t                object;
    const char*             pObjectName;
} VkDebugMarkerObjectNameInfoEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **objectType** is a [VkDebugReportObjectTypeEXT](#) specifying the type of the object to be named.
- **object** is the object to be named.
- **pObjectName** is a null-terminated UTF-8 string specifying the name to apply to **object**.

Applications **may** change the name associated with an object simply by calling [vkDebugMarkerSetObjectNameEXT](#) again with a new string. To remove a previously set name, **pObjectName** **should** be set to an empty string.

Valid Usage

- VUID-VkDebugMarkerObjectNameInfoEXT-objectType-01490
objectType **must** not be [VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT](#)
- VUID-VkDebugMarkerObjectNameInfoEXT-object-01491
object **must** not be [VK_NULL_HANDLE](#)
- VUID-VkDebugMarkerObjectNameInfoEXT-object-01492
object **must** be a Vulkan object of the type associated with **objectType** as defined in [VkDebugReportObjectTypeEXT](#) and [Vulkan Handle Relationship](#)

Valid Usage (Implicit)

- VUID-VkDebugMarkerObjectNameInfoEXT-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_NAME_INFO_EXT](#)
- VUID-VkDebugMarkerObjectNameInfoEXT-pNext-pNext
pNext **must** be **NULL**
- VUID-VkDebugMarkerObjectNameInfoEXT-objectType-parameter
objectType **must** be a valid [VkDebugReportObjectTypeEXT](#) value
- VUID-VkDebugMarkerObjectNameInfoEXT-pObjectName-parameter
pObjectName **must** be a null-terminated UTF-8 string

In addition to setting a name for an object, debugging and validation layers may have uses for additional binary data on a per-object basis that has no other place in the Vulkan API. For example,

a `VkShaderModule` could have additional debugging data attached to it to aid in offline shader tracing. To attach data to an object, call:

```
// Provided by VK_EXT_debug_marker
VkResult vkDebugMarkerSetObjectTagEXT(
    VkDevice                                     device,
    const VkDebugMarkerObjectTagInfoEXT* pTagInfo);
```

- `device` is the device that created the object.
- `pTagInfo` is a pointer to a `VkDebugMarkerObjectTagInfoEXT` structure specifying the parameters of the tag to attach to the object.

Valid Usage (Implicit)

- VUID-vkDebugMarkerSetObjectTagEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDebugMarkerSetObjectTagEXT-pTagInfo-parameter
`pTagInfo` **must** be a valid pointer to a valid `VkDebugMarkerObjectTagInfoEXT` structure

Host Synchronization

- Host access to `pTagInfo->object` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDebugMarkerObjectTagInfoEXT` structure is defined as:

```

// Provided by VK_EXT_debug_marker
typedef struct VkDebugMarkerObjectTagInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDebugReportObjectTypeEXT objectType;
    uint64_t object;
    uint64_t tagName;
    size_t tagSize;
    const void* pTag;
} VkDebugMarkerObjectTagInfoEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **objectType** is a **VkDebugReportObjectTypeEXT** specifying the type of the object to be named.
- **object** is the object to be tagged.
- **tagName** is a numerical identifier of the tag.
- **tagSize** is the number of bytes of data to attach to the object.
- **pTag** is a pointer to an array of **tagSize** bytes containing the data to be associated with the object.

The **tagName** parameter gives a name or identifier to the type of data being tagged. This can be used by debugging layers to easily filter for only data that can be used by that implementation.

Valid Usage

- VUID-VkDebugMarkerObjectTagInfoEXT-objectType-01493
objectType **must** not be **VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT**
- VUID-VkDebugMarkerObjectTagInfoEXT-object-01494
object **must** not be **VK_NULL_HANDLE**
- VUID-VkDebugMarkerObjectTagInfoEXT-object-01495
object **must** be a Vulkan object of the type associated with **objectType** as defined in **VkDebugReportObjectTypeEXT** and **Vulkan Handle Relationship**

Valid Usage (Implicit)

- VUID-VkDebugMarkerObjectTagInfoEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_TAG_INFO_EXT`
- VUID-VkDebugMarkerObjectTagInfoEXT-pNext-pNext
pNext must be `NULL`
- VUID-VkDebugMarkerObjectTagInfoEXT-objectType-parameter
objectType must be a valid `VkDebugReportObjectTypeEXT` value
- VUID-VkDebugMarkerObjectTagInfoEXT-pTag-parameter
pTag must be a valid pointer to an array of **tagSize** bytes
- VUID-VkDebugMarkerObjectTagInfoEXT-tagSize-arraylength
tagSize must be greater than `0`

45.2.2. Command Buffer Markers

Typical Vulkan applications will submit many command buffers in each frame, with each command buffer containing a large number of individual commands. Being able to logically annotate regions of command buffers that belong together as well as hierarchically subdivide the frame is important to a developer's ability to navigate the commands viewed holistically.

The marker commands `vkCmdDebugMarkerBeginEXT` and `vkCmdDebugMarkerEndEXT` define regions of a series of commands that are grouped together, and they can be nested to create a hierarchy. The `vkCmdDebugMarkerInsertEXT` command allows insertion of a single label within a command buffer.

A marker region can be opened by calling:

```
// Provided by VK_EXT_debug_marker
void vkCmdDebugMarkerBeginEXT(
    VkCommandBuffer                                commandBuffer,
    const VkDebugMarkerMarkerInfoEXT*               pMarkerInfo);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **pMarkerInfo** is a pointer to a `VkDebugMarkerMarkerInfoEXT` structure specifying the parameters of the marker region to open.

Valid Usage (Implicit)

- VUID-vkCmdDebugMarkerBeginEXT-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdDebugMarkerBeginEXT-pMarkerInfo-parameter
pMarkerInfo **must** be a valid pointer to a valid [VkDebugMarkerMarkerInfoEXT](#) structure
- VUID-vkCmdDebugMarkerBeginEXT-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdDebugMarkerBeginEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support graphics, or compute operations

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary Secondary	Both	Graphics Compute

The [VkDebugMarkerMarkerInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_debug_marker
typedef struct VkDebugMarkerMarkerInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    const char*          pMarkerName;
    float                color[4];
} VkDebugMarkerMarkerInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pMarkerName** is a pointer to a null-terminated UTF-8 string containing the name of the marker.
- **color** is an **optional** RGBA color value that can be associated with the marker. A particular implementation **may** choose to ignore this color value. The values contain RGBA values in order, in the range 0.0 to 1.0. If all elements in **color** are set to 0.0 then it is ignored.

Valid Usage (Implicit)

- VUID-VkDebugMarkerMarkerInfoEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT`
- VUID-VkDebugMarkerMarkerInfoEXT-pNext-pNext
pNext must be `NULL`
- VUID-VkDebugMarkerMarkerInfoEXT-pMarkerName-parameter
pMarkerName must be a null-terminated UTF-8 string

A marker region can be closed by calling:

```
// Provided by VK_EXT_debug_marker
void vkCmdDebugMarkerEndEXT(
    VkCommandBuffer
        commandBuffer);
```

- **commandBuffer** is the command buffer into which the command is recorded.

An application **may** open a marker region in one command buffer and close it in another, or otherwise split marker regions across multiple command buffers or multiple queue submissions. When viewed from the linear series of submissions to a single queue, the calls to `vkCmdDebugMarkerBeginEXT` and `vkCmdDebugMarkerEndEXT` **must** be matched and balanced.

Valid Usage

- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-01239
There **must** be an outstanding `vkCmdDebugMarkerBeginEXT` command prior to the `vkCmdDebugMarkerEndEXT` on the queue that **commandBuffer** is submitted to
- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-01240
If **commandBuffer** is a secondary command buffer, there **must** be an outstanding `vkCmdDebugMarkerBeginEXT` command recorded to **commandBuffer** that has not previously been ended by a call to `vkCmdDebugMarkerEndEXT`

Valid Usage (Implicit)

- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-parameter
commandBuffer must be a valid `VkCommandBuffer` handle
- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-recording
commandBuffer must be in the `recording` state
- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-cmdpool
The `VkCommandPool` that **commandBuffer** was allocated from must support graphics, or compute operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Both	Graphics
Secondary		Compute

A single marker label can be inserted into a command buffer by calling:

```
// Provided by VK_EXT_debug_marker
void vkCmdDebugMarkerInsertEXT(
    VkCommandBuffer
    const VkDebugMarkerMarkerInfoEXT* commandBuffer,
                                         pMarkerInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pMarkerInfo` is a pointer to a `VkDebugMarkerMarkerInfoEXT` structure specifying the parameters of the marker to insert.

Valid Usage (Implicit)

- VUID-vkCmdDebugMarkerInsertEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDebugMarkerInsertEXT-pMarkerInfo-parameter
`pMarkerInfo` **must** be a valid pointer to a valid `VkDebugMarkerMarkerInfoEXT` structure
- VUID-vkCmdDebugMarkerInsertEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdDebugMarkerInsertEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Both	Graphics
Secondary		Compute

45.3. Debug Report Callbacks

Debug report callbacks are represented by `VkDebugReportCallbackEXT` handles:

```
// Provided by VK_EXT_debug_report
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDebugReportCallbackEXT)
```

Debug report callbacks give more detailed feedback on the application's use of Vulkan when events of interest occur.

To register a debug report callback, an application uses `vkCreateDebugReportCallbackEXT`.

```
// Provided by VK_EXT_debug_report
VkResult vkCreateDebugReportCallbackEXT(
    VkInstance instance,
    const VkDebugReportCallbackCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDebugReportCallbackEXT* pCallback);
```

- `instance` is the instance the callback will be logged on.
- `pCreateInfo` is a pointer to a `VkDebugReportCallbackCreateInfoEXT` structure defining the conditions under which this callback will be called.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pCallback` is a pointer to a `VkDebugReportCallbackEXT` handle in which the created object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDebugReportCallbackEXT-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateDebugReportCallbackEXT-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkDebugReportCallbackCreateInfoEXT](#) structure
- VUID-vkCreateDebugReportCallbackEXT-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateDebugReportCallbackEXT-pCallback-parameter
pCallback **must** be a valid pointer to a [VkDebugReportCallbackEXT](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)

The definition of [VkDebugReportCallbackCreateInfoEXT](#) is:

```
// Provided by VK_EXT_debug_report
typedef struct VkDebugReportCallbackCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkDebugReportFlagsEXT    flags;
    PFN_vkDebugReportCallbackEXT pfnCallback;
    void*                    pUserData;
} VkDebugReportCallbackCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkDebugReportFlagBitsEXT](#) specifying which event(s) will cause this callback to be called.
- **pfnCallback** is the application callback function to call.
- **pUserData** is user data to be passed to the callback.

For each [VkDebugReportCallbackEXT](#) that is created the [VkDebugReportCallbackCreateInfoEXT::flags](#) determine when that [VkDebugReportCallbackCreateInfoEXT::pfnCallback](#) is called. When an event happens, the implementation will do a bitwise AND of the event's [VkDebugReportFlagBitsEXT](#) flags

to each `VkDebugReportCallbackEXT` object's flags. For each non-zero result the corresponding callback will be called. The callback will come directly from the component that detected the event, unless some other layer intercepts the calls for its own purposes (filter them in a different way, log to a system error log, etc.).

An application **may** receive multiple callbacks if multiple `VkDebugReportCallbackEXT` objects were created. A callback will always be executed in the same thread as the originating Vulkan call.

A callback may be called from multiple threads simultaneously (if the application is making Vulkan calls from multiple threads).

Valid Usage (Implicit)

- VUID-VkDebugReportCallbackCreateInfoEXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT`
- VUID-VkDebugReportCallbackCreateInfoEXT-flags-parameter
flags **must** be a valid combination of `VkDebugReportFlagBitsEXT` values
- VUID-VkDebugReportCallbackCreateInfoEXT-pfnCallback-parameter
pfnCallback **must** be a valid `PFN_vkDebugReportCallbackEXT` value

Bits which **can** be set in `VkDebugReportCallbackCreateInfoEXT::flags`, specifying events which cause a debug report, are:

```
// Provided by VK_EXT_debug_report
typedef enum VkDebugReportFlagBitsEXT {
    VK_DEBUG_REPORT_INFORMATION_BIT_EXT = 0x00000001,
    VK_DEBUG_REPORT_WARNING_BIT_EXT = 0x00000002,
    VK_DEBUG_REPORT_PERFORMANCE_WARNING_BIT_EXT = 0x00000004,
    VK_DEBUG_REPORT_ERROR_BIT_EXT = 0x00000008,
    VK_DEBUG_REPORT_DEBUG_BIT_EXT = 0x00000010,
} VkDebugReportFlagBitsEXT;
```

- `VK_DEBUG_REPORT_ERROR_BIT_EXT` specifies that the application has violated a valid usage condition of the specification.
- `VK_DEBUG_REPORT_WARNING_BIT_EXT` specifies use of Vulkan that **may** expose an app bug. Such cases may not be immediately harmful, such as a fragment shader outputting to a location with no attachment. Other cases **may** point to behavior that is almost certainly bad when unintended such as using an image whose memory has not been filled. In general if you see a warning but you know that the behavior is intended/desired, then simply ignore the warning.
- `VK_DEBUG_REPORT_PERFORMANCE_WARNING_BIT_EXT` specifies a potentially non-optimal use of Vulkan, e.g. using `vkCmdClearColorImage` when setting `VkAttachmentDescription::loadOp` to `VK_ATTACHMENT_LOAD_OP_CLEAR` would have worked.
- `VK_DEBUG_REPORT_INFORMATION_BIT_EXT` specifies an informational message such as resource details that may be handy when debugging an application.
- `VK_DEBUG_REPORT_DEBUG_BIT_EXT` specifies diagnostic information from the implementation and

layers.

```
// Provided by VK_EXT_debug_report
typedef VkFlags VkDebugReportFlagsEXT;
```

`VkDebugReportFlagsEXT` is a bitmask type for setting a mask of zero or more `VkDebugReportFlagBitsEXT`.

The prototype for the `VkDebugReportCallbackCreateInfoEXT::pfnCallback` function implemented by the application is:

```
// Provided by VK_EXT_debug_report
typedef VkBool32 (VKAPI_PTR *PFN_vkDebugReportCallbackEXT)(
    VkDebugReportFlagsEXT
    VkDebugReportObjectTypeEXT
    uint64_t
    size_t
    int32_t
    const char*
    const char*
    void*
```

- `flags` specifies the `VkDebugReportFlagBitsEXT` that triggered this callback.
- `objectType` is a `VkDebugReportObjectTypeEXT` value specifying the type of object being used or created at the time the event was triggered.
- `object` is the object where the issue was detected. If `objectType` is `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT`, `object` is undefined.
- `location` is a component (layer, driver, loader) defined value specifying the *location* of the trigger. This is an **optional** value.
- `messageCode` is a layer-defined value indicating what test triggered this callback.
- `pLayerPrefix` is a null-terminated string that is an abbreviation of the name of the component making the callback. `pLayerPrefix` is only valid for the duration of the callback.
- `pMessage` is a null-terminated string detailing the trigger conditions. `pMessage` is only valid for the duration of the callback.
- `pUserData` is the user data given when the `VkDebugReportCallbackEXT` was created.

The callback **must** not call `vkDestroyDebugReportCallbackEXT`.

The callback returns a `VkBool32`, which is interpreted in a layer-specified manner. The application **should** always return `VK_FALSE`. The `VK_TRUE` value is reserved for use in layer development.

`object` **must** be a Vulkan object or `VK_NULL_HANDLE`. If `objectType` is not `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT` and `object` is not `VK_NULL_HANDLE`, `object` **must** be a Vulkan object of the corresponding type associated with `objectType` as defined in `VkDebugReportObjectTypeEXT` and `Vulkan Handle Relationship`.

Possible values passed to the `objectType` parameter of the callback function specified by `VkDebugReportCallbackCreateInfoEXT::pfnCallback`, specifying the type of object handle being reported, are:

```
// Provided by VK_EXT_debug_marker, VK_EXT_debug_report
typedef enum VkDebugReportObjectTypeEXT {
    VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT = 0,
    VK_DEBUG_REPORT_OBJECT_TYPE_INSTANCE_EXT = 1,
    VK_DEBUG_REPORT_OBJECT_TYPE_PHYSICAL_DEVICE_EXT = 2,
    VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_EXT = 3,
    VK_DEBUG_REPORT_OBJECT_TYPE_QUEUE_EXT = 4,
    VK_DEBUG_REPORT_OBJECT_TYPE_SEMAPHORE_EXT = 5,
    VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_BUFFER_EXT = 6,
    VK_DEBUG_REPORT_OBJECT_TYPE_FENCE_EXT = 7,
    VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_MEMORY_EXT = 8,
    VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_EXT = 9,
    VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_EXT = 10,
    VK_DEBUG_REPORT_OBJECT_TYPE_EVENT_EXT = 11,
    VK_DEBUG_REPORT_OBJECT_TYPE_QUERY_POOL_EXT = 12,
    VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_VIEW_EXT = 13,
    VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_VIEW_EXT = 14,
    VK_DEBUG_REPORT_OBJECT_TYPE_SHADER_MODULE_EXT = 15,
    VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_CACHE_EXT = 16,
    VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_LAYOUT_EXT = 17,
    VK_DEBUG_REPORT_OBJECT_TYPE_RENDER_PASS_EXT = 18,
    VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_EXT = 19,
    VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT_EXT = 20,
    VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_EXT = 21,
    VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_POOL_EXT = 22,
    VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_EXT = 23,
    VK_DEBUG_REPORT_OBJECT_TYPE_FRAMEBUFFER_EXT = 24,
    VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_POOL_EXT = 25,
    VK_DEBUG_REPORT_OBJECT_TYPE_SURFACE_KHR_EXT = 26,
    VK_DEBUG_REPORT_OBJECT_TYPE_SWAPCHAIN_KHR_EXT = 27,
    VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT_EXT = 28,
    VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_KHR_EXT = 29,
    VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_MODE_KHR_EXT = 30,
    VK_DEBUG_REPORT_OBJECT_TYPE_VALIDATION_CACHE_EXT_EXT = 33,
// Provided by VK_VERSION_1_1 with VK_EXT_debug_report,
VK_KHR_sampler_ycbcr_conversion with VK_EXT_debug_report
    VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_EXT = 1000156000,
// Provided by VK_VERSION_1_1 with VK_EXT_debug_report
    VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_EXT = 1000085000,
// Provided by VK_NVX_binary_import
    VK_DEBUG_REPORT_OBJECT_TYPE_CU_MODULE_NVX_EXT = 1000029000,
// Provided by VK_NVX_binary_import
    VK_DEBUG_REPORT_OBJECT_TYPE_CU_FUNCTION_NVX_EXT = 1000029001,
// Provided by VK_KHR_acceleration_structure
    VK_DEBUG_REPORT_OBJECT_TYPE_ACCELERATION_STRUCTURE_KHR_EXT = 1000150000,
// Provided by VK_NV_ray_tracing
```

```

VK_DEBUG_REPORT_OBJECT_TYPE_ACCELERATION_STRUCTURE_NV_EXT = 1000165000,
// Provided by VK_FUCHSIA_buffer_collection
VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_COLLECTION_FUCHSIA_EXT = 1000366000,
VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_EXT =
VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT_EXT,
VK_DEBUG_REPORT_OBJECT_TYPE_VALIDATION_CACHE_EXT =
VK_DEBUG_REPORT_OBJECT_TYPE_VALIDATION_CACHE_EXT_EXT,
// Provided by VK_KHR_descriptor_update_template with VK_EXT_debug_report
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_KHR_EXT =
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_EXT,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_KHR_EXT =
VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_EXT,
} VkDebugReportObjectTypeEXT;

```

Table 81. `VkDebugReportObjectTypeEXT` and Vulkan Handle Relationship

VkDebugReportObjectTypeEXT	Vulkan Handle Type
VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT	Unknown/Undefined Handle
VK_DEBUG_REPORT_OBJECT_TYPE_INSTANCE_EXT	VkInstance
VK_DEBUG_REPORT_OBJECT_TYPE_PHYSICAL_DEVICE_EXT	VkPhysicalDevice
VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_EXT	VkDevice
VK_DEBUG_REPORT_OBJECT_TYPE_QUEUE_EXT	VkQueue
VK_DEBUG_REPORT_OBJECT_TYPE_SEMAPHORE_EXT	VkSemaphore
VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_BUFFER_EXT	VkCommandBuffer
VK_DEBUG_REPORT_OBJECT_TYPE_FENCE_EXT	VkFence
VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_MEMORY_EXT	VkDeviceMemory
VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_EXT	VkBuffer
VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_EXT	VkImage
VK_DEBUG_REPORT_OBJECT_TYPE_EVENT_EXT	VkEvent
VK_DEBUG_REPORT_OBJECT_TYPE_QUERY_POOL_EXT	VkQueryPool
VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_VIEW_EXT	VkBufferView
VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_VIEW_EXT	VkImageView
VK_DEBUG_REPORT_OBJECT_TYPE_SHADER_MODULE_EXT	VkShaderModule
VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_CACHE_EXT	VkPipelineCache
VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_LAYOUT_EXT	VkPipelineLayout
VK_DEBUG_REPORT_OBJECT_TYPE_RENDER_PASS_EXT	VkRenderPass

VkDebugReportObjectTypeEXT	Vulkan Handle Type
<code>VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_EXT</code>	VkPipeline
<code>VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT_EXT</code>	VkDescriptorSetLayout
<code>VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_EXT</code>	VkSampler
<code>VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_POOL_EXT</code>	VkDescriptorPool
<code>VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_EXT</code>	VkDescriptorSet
<code>VK_DEBUG_REPORT_OBJECT_TYPE_FRAMEBUFFER_EXT</code>	VkFramebuffer
<code>VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_POOL_EXT</code>	VkCommandPool
<code>VK_DEBUG_REPORT_OBJECT_TYPE_SURFACE_KHR_EXT</code>	VkSurfaceKHR
<code>VK_DEBUG_REPORT_OBJECT_TYPE_SWAPCHAIN_KHR_EXT</code>	VkSwapchainKHR
<code>VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT</code>	VkDebugReportCallbackEXT
<code>VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_KHR_EXT</code>	VkDisplayKHR
<code>VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_MODE_KHR_EXT</code>	VkDisplayModeKHR
<code>VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_EXT</code>	VkDescriptorUpdateTemplate

Note

The primary expected use of `VK_ERROR_VALIDATION_FAILED_EXT` is for validation layer testing. It is not expected that an application would see this error code during normal use of the validation layers.

To inject its own messages into the debug stream, call:

```
// Provided by VK_EXT_debug_report
void vkDebugReportMessageEXT(
    VkInstance instance,
    VkDebugReportFlagsEXT flags,
    VkDebugReportObjectTypeEXT objectType,
    uint64_t object,
    size_t location,
    int32_t messageCode,
    const char* pLayerPrefix,
    const char* pMessage);
```

- `instance` is the debug stream's [VkInstance](#).
- `flags` specifies the [VkDebugReportFlagBitsEXT](#) classification of this event/message.
- `objectType` is a [VkDebugReportObjectTypeEXT](#) specifying the type of object being used or created at the time the event was triggered.

- `object` is the object where the issue was detected. `object` can be `VK_NULL_HANDLE` if there is no object associated with the event.
- `location` is an application defined value.
- `messageCode` is an application defined value.
- `pLayerPrefix` is the abbreviation of the component making this event/message.
- `pMessage` is a null-terminated string detailing the trigger conditions.

The call will propagate through the layers and generate callback(s) as indicated by the message's flags. The parameters are passed on to the callback in addition to the `pUserData` value that was defined at the time the callback was registered.

Valid Usage

- VUID-vkDebugReportMessageEXT-object-01241
`object` must be a Vulkan object or `VK_NULL_HANDLE`
- VUID-vkDebugReportMessageEXT-objectType-01498
If `objectType` is not `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT` and `object` is not `VK_NULL_HANDLE`, `object` must be a Vulkan object of the corresponding type associated with `objectType` as defined in `VkDebugReportObjectTypeEXT` and `Vulkan Handle Relationship`

Valid Usage (Implicit)

- VUID-vkDebugReportMessageEXT-instance-parameter
`instance` must be a valid `VkInstance` handle
- VUID-vkDebugReportMessageEXT-flags-parameter
`flags` must be a valid combination of `VkDebugReportFlagBitsEXT` values
- VUID-vkDebugReportMessageEXT-flags-requiredbitmask
`flags` must not be 0
- VUID-vkDebugReportMessageEXT-objectType-parameter
`objectType` must be a valid `VkDebugReportObjectTypeEXT` value
- VUID-vkDebugReportMessageEXT-pLayerPrefix-parameter
`pLayerPrefix` must be a null-terminated UTF-8 string
- VUID-vkDebugReportMessageEXT-pMessage-parameter
`pMessage` must be a null-terminated UTF-8 string

To destroy a `VkDebugReportCallbackEXT` object, call:

```
// Provided by VK_EXT_debug_report
void vkDestroyDebugReportCallbackEXT(
    VkInstance instance,
    VkDebugReportCallbackEXT callback,
    const VkAllocationCallbacks* pAllocator);
```

- **instance** is the instance where the callback was created.
- **callback** is the `VkDebugReportCallbackEXT` object to destroy. **callback** is an externally synchronized object and **must** not be used on more than one thread at a time. This means that `vkDestroyDebugReportCallbackEXT` **must** not be called when a callback is active.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyDebugReportCallbackEXT-instance-01242
If `VkAllocationCallbacks` were provided when `callback` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDebugReportCallbackEXT-instance-01243
If no `VkAllocationCallbacks` were provided when `callback` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyDebugReportCallbackEXT-instance-parameter
instance must be a valid `VkInstance` handle
- VUID-vkDestroyDebugReportCallbackEXT-callback-parameter
If `callback` is not `VK_NULL_HANDLE`, `callback` **must** be a valid `VkDebugReportCallbackEXT` handle
- VUID-vkDestroyDebugReportCallbackEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyDebugReportCallbackEXT-callback-parent
If `callback` is a valid handle, it **must** have been created, allocated, or retrieved from `instance`

Host Synchronization

- Host access to `callback` **must** be externally synchronized

45.4. Device Loss Debugging

45.4.1. Device Diagnostic Checkpoints

Device execution progress **can** be tracked for the purposes of debugging a device loss by annotating the command stream with application-defined diagnostic checkpoints.

Device diagnostic checkpoints are inserted into the command stream by calling [vkCmdSetCheckpointNV](#).

```
// Provided by VK_NV_device_diagnostic_checkpoints
void vkCmdSetCheckpointNV(
    VkCommandBuffer commandBuffer,
    const void* pCheckpointMarker);
```

- **commandBuffer** is the command buffer that will receive the marker
- **pCheckpointMarker** is an opaque application-provided value that will be associated with the checkpoint.

Valid Usage (Implicit)

- VUID-vkCmdSetCheckpointNV-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetCheckpointNV-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdSetCheckpointNV-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support graphics, compute, or transfer operations

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types
Primary	Both	Graphics
Secondary		Compute Transfer

Note that `pCheckpointMarker` is treated as an opaque value. It does not need to be a valid pointer and will not be dereferenced by the implementation.

If the device encounters an error during execution, the implementation will return a `VK_ERROR_DEVICE_LOST` error to the application at some point during host execution. When this happens, the application **can** call `vkGetQueueCheckpointData2NV` to retrieve information on the most recent diagnostic checkpoints that were executed by the device.

```
// Provided by VK_KHR_synchronization2 with VK_NV_device_diagnostic_checkpoints
void vkGetQueueCheckpointData2NV(
    VkQueue queue,
    uint32_t* pCheckpointDataCount,
    VkCheckpointData2NV* pCheckpointData);
```

- `queue` is the `VkQueue` object the caller would like to retrieve checkpoint data for
- `pCheckpointDataCount` is a pointer to an integer related to the number of checkpoint markers available or queried, as described below.
- `pCheckpointData` is either `NULL` or a pointer to an array of `VkCheckpointData2NV` structures.

If `pCheckpointData` is `NULL`, then the number of checkpoint markers available is returned in `pCheckpointDataCount`. Otherwise, `pCheckpointDataCount` **must** point to a variable set by the user to the number of elements in the `pCheckpointData` array, and on return the variable is overwritten with the number of structures actually written to `pCheckpointData`.

If `pCheckpointDataCount` is less than the number of checkpoint markers available, at most `pCheckpointDataCount` structures will be written.

Valid Usage

- VUID-vkGetQueueCheckpointData2NV-queue-03892
The device that `queue` belongs to **must** be in the lost state

Valid Usage (Implicit)

- VUID-vkGetQueueCheckpointData2NV-queue-parameter
`queue` **must** be a valid `VkQueue` handle
- VUID-vkGetQueueCheckpointData2NV-pCheckpointDataCount-parameter
`pCheckpointDataCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetQueueCheckpointData2NV-pCheckpointData-parameter
If the value referenced by `pCheckpointDataCount` is not `0`, and `pCheckpointData` is not `NULL`,
`pCheckpointData` **must** be a valid pointer to an array of `pCheckpointDataCount` `VkCheckpointData2NV` structures

The `VkCheckpointData2NV` structure is defined as:

```
// Provided by VK_KHR_synchronization2 with VK_NV_device_diagnostic_checkpoints
typedef struct VkCheckpointData2NV {
    VkStructureType sType;
    void* pNext;
    VkPipelineStageFlags2 stage;
    void* pCheckpointMarker;
} VkCheckpointData2NV;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **stage** indicates a single pipeline stage which the checkpoint marker data refers to.
- **pCheckpointMarker** contains the value of the last checkpoint marker executed in the stage that **stage** refers to.

Valid Usage (Implicit)

- VUID-VkCheckpointData2NV-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_CHECKPOINT_DATA_2_NV**
- VUID-VkCheckpointData2NV-pNext-pNext
pNext **must** be **NULL**

The stages at which a checkpoint marker **can** be executed are implementation-defined and **can** be queried by calling [vkGetPhysicalDeviceQueueFamilyProperties2](#).

If the device encounters an error during execution, the implementation will return a **VK_ERROR_DEVICE_LOST** error to the application at a certain point during host execution. When this happens, the application **can** call [vkGetQueueCheckpointDataNV](#) to retrieve information on the most recent diagnostic checkpoints that were executed by the device.

```
// Provided by VK_NV_device_diagnostic_checkpoints
void vkGetQueueCheckpointDataNV(  
    VkQueue queue,  
    uint32_t* pCheckpointDataCount,  
    VkCheckpointDataNV* pCheckpointData);
```

- **queue** is the **VkQueue** object the caller would like to retrieve checkpoint data for
- **pCheckpointDataCount** is a pointer to an integer related to the number of checkpoint markers available or queried, as described below.
- **pCheckpointData** is either **NULL** or a pointer to an array of **VkCheckpointDataNV** structures.

If **pCheckpointData** is **NULL**, then the number of checkpoint markers available is returned in **pCheckpointDataCount**.

Otherwise, **pCheckpointDataCount** **must** point to a variable set by the user to the number of elements

in the `pCheckpointData` array, and on return the variable is overwritten with the number of structures actually written to `pCheckpointData`.

If `pCheckpointDataCount` is less than the number of checkpoint markers available, at most `pCheckpointDataCount` structures will be written.

Valid Usage

- VUID-vkGetQueueCheckpointDataNV-queue-02025
The device that `queue` belongs to **must** be in the lost state

Valid Usage (Implicit)

- VUID-vkGetQueueCheckpointDataNV-queue-parameter
`queue` **must** be a valid `VkQueue` handle
- VUID-vkGetQueueCheckpointDataNV-pCheckpointDataCount-parameter
`pCheckpointDataCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetQueueCheckpointDataNV-pCheckpointData-parameter
If the value referenced by `pCheckpointDataCount` is not `0`, and `pCheckpointData` is not `NULL`,
`pCheckpointData` **must** be a valid pointer to an array of `pCheckpointDataCount` `VkCheckpointDataNV` structures

The `VkCheckpointDataNV` structure is defined as:

```
// Provided by VK_NV_device_diagnostic_checkpoints
typedef struct VkCheckpointDataNV {
    VkStructureType          sType;
    void*                   pNext;
    VkPipelineStageFlagBits   stage;
    void*                   pCheckpointMarker;
} VkCheckpointDataNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stage` is a `VkPipelineStageFlagBits` value specifying which pipeline stage the checkpoint marker data refers to.
- `pCheckpointMarker` contains the value of the last checkpoint marker executed in the stage that `stage` refers to.

The stages at which a checkpoint marker **can** be executed are implementation-defined and **can** be queried by calling `vkGetPhysicalDeviceQueueFamilyProperties2`.

Valid Usage (Implicit)

- VUID-VkCheckpointDataNV-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_CHECKPOINT_DATA_NV`
- VUID-VkCheckpointDataNV-pNext-pNext
pNext **must** be `NULL`

45.5. Active Tooling Information

Information about tools providing debugging, profiling, or similar services, active for a given physical device, can be obtained by calling:

```
// Provided by VK_VERSION_1_3
VkResult vkGetPhysicalDeviceToolProperties(
    VkPhysicalDevice           physicalDevice,
    uint32_t*                  pToolCount,
    VkPhysicalDeviceToolProperties* pToolProperties);
```

or the equivalent command

```
// Provided by VK_EXT_tooling_info
VkResult vkGetPhysicalDeviceToolPropertiesEXT(
    VkPhysicalDevice           physicalDevice,
    uint32_t*                  pToolCount,
    VkPhysicalDeviceToolProperties* pToolProperties);
```

- **physicalDevice** is the handle to the physical device to query for active tools.
- **pToolCount** is a pointer to an integer describing the number of tools active on **physicalDevice**.
- **pToolProperties** is either `NULL` or a pointer to an array of `VkPhysicalDeviceToolProperties` structures.

If **pToolProperties** is `NULL`, then the number of tools currently active on **physicalDevice** is returned in **pToolCount**. Otherwise, **pToolCount** **must** point to a variable set by the user to the number of elements in the **pToolProperties** array, and on return the variable is overwritten with the number of structures actually written to **pToolProperties**. If **pToolCount** is less than the number of currently active tools, at most **pToolCount** structures will be written.

The count and properties of active tools **may** change in response to events outside the scope of the specification. An application **should** assume these properties might change at any given time.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceToolProperties-parameter
physicalDevice **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceToolProperties-pToolCount-parameter
pToolCount **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceToolProperties-pToolProperties-parameter
If the value referenced by **pToolCount** is not `0`, and **pToolProperties** is not `NULL`,
pToolProperties **must** be a valid pointer to an array of **pToolCount** `VkPhysicalDeviceToolProperties` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPhysicalDeviceToolProperties` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceToolProperties {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_EXTENSION_NAME_SIZE];
    char version[VK_MAX_EXTENSION_NAME_SIZE];
    VkToolPurposeFlags purposes;
    char description[VK_MAX_DESCRIPTION_SIZE];
    char layer[VK_MAX_EXTENSION_NAME_SIZE];
} VkPhysicalDeviceToolProperties;
```

or the equivalent

```
// Provided by VK_EXT_tooling_info
typedef VkPhysicalDeviceToolProperties VkPhysicalDeviceToolPropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **name** is a null-terminated UTF-8 string containing the name of the tool.
- **version** is a null-terminated UTF-8 string containing the version of the tool.

- **purposes** is a bitmask of `VkToolPurposeFlagBits` which is populated with purposes supported by the tool.
- **description** is a null-terminated UTF-8 string containing a description of the tool.
- **layer** is a null-terminated UTF-8 string containing the name of the layer implementing the tool, if the tool is implemented in a layer - otherwise it **may** be an empty string.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceToolProperties-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TOOL_PROPERTIES`
- VUID-VkPhysicalDeviceToolProperties-pNext-pNext
pNext **must** be `NULL`

Bits which **can** be set in `VkPhysicalDeviceToolProperties::purposes`, specifying the purposes of an active tool, are:

```
// Provided by VK_VERSION_1_3
typedef enum VkToolPurposeFlagBits {
    VK_TOOL_PURPOSE_VALIDATION_BIT = 0x00000001,
    VK_TOOL_PURPOSE_PROFILING_BIT = 0x00000002,
    VK_TOOL_PURPOSE_TRACING_BIT = 0x00000004,
    VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT = 0x00000008,
    VK_TOOL_PURPOSE MODIFYING_FEATURES_BIT = 0x00000010,
    // Provided by VK_EXT_debug_report with VK_EXT_tooling_info, VK_EXT_debug_utils with
    // VK_EXT_tooling_info
    VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT = 0x00000020,
    // Provided by VK_EXT_debug_marker with VK_EXT_tooling_info, VK_EXT_debug_utils with
    // VK_EXT_tooling_info
    VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT = 0x00000040,
    VK_TOOL_PURPOSE_VALIDATION_BIT_EXT = VK_TOOL_PURPOSE_VALIDATION_BIT,
    VK_TOOL_PURPOSE_PROFILING_BIT_EXT = VK_TOOL_PURPOSE_PROFILING_BIT,
    VK_TOOL_PURPOSE_TRACING_BIT_EXT = VK_TOOL_PURPOSE_TRACING_BIT,
    VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT_EXT =
VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT,
    VK_TOOL_PURPOSE MODIFYING_FEATURES_BIT_EXT =
VK_TOOL_PURPOSE MODIFYING_FEATURES_BIT,
} VkToolPurposeFlagBits;
```

or the equivalent

```
// Provided by VK_EXT_tooling_info
typedef VkToolPurposeFlagBits VkToolPurposeFlagBitsEXT;
```

- `VK_TOOL_PURPOSE_VALIDATION_BIT` specifies that the tool provides validation of API usage.
- `VK_TOOL_PURPOSE_PROFILING_BIT` specifies that the tool provides profiling of API usage.

- `VK_TOOL_PURPOSE_TRACING_BIT` specifies that the tool is capturing data about the application's API usage, including anything from simple logging to capturing data for later replay.
- `VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT` specifies that the tool provides additional API features/extensions on top of the underlying implementation.
- `VK_TOOL_PURPOSE MODIFYING_FEATURES_BIT` specifies that the tool modifies the API features/limits/extensions presented to the application.
- `VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT` specifies that the tool reports additional information to the application via callbacks specified by `vkCreateDebugReportCallbackEXT` or `vkCreateDebugUtilsMessengerEXT`
- `VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT` specifies that the tool consumes `debug markers` or `object debug annotation`, `queue labels`, or `command buffer labels`

```
// Provided by VK_VERSION_1_3
typedef VkFlags VkToolPurposeFlags;
```

or the equivalent

```
// Provided by VK_EXT_tooling_info
typedef VkToolPurposeFlags VkToolPurposeFlagsEXT;
```

`VkToolPurposeFlags` is a bitmask type for setting a mask of zero or more `VkToolPurposeFlagBits`.

Appendix A: Vulkan Environment for SPIR-V

Shaders for Vulkan are defined by the [Khronos SPIR-V Specification](#) as well as the [Khronos SPIR-V Extended Instructions for GLSL Specification](#). This appendix defines additional SPIR-V requirements applying to Vulkan shaders.

Versions and Formats

A Vulkan 1.3 implementation **must** support the 1.0, 1.1, 1.2, 1.3, 1.4, 1.5, and 1.6 versions of SPIR-V and the 1.0 version of the SPIR-V Extended Instructions for GLSL.

A SPIR-V module passed into `vkCreateShaderModule` is interpreted as a series of 32-bit words in host endianness, with literal strings packed as described in section 2.2 of the SPIR-V Specification. The first few words of the SPIR-V module **must** be a magic number and a SPIR-V version number, as described in section 2.3 of the SPIR-V Specification.

Capabilities

The [table below](#) lists the set of SPIR-V capabilities that **may** be supported in Vulkan implementations. The application **must** not use any of these capabilities in SPIR-V passed to `vkCreateShaderModule` unless one of the following conditions is met for the `VkDevice` specified in the `device` parameter of `vkCreateShaderModule`:

- The corresponding field in the table is blank.
- Any corresponding Vulkan feature is enabled.
- Any corresponding Vulkan extension is enabled.
- Any corresponding Vulkan property is supported.
- The corresponding core version is supported (as returned by `VkPhysicalDeviceProperties::apiVersion`).

Table 82. List of SPIR-V Capabilities and corresponding Vulkan features, extensions, or core version

The application **must** not pass a SPIR-V module containing any of the following to `vkCreateShaderModule`:

- any `OpCapability` not listed above,

- an unsupported capability, or
- a capability which corresponds to a Vulkan feature or extension which has not been enabled.

SPIR-V Extensions

The [following table](#) lists SPIR-V extensions that implementations **may** support. The application **must** not pass a SPIR-V module to [vkCreateShaderModule](#) that uses the following SPIR-V extensions unless one of the following conditions is met for the [VkDevice](#) specified in the [device](#) parameter of [vkCreateShaderModule](#):

- Any corresponding Vulkan extension is enabled.
- The corresponding core version is supported (as returned by [VkPhysicalDeviceProperties ::apiVersion](#)).

Table 83. List of SPIR-V Extensions and corresponding Vulkan extensions or core version

Validation Rules within a Module

A SPIR-V module passed to `vkCreateShaderModule` **must** conform to the following rules:

Standalone SPIR-V Validation

The following rules **can** be validated with only the SPIR-V module itself. They do not depend on

knowledge of the implementation and its capabilities or knowledge of runtime information, such as enabled features.

Valid Usage

- VUID-StandaloneSpirv-None-04633
Every entry point **must** have no return value and accept no arguments
- VUID-StandaloneSpirv-None-04634
The static function-call graph for an entry point **must** not contain cycles; that is, static recursion is not allowed
- VUID-StandaloneSpirv-None-04635
The **Logical or PhysicalStorageBuffer64** addressing model **must** be selected
- VUID-StandaloneSpirv-None-04636
Scope for execution **must** be limited to **Workgroup** or **Subgroup**
- VUID-StandaloneSpirv-None-04637
If the **Scope** for execution is **Workgroup**, then it **must** only be used in the task, mesh, tessellation control, or compute execution models
- VUID-StandaloneSpirv-None-04638
Scope for memory **must** be limited to **Device**, **QueueFamily**, **Workgroup**, **ShaderCallKHR**, **Subgroup**, or **Invocation**
- VUID-StandaloneSpirv-None-04639
If the **Scope** for memory is **Workgroup**, then it **must** only be used in the task, mesh, or compute execution models
- VUID-StandaloneSpirv-None-04640
If the **Scope** for memory is **ShaderCallKHR**, then it **must** only be used in ray generation, intersection, closest hit, any-hit, miss, and callable execution models
- VUID-StandaloneSpirv-None-04641
If the **Scope** for memory is **Invocation**, then memory semantics **must** be **None**
- VUID-StandaloneSpirv-None-04642
Scope for group operations **must** be limited to **Subgroup**
- VUID-StandaloneSpirv-None-04643
Storage Class **must** be limited to **UniformConstant**, **Input**, **Uniform**, **Output**, **Workgroup**, **Private**, **Function**, **PushConstant**, **Image**, **StorageBuffer**, **RayPayloadKHR**, **IncomingRayPayloadKHR**, **HitAttributeKHR**, **CallableDataKHR**, **IncomingCallableDataKHR**, **ShaderRecordBufferKHR**, or **PhysicalStorageBuffer**
- VUID-StandaloneSpirv-None-04644
If the **Storage Class** is **Output**, then it **must** not be used in the **GlCompute**, **RayGenerationKHR**, **IntersectionKHR**, **AnyHitKHR**, **ClosestHitKHR**, **MissKHR**, or **CallableKHR** execution models
- VUID-StandaloneSpirv-None-04645
If the **Storage Class** is **Workgroup**, then it **must** only be used in the task, mesh, or compute execution models
- VUID-StandaloneSpirv-OpAtomicStore-04730
OpAtomicStore **must** not use **Acquire**, **AcquireRelease**, or **SequentiallyConsistent** memory semantics

- VUID-StandaloneSpirv-OpAtomicLoad-04731
OpAtomicLoad must not use **Release**, **AcquireRelease**, or **SequentiallyConsistent** memory semantics
- VUID-StandaloneSpirv-OpMemoryBarrier-04732
OpMemoryBarrier must use one of **Acquire**, **Release**, **AcquireRelease**, or **SequentiallyConsistent** memory semantics
- VUID-StandaloneSpirv-OpMemoryBarrier-04733
OpMemoryBarrier must include at least one storage class
- VUID-StandaloneSpirv-OpControlBarrier-04650
 If the semantics for **OpControlBarrier** includes one of **Acquire**, **Release**, **AcquireRelease**, or **SequentiallyConsistent** memory semantics, then it must include at least one storage class
- VUID-StandaloneSpirv-OpVariable-04651
 Any **OpVariable** with an **Initializer** operand must have **Output**, **Private**, **Function**, or **Workgroup** as its **Storage Class** operand
- VUID-StandaloneSpirv-OpVariable-04734
 Any **OpVariable** with an **Initializer** operand and **Workgroup** as its **Storage Class** operand must use **OpConstantNull** as the initializer
- VUID-StandaloneSpirv-OpReadClockKHR-04652
Scope for **OpReadClockKHR** must be limited to **Subgroup** or **Device**
- VUID-StandaloneSpirv-OriginLowerLeft-04653
 The **OriginLowerLeft** execution mode must not be used; fragment entry points must declare **OriginUpperLeft**
- VUID-StandaloneSpirv-PixelCenterInteger-04654
 The **PixelCenterInteger** execution mode must not be used (pixels are always centered at half-integer coordinates)
- VUID-StandaloneSpirv-UniformConstant-04655
 Any variable in the **UniformConstant** storage class must be typed as either **OpTypeImage**, **OpTypeSampler**, **OpTypeSampledImage**, **OpTypeAccelerationStructureKHR**, or an array of one of these types
- VUID-StandaloneSpirv-OpTypeImage-04656
OpTypeImage must declare a scalar 32-bit float, 64-bit integer, or 32-bit integer type for the “Sampled Type” (**RelaxedPrecision** can be applied to a sampling instruction and to the variable holding the result of a sampling instruction)
- VUID-StandaloneSpirv-OpTypeImage-04657
OpTypeImage must have a “Sampled” operand of 1 (sampled image) or 2 (storage image)
- VUID-StandaloneSpirv-Image-04965
 The converted bit width, signedness, and numeric type of the **Image Format** operand of an **OpTypeImage** must match the **Sampled Type**, as defined in [Image Format and Type Matching](#)
- VUID-StandaloneSpirv-OpImageTexelPointer-04658
 If an **OpImageTexelPointer** is used in an atomic operation, the image type of the **image** parameter to **OpImageTexelPointer** must have an image format of **R64i**, **R64ui**, **R32f**, **R32i**, or **R32ui**

- VUID-StandaloneSpirv-OpImageQuerySizeLod-04659
OpImageQuerySizeLod, **OpImageQueryLod**, and **OpImageQueryLevels** **must** only consume an “Image” operand whose type has its “Sampled” operand set to 1
- VUID-StandaloneSpirv-OpTypeImage-06214
An **OpTypeImage** with a “Dim” operand of **SubpassData** **must** have an “Arrayed” operand of 0 (non-arrayed) and a “Sampled” operand of 2 (storage image)
- VUID-StandaloneSpirv-SubpassData-04660
The (u,v) coordinates used for a **SubpassData** **must** be the <id> of a constant vector (0,0), or if a layer coordinate is used, **must** be a vector that was formed with constant 0 for the u and v components
- VUID-StandaloneSpirv-OpTypeImage-04661
Objects of types **OpTypeImage**, **OpTypeSampler**, **OpTypeSampledImage**, and arrays of these types **must** not be stored to or modified
- VUID-StandaloneSpirv-Offset-04662
Any image operation **must** use at most one of the **Offset**, **ConstOffset**, and **ConstOffsets** image operands
- VUID-StandaloneSpirv-Offset-04663
Image operand **Offset** **must** only be used with **OpImage*Gather** instructions
- VUID-StandaloneSpirv-Offset-04865
Any image instruction which uses an **Offset**, **ConstOffset**, or **ConstOffsets** image operand, must only consume a “Sampled Image” operand whose type has its “Sampled” operand set to 1
- VUID-StandaloneSpirv-OpImageGather-04664
The “Component” operand of **OpImageGather**, and **OpImageSparseGather** **must** be the <id> of a constant instruction
- VUID-StandaloneSpirv-OpImage-04777
OpImage*Dref **must** not consume an image whose **Dim** is 3D
- VUID-StandaloneSpirv-OpTypeAccelerationStructureKHR-04665
Objects of types **OpTypeAccelerationStructureKHR** and arrays of this type **must** not be stored to or modified
- VUID-StandaloneSpirv-OpReportIntersectionKHR-04666
The value of the “Hit Kind” operand of **OpReportIntersectionKHR** **must** be in the range [0,127]
- VUID-StandaloneSpirv-None-04667
Structure types **must** not contain opaque types
- VUID-StandaloneSpirv-BuiltIn-04668
Any **BuiltIn** decoration not listed in **Built-In Variables** **must** not be used
- VUID-StandaloneSpirv-Location-04915
The **Location** or **Component** decorations **must** not be used with **BuiltIn**
- VUID-StandaloneSpirv-Location-04916
The **Location** decorations **must** be used on **user-defined variables**
- VUID-StandaloneSpirv-Location-04917

The **Location** decorations **must** be used on an **OpVariable** with a structure type that is not a block

- VUID-StandaloneSpirv-Location-04918

The **Location** decorations **must** not be used on the members of **OpVariable** with a structure type that is decorated with **Location**

- VUID-StandaloneSpirv-Location-04919

The **Location** decorations **must** be used on each member of **OpVariable** with a structure type that is a block not decorated with **Location**

- VUID-StandaloneSpirv-Component-04920

The **Component** decoration value **must** not be greater than 3

- VUID-StandaloneSpirv-Component-04921

If the **Component** decoration is used on an **OpVariable** that has a **OpTypeVector** type with a **Component Type** with a **Width** that is less than or equal to 32, the sum of its **Component Count** and the **Component** decoration value **must** be less than 4

- VUID-StandaloneSpirv-Component-04922

If the **Component** decoration is used on an **OpVariable** that has a **OpTypeVector** type with a **Component Type** with a **Width** that is equal to 64, the sum of two times its **Component Count** and the **Component** decoration value **must** be less than 4

- VUID-StandaloneSpirv-Component-04923

The **Component** decorations value **must** not be 1 or 3 for scalar or two-component 64-bit data types

- VUID-StandaloneSpirv-Component-04924

The **Component** decorations **must** not be used with any type that is not a scalar or vector

- VUID-StandaloneSpirv-GLSLShared-04669

The **GLSLShared** and **GLSLPacked** decorations **must** not be used

- VUID-StandaloneSpirv-Flat-04670

The **Flat**, **NoPerspective**, **Sample**, and **Centroid** decorations **must** only be used on variables with the **Output** or **Input** storage class

- VUID-StandaloneSpirv-Flat-06201

The **Flat**, **NoPerspective**, **Sample**, and **Centroid** decorations **must** not be used on variables with the **Output** storage class in a fragment shader

- VUID-StandaloneSpirv-Flat-06202

The **Flat**, **NoPerspective**, **Sample**, and **Centroid** decorations **must** not be used on variables with the **Input** storage class in a vertex shader

- VUID-StandaloneSpirv-Flat-04744

Any variable with integer or double-precision floating-point type and with **Input** storage class in a fragment shader, **must** be decorated **Flat**

- VUID-StandaloneSpirv-ViewportRelativeNV-04672

The **ViewportRelativeNV** decoration **must** only be used on a variable decorated with **Layer** in the vertex, tessellation evaluation, or geometry shader stages

- VUID-StandaloneSpirv-ViewportRelativeNV-04673

The **ViewportRelativeNV** decoration **must** not be used unless a variable decorated with one

of `ViewportIndex` or `ViewportMaskNV` is also statically used by the same `OpEntryPoint`

- VUID-StandaloneSpirv-ViewportMaskNV-04674

The `ViewportMaskNV` and `ViewportIndex` decorations **must** not both be statically used by one or more `OpEntryPoint`'s that form the `pre-rasterization` shader stages of a graphics pipeline

- VUID-StandaloneSpirv-FPRoundingMode-04675

Rounding modes other than round-to-nearest-even and round-towards-zero **must** not be used for the `FPRoundingMode` decoration

- VUID-StandaloneSpirv-FPRoundingMode-04676

The `FPRoundingMode` decoration **must** only be used for a width-only conversion instruction whose only uses are `Object` operands of `OpStore` instructions storing through a pointer to a 16-bit floating-point object in the `StorageBuffer`, `PhysicalStorageBuffer`, `Uniform`, or `Output` storage class

- VUID-StandaloneSpirv-Invariant-04677

Variables decorated with `Invariant` and variables with structure types that have any members decorated with `Invariant` **must** be in the `Output` or `Input` storage class, `Invariant` used on an `Input` storage class variable or structure member has no effect

- VUID-StandaloneSpirv-VulkanMemoryModel-04678

If the `VulkanMemoryModel` capability is not declared, the `Volatile` decoration **must** be used on any variable declaration that includes one of the `SMIDNV`, `WarpIDNV`, `SubgroupSize`, `SubgroupLocalInvocationId`, `SubgroupEqMask`, `SubgroupGeMask`, `SubgroupGtMask`, `SubgroupLeMask`, or `SubgroupLtMask` `BuiltIn` decorations when used in the ray generation, closest hit, miss, intersection, or callable shaders, or with the `RayTmaxKHR` `Builtin` decoration when used in an intersection shader

- VUID-StandaloneSpirv-VulkanMemoryModel-04679

If the `VulkanMemoryModel` capability is declared, the `OpLoad` instruction **must** use the `Volatile` memory semantics when it accesses into any variable that includes one of the `SMIDNV`, `WarpIDNV`, `SubgroupSize`, `SubgroupLocalInvocationId`, `SubgroupEqMask`, `SubgroupGeMask`, `SubgroupGtMask`, `SubgroupLeMask`, or `SubgroupLtMask` `BuiltIn` decorations when used in the ray generation, closest hit, miss, intersection, or callable shaders, or with the `RayTmaxKHR` `Builtin` decoration when used in an intersection shader

- VUID-StandaloneSpirv-OpTypeRuntimeArray-04680

`OpTypeRuntimeArray` **must** only be used for the last member of a `Block`-decorated `OpTypeStruct` in `StorageBuffer` or `PhysicalStorageBuffer` storage classes; `BufferBlock`-decorated `OpTypeStruct` in `Uniform` storage class; the outermost dimension of an arrayed variable in the `StorageBuffer`, `Uniform`, or `UniformConstant` storage classes.

- VUID-StandaloneSpirv-Function-04681

A type T that is an array sized with a specialization constant **must** neither be, nor be contained in, the type T_2 of a variable V , unless either: a) T is equal to T_2 , b) V is declared in the `Function`, or `Private` storage classes, c) V is a non-Block variable in the `Workgroup` storage class, or d) V is an interface variable with an additional level of arrayness, as described in `interface matching`, and T is the member type of the array type T_2

- VUID-StandaloneSpirv-OpControlBarrier-04682

If `OpControlBarrier` is used in ray generation, intersection, any-hit, closest hit, miss, fragment, vertex, tessellation evaluation, or geometry shaders, the execution Scope **must**

be Subgroup

- VUID-StandaloneSpirv-LocalSize-06426

For each compute shader entry point, either a `LocalSize` or `LocalSizeId` execution mode, or an object decorated with the `WorkgroupSize` decoration **must** be specified

- VUID-StandaloneSpirv-DerivativeGroupQuadsNV-04684

For compute shaders using the `DerivativeGroupQuadsNV` execution mode, the first two dimensions of the local workgroup size **must** be a multiple of two

- VUID-StandaloneSpirv-DerivativeGroupLinearNV-04778

For compute shaders using the `DerivativeGroupLinearNV` execution mode, the product of the dimensions of the local workgroup size **must** be a multiple of four

- VUID-StandaloneSpirv-OpGroupNonUniformBallotBitCount-04685

If `OpGroupNonUniformBallotBitCount` is used, the group operation **must** be limited to **Reduce**, **InclusiveScan**, or **ExclusiveScan**

- VUID-StandaloneSpirv-None-04686

The `Pointer` operand of all atomic instructions **must** have a **Storage Class** limited to **Uniform**, **Workgroup**, **Image**, **StorageBuffer**, or **PhysicalStorageBuffer**

- VUID-StandaloneSpirv-Offset-04687

Output variables or block members decorated with `Offset` that have a 64-bit type, or a composite type containing a 64-bit type, **must** specify an `Offset` value aligned to a 8 byte boundary

- VUID-StandaloneSpirv-Offset-04689

The size of any output block containing any member decorated with `Offset` that is a 64-bit type **must** be a multiple of 8

- VUID-StandaloneSpirv-Offset-04690

The first member of an output block specifying a `Offset` decoration **must** specify a `Offset` value that is aligned to an 8 byte boundary if that block contains any member decorated with `Offset` and is a 64-bit type

- VUID-StandaloneSpirv-Offset-04691

Output variables or block members decorated with `Offset` that have a 32-bit type, or a composite type contains a 32-bit type, **must** specify an `Offset` value aligned to a 4 byte boundary

- VUID-StandaloneSpirv-Offset-04692

Output variables, blocks or block members decorated with `Offset` **must** only contain base types that have components that are either 32-bit or 64-bit in size

- VUID-StandaloneSpirv-Offset-04716

Only variables or block members in the output interface decorated with `Offset` **can** be captured for transform feedback, and those variables or block members **must** also be decorated with `XfbBuffer` and `XfbStride`, or inherit `XfbBuffer` and `XfbStride` decorations from a block containing them

- VUID-StandaloneSpirv-XfbBuffer-04693

All variables or block members in the output interface of the entry point being compiled decorated with a specific `XfbBuffer` value **must** all be decorated with identical `XfbStride` values

- VUID-StandaloneSpirv-Stream-04694
If any variables or block members in the output interface of the entry point being compiled are decorated with **Stream**, then all variables belonging to the same **XfbBuffer** **must** specify the same **Stream** value
- VUID-StandaloneSpirv-XfbBuffer-04696
For any two variables or block members in the output interface of the entry point being compiled with the same **XfbBuffer** value, the ranges determined by the **Offset** decoration and the size of the type **must** not overlap
- VUID-StandaloneSpirv-XfbBuffer-04697
All block members in the output interface of the entry point being compiled that are in the same block and have a declared or inherited **XfbBuffer** decoration **must** specify the same **XfbBuffer** value
- VUID-StandaloneSpirv-RayPayloadKHR-04698
RayPayloadKHR storage class **must** only be used in ray generation, closest hit or miss shaders
- VUID-StandaloneSpirv-IncomingRayPayloadKHR-04699
IncomingRayPayloadKHR storage class **must** only be used in closest hit, any-hit, or miss shaders
- VUID-StandaloneSpirv-IncomingRayPayloadKHR-04700
There **must** be at most one variable with the **IncomingRayPayloadKHR** storage class in the input interface of an entry point
- VUID-StandaloneSpirv-HitAttributeKHR-04701
HitAttributeKHR storage class **must** only be used in intersection, any-hit, or closest hit shaders
- VUID-StandaloneSpirv-HitAttributeKHR-04702
There **must** be at most one variable with the **HitAttributeKHR** storage class in the input interface of an entry point
- VUID-StandaloneSpirv-HitAttributeKHR-04703
A variable with **HitAttributeKHR** storage class **must** only be written to in an intersection shader
- VUID-StandaloneSpirv-CallableDataKHR-04704
CallableDataKHR storage class **must** only be used in ray generation, closest hit, miss, and callable shaders
- VUID-StandaloneSpirv-IncomingCallableDataKHR-04705
IncomingCallableDataKHR storage class **must** only be used in callable shaders
- VUID-StandaloneSpirv-IncomingCallableDataKHR-04706
There **must** be at most one variable with the **IncomingCallableDataKHR** storage class in the input interface of an entry point
- VUID-StandaloneSpirv-Base-04707
The **Base** operand of **OpPtrAccessChain** **must** point to one of the following: **Workgroup**, if **VariablePointers** is enabled; **StorageBuffer**, if **VariablePointers** or **VariablePointersStorageBuffer** is enabled; **PhysicalStorageBuffer**, if the **PhysicalStorageBuffer64** addressing model is enabled

- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04708
If the **PhysicalStorageBuffer64** addressing model is enabled, all instructions that support memory access operands and that use a physical pointer **must** include the **Aligned** operand
- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04709
If the **PhysicalStorageBuffer64** addressing model is enabled, any access chain instruction that accesses into a **RowMajor** matrix **must** only be used as the **Pointer** operand to **OpLoad** or **OpStore**
- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04710
If the **PhysicalStorageBuffer64** addressing model is enabled, **OpConvertUToPtr** and **OpConvertPtrToU** **must** use an integer type whose **Width** is 64
- VUID-StandaloneSpirv-OpTypeForwardPointer-04711
OpTypeForwardPointer **must** have a storage class of **PhysicalStorageBuffer**
- VUID-StandaloneSpirv-None-04745
All variables with a storage class of **PushConstant** declared as an array **must** only be accessed by dynamically uniform indices
- VUID-StandaloneSpirv-Result-04780
The **Result Type** operand of any **OpImageRead** or **OpImageSparseRead** instruction **must** be a vector of four components
- VUID-StandaloneSpirv-Base-04781
The **Base** operand of any **OpBitCount**, **OpBitReverse**, **OpBitFieldInsert**, **OpBitFieldSExtract**, or **OpBitFieldUExtract** instruction **must** be a 32-bit integer scalar or a vector of 32-bit integers
- VUID-StandaloneSpirv-DescriptorSet-06491
If a variable is decorated by **DescriptorSet** or **Binding**, the storage class **must** correspond to an entry in [Shader Resource and Storage Class Correspondence](#)

Runtime SPIR-V Validation

The following rules **must** be validated at runtime. These rules depend on knowledge of the implementation and its capabilities and knowledge of runtime information, such as enabled features.

Valid Usage

- VUID-RuntimeSpirv-vulkanMemoryModel-06265
If `vulkanMemoryModel` is enabled and `vulkanMemoryModelDeviceScope` is not enabled, `Device` memory scope **must** not be used.
- VUID-RuntimeSpirv-vulkanMemoryModel-06266
If `vulkanMemoryModel` is not enabled, `QueueFamily` memory scope **must** not be used.
- VUID-RuntimeSpirv-shaderSubgroupClock-06267
If `shaderSubgroupClock` is not enabled, the `Subgroup` scope **must** not be used for `OpReadClockKHR`.
- VUID-RuntimeSpirv-shaderDeviceClock-06268
If `shaderDeviceClock` is not enabled, the `Device` scope **must** not be used for `OpReadClockKHR`.
- VUID-RuntimeSpirv-Location-06272
The sum of `Location` and the number of locations the variable it decorates consumes **must** be less than or equal to the value for the matching `Execution Model` defined in [Shader Input and Output Locations](#)
- VUID-RuntimeSpirv-Fragment-06427
When blending is enabled and one of the dual source blend modes is in use, the maximum number of output attachments written to in the `Fragment Execution Model` **must** be less than or equal to `maxFragmentDualSrcAttachments`
- VUID-RuntimeSpirv-Location-06428
The maximum number of storage buffers, storage images, and output `Location` decorated color attachments written to in the `Fragment Execution Model` **must** be less than or equal to `maxFragmentCombinedOutputResources`
- VUID-RuntimeSpirv-NonUniform-06274
If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the operand corresponding to that resource (e.g. the pointer or sampled image operand) **must** be decorated with `NonUniform`.
- VUID-RuntimeSpirv-None-06275
`shaderSubgroupExtendedTypes` **must** be enabled for [group operations](#) to use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types
- VUID-RuntimeSpirv-subgroupBroadcastDynamicId-06276
If `subgroupBroadcastDynamicId` is `VK_TRUE`, and the shader module version is 1.5 or higher, the “Index” for `OpGroupNonUniformQuadBroadcast` **must** be dynamically uniform within the derivative group. Otherwise, “Index” **must** be a constant.
- VUID-RuntimeSpirv-subgroupBroadcastDynamicId-06277
If `subgroupBroadcastDynamicId` is `VK_TRUE`, and the shader module version is 1.5 or higher, the “Id” for `OpGroupNonUniformBroadcast` **must** be dynamically uniform within the subgroup. Otherwise, “Id” **must** be a constant.
- VUID-RuntimeSpirv-None-06278
`shaderBufferInt64Atomics` **must** be enabled for 64-bit integer atomic operations to be supported on a `Pointer` with a `Storage Class` of `StorageBuffer` or `Uniform`.

- VUID-RuntimeSpirv-None-06279
`shaderSharedInt64Atomics` **must** be enabled for 64-bit integer atomic operations to be supported on a *Pointer* with a **Storage Class of Workgroup**.
- VUID-RuntimeSpirv-None-06284
`shaderBufferFloat32Atomics`, or `shaderBufferFloat32AtomicAdd`, or
`shaderBufferFloat64Atomics`, or `shaderBufferFloat64AtomicAdd`, or
`shaderBufferFloat16Atomics`, or `shaderBufferFloat16AtomicAdd`, or
`shaderBufferFloat16AtomicMinMax`, or `shaderBufferFloat32AtomicMinMax`, or
`shaderBufferFloat64AtomicMinMax` **must** be enabled for floating-point atomic operations to be supported on a *Pointer* with a **Storage Class of StorageBuffer**.
- VUID-RuntimeSpirv-None-06285
`shaderSharedFloat32Atomics`, or `shaderSharedFloat32AtomicAdd`, or
`shaderSharedFloat64Atomics`, or `shaderSharedFloat64AtomicAdd`, or
`shaderSharedFloat16Atomics`, or `shaderSharedFloat16AtomicAdd`, or
`shaderSharedFloat16AtomicMinMax`, or `shaderSharedFloat32AtomicMinMax`, or
`shaderSharedFloat64AtomicMinMax` **must** be enabled for floating-point atomic operations to be supported on a *Pointer* with a **Storage Class of Workgroup**.
- VUID-RuntimeSpirv-None-06286
`shaderImageFloat32Atomics`, or `shaderImageFloat32AtomicAdd`, or
`shaderImageFloat32AtomicMinMax` **must** be enabled for 32-bit floating-point atomic operations to be supported on a *Pointer* with a **Storage Class of Image**.
- VUID-RuntimeSpirv-None-06287
`sparseImageFloat32Atomics`, or `sparseImageFloat32AtomicAdd`, or
`sparseImageFloat32AtomicMinMax` **must** be enabled for 32-bit floating-point atomics to be supported on sparse images.
- VUID-RuntimeSpirv-None-06288
`shaderImageInt64Atomics` **must** be enabled for 64-bit integer atomic operations to be supported on a *Pointer* with a **Storage Class of Image**.
- VUID-RuntimeSpirv-denormBehaviorIndependence-06289
If `denormBehaviorIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY`, then the entry point **must** use the same denormals execution mode for both 16-bit and 64-bit floating-point types.
- VUID-RuntimeSpirv-denormBehaviorIndependence-06290
If `denormBehaviorIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE`, then the entry point **must** use the same denormals execution mode for all floating-point types.
- VUID-RuntimeSpirv-roundingModeIndependence-06291
If `roundingModeIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY`, then the entry point **must** use the same rounding execution mode for both 16-bit and 64-bit floating-point types.
- VUID-RuntimeSpirv-roundingModeIndependence-06292
If `roundingModeIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE`, then the entry point **must** use the same rounding execution mode for all floating-point types.
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat16-06293
If `shaderSignedZeroInfNanPreserveFloat16` is `VK_FALSE`, then `SignedZeroInfNanPreserve` for

16-bit floating-point type **must** not be used.

- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat32-06294
If `shaderSignedZeroInfNanPreserveFloat32` is `VK_FALSE`, then `SignedZeroInfNanPreserve` for 32-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat64-06295
If `shaderSignedZeroInfNanPreserveFloat64` is `VK_FALSE`, then `SignedZeroInfNanPreserve` for 64-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderDenormPreserveFloat16-06296
If `shaderDenormPreserveFloat16` is `VK_FALSE`, then `DenormPreserve` for 16-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderDenormPreserveFloat32-06297
If `shaderDenormPreserveFloat32` is `VK_FALSE`, then `DenormPreserve` for 32-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderDenormPreserveFloat64-06298
If `shaderDenormPreserveFloat64` is `VK_FALSE`, then `DenormPreserve` for 64-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat16-06299
If `shaderDenormFlushToZeroFloat16` is `VK_FALSE`, then `DenormFlushToZero` for 16-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat32-06300
If `shaderDenormFlushToZeroFloat32` is `VK_FALSE`, then `DenormFlushToZero` for 32-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat64-06301
If `shaderDenormFlushToZeroFloat64` is `VK_FALSE`, then `DenormFlushToZero` for 64-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderRoundingModeRTFloat16-06302
If `shaderRoundingModeRTFloat16` is `VK_FALSE`, then `RoundingModeRT` for 16-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderRoundingModeRTFloat32-06303
If `shaderRoundingModeRTFloat32` is `VK_FALSE`, then `RoundingModeRT` for 32-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderRoundingModeRTFloat64-06304
If `shaderRoundingModeRTFloat64` is `VK_FALSE`, then `RoundingModeRT` for 64-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderRoundingModeRTZFloat16-06305
If `shaderRoundingModeRTZFloat16` is `VK_FALSE`, then `RoundingModeRTZ` for 16-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderRoundingModeRTZFloat32-06306
If `shaderRoundingModeRTZFloat32` is `VK_FALSE`, then `RoundingModeRTZ` for 32-bit floating-point type **must** not be used.
- VUID-RuntimeSpirv-shaderRoundingModeRTZFloat64-06307
If `shaderRoundingModeRTZFloat64` is `VK_FALSE`, then `RoundingModeRTZ` for 64-bit floating-point type **must** not be used.

type **must** not be used.

- VUID-RuntimeSpirv-Offset-06308

The **Offset** plus size of the type of each variable, in the output interface of the entry point being compiled, decorated with **XfbBuffer** **must** not be greater than **VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSize**

- VUID-RuntimeSpirv-XfbBuffer-06309

For any given **XfbBuffer** value, define the buffer data size to be smallest number of bytes such that, for all outputs decorated with the same **XfbBuffer** value, the size of the output interface variable plus the **Offset** is less than or equal to the buffer data size. For a given **Stream**, the sum of all the buffer data sizes for all buffers writing to that stream the **must** not exceed **VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize**

- VUID-RuntimeSpirv-OpEmitStreamVertex-06310

The **Stream** value to **OpEmitStreamVertex** and **OpEndStreamPrimitive** **must** be less than **VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams**

- VUID-RuntimeSpirv-transformFeedbackStreamsLinesTriangles-06311

If the geometry shader emits to more than one vertex stream and **VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles** is **VK_FALSE**, then execution mode **must** be **OutputPoints**

- VUID-RuntimeSpirv-Stream-06312

The stream number value to **Stream** **must** be less than **VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams**

- VUID-RuntimeSpirv-XfbStride-06313

The XFB Stride value to **XfbStride** **must** be less than or equal to **VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataStride**

- VUID-RuntimeSpirv-PhysicalStorageBuffer64-06314

If the **PhysicalStorageBuffer64** addressing model is enabled any load or store through a physical pointer type **must** be aligned to a multiple of the size of the largest scalar type in the pointed-to type.

- VUID-RuntimeSpirv-PhysicalStorageBuffer64-06315

If the **PhysicalStorageBuffer64** addressing model is enabled the pointer value of a memory access instruction **must** be at least as aligned as specified by the **Aligned** memory access operand.

- VUID-RuntimeSpirv-OpTypeCooperativeMatrixNV-06316

For **OpTypeCooperativeMatrixNV**, the component type, scope, number of rows, and number of columns **must** match one of the matrices in any of the supported **VkCooperativeMatrixPropertiesNV**.

- VUID-RuntimeSpirv-OpCooperativeMatrixMulAddNV-06317

For **OpCooperativeMatrixMulAddNV**, the type of **A** **must** have **VkCooperativeMatrixPropertiesNV::MSize** rows and **VkCooperativeMatrixPropertiesNV::KSize** columns and have a component type that matches **VkCooperativeMatrixPropertiesNV::AType**.

- VUID-RuntimeSpirv-OpCooperativeMatrixMulAddNV-06318

For `OpCooperativeMatrixMulAddNV`, the type of `B` must have `VkCooperativeMatrixPropertiesNV::KSize` rows and `VkCooperativeMatrixPropertiesNV::NSize` columns and have a component type that matches `VkCooperativeMatrixPropertiesNV::BType`.

- VUID-RuntimeSpirv-`OpCooperativeMatrixMulAddNV`-06319
For `OpCooperativeMatrixMulAddNV`, the type of `C` must have `VkCooperativeMatrixPropertiesNV::MSize` rows and `VkCooperativeMatrixPropertiesNV::NSize` columns and have a component type that matches `VkCooperativeMatrixPropertiesNV::CType`.
- VUID-RuntimeSpirv-`OpCooperativeMatrixMulAddNV`-06320
For `OpCooperativeMatrixMulAddNV`, the type of `Result` must have `VkCooperativeMatrixPropertiesNV::MSize` rows and `VkCooperativeMatrixPropertiesNV::NSize` columns and have a component type that matches `VkCooperativeMatrixPropertiesNV::DType`.
- VUID-RuntimeSpirv-`OpCooperativeMatrixMulAddNV`-06321
For `OpCooperativeMatrixMulAddNV`, the type of `A`, `B`, `C`, and `Result` must all have a scope of scope.
- VUID-RuntimeSpirv-`OpTypeCooperativeMatrixNV`-06322
`OpTypeCooperativeMatrixNV` and `OpCooperativeMatrix*` instructions must not be used in shader stages not included in `VkPhysicalDeviceCooperativeMatrixPropertiesNV::cooperativeMatrixSupportedStages`.
- VUID-RuntimeSpirv-`DescriptorSet`-06323
`DescriptorSet` and `Binding` decorations must obey the constraints on storage class, type, and descriptor type described in `DescriptorSet` and `Binding Assignment`
- VUID-RuntimeSpirv-`OpCooperativeMatrixLoadNV`-06324
For `OpCooperativeMatrixLoadNV` and `OpCooperativeMatrixStoreNV` instructions, the `Pointer` and `Stride` operands must be aligned to at least the lesser of 16 bytes or the natural alignment of a row or column (depending on `ColumnMajor`) of the matrix (where the natural alignment is the number of columns/rows multiplied by the component size).
- VUID-RuntimeSpirv-`shaderSampleRateInterpolationFunctions`-06325
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::shaderSampleRateInterpolationFunctions` is `VK_FALSE`, then `GLSL.std.450` fragment interpolation functions are not supported by the implementation and `OpCapability` must not be set to `InterpolationFunction`.
- VUID-RuntimeSpirv-`tessellationShader`-06326
If `tessellationShader` is enabled, and the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then `OpExecutionMode` must not be set to `IsoLines`.
- VUID-RuntimeSpirv-`tessellationShader`-06327
If `tessellationShader` is enabled, and the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode` is `VK_FALSE`, then `OpExecutionMode` must not be set to `PointMode`.
- VUID-RuntimeSpirv-`storageBuffer8BitAccess`-06328
If `storageBuffer8BitAccess` is `VK_FALSE`, then objects containing an 8-bit integer element

must not have storage class of **StorageBuffer**, **ShaderRecordBufferKHR**, or **PhysicalStorageBuffer**.

- VUID-RuntimeSpirv-uniformAndStorageBuffer8BitAccess-06329
If **uniformAndStorageBuffer8BitAccess** is **VK_FALSE**, then objects in the **Uniform** storage class with the **Block** decoration **must** not have an 8-bit integer member.
- VUID-RuntimeSpirv-storagePushConstant8-06330
If **storagePushConstant8** is **VK_FALSE**, then objects containing an 8-bit integer element **must** not have storage class of **PushConstant**.
- VUID-RuntimeSpirv-storageBuffer16BitAccess-06331
If **storageBuffer16BitAccess** is **VK_FALSE**, then objects containing 16-bit integer or 16-bit floating-point elements **must** not have storage class of **StorageBuffer**, **ShaderRecordBufferKHR**, or **PhysicalStorageBuffer**.
- VUID-RuntimeSpirv-uniformAndStorageBuffer16BitAccess-06332
If **uniformAndStorageBuffer16BitAccess** is **VK_FALSE**, then objects in the **Uniform** storage class with the **Block** decoration **must** not have 16-bit integer or 16-bit floating-point members.
- VUID-RuntimeSpirv-storagePushConstant16-06333
If **storagePushConstant16** is **VK_FALSE**, then objects containing 16-bit integer or 16-bit floating-point elements **must** not have storage class of **PushConstant**.
- VUID-RuntimeSpirv-storageInputOutput16-06334
If **storageInputOutput16** is **VK_FALSE**, then objects containing 16-bit integer or 16-bit floating-point elements **must** not have storage class of **Input** or **Output**.
- VUID-RuntimeSpirv-None-06337
shaderBufferFloat16Atomics, or **shaderBufferFloat16AtomicAdd**, or
shaderBufferFloat16AtomicMinMax, or **shaderSharedFloat16Atomics**, or
shaderSharedFloat16AtomicAdd, or **shaderSharedFloat16AtomicMinMax** **must** be enabled for 16-bit floating point atomic operations
- VUID-RuntimeSpirv-None-06338
shaderBufferFloat32Atomics, or **shaderBufferFloat32AtomicAdd**, or
shaderSharedFloat32Atomics, or **shaderSharedFloat32AtomicAdd**, or
shaderImageFloat32Atomics, or **shaderImageFloat32AtomicAdd** or
shaderBufferFloat32AtomicMinMax, or **shaderSharedFloat32AtomicMinMax**, or
shaderImageFloat32AtomicMinMax **must** be enabled for 32-bit floating point atomic operations
- VUID-RuntimeSpirv-None-06339
shaderBufferFloat64Atomics, or **shaderBufferFloat64AtomicAdd**, or
shaderSharedFloat64Atomics, or **shaderSharedFloat64AtomicAdd**, or
shaderBufferFloat64AtomicMinMax, or **shaderSharedFloat64AtomicMinMax**, **must** be enabled for 64-bit floating point atomic operations
- VUID-RuntimeSpirv-NonWritable-06340
If **fragmentStoresAndAtomics** is not enabled, then all storage image, storage texel buffer, and storage buffer variables in the fragment stage **must** be decorated with the **NonWritable** decoration.

- VUID-RuntimeSpirv-NonWritable-06341
If `vertexPipelineStoresAndAtomics` is not enabled, then all storage image, storage texel buffer, and storage buffer variables in the vertex, tessellation, and geometry stages **must** be decorated with the `NonWritable` decoration.
- VUID-RuntimeSpirv-None-06342
If `subgroupQuadOperationsInAllStages` is `VK_FALSE`, then **quad** subgroup operations **must** not be used except for in fragment and compute stages.
- VUID-RuntimeSpirv-None-06343
Group operations with `subgroup scope` **must** not be used if the shader stage is not in `subgroupSupportedStages`.
- VUID-RuntimeSpirv-Offset-06344
The first element of the `Offset` operand of `InterpolateAtOffset` **must** be greater than or equal to:

$$\text{frag}_{\text{width}} \times \text{minInterpolationOffset}$$

where `fragwidth` is the width of the current fragment in pixels.

- VUID-RuntimeSpirv-Offset-06345
The first element of the `Offset` operand of `InterpolateAtOffset` **must** be less than or equal to:

$$\text{frag}_{\text{width}} \times (\text{maxInterpolationOffset} + \text{ULP}) - \text{ULP}$$

where `fragwidth` is the width of the current fragment in pixels and $\text{ULP} = 1 / 2^{\text{subPixelInterpolationOffsetBits}}$.

- VUID-RuntimeSpirv-Offset-06346
The second element of the `Offset` operand of `InterpolateAtOffset` **must** be greater than or equal to:

$$\text{frag}_{\text{height}} \times \text{minInterpolationOffset}$$

where `fragheight` is the height of the current fragment in pixels.

- VUID-RuntimeSpirv-Offset-06347
The second element of the `Offset` operand of `InterpolateAtOffset` **must** be less than or equal to:

$$\text{frag}_{\text{height}} \times (\text{maxInterpolationOffset} + \text{ULP}) - \text{ULP}$$

where `fragheight` is the height of the current fragment in pixels and $\text{ULP} = 1 / 2^{\text{subPixelInterpolationOffsetBits}}$.

- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06348

For `OpRayQueryInitializeKHR` instructions, all components of the `RayOrigin` and `RayDirection` operands **must** be finite floating-point values.

- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06349

For `OpRayQueryInitializeKHR` instructions, the `RayTmin` and `RayTmax` operands **must** be non-negative floating-point values.

- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06350

For `OpRayQueryInitializeKHR` instructions, the `RayTmin` operand **must** be less than or equal to the `RayTmax` operand.

- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06351

For `OpRayQueryInitializeKHR` instructions, `RayOrigin`, `RayDirection`, `RayTmin`, and `RayTmax` operands **must** not contain NaNs.

- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06352

For `OpRayQueryInitializeKHR` instructions, **Acceleration Structure** **must** be an acceleration structure built as a **top-level acceleration structure**.

- VUID-RuntimeSpirv-OpRayQueryGenerateIntersectionKHR-06353

For `OpRayQueryGenerateIntersectionKHR` instructions, `Hit T` **must** satisfy the condition `RayTmin ≤ Hit T ≤ RayTmax`, where `RayTmin` is equal to the value returned by `OpRayQueryGetRayTMinKHR` with the same ray query object, and `RayTmax` is equal to the value of `OpRayQueryGetIntersectionTKHR` for the current committed intersection with the same ray query object.

- VUID-RuntimeSpirv-OpRayQueryGenerateIntersectionKHR-06354

For `OpRayQueryGenerateIntersectionKHR` instructions, **Acceleration Structure** **must** not be built with `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags`.

- VUID-RuntimeSpirv-OpTraceRayKHR-06355

For `OpTraceRayKHR` instructions, all components of the `RayOrigin` and `RayDirection` operands **must** be finite floating-point values.

- VUID-RuntimeSpirv-OpTraceRayKHR-06356

For `OpTraceRayKHR` instructions, the `RayTmin` and `RayTmax` operands **must** be non-negative floating-point values.

- VUID-RuntimeSpirv-OpTraceRayKHR-06552

For `OpTraceRayKHR` instructions, the `Rayflags` operand **must** not contain both `SkipTrianglesKHR` and `SkipAABBSKHR`

- VUID-RuntimeSpirv-OpTraceRayKHR-06553

For `OpTraceRayKHR` instructions, if the `Rayflags` operand contains `SkipTrianglesKHR`, the pipeline **must** not have been created with `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` set

- VUID-RuntimeSpirv-OpTraceRayKHR-06554

For `OpTraceRayKHR` instructions, if the `Rayflags` operand contains `SkipAABBSKHR`, the pipeline **must** not have been created with `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` set

- VUID-RuntimeSpirv-OpTraceRayKHR-06357

For `OpTraceRayKHR` instructions, the `RayTmin` operand **must** be less than or equal to the `RayTmax` operand.

- VUID-RuntimeSpirv-OpTraceRayKHR-06358
For `OpTraceRayKHR` instructions, `RayOrigin`, `RayDirection`, `RayTmin`, and `RayTmax` operands **must** not contain NaNs.
- VUID-RuntimeSpirv-OpTraceRayKHR-06359
For `OpTraceRayKHR` instructions, `Acceleration Structure` **must** be an acceleration structure built as a `top-level acceleration structure`.
- VUID-RuntimeSpirv-OpTraceRayKHR-06360
For `OpTraceRayKHR` instructions, if `Acceleration Structure` was built with `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags`, the pipeline **must** have been created with `VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV` set
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06361
For `OpTraceRayMotionNV` instructions, all components of the `RayOrigin` and `RayDirection` operands **must** be finite floating-point values.
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06362
For `OpTraceRayMotionNV` instructions, the `RayTmin` and `RayTmax` operands **must** be non-negative floating-point values.
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06363
For `OpTraceRayMotionNV` instructions, the `RayTmin` operand **must** be less than or equal to the `RayTmax` operand.
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06364
For `OpTraceRayMotionNV` instructions, `RayOrigin`, `RayDirection`, `RayTmin`, and `RayTmax` operands **must** not contain NaNs.
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06365
For `OpTraceRayMotionNV` instructions, `Acceleration Structure` **must** be an acceleration structure built as a `top-level acceleration structure` with `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags`
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06366
For `OpTraceRayMotionNV` instructions the `time` operand **must** be between 0.0 and 1.0
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06367
For `OpTraceRayMotionNV` instructions the pipeline **must** have been created with `VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV` set
- VUID-RuntimeSpirv-x-06429
The `x` size in `LocalSize` or `LocalSizeId` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`
- VUID-RuntimeSpirv-y-06430
The `y` size in `LocalSize` or `LocalSizeId` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`
- VUID-RuntimeSpirv-z-06431
The `z` size in `LocalSize` or `LocalSizeId` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`
- VUID-RuntimeSpirv-x-06432
The product of `x` size, `y` size, and `z` size in `LocalSize` or `LocalSizeId` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupInvocations`

- VUID-RuntimeSpirv-LocalSizeId-06434
if execution mode **LocalSizeId** is used, **maintenance4** must be enabled
- VUID-RuntimeSpirv-Workgroup-06530
The sum of size in bytes for variables and **padding** in the **Workgroup** storage class in the **GLCompute Execution Model** must be less than or equal to **maxComputeSharedMemorySize**
- VUID-RuntimeSpirv-shaderZeroInitializeWorkgroupMemory-06372
If **shaderZeroInitializeWorkgroupMemory** is not enabled, any **OpVariable** with **Workgroup** as its **Storage Class** must not have an **Initializer** operand
- VUID-RuntimeSpirv-OpImage-06376
If an **OpImage*Gather** operation has an image operand of **Offset**, **ConstOffset**, or **ConstOffsets** the offset value must be greater than or equal to **minTexelGatherOffset**
- VUID-RuntimeSpirv-OpImage-06377
If an **OpImage*Gather** operation has an image operand of **Offset**, **ConstOffset**, or **ConstOffsets** the offset value must be less than or equal to **maxTexelGatherOffset**
- VUID-RuntimeSpirv-OpImageSample-06435
If an **OpImageSample*** or **OpImageFetch*** operation has an image operand of **ConstOffset** then the offset value must be greater than or equal to **minTexelOffset**
- VUID-RuntimeSpirv-OpImageSample-06436
If an **OpImageSample*** or **OpImageFetch*** operation has an image operand of **ConstOffset** then the offset value must be less than or equal to **maxTexelOffset**
- VUID-RuntimeSpirv-SampleRateShading-06378
If the subpass description contains **VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM**, then the SPIR-V fragment shader Capability **SampleRateShading** must not be enabled.
- VUID-RuntimeSpirv-SubgroupUniformControlFlowKHR-06379
The execution mode **SubgroupUniformControlFlowKHR** must not be applied to an entry point unless **shaderSubgroupUniformControlFlow** is enabled and the corresponding shader stage bit is set in subgroup **supportedStages** and the entry point does not execute any **invocation repack instructions**.

Precision and Operation of SPIR-V Instructions

The following rules apply to half, single, and double-precision floating point instructions:

- Positive and negative infinities and positive and negative zeros are generated as dictated by [IEEE 754](#), but subject to the precisions allowed in the following table.
- Dividing a non-zero by a zero results in the appropriately signed [IEEE 754](#) infinity.
- Signaling NaNs are not required to be generated and exceptions are never raised. Signaling NaN may be converted to quiet NaNs values by any floating point instruction.
- By default, the implementation may perform optimizations on half, single, or double-precision floating-point instructions that ignore sign of a zero, or assume that arguments and results are not NaNs or infinities. If the entry point is declared with the **SignedZeroInfNanPreserve** execution mode, then NaNs, infinities, and the sign of zero must not be ignored.

- The following core SPIR-V instructions **must** respect the `SignedZeroInfNanPreserve` execution mode: `OpPhi`, `OpSelect`, `OpReturnValue`, `OpVectorExtractDynamic`, `OpVectorInsertDynamic`, `OpVectorShuffle`, `OpCompositeConstruct`, `OpCompositeExtract`, `OpCompositeInsert`, `OpCopyObject`, `OpTranspose`, `OpFConvert`, `OpFNegate`, `OpFAdd`, `OpFSub`, `OpFMul`, `OpStore`. This execution mode **must** also be respected by `OpLoad` except for loads from the `Input` storage class in the fragment shader stage with the floating-point result type. Other SPIR-V instructions **may** also respect the `SignedZeroInfNanPreserve` execution mode.
- The following instructions **must** not flush denormalized values: `OpConstant`, `OpConstantComposite`, `OpSpecConstant`, `OpSpecConstantComposite`, `OpLoad`, `OpStore`, `OpBitcast`, `OpPhi`, `OpSelect`, `OpFunctionCall`, `OpReturnValue`, `OpVectorExtractDynamic`, `OpVectorInsertDynamic`, `OpVectorShuffle`, `OpCompositeConstruct`, `OpCompositeExtract`, `OpCompositeInsert`, `OpCopyMemory`, `OpCopyObject`.
- Denormalized values are supported.
 - By default, any half, single, or double-precision denormalized value input into a shader or potentially generated by any instruction (except those listed above) or any extended instructions for GLSL in a shader **may** be flushed to zero.
 - If the entry point is declared with the `DenormFlushToZero` execution mode then for the affected instructions the denormalized result **must** be flushed to zero and the denormalized operands **may** be flushed to zero. Denormalized values obtained via unpacking an integer into a vector of values with smaller bit width and interpreting those values as floating-point numbers **must** be flushed to zero.
 - The following core SPIR-V instructions **must** respect the `DenormFlushToZero` execution mode: `OpSpecConstantOp` (with opcode `OpFConvert`), `OpFConvert`, `OpFNegate`, `OpFAdd`, `OpFSub`, `OpFMul`, `OpFDiv`, `OpFRem`, `OpFMod`, `OpVectorTimesScalar`, `OpMatrixTimesScalar`, `OpVectorTimesMatrix`, `OpMatrixTimesVector`, `OpMatrixTimesMatrix`, `OpOuterProduct`, `OpDot`; and the following extended instructions for GLSL: `Round`, `RoundEven`, `Trunc`, `FAbs`, `Floor`, `Ceil`, `Fract`, `Radians`, `Degrees`, `Sin`, `Cos`, `Tan`, `Asin`, `Acos`, `Atan`, `Sinh`, `Cosh`, `Tanh`, `Asinh`, `Acosh`, `Atanh`, `Atan2`, `Pow`, `Exp`, `Log`, `Exp2`, `Log2`, `Sqrt`, `InverseSqrt`, `Determinant`, `MatrixInverse`, `Modf`, `ModfStruct`, `FMin`, `FMax`, `FClamp`, `FMix`, `Step`, `SmoothStep`, `Fma`, `UnpackHalf2x16`, `UnpackDouble2x32`, `Length`, `Distance`, `Cross`, `Normalize`, `FaceForward`, `Reflect`, `Refract`, `NMin`, `NMax`, `NClamp`. Other SPIR-V instructions (except those excluded above) **may** also flush denormalized values.
 - The following core SPIR-V instructions **must** respect the `DenormPreserve` execution mode: `OpTranspose`, `OpSpecConstantOp`, `OpFConvert`, `OpFNegate`, `OpFAdd`, `OpFSub`, `OpFMul`, `OpVectorTimesScalar`, `OpMatrixTimesScalar`, `OpVectorTimesMatrix`, `OpMatrixTimesVector`, `OpMatrixTimesMatrix`, `OpOuterProduct`, `OpDot`, `OpFOrdEqual`, `OpFUnordEqual`, `OpFOrdNotEqual`, `OpFUnordNotEqual`, `OpFOrdLessThan`, `OpFUnordLessThan`, `OpFOrdGreaterThanOrEqual`, `OpFUnordGreaterThanOrEqual`, `OpFOrdLessThanOrEqual`, `OpFUnordLessThanOrEqual`, `OpFOrdGreaterThanOrEqual`, `OpFUnordGreaterThanOrEqual`; and the following extended instructions for GLSL: `FAbs`, `FSign`, `Radians`, `Degrees`, `FMin`, `FMax`, `FClamp`, `FMix`, `Fma`, `PackHalf2x16`, `PackDouble2x32`, `UnpackHalf2x16`, `UnpackDouble2x32`, `NMin`, `NMax`, `NClamp`. Other SPIR-V instructions **may** also preserve denorm values.

The precision of double-precision instructions is at least that of single precision.

The precision of operations is defined either in terms of rounding, as an error bound in ULP, or as inherited from a formula as follows.

Correctly Rounded

Operations described as “correctly rounded” will return the infinitely precise result, x , rounded so as to be representable in floating-point. The rounding mode is not specified, unless the entry point is declared with the [RoundingModeRTE](#) or the [RoundingModeRTZ](#) execution mode. These execution modes affect only correctly rounded SPIR-V instructions. These execution modes do not affect [OpQuantizeToF16](#). If the rounding mode is not specified then this rounding is implementation specific, subject to the following rules. If x is exactly representable then x will be returned. Otherwise, either the floating-point value closest to and no less than x or the value closest to and no greater than x will be returned.

ULP

Where an error bound of n ULP (units in the last place) is given, for an operation with infinitely precise result x the value returned **must** be in the range $[x - n \times \text{ulp}(x), x + n \times \text{ulp}(x)]$. The function $\text{ulp}(x)$ is defined as follows:

If there exist non-equal floating-point numbers a and b such that $a \leq x \leq b$ then $\text{ulp}(x)$ is the minimum possible distance between such numbers, $\text{ulp}(x) = \min_{a, b} |b - a|$. If such numbers do not exist then $\text{ulp}(x)$ is defined to be the difference between the two finite floating-point numbers nearest to x .

Where the range of allowed return values includes any value of magnitude larger than that of the largest representable finite floating-point number, operations **may**, additionally, return either an infinity of the appropriate sign or the finite number with the largest magnitude of the appropriate sign. If the infinitely precise result of the operation is not mathematically defined then the value returned is undefined.

Inherited From ...

Where an operation’s precision is described as being inherited from a formula, the result returned **must** be at least as accurate as the result of computing an approximation to x using a formula equivalent to the given formula applied to the supplied inputs. Specifically, the formula given may be transformed using the mathematical associativity, commutativity and distributivity of the operators involved to yield an equivalent formula. The SPIR-V precision rules, when applied to each such formula and the given input values, define a range of permitted values. If NaN is one of the permitted values then the operation may return any result, otherwise let the largest permitted value in any of the ranges be F_{\max} and the smallest be F_{\min} . The operation **must** return a value in the range $[x - E, x + E]$ where $E = \max(|x - F_{\min}|, |x - F_{\max}|)$. If the entry point is declared with the [DenormFlushToZero](#) execution mode, then any intermediate denormal value(s) while evaluating the formula **may** be flushed to zero. Denormal final results **must** be flushed to zero. If the entry point is declared with the [DenormPreserve](#) execution mode, then denormals **must** be preserved throughout the formula.

For half- (16 bit) and single- (32 bit) precision instructions, precisions are **required** to be at least as follows:

Table 84. Precision of core SPIR-V Instructions

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
OpFAdd	Correctly rounded.	
OpFSub	Correctly rounded.	
OpFMul, OpVectorTimesScalar, OpMatrixTimesScalar	Correctly rounded.	
OpDot(x, y)	Inherited from $\sum_{i=0}^{n-1} x_i \times y_i$.	
OpFOrdEqual, OpFUnordEqual	Correct result.	
OpFOrdLessThan, OpFUnordLessThan	Correct result.	
OpFOrdGreaterThanOrEqual, OpFUnordGreaterThanOrEqual	Correct result.	
OpFOrdLessThanEqual, OpFUnordLessThanEqual	Correct result.	
OpFOrdGreaterThanOrEqual, OpFUnordGreaterThanOrEqual	Correct result.	
OpFDiv(x,y)	2.5 ULP for $ y $ in the range $[2^{-126}, 2^{126}]$.	2.5 ULP for $ y $ in the range $[2^{-14}, 2^{14}]$.
OpFRem(x,y)	Inherited from $x - y \times \text{trunc}(x/y)$.	
OpFMod(x,y)	Inherited from $x - y \times \text{floor}(x/y)$.	
conversions between types	Correctly rounded.	

Note
