In a pipeline with a depth bias representation of VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT, r, for the given primitive is defined as

$$r = 1$$

Otherwise r is the minimum resolvable difference that depends on the depth attachment representation. If VkDepthBiasRepresentationInfoEXT::depthBiasExact is VK_FALSE it is the smallest difference in a sample's depth z_f values that is guaranteed to remain distinct throughout polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but z_f values that differ by r, will have distinct depth values.

For fixed-point depth attachment representations, or in a pipeline with a depth bias representation of VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT, r is constant throughout the range of the entire depth attachment. If VkDepthBiasRepresentationInfoEXT::depthBiasExact is VK_TRUE, then its value **must** be

$$r = 2^{-n}$$

Otherwise its value is implementation-dependent but **must** be at most

$$r = 2 \times 2^{-n}$$

where n is the number of bits used for the depth aspect when using a fixed-point attachment, or the number of mantissa bits plus one when using a floating-point attachment.

Otherwise for floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, e, in the range of z values spanned by the primitive. If n is the number of bits in the floating-point mantissa, the minimum resolvable difference, r, for the given primitive is defined as

$r = 2^{e-n}$

If no depth attachment is present, r is undefined.

The bias value o for a polygon is

$$o = \text{dbclamp}(m \times depthBiasSlopeFactor + r \times depthBiasConstantFactor)$$

$$\text{where} \quad \text{dbclamp}(x) = \begin{cases} x & depthBiasClamp = 0 \text{ or } NaN \\ \min(x, depthBiasClamp) & depthBiasClamp > 0 \\ \max(x, depthBiasClamp) & depthBiasClamp < 0 \end{cases}$$

m is computed as described above. If the depth attachment uses a fixed-point representation, m is a function of depth values in the range [0,1], and o is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of polygon mode. Depth bias **may** also be applied to line and point topology primitives received by the rasterizer.

To dynamically set the depth bias parameters, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias(
    VkCommandBuffer                             commandBuffer,
    float                                       depthBiasConstantFactor,
    float                                       depthBiasClamp,
    float                                       depthBiasSlopeFactor);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the corresponding VkPipelineRasterizationStateCreateInfo::`depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` values used to create the currently active pipeline.

Calling this function is equivalent to calling `vkCmdSetDepthBias2EXT` without a `VkDepthBiasRepresentationInfoEXT` in the pNext chain of `VkDepthBiasInfoEXT`.

Valid Usage

- VUID-vkCmdSetDepthBias-depthBiasClamp-00790

If the depthBiasClamp feature is not enabled, depthBiasClamp **must** be 0.0

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthBias-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetDepthBias-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetDepthBias-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

The VkDepthBiasRepresentationInfoEXT structure is defined as:

```
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasRepresentationInfoEXT {
    VkStructureType                 sType;
    const void*                     pNext;
    VkDepthBiasRepresentationEXT    depthBiasRepresentation;
    VkBool32                        depthBiasExact;
} VkDepthBiasRepresentationInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- depthBiasRepresentation is a VkDepthBiasRepresentationEXT value specifying the depth bias

representation.

- `depthBiasExact` specifies that the implementation is not allowed to scale the depth bias value to ensure a minimum resolvable distance.

Valid Usage

- VUID-VkDepthBiasRepresentationInfoEXT-leastRepresentableValueForceUnormRepresentation-08947
  If the `leastRepresentableValueForceUnormRepresentation` feature is not enabled, `depthBiasRepresentation` **must** not be `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`
- VUID-VkDepthBiasRepresentationInfoEXT-floatRepresentation-08948
  If the `floatRepresentation` feature is not enabled, `depthBiasRepresentation` **must** not be `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`
- VUID-VkDepthBiasRepresentationInfoEXT-depthBiasExact-08949
  If the `depthBiasExact` feature is not enabled, `depthBiasExact` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-VkDepthBiasRepresentationInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEPTH_BIAS_REPRESENTATION_INFO_EXT`
- VUID-VkDepthBiasRepresentationInfoEXT-depthBiasRepresentation-parameter
  `depthBiasRepresentation` **must** be a valid VkDepthBiasRepresentationEXT value

Possible values of VkDepthBiasRepresentationInfoEXT::`depthBiasRepresentation`, specifying the depth bias representation are:

```
// Provided by VK_EXT_depth_bias_control
typedef enum VkDepthBiasRepresentationEXT {
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT = 0,
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT = 1,
    VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT = 2,
} VkDepthBiasRepresentationEXT;
```

- `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT` specifies that the depth bias representation is a factor of the format's r as described in Depth Bias Computation.
- `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT` specifies that the depth bias representation is a factor of a constant r defined by the bit-size or mantissa of the format as described in Depth Bias Computation.
- `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT` specifies that the depth bias representation is a factor of constant r equal to 1.

The `VkDepthBiasInfoEXT` structure is defined as:

```
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    float              depthBiasConstantFactor;
    float              depthBiasClamp;
    float              depthBiasSlopeFactor;
} VkDepthBiasInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

If `pNext` does not contain a VkDepthBiasRepresentationInfoEXT structure, then this command is equivalent to including a VkDepthBiasRepresentationInfoEXT with `depthBiasExact` set to `VK_FALSE` and `depthBiasRepresentation` set to `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT`.

Valid Usage

- VUID-VkDepthBiasInfoEXT-depthBiasClamp-08950
  If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` **must** be `0.0`

Valid Usage (Implicit)

- VUID-VkDepthBiasInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEPTH_BIAS_INFO_EXT`
- VUID-VkDepthBiasInfoEXT-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkDepthBiasRepresentationInfoEXT
- VUID-VkDepthBiasInfoEXT-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique

To dynamically set the depth bias parameters, call:

```
// Provided by VK_EXT_depth_bias_control
void vkCmdSetDepthBias2EXT(
    VkCommandBuffer                             commandBuffer,
    const VkDepthBiasInfoEXT*                   pDepthBiasInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pDepthBiasInfo` is a pointer to a VkDepthBiasInfoEXT structure specifying depth bias parameters.

This command is functionally identical to vkCmdSetDepthBias, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias2EXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthBias2EXT-pDepthBiasInfo-parameter
  `pDepthBiasInfo` **must** be a valid pointer to a valid VkDepthBiasInfoEXT structure
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetDepthBias2EXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

26.11.4. Conservative Rasterization

If the `pNext` chain of VkPipelineRasterizationStateCreateInfo includes a `VkPipelineRasterizationConservativeStateCreateInfoEXT` structure, then that structure includes parameters controlling conservative rasterization.

`VkPipelineRasterizationConservativeStateCreateInfoEXT` is defined as:

```
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType                                           sType;
    const void*                                               pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT    flags;
    VkConservativeRasterizationModeEXT
conservativeRasterizationMode;
    float
extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in `X` and `Y` equally in screen space beyond the base overestimation specified in `VkPhysicalDeviceConservativeRasterizationPropertiesEXT` ::`primitiveOverestimationSize`. If `conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, this value is ignored.

If this structure is not included in the `pNext` chain, `conservativeRasterizationMode` is considered to be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`, and conservative rasterization is disabled.

Polygon rasterization **can** be made conservative by setting `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` or `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` in `VkPipelineRasterizationConservativeStateCreateInfoEXT`.

NOTE If `conservativePointAndLineRasterization` is supported, conservative rasterization can be applied to line and point primitives, otherwise it must be disabled.

Valid Usage

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769
  `extraPrimitiveOverestimationSize` **must** be in the range of `0.0` to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT`::`maxExtraPrimitiveOverestimationSize` inclusive

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType
  `sType` **must** be

VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zerobitmask flags **must** be 0
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-conservativeRasterizationMode-parameter conservativeRasterizationMode **must** be a valid VkConservativeRasterizationModeEXT value

```
// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;
```

VkPipelineRasterizationConservativeStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineRasterizationConservativeStateCreateInfoEXT ::conservativeRasterizationMode, specifying the conservative rasterization mode are:

```
// Provided by VK_EXT_conservative_rasterization
typedef enum VkConservativeRasterizationModeEXT {
    VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
    VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
    VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;
```

- VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT specifies that conservative rasterization is disabled and rasterization proceeds as normal.
- VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT specifies that conservative rasterization is enabled in overestimation mode.
- VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT specifies that conservative rasterization is enabled in underestimation mode.

To dynamically set the conservativeRasterizationMode, call:

```
// Provided by VK_EXT_conservative_rasterization with VK_EXT_extended_dynamic_state3,
VK_EXT_conservative_rasterization with VK_EXT_shader_object
void vkCmdSetConservativeRasterizationModeEXT(
    VkCommandBuffer                             commandBuffer,
    VkConservativeRasterizationModeEXT          conservativeRasterizationMode);
```

- commandBuffer is the command buffer into which the command will be recorded.
- conservativeRasterizationMode specifies the conservativeRasterizationMode state.

This command sets the conservativeRasterizationMode state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with

VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetConservativeRasterizationModeEXT-None-09423
  At least one of the following **must** be true:
  - The extendedDynamicState3ConservativeRasterizationMode feature is enabled
  - The shaderObject feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetConservativeRasterizationModeEXT-conservativeRasterizationMode-parameter
  conservativeRasterizationMode **must** be a valid VkConservativeRasterizationModeEXT value
- VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetConservativeRasterizationModeEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set the extraPrimitiveOverestimationSize, call:

```
// Provided by VK_EXT_conservative_rasterization with VK_EXT_extended_dynamic_state3,
VK_EXT_conservative_rasterization with VK_EXT_shader_object
void vkCmdSetExtraPrimitiveOverestimationSizeEXT(
    VkCommandBuffer                             commandBuffer,
    float                                       extraPrimitiveOverestimationSize);
```

- commandBuffer is the command buffer into which the command will be recorded.
- extraPrimitiveOverestimationSize specifies the extraPrimitiveOverestimationSize.

This command sets the extraPrimitiveOverestimationSize for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationConservativeStateCreateInfoEXT::extraPrimitiveOverestimationSize value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-None-09423
  At least one of the following **must** be true:
  - The extendedDynamicState3ExtraPrimitiveOverestimationSize feature is enabled
  - The shaderObject feature is enabled
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-extraPrimitiveOverestimationSize-07428
  extraPrimitiveOverestimationSize **must** be in the range of 0.0 to VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize inclusive

Valid Usage (Implicit)

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the coverage mask for the fragment corresponding to that pixel are enabled. If the render pass has a fragment density map attachment and any bit of the coverage mask for the fragment is enabled, then all bits of the coverage mask for the fragment are enabled.

For the purposes of evaluating which pixels are covered by the primitive, implementations **can** increase the size of the primitive by up to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize` pixels at each of the primitive edges. This **may** increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the `extraPrimitiveOverestimationSize` value above `0.0` in steps of `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity` up to and including `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize`. This **may** further increase the number of fragments generated by this primitive.

The actual precision of the overestimation size used for conservative rasterization **may** vary between implementations and produce results that only approximate the `primitiveOverestimationSize` and `extraPrimitiveOverestimationSizeGranularity` properties. Implementations **may** especially vary these approximations when the render pass has a fragment density map and the fragment area covers multiple pixels.

For triangles if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in Basic Polygon Rasterization does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized` is `VK_FALSE` or will generate fragments if `degenerateTrianglesRasterized` is `VK_TRUE`. The fragment input values

for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered backfacing and the application **can** enable backface culling if desired. Triangles that are zero area before rasterization **may** be culled regardless.

For lines if VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT is enabled, and the implementation sets VkPhysicalDeviceConservativeRasterizationPropertiesEXT ::conservativePointAndLineRasterization to VK_TRUE, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized is VK_FALSE or will generate fragments if degenerateLinesRasterized is VK_TRUE. The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization **may** be culled regardless.

For points if VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT is enabled, and the implementation sets VkPhysicalDeviceConservativeRasterizationPropertiesEXT ::conservativePointAndLineRasterization to VK_TRUE, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its coverage mask corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered. If the render pass has a fragment density map attachment and any pixel inside the fragment area is not considered covered, then the fragment is discarded even if some pixels are considered covered.

For triangles, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.

For points, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

If the render pass has a fragment density map and VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if the entirety of all pixels inside the fragment area are covered by the generating primitive, line, or point.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive **must** set FullyCoveredEXT to VK_TRUE if the implementation enables the VkPhysicalDeviceConservativeRasterizationPropertiesEXT ::fullyCoveredFragmentShaderInputVariable feature.

When setting the fragment shading rate results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with `FullyCoveredEXT`, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.

Chapter 27. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Sample mask test
4. Certain Fragment shading operations:
    - Sample Mask Accesses
    - Tile Image Reads
    - Depth Replacement
    - Stencil Reference Replacement
    - Interlocked Operations
5. Multisample coverage
6. Depth bounds test
7. Stencil test
8. Depth test
9. Sample counting
10. Coverage reduction

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being `0`, the fragment is discarded, and no further operations are performed.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.

If there is a fragment shader and it declares the `PostDepthCoverage` execution mode, the sample mask test is instead performed after the depth test.

If `VkPhysicalDeviceMaintenance5PropertiesKHR`::`earlyFragmentMultisampleCoverageAfterSampleCounting` is `VK_TRUE` and there is a fragment shader which declares the `EarlyFragmentTests` execution mode, fragment shading and multisample coverage operations **must** be performed after sample counting.

Otherwise, if `VkPhysicalDeviceMaintenance5PropertiesKHR`::`earlyFragmentMultisampleCoverageAfterSampleCounting` is `VK_FALSE` and there is a fragment shader

which declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations **should** instead be performed after sample counting, but **may** be performed before sample counting.

If VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is VK_TRUE and there is a fragment shader which declares the EarlyFragmentTests execution mode sample mask test operations **must** follow the order of fragment operations from above.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is VK_FALSE and there is a fragment shader which declares the EarlyFragmentTests execution mode, sample mask test operations **should** follow the order of fragment operations from above but **may** instead be performed after sample counting.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader does not write to storage resources;
- the fragment shader specifies the DepthReplacing execution mode; and
- either
  - the fragment shader specifies the DepthUnchanged execution mode;
  - the fragment shader specifies the DepthLess execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the DepthGreater execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL

the implementation **may** perform depth bounds test before fragment shading and perform an additional depth test immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through framebuffer operations.

27.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates (x_f,y_f) of each sample covered by a fragment against a set of *discard rectangles*.

Each discard rectangle is defined by a VkRect2D. These values are either set by the VkPipelineDiscardRectangleStateCreateInfoEXT structure during pipeline creation, or dynamically by the vkCmdSetDiscardRectangleEXT command.

A given sample is considered inside a discard rectangle if the x_f is in the range [VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x), and y_f is in the range [VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that

are inside any of the discard rectangles will have their coverage set to `0`.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType                                    sType;
    const void*                                        pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT      flags;
    VkDiscardRectangleModeEXT                          discardRectangleMode;
    uint32_t                                           discardRectangleCount;
    const VkRect2D*                                    pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a VkDiscardRectangleModeEXT value determining whether the discard rectangle test is inclusive or exclusive.
- `discardRectangleCount` is the number of discard rectangles to use.
- `pDiscardRectangles` is a pointer to an array of VkRect2D structures defining discard rectangles.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state is not enabled for the pipeline the presence of this structure in the VkGraphicsPipelineCreateInfo chain, and a `discardRectangleCount` greater than zero, implicitly enables discard rectangles in the pipeline, otherwise discard rectangles **must** enabled or disabled by vkCmdSetDiscardRectangleEnableEXT. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state is enabled for the pipeline, the `discardRectangleMode` member is ignored, and the discard rectangle mode **must** be set by vkCmdSetDiscardRectangleModeEXT.

When this structure is included in the `pNext` chain of VkGraphicsPipelineCreateInfo, it defines parameters of the discard rectangle test. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is not enabled, and this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of `0`.

Valid Usage

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582 `discardRectangleCount` **must** be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

Valid Usage (Implicit)

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter
  `discardRectangleMode` **must** be a valid VkDiscardRectangleModeEXT value

```
// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;
```

`VkPipelineDiscardRectangleStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

`VkDiscardRectangleModeEXT` values are:

```
// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
    VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
    VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;
```

- `VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT` specifies that the discard rectangle test is inclusive.
- `VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT` specifies that the discard rectangle test is exclusive.

To dynamically set the discard rectangles, call:

```
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    firstDiscardRectangle,
    uint32_t                                    discardRectangleCount,
    const VkRect2D*                             pDiscardRectangles);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstDiscardRectangle` is the index of the first discard rectangle whose state is updated by the command.
- `discardRectangleCount` is the number of discard rectangles whose state are updated by the command.
- `pDiscardRectangles` is a pointer to an array of VkRect2D structures specifying discard rectangles.

The discard rectangle taken from element i of `pDiscardRectangles` replace the current state for the

discard rectangle at index `firstDiscardRectangle` + i, for i in [0, `discardRectangleCount`).

This command sets the discard rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the VkPipelineDiscardRectangleStateCreateInfoEXT::`pDiscardRectangles` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585
  The sum of `firstDiscardRectangle` and `discardRectangleCount` **must** be less than or equal to VkPhysicalDeviceDiscardRectanglePropertiesEXT::`maxDiscardRectangles`
- VUID-vkCmdSetDiscardRectangleEXT-x-00587
  The `x` and `y` member of `offset` in each VkRect2D element of `pDiscardRectangles` **must** be greater than or equal to `0`
- VUID-vkCmdSetDiscardRectangleEXT-offset-00588
  Evaluation of (`offset.x` + `extent.width`) in each VkRect2D element of `pDiscardRectangles` **must** not cause a signed integer addition overflow
- VUID-vkCmdSetDiscardRectangleEXT-offset-00589
  Evaluation of (`offset.y` + `extent.height`) in each VkRect2D element of `pDiscardRectangles` **must** not cause a signed integer addition overflow

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter
  `pDiscardRectangles` **must** be a valid pointer to an array of `discardRectangleCount` VkRect2D structures
- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetDiscardRectangleEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength
  `discardRectangleCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set whether discard rectangles are enabled, call:

```
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    discardRectangleEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleEnable` specifies whether discard rectangles are enabled or not.

This command sets the discard rectangle enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is implied by the VkPipelineDiscardRectangleStateCreateInfoEXT::`discardRectangleCount` value used to create the currently active pipeline, where a non-zero `discardRectangleCount` implicitly enables discard rectangles, otherwise they are disabled.

Valid Usage

- VUID-vkCmdSetDiscardRectangleEnableEXT-specVersion-07851
  The `VK_EXT_discard_rectangles` extension **must** be enabled, and the implementation **must** support at least `specVersion` `2` of this extension

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-recording

commandBuffer **must** be in the recording state

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetDiscardRectangleEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set the discard rectangle mode, call:

```
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleModeEXT(
    VkCommandBuffer                             commandBuffer,
    VkDiscardRectangleModeEXT                   discardRectangleMode);
```

- commandBuffer is the command buffer into which the command will be recorded.
- discardRectangleMode specifies the discard rectangle mode for all discard rectangles, either inclusive or exclusive.

This command sets the discard rectangle mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleMode value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDiscardRectangleModeEXT-specVersion-07852
  The VK_EXT_discard_rectangles extension **must** be enabled, and the implementation **must**

support at least specVersion 2 of this extension

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDiscardRectangleModeEXT-discardRectangleMode-parameter
  discardRectangleMode **must** be a valid VkDiscardRectangleModeEXT value
- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetDiscardRectangleModeEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

27.2. Scissor Test

The scissor test compares the framebuffer coordinates (x_f,y_f) of each sample covered by a fragment against a *scissor rectangle* at the index equal to the fragment's ViewportIndex.

Each scissor rectangle is defined by a VkRect2D. These values are either set by the VkPipelineViewportStateCreateInfo structure during pipeline creation, or dynamically by the vkCmdSetScissor command.

A given sample is considered inside a scissor rectangle if x_f is in the range [VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x), and y_f is in the range [VkRect2D::offset.y, VkRect2D ::offset.y + VkRect2D::extent.y). Samples with coordinates outside the scissor rectangle at the

corresponding ViewportIndex will have their coverage set to 0.

To dynamically set the scissor rectangles, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    firstScissor,
    uint32_t                                    scissorCount,
    const VkRect2D*                             pScissors);
```

- commandBuffer is the command buffer into which the command will be recorded.
- firstScissor is the index of the first scissor whose state is updated by the command.
- scissorCount is the number of scissors whose rectangles are updated by the command.
- pScissors is a pointer to an array of VkRect2D structures defining scissor rectangles.

The scissor rectangles taken from element i of pScissors replace the current state for the scissor index firstScissor + i, for i in [0, scissorCount).

This command sets the scissor rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_SCISSOR set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineViewportStateCreateInfo::pScissors values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetScissor-firstScissor-00592
  The sum of firstScissor and scissorCount **must** be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive
- VUID-vkCmdSetScissor-firstScissor-00593
  If the multiViewport feature is not enabled, firstScissor **must** be 0
- VUID-vkCmdSetScissor-scissorCount-00594
  If the multiViewport feature is not enabled, scissorCount **must** be 1
- VUID-vkCmdSetScissor-x-00595
  The x and y members of offset member of any element of pScissors **must** be greater than or equal to 0
- VUID-vkCmdSetScissor-offset-00596
  Evaluation of (offset.x + extent.width) **must** not cause a signed integer addition overflow for any element of pScissors
- VUID-vkCmdSetScissor-offset-00597
  Evaluation of (offset.y + extent.height) **must** not cause a signed integer addition overflow for any element of pScissors

Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetScissor-pScissors-parameter
  `pScissors` **must** be a valid pointer to an array of `scissorCount` VkRect2D structures
- VUID-vkCmdSetScissor-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetScissor-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetScissor-scissorCount-arraylength
  `scissorCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

27.3. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the *sample mask* defined by VkPipelineMultisampleStateCreateInfo::`pSampleMask`.

To dynamically set the sample mask, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetSampleMaskEXT(
    VkCommandBuffer                             commandBuffer,
    VkSampleCountFlagBits                       samples,
    const VkSampleMask*                         pSampleMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `samples` specifies the number of sample bits in the `pSampleMask`.
- `pSampleMask` is a pointer to an array of VkSampleMask values, where the array size is based on the `samples` parameter.

This command sets the sample mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo::`pSampleMask` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetSampleMaskEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3SampleMask` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetSampleMaskEXT-samples-parameter
  `samples` **must** be a valid VkSampleCountFlagBits value
- VUID-vkCmdSetSampleMaskEXT-pSampleMask-parameter
  `pSampleMask` **must** be a valid pointer to an array of $\lceil \frac{samples}{32} \rceil$ VkSampleMask values
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetSampleMaskEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in VkPipelineMultisampleStateCreateInfo::`pSampleMask` which is associated with that same sample index is set to `0`, the coverage mask bit is set to `0`.

27.4. Fragment Shading

Fragment shaders are invoked for each fragment, or as helper invocations.

Most operations in the fragment shader are not performed in rasterization order, with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader **must** not be executed if a fragment operation that executes before fragment shading discards the fragment.
- A fragment shader **may** not be executed if:
  - An implementation determines that another fragment shader, invoked by a subsequent primitive in primitive order, overwrites all results computed by the shader (including writes to storage resources).
  - Any other fragment operation discards the fragment, and the shader does not write to any storage resources.
  - If a fragment shader statically computes the same values for different framebuffer locations, and does not write to any storage resources, multiple fragments **may** be shaded by one fragment shader invocation. This **may** affect `VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT` results, but **must** otherwise not be visible behavior to applications.
- Otherwise, at least one fragment shader **must** be executed.
  - If sample shading is enabled and multiple invocations per fragment are **required**, additional invocations **must** be executed as specified.

- Each covered sample **must** be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined values **may** be written to all color attachment outputs during this fragment operation.

NOTE

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

Similarly, if the render pass has a fragment density map attachment, more than one fragment shader invocation may be invoked for each covered sample. Such additional invocations are only produced if `VkPhysicalDeviceFragmentDensityMapPropertiesEXT`::`fragmentDensityInvocations` is `VK_TRUE`. Implementations may generate these additional fragment shader invocations in order to make transitions between fragment areas with different fragment densities more smooth.

27.4.1. Sample Mask

Reading from the `SampleMask` built-in in the `Input` storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If sample shading is enabled, fragment shaders will only see values of `1` for samples being shaded - other bits will be `0`.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in `SampleMask` which is associated with that same sample index is set to `0`, that coverage mask bit is set to `0`.

Values written to the `SampleMask` built-in in the `Output` storage class will be used by the multisample coverage operation, with the same encoding as the input built-in.

27.4.2. Shader Termination and Demotion

If a fragment shader is terminated early or demoted to a helper invocation by using `OpKill`, `OpTerminateInvocation`, or `OpDemoteToHelperInvocation`, samples covered by that shader invocation have their coverage mask bits set to `0`.

27.4.3. Fragment Shader Tile Image Reads

If the `VK_EXT_shader_tile_image` extension is enabled, implementations divide the framebuffer into a grid of tiles. A tile image is a view of a framebuffer attachment tile for fragments with locations within the tile.

Within a render pass instance initiated by vkCmdBeginRenderingKHR, fragment shader invocations **can** read the framebuffer color, depth, and stencil values at the fragment location via tile images.

NOTE

Even though fragment shader invocation can only read from the corresponding fragment location, the abstraction of a tile image is introduced for the following reasons:

- Tile dimensions will be exposed in a future extension
- Future functionality such as executing compute dispatches within render passes via tile shaders can leverage tile images.

Enabling shaderTileImageColorReadAccess, shaderTileImageDepthReadAccess, shaderTileImageStencilReadAccess enables fragment shader invocations to read from color, depth, and stencil, respectively.

Color values are read from tile image variables with `OpColorAttachmentReadEXT`. Tile image variables are linked to specific color attachments using `Location` decoration. See Fragment Tile Image Interface for more details.

Depth values are read with `OpDepthAttachmentReadEXT`.

Stencil values are read with `OpStencilAttachmentReadEXT`.

The sample to read is specified by a sample index value specified as the `Sample` operand to `OpColorAttachmentReadEXT`, `OpDepthAttachmentReadEXT`, or `OpStencilAttachmentReadEXT`.

If sample shading is disabled, a fragment invocation **can** read from all sample locations associated with the fragment regardless of the fragment's coverage. This functionality is supported for VkPipelineMultisampleStateCreateInfo::`rasterizationSamples` > 1 when VkPhysicalDeviceShaderTileImagePropertiesEXT::`shaderTileImageReadSampleFromPixelRateInvocation` is `VK_TRUE`.

If sample shading is enabled, and `minSampleShading` is 1.0, a fragment invocation **must** only read from the coverage index sample. Tile image access **must** not be used if the value of `minSampleShading` is not 1.0.

If the fragment shader declares the `EarlyFragmentTests` execution mode, depth reads are allowed only if depth writes are disabled and stencil reads are allowed only if stencil writes are disabled.

If VkPhysicalDeviceShaderTileImagePropertiesEXT::`shaderTileImageReadFromHelperInvocation` is `VK_FALSE`, values read from helper invocations are undefined otherwise the values read are subject to the coherency guarantees described below.

`OpDepthAttachmentReadEXT` returns an undefined value if no depth attachment is present. `OpStencilAttachmentReadEXT` returns an undefined value if no stencil attachment is present.

Tile image reads from color, depth and stencil attachments are said to be coherent when the accesses happen in raster order and without data race with respect to accesses to the attachments from framebuffer-space pipeline stages. The samples which qualify for coherent access and the

enabling conditions are described below.

- Let Rc be the set of components being read from an attachment A in a draw call
- Let Wc be the set of components being written to A by the draw call

The samples which qualify for coherent tile image reads from an attachment A are:

- All samples in a pixel when Rc is disjoint with Wc.
- The samples with coverage in a fragment when Rc is not disjoint with Wc. The samples with coverage are determined by the coverage mask for the fragment as calculated by fragment operations that executed prior to fragment shading, including early fragment tests if enabled for the draw call.

A fragment shader **can** declare `NonCoherentColorAttachmentReadEXT`, `NonCoherentDepthAttachmentReadEXT`, or `NonCoherentStencilAttachmentReadEXT` execution modes to enable non-coherent tile image reads which require an explicit vkCmdPipelineBarrier2KHR call for the writes to an attachment to be made visible via tile image reads.

When VkPhysicalDeviceShaderTileImagePropertiesEXT::`shaderTileImageCoherentReadAccelerated` is `VK_TRUE`, the implementation prefers that coherent tile image reads are used, otherwise the implementation prefers that non-coherent tile image reads are used.

NOTE

In practice, the most common tile image reads usage patterns fall under one of the following:

- Programmable blending - each fragment reads from a single sample (SampleID) at its location. Per-sample shading is typically enabled when multisampled rendertargets are used.
- G-buffer generation and shading in one render pass - in the shading phase a fragment reads from a single sample at its location.
- Programmable resolve - a fragment reads from all samples at its location (per-sample shading is disabled). This requires the use of a "full-screen triangle" instead of a rectangle composed of two triangles in order to avoid data races along the shared edge of the triangles.
- 1:1 texturing with LOD - in use cases such a deferred screen space decals a fragment reads a single sample (SampleID) from depth buffer, but requires being able to read from helper threads to derive the texture LOD. This use case is supported as long as the attachment components being read are not overwritten by color, depth, or stencil attachment writes.

All of the above use cases are supported by coherent tile image reads, but only the latter three are supported when non-coherent reads are used as there is no mechanism to synchronize non-coherent reads with writes within a draw call.

27.4.4. Depth Replacement

Writing to the `FragDepth` built-in will replace the fragment's calculated depth values for each sample

in the input SampleMask. Depth testing performed after the fragment shader for this fragment will use this new value as z_f.

27.4.5. Stencil Reference Replacement

Writing to the FragStencilRefEXT built-in will replace the fragment's stencil reference value for each sample in the input SampleMask. Stencil testing performed after the fragment shader for this fragment will use this new value as s_r.

27.4.6. Interlocked Operations

OpBeginInvocationInterlockEXT and OpEndInvocationInterlockEXT define a section of a fragment shader which imposes additional ordering constraints on operations performed within them. These operations are defined as *interlocked operations*. How interlocked operations are ordered against other fragment shader invocations depends on the specified execution modes.

If the ShadingRateInterlockOrderedEXT execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one sample in the same fragment area, and **must** happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one sample in the same fragment area.

If the ShadingRateInterlockUnorderedEXT execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one sample in the same fragment area.

If the PixelInterlockOrderedEXT execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one sample in the same pixel, and **must** happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one sample in the same pixel.

If the PixelInterlockUnorderedEXT execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one sample in the same pixel.

If the SampleInterlockOrderedEXT execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one of the same samples, and **must** happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one of the same samples.

If the SampleInterlockUnorderedEXT execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one of the same samples.

27.5. Multisample Coverage

If a fragment shader is active and its entry point's interface includes a built-in output variable decorated with SampleMask, the coverage mask is ANDed with the bits of the SampleMask built-in to generate a new coverage mask. If sample shading is enabled, bits written to SampleMask corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include SampleMask in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the lineRasterizationMode member of the VkPipelineRasterizationStateCreateInfo structure is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, and the alphaToCoverageEnable and alphaToOneEnable members of the VkPipelineMultisampleStateCreateInfo structure.

To dynamically set the alphaToCoverageEnable state, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToCoverageEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    alphaToCoverageEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- alphaToCoverageEnable specifies the alphaToCoverageEnable state.

This command sets the alphaToCoverageEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo ::pDynamicStates. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo ::alphaToCoverageEnable value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetAlphaToCoverageEnableEXT-None-09423
  At least one of the following **must** be true:
  - The extendedDynamicState3AlphaToCoverageEnable feature is enabled
  - The shaderObject feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-cmdpool

The VkCommandPool that commandBuffer was allocated from **must** support graphics operations

- VUID-vkCmdSetAlphaToCoverageEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set the alphaToOneEnable state, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToOneEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    alphaToOneEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- alphaToOneEnable specifies the alphaToOneEnable state.

This command sets the alphaToOneEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo::alphaToOneEnable value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetAlphaToOneEnableEXT-None-09423
  At least one of the following **must** be true:
  - The extendedDynamicState3AlphaToOneEnable feature is enabled
  - The shaderObject feature is enabled
- VUID-vkCmdSetAlphaToOneEnableEXT-alphaToOne-07607

If the alphaToOne feature is not enabled, alphaToOneEnable **must** be VK_FALSE

Valid Usage (Implicit)

- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetAlphaToOneEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

All alpha values in this section refer only to the alpha component of the fragment shader output that has a Location and Index decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the lineRasterizationMode member of the VkPipelineRasterizationStateCreateInfo structure is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed during smooth line rasterization.

If alphaToCoverageEnable is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm **may** be

different at different framebuffer coordinates.

NOTE	Using different algorithms at different framebuffer coordinates **may** help to avoid artifacts caused by regular coverage sample locations.

Finally, if `alphaToOneEnable` is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

27.6. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the `VkPipelineDepthStencilStateCreateInfo` structure.

The `VkPipelineDepthStencilStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType                           sType;
    const void*                               pNext;
    VkPipelineDepthStencilStateCreateFlags    flags;
    VkBool32                                  depthTestEnable;
    VkBool32                                  depthWriteEnable;
    VkCompareOp                               depthCompareOp;
    VkBool32                                  depthBoundsTestEnable;
    VkBool32                                  stencilTestEnable;
    VkStencilOpState                          front;
    VkStencilOpState                          back;
    float                                     minDepthBounds;
    float                                     maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `depthTestEnable` controls whether depth testing is enabled.
- `depthWriteEnable` controls whether depth writes are enabled when `depthTestEnable` is `VK_TRUE`. Depth writes are always disabled when `depthTestEnable` is `VK_FALSE`.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator to use in the Depth Comparison step of the depth test.
- `depthBoundsTestEnable` controls whether depth bounds testing is enabled.
- `stencilTestEnable` controls whether stencil testing is enabled.
- `front` and `back` are `VkStencilOpState` values controlling the corresponding parameters of the stencil test.

- `minDepthBounds` is the minimum depth bound used in the depth bounds test.
- `maxDepthBounds` is the maximum depth bound used in the depth bounds test.

Valid Usage

- VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598
  If the `depthBounds` feature is not enabled, `depthBoundsTestEnable` **must** be `VK_FALSE`
- VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453
  If the `VK_KHR_portability_subset` extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::`separateStencilMaskRef` is `VK_FALSE`, and the value of VkPipelineDepthStencilStateCreateInfo::`stencilTestEnable` is `VK_TRUE`, and the value of VkPipelineRasterizationStateCreateInfo::`cullMode` is `VK_CULL_MODE_NONE`, the value of `reference` in each of the VkStencilOpState structs in `front` and `back` **must** be the same

Valid Usage (Implicit)

- VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`
- VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPipelineDepthStencilStateCreateInfo-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter
  `depthCompareOp` **must** be a valid VkCompareOp value
- VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter
  `front` **must** be a valid VkStencilOpState structure
- VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter
  `back` **must** be a valid VkStencilOpState structure

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;
```

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

27.7. Depth Bounds Test

The depth bounds test compares the depth value z_a in the depth/stencil attachment at each sample's framebuffer coordinates (x_f, y_f) and sample index i against a set of *depth bounds*.

The depth bounds are determined by two floating-point values defining a minimum (`minDepthBounds`) and maximum (`maxDepthBounds`) depth value. These values are either set by the

VkPipelineDepthStencilStateCreateInfo structure during pipeline creation, or dynamically by vkCmdSetDepthBoundsTestEnableEXT and vkCmdSetDepthBounds.

A given sample is considered within the depth bounds if z_a is in the range [minDepthBounds ,maxDepthBounds]. Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test, call:

```
// Provided by VK_EXT_shader_object
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    depthBoundsTestEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- depthBoundsTestEnable specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::depthBoundsTestEnable value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthBoundsTestEnable-None-08971
  At least one of the following **must** be true:
  - the shaderObject feature is enabled
- VUID-vkCmdSetDepthBoundsTestEnable-depthBounds-10010
  If the depthBounds feature is not enabled, depthBoundsTestEnable **must** be VK_FALSE

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetDepthBoundsTestEnable-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set the depth bounds range, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer                             commandBuffer,
    float                                       minDepthBounds,
    float                                       maxDepthBounds);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `minDepthBounds` is the minimum depth bound.
- `maxDepthBounds` is the maximum depth bound.

This command sets the depth bounds range for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::`minDepthBounds` and VkPipelineDepthStencilStateCreateInfo::`maxDepthBounds` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthBounds-minDepthBounds-00600
  If the `VK_EXT_depth_range_unrestricted` extension is not enabled `minDepthBounds` **must** be between `0.0` and `1.0`, inclusive
- VUID-vkCmdSetDepthBounds-maxDepthBounds-00601
  If the `VK_EXT_depth_range_unrestricted` extension is not enabled `maxDepthBounds` **must** be between `0.0` and `1.0`, inclusive

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBounds-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthBounds-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetDepthBounds-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

27.8. Stencil Test

The stencil test compares the stencil attachment value s_a in the depth/stencil attachment at each sample's framebuffer coordinates (x_f,y_f) and sample index i against a *stencil reference value*.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of coverage samples to stencil attachment samples within the fragment. However, if all samples in the fragment are covered, and the stencil attachment value is updated as a result of this test, all stencil attachment samples will be updated.

If the stencil test is not enabled, as specified by VkPipelineDepthStencilStateCreateInfo ::`stencilTestEnable`, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments

generated by front-facing polygons or any other primitives.

The comparison operation performed is determined by the VkCompareOp value set by VkStencilOpState::compareOp during pipeline creation.

The compare mask s_c and stencil reference value s_r of the front or the back stencil state set determine arguments of the comparison operation. s_c is set by the VkPipelineDepthStencilStateCreateInfo structure during pipeline creation, or by the vkCmdSetStencilCompareMask command. s_r is set by VkPipelineDepthStencilStateCreateInfo or by vkCmdSetStencilReference.

s_r and s_a are each independently combined with s_c using a bitwise AND operation to create masked reference and attachment values s'_r and s'_a. s'_r and s'_a are used as the *reference* and *test* values, respectively, in the operation specified by the VkCompareOp.

If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value s_g is generated according to a stencil operation defined by VkStencilOp parameters set by VkPipelineDepthStencilStateCreateInfo. If the stencil test fails, failOp defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, VkPipelineDepthStencilStateCreateInfo::passOp is used, otherwise VkPipelineDepthStencilStateCreateInfo::depthFailOp is used.

The stencil attachment value s_a is then updated with the generated stencil value s_g according to the write mask s_w defined by writeMask in VkPipelineDepthStencilStateCreateInfo::front and VkPipelineDepthStencilStateCreateInfo::back as:

$$s_a = (s_a \,\&\, \neg s_w) \mid (s_g \,\&\, s_w)$$

To dynamically enable or disable the stencil test, call:

```
// Provided by VK_EXT_shader_object
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    stencilTestEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- stencilTestEnable specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo ::stencilTestEnable value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetStencilTestEnable-None-08971
  At least one of the following **must** be true:

- the shaderObject feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetStencilTestEnable-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set the stencil operation, call:

```
// Provided by VK_EXT_shader_object
void vkCmdSetStencilOpEXT(
    VkCommandBuffer                             commandBuffer,
    VkStencilFaceFlags                          faceMask,
    VkStencilOp                                 failOp,
    VkStencilOp                                 passOp,
    VkStencilOp                                 depthFailOp,
    VkCompareOp                                 compareOp);
```

- commandBuffer is the command buffer into which the command will be recorded.
- faceMask is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the stencil operation.

- `failOp` is a VkStencilOp value specifying the action performed on samples that fail the stencil test.
- `passOp` is a VkStencilOp value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a VkStencilOp value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a VkCompareOp value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when when drawing using shader objects. Otherwise, this state is specified by the corresponding `VkPipelineDepthStencilStateCreateInfo`::`failOp`, `passOp`, `depthFailOp`, and `compareOp` values used to create the currently active pipeline, for both front and back faces.

Valid Usage

- VUID-vkCmdSetStencilOp-None-08971
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetStencilOp-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetStencilOp-faceMask-parameter
  `faceMask` **must** be a valid combination of VkStencilFaceFlagBits values
- VUID-vkCmdSetStencilOp-faceMask-requiredbitmask
  `faceMask` **must** not be `0`
- VUID-vkCmdSetStencilOp-failOp-parameter
  `failOp` **must** be a valid VkStencilOp value
- VUID-vkCmdSetStencilOp-passOp-parameter
  `passOp` **must** be a valid VkStencilOp value
- VUID-vkCmdSetStencilOp-depthFailOp-parameter
  `depthFailOp` **must** be a valid VkStencilOp value
- VUID-vkCmdSetStencilOp-compareOp-parameter
  `compareOp` **must** be a valid VkCompareOp value
- VUID-vkCmdSetStencilOp-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetStencilOp-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetStencilOp-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

The `VkStencilOpState` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp    failOp;
    VkStencilOp    passOp;
    VkStencilOp    depthFailOp;
    VkCompareOp    compareOp;
    uint32_t       compareMask;
    uint32_t       writeMask;
    uint32_t       reference;
} VkStencilOpState;
```

- `failOp` is a VkStencilOp value specifying the action performed on samples that fail the stencil test.
- `passOp` is a VkStencilOp value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a VkStencilOp value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a VkCompareOp value specifying the comparison operator used in the stencil test.
- `compareMask` selects the bits of the unsigned integer stencil values participating in the stencil test.
- `writeMask` selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- `reference` is an integer stencil reference value that is used in the unsigned stencil comparison.

Valid Usage (Implicit)

- VUID-VkStencilOpState-failOp-parameter
  `failOp` **must** be a valid VkStencilOp value
- VUID-VkStencilOpState-passOp-parameter
  `passOp` **must** be a valid VkStencilOp value
- VUID-VkStencilOpState-depthFailOp-parameter
  `depthFailOp` **must** be a valid VkStencilOp value
- VUID-VkStencilOpState-compareOp-parameter
  `compareOp` **must** be a valid VkCompareOp value

To dynamically set the stencil compare mask, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer                             commandBuffer,
    VkStencilFaceFlags                          faceMask,
    uint32_t                                    compareMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the compare mask.
- `compareMask` is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the VkStencilOpState::`compareMask` value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetStencilCompareMask-faceMask-parameter
  `faceMask` **must** be a valid combination of VkStencilFaceFlagBits values
- VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitmask
  `faceMask` **must** not be `0`
- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics

operations

- VUID-vkCmdSetStencilCompareMask-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

`VkStencilFaceFlagBits` values are:

```
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
  // VK_STENCIL_FRONT_AND_BACK is a deprecated alias
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

- `VK_STENCIL_FACE_FRONT_BIT` specifies that only the front set of stencil state is updated.
- `VK_STENCIL_FACE_BACK_BIT` specifies that only the back set of stencil state is updated.
- `VK_STENCIL_FACE_FRONT_AND_BACK` is the combination of `VK_STENCIL_FACE_FRONT_BIT` and `VK_STENCIL_FACE_BACK_BIT`, and specifies that both sets of stencil state are updated.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

`VkStencilFaceFlags` is a bitmask type for setting a mask of zero or more VkStencilFaceFlagBits.

To dynamically set the stencil write mask, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer                             commandBuffer,
    VkStencilFaceFlags                          faceMask,
    uint32_t                                    writeMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the write mask, as described above for vkCmdSetStencilCompareMask.
- `writeMask` is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the `writeMask` value used to create the currently active pipeline, for both VkPipelineDepthStencilStateCreateInfo::`front` and VkPipelineDepthStencilStateCreateInfo::`back` faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetStencilWriteMask-faceMask-parameter
  `faceMask` **must** be a valid combination of VkStencilFaceFlagBits values
- VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmask
  `faceMask` **must** not be `0`
- VUID-vkCmdSetStencilWriteMask-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetStencilWriteMask-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set the stencil reference value, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer                             commandBuffer,
    VkStencilFaceFlags                          faceMask,
    uint32_t                                    reference);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the reference value, as described above for vkCmdSetStencilCompareMask.
- `reference` is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_REFERENCE` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::`reference` value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilReference-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetStencilReference-faceMask-parameter
  `faceMask` **must** be a valid combination of VkStencilFaceFlagBits values
- VUID-vkCmdSetStencilReference-faceMask-requiredbitmask
  `faceMask` **must** not be `0`
- VUID-vkCmdSetStencilReference-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetStencilReference-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

Possible values of the `failOp`, `passOp`, and `depthFailOp` members of VkStencilOpState, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;
```

- `VK_STENCIL_OP_KEEP` keeps the current value.
- `VK_STENCIL_OP_ZERO` sets the value to 0.
- `VK_STENCIL_OP_REPLACE` sets the value to `reference`.
- `VK_STENCIL_OP_INCREMENT_AND_CLAMP` increments the current value and clamps to the maximum representable unsigned value.
- `VK_STENCIL_OP_DECREMENT_AND_CLAMP` decrements the current value and clamps to 0.
- `VK_STENCIL_OP_INVERT` bitwise-inverts the current value.
- `VK_STENCIL_OP_INCREMENT_AND_WRAP` increments the current value and wraps to 0 when the maximum value would have been exceeded.
- `VK_STENCIL_OP_DECREMENT_AND_WRAP` decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

27.9. Depth Test

The depth test compares the depth value z_a in the depth/stencil attachment at each sample's framebuffer coordinates (x_f,y_f) and sample index i against the sample's depth value z_f. If there is no depth attachment then the depth test is skipped.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of rasterization samples to depth attachment samples within the fragment. However, if all samples in the fragment are covered, and the depth attachment value is updated as a result of this test, all depth attachment samples will be updated.

The depth test occurs in three stages, as detailed in the following sections.

27.9.1. Depth Clamping and Range Adjustment

If VkPipelineRasterizationStateCreateInfo::depthClampEnable is enabled, z_f is clamped to [z_{min}, z_{max}], where z_{min} = min(n,f), z_{max} = max(n,f), and n and f are the minDepth and maxDepth depth range values of the viewport used by this fragment, respectively. If the depthClampControl feature is enabled and VkPipelineViewportDepthClampControlCreateInfoEXT::depthClampMode is VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT, then z_{min} and z_{max} are equal to the minDepthClamp and maxDepthClamp values of the VkDepthClampRangeEXT structure pointed to by pDepthClampRange.

Following depth clamping:

- If z_f is not in the range [z_{min}, z_{max}], then z_f is undefined following this step.
- If the depth attachment has a fixed-point format and z_f is not in the range [0, 1], then z_f is undefined following this step.

The VkPipelineViewportDepthClampControlCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_depth_clamp_control
typedef struct VkPipelineViewportDepthClampControlCreateInfoEXT {
    VkStructureType                sType;
    const void*                    pNext;
    VkDepthClampModeEXT            depthClampMode;
    const VkDepthClampRangeEXT*    pDepthClampRange;
} VkPipelineViewportDepthClampControlCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- depthClampMode determines how the clamp range is determined for each viewport.
- pDepthClampRange sets the depth clamp range for all viewports if depthClampMode is VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT.

This structure extends VkPipelineViewportStateCreateInfo and specifies the depth clamp range used in the pipeline. If this structure is not provided in the next chain then depthClampMode defaults to VK_DEPTH_CLAMP_MODE_VIEWPORT_RANGE_EXT.

Valid Usage

- VUID-VkPipelineViewportDepthClampControlCreateInfoEXT-pDepthClampRange-09646
  If `depthClampMode` is `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT`, and the pipeline is not created with `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT`, then `pDepthClampRange` **must** be a valid pointer to a valid `VkDepthClampRangeEXT` structure

Valid Usage (Implicit)

- VUID-VkPipelineViewportDepthClampControlCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLAMP_CONTROL_CREATE_INFO_EXT`
- VUID-VkPipelineViewportDepthClampControlCreateInfoEXT-depthClampMode-parameter
  `depthClampMode` **must** be a valid VkDepthClampModeEXT value
- VUID-VkPipelineViewportDepthClampControlCreateInfoEXT-pDepthClampRange-parameter
  If `pDepthClampRange` is not `NULL`, `pDepthClampRange` **must** be a valid pointer to a valid VkDepthClampRangeEXT structure

Possible values of VkPipelineViewportDepthClampControlCreateInfoEXT::`depthClampMode`, specifying which range should be used for depth clamping, are:

```
// Provided by VK_EXT_depth_clamp_control
typedef enum VkDepthClampModeEXT {
    VK_DEPTH_CLAMP_MODE_VIEWPORT_RANGE_EXT = 0,
    VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT = 1,
} VkDepthClampModeEXT;
```

- `VK_DEPTH_CLAMP_MODE_VIEWPORT_RANGE_EXT` specifies that the depth clamp range follows the viewport depth range. The depth clamp range of each viewport will implicitly be set to z_{min} = min(n,f) and z_{max} = max(n,f), where n and f are the `minDepth` and `maxDepth` depth range values of the viewport.
- `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT` specifies that a single user-defined depth clamp range will be used for all viewports. The user-defined depth clamp range is defined by the `minDepthClamp` and `maxDepthClamp` members of VkDepthClampRangeEXT.

To dynamically set the viewport depth clamp range parameters, call:

```
// Provided by VK_EXT_depth_clamp_control, VK_EXT_depth_clamp_control with
VK_EXT_shader_object
void vkCmdSetDepthClampRangeEXT(
    VkCommandBuffer                             commandBuffer,
    VkDepthClampModeEXT                         depthClampMode,
    const VkDepthClampRangeEXT*                 pDepthClampRange);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthClampMode` determines how the clamp range is determined for each viewport.
- `pDepthClampRange` sets the depth clamp range for all viewports if `depthClampMode` is `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT`.

This command sets the viewport depth clamp range for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the VkPipelineViewportDepthClampControlCreateInfoEXT ::`depthClampMode` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthClampRangeEXT-pDepthClampRange-09647
  If `depthClampMode` is `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT`, then `pDepthClampRange` must be a valid pointer to a valid `VkDepthClampRangeEXT` structure

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClampRangeEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthClampRangeEXT-depthClampMode-parameter
  `depthClampMode` **must** be a valid VkDepthClampModeEXT value
- VUID-vkCmdSetDepthClampRangeEXT-pDepthClampRange-parameter
  If `pDepthClampRange` is not `NULL`, `pDepthClampRange` **must** be a valid pointer to a valid VkDepthClampRangeEXT structure
- VUID-vkCmdSetDepthClampRangeEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetDepthClampRangeEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetDepthClampRangeEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

Both VkPipelineViewportDepthClampControlCreateInfoEXT and vkCmdSetDepthClampRangeEXT use VkDepthClampRangeEXT to set the viewport depth clamp range parameters.

The VkDepthClampRangeEXT structure is defined as:

```
// Provided by VK_EXT_depth_clamp_control
typedef struct VkDepthClampRangeEXT {
    float    minDepthClamp;
    float    maxDepthClamp;
} VkDepthClampRangeEXT;
```

- minDepthClamp sets z_{min} in the depth clamp range of the viewport.
- maxDepthClamp sets z_{max} in the depth clamp range of the viewport.

Valid Usage

- VUID-VkDepthClampRangeEXT-pDepthClampRange-00999
  minDepthClamp **must** be less than or equal to maxDepthClamp
- VUID-VkDepthClampRangeEXT-pDepthClampRange-09648
  If the VK_EXT_depth_range_unrestricted extension is not enabled, minDepthClamp **must** be greater than or equal to 0.0
- VUID-VkDepthClampRangeEXT-pDepthClampRange-09649
  If the VK_EXT_depth_range_unrestricted extension is not enabled, maxDepthClamp **must** be less than or equal to 1.0

27.9.2. Depth Comparison

If the depth test is not enabled, as specified by vkCmdSetDepthTestEnableEXT or VkPipelineDepthStencilStateCreateInfo::depthTestEnable, then this step is skipped.

The comparison operation performed is determined by the VkCompareOp value set by vkCmdSetDepthCompareOpEXT, or by VkPipelineDepthStencilStateCreateInfo::depthCompareOp during pipeline creation. z_f and z_a are used as the *reference* and *test* values, respectively, in the operation specified by the VkCompareOp.

If the comparison evaluates to false, the coverage for the sample is set to 0.

27.9.3. Depth Attachment Writes

If depth writes are enabled, as specified by vkCmdSetDepthWriteEnableEXT or VkPipelineDepthStencilStateCreateInfo::depthWriteEnable, and the comparison evaluated to true, the depth attachment value z_a is set to the sample's depth value z_f. If there is no depth attachment, no value is written.

To dynamically enable or disable the depth test, call:

```
// Provided by VK_EXT_shader_object
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    depthTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo ::depthTestEnable value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthTestEnable-None-08971
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetDepthTestEnable-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally

synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set the depth compare operator, call:

```
// Provided by VK_EXT_shader_object
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer                             commandBuffer,
    VkCompareOp                                 depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a VkCompareOp value specifying the comparison operator used for the Depth Comparison step of the depth test.

This command sets the depth comparison operator for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::`depthCompareOp` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthCompareOp-None-08971
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter
  `depthCompareOp` **must** be a valid VkCompareOp value
- VUID-vkCmdSetDepthCompareOp-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics

operations

- VUID-vkCmdSetDepthCompareOp-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set the depth write enable, call:

```
// Provided by VK_EXT_shader_object
void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    depthWriteEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthWriteEnable` specifies if depth writes are enabled.

This command sets the depth write enable for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo ::`depthWriteEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthWriteEnable-None-08971
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetDepthWriteEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetDepthWriteEnable-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

27.10. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in Occlusion Queries.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, sample mask, alpha to coverage, stencil, and depth tests.

27.11. Coverage Reduction

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

27.11.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of `rasterizationSamples` unique coverage samples for each pixel in the fragment area, each with a unique sample index. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, pixel coverage is generated in an implementation-dependent manner. If all samples in the fragment are covered, all samples will be covered in each pixel coverage.

If the fragment shading rate is set, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples with a pixel index matching that pixel, and each sample retains its unique sample index i.

27.11.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

The number of `rasterizationSamples` is identical to the number of samples in the color attachments. A color sample is covered if the pixel coverage sample with the same sample index i is covered.

Chapter 28. The Framebuffer

28.1. Blending

Blending combines the incoming *source* fragment's R, G, B, and A values with the *destination* R, G, B, and A values of each sample stored in the framebuffer at the fragment's (x_f,y_f) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. Advanced blending operations are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

NOTE

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

The pipeline blend state is included in the `VkPipelineColorBlendStateCreateInfo` structure during graphics pipeline creation:

The `VkPipelineColorBlendStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType                               sType;
    const void*                                   pNext;
    VkPipelineColorBlendStateCreateFlags          flags;
    VkBool32                                      logicOpEnable;
    VkLogicOp                                     logicOp;
    uint32_t                                      attachmentCount;
    const VkPipelineColorBlendAttachmentState*    pAttachments;
    float                                         blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `flags` is reserved for future use.
- `logicOpEnable` controls whether to apply Logical Operations.
- `logicOp` selects which logical operation to apply.
- `attachmentCount` is the number of VkPipelineColorBlendAttachmentState elements in `pAttachments`. It is ignored if the pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, and `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states set, and either `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` set or the advancedBlendCoherentOperations feature is not enabled.
- `pAttachments` is a pointer to an array of VkPipelineColorBlendAttachmentState structures defining blend state for each color attachment. It is ignored if the pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, and `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states set, and either `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` set or the advancedBlendCoherentOperations feature is not enabled.
- `blendConstants` is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the blend factor.

Valid Usage

- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605
  If the `independentBlend` feature is not enabled, all elements of `pAttachments` **must** be identical
- VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606
  If the `logicOp` feature is not enabled, `logicOpEnable` **must** be `VK_FALSE`
- VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607
  If `logicOpEnable` is `VK_TRUE`, `logicOp` **must** be a valid VkLogicOp value
- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353
  If `attachmentCount` is not `0` , and any of `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, or `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` are not set, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid VkPipelineColorBlendAttachmentState structures

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendStateCreateInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO`
- VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkPipelineColorBlendAdvancedStateCreateInfoEXT or VkPipelineColorWriteCreateInfoEXT
- VUID-VkPipelineColorBlendStateCreateInfo-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkPipelineColorBlendStateCreateInfo-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter
  If `attachmentCount` is not `0`, and `pAttachments` is not `NULL`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid VkPipelineColorBlendAttachmentState structures

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;
```

`VkPipelineColorBlendStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineColorBlendAttachmentState` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32                 blendEnable;
    VkBlendFactor            srcColorBlendFactor;
    VkBlendFactor            dstColorBlendFactor;
    VkBlendOp                colorBlendOp;
    VkBlendFactor            srcAlphaBlendFactor;
    VkBlendFactor            dstAlphaBlendFactor;
    VkBlendOp                alphaBlendOp;
    VkColorComponentFlags    colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- `blendEnable` controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment's color for that attachment is passed through unmodified.
- `srcColorBlendFactor` selects which blend factor is used to determine the source factors (S_r,S_g,S_b).
- `dstColorBlendFactor` selects which blend factor is used to determine the destination factors (D_r,D_g,D_b).
- `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor S_a.
- `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor D_a.
- `alphaBlendOp` selects which blend operation is used to calculate the alpha values to write to the color attachment.
- `colorWriteMask` is a bitmask of VkColorComponentFlagBits specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.

Valid Usage

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608
  If the dualSrcBlend feature is not enabled, srcColorBlendFactor **must** not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA
- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609
  If the dualSrcBlend feature is not enabled, dstColorBlendFactor **must** not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA
- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610
  If the dualSrcBlend feature is not enabled, srcAlphaBlendFactor **must** not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA
- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611
  If the dualSrcBlend feature is not enabled, dstAlphaBlendFactor **must** not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA
- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01406
  If either of colorBlendOp or alphaBlendOp is an advanced blend operation, then colorBlendOp **must** equal alphaBlendOp
- VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01407
  If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and colorBlendOp is an advanced blend operation, then colorBlendOp **must** be the same for all attachments
- VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01408
  If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and alphaBlendOp is an advanced blend operation, then alphaBlendOp **must** be the same for all attachments
- VUID-VkPipelineColorBlendAttachmentState-advancedBlendAllOperations-01409
  If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendAllOperations is VK_FALSE, then colorBlendOp **must** not be VK_BLEND_OP_ZERO_EXT, VK_BLEND_OP_SRC_EXT, VK_BLEND_OP_DST_EXT, VK_BLEND_OP_SRC_OVER_EXT, VK_BLEND_OP_DST_OVER_EXT, VK_BLEND_OP_SRC_IN_EXT, VK_BLEND_OP_DST_IN_EXT, VK_BLEND_OP_SRC_OUT_EXT, VK_BLEND_OP_DST_OUT_EXT, VK_BLEND_OP_SRC_ATOP_EXT, VK_BLEND_OP_DST_ATOP_EXT, VK_BLEND_OP_XOR_EXT, VK_BLEND_OP_INVERT_EXT, VK_BLEND_OP_INVERT_RGB_EXT, VK_BLEND_OP_LINEARDODGE_EXT, VK_BLEND_OP_LINEARBURN_EXT, VK_BLEND_OP_VIVIDLIGHT_EXT, VK_BLEND_OP_LINEARLIGHT_EXT, VK_BLEND_OP_PINLIGHT_EXT, VK_BLEND_OP_HARDMIX_EXT, VK_BLEND_OP_PLUS_EXT, VK_BLEND_OP_PLUS_CLAMPED_EXT, VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT, VK_BLEND_OP_PLUS_DARKER_EXT, VK_BLEND_OP_MINUS_EXT, VK_BLEND_OP_MINUS_CLAMPED_EXT, VK_BLEND_OP_CONTRAST_EXT, VK_BLEND_OP_INVERT_OVG_EXT, VK_BLEND_OP_RED_EXT, VK_BLEND_OP_GREEN_EXT, or VK_BLEND_OP_BLUE_EXT
- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01410
  If colorBlendOp or alphaBlendOp is an advanced blend operation, then colorAttachmentCount

of the subpass this pipeline is compiled against **must** be less than or equal to VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments

- VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04454
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, srcColorBlendFactor **must** not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA
- VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04455
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, dstColorBlendFactor **must** not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter
  srcColorBlendFactor **must** be a valid VkBlendFactor value
- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter
  dstColorBlendFactor **must** be a valid VkBlendFactor value
- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter
  colorBlendOp **must** be a valid VkBlendOp value
- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter
  srcAlphaBlendFactor **must** be a valid VkBlendFactor value
- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter
  dstAlphaBlendFactor **must** be a valid VkBlendFactor value
- VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter
  alphaBlendOp **must** be a valid VkBlendOp value
- VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter
  colorWriteMask **must** be a valid combination of VkColorComponentFlagBits values

To dynamically set blendEnable, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEnableEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    firstAttachment,
    uint32_t                                    attachmentCount,
    const VkBool32*                             pColorBlendEnables);
```

- commandBuffer is the command buffer into which the command will be recorded.
- firstAttachment the first color attachment the color blending enable applies.

- `attachmentCount` the number of color blending enables in the `pColorBlendEnables` array.
- `pColorBlendEnables` an array of booleans to indicate whether color blending is enabled for the corresponding attachment.

This command sets the color blending enable of the specified color attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` set in VkPipelineDynamicStateCreateInfo ::`pDynamicStates`. Otherwise, this state is specified by the VkPipelineColorBlendAttachmentState ::`blendEnable` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorBlendEnableEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendEnable` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetColorBlendEnableEXT-pColorBlendEnables-parameter
  `pColorBlendEnables` **must** be a valid pointer to an array of `attachmentCount` VkBool32 values
- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetColorBlendEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorBlendEnableEXT-attachmentCount-arraylength
  `attachmentCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set color blend factors and operations, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEquationEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    firstAttachment,
    uint32_t                                    attachmentCount,
    const VkColorBlendEquationEXT*              pColorBlendEquations);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color blend factors and operations apply to.
- `attachmentCount` the number of VkColorBlendEquationEXT elements in the `pColorBlendEquations` array.
- `pColorBlendEquations` an array of VkColorBlendEquationEXT structs that specify the color blend factors and operations for the corresponding attachments.

This command sets the color blending factors and operations of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the VkPipelineColorBlendAttachmentState::`srcColorBlendFactor`, VkPipelineColorBlendAttachmentState::`dstColorBlendFactor`, VkPipelineColorBlendAttachmentState::`colorBlendOp`, VkPipelineColorBlendAttachmentState::`srcAlphaBlendFactor`, VkPipelineColorBlendAttachmentState::`dstAlphaBlendFactor`, and VkPipelineColorBlendAttachmentState::`alphaBlendOp` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorBlendEquationEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendEquation` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetColorBlendEquationEXT-pColorBlendEquations-parameter
  `pColorBlendEquations` **must** be a valid pointer to an array of `attachmentCount` valid VkColorBlendEquationEXT structures
- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetColorBlendEquationEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorBlendEquationEXT-attachmentCount-arraylength
  `attachmentCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

The `VkColorBlendEquationEXT` structure is defined as:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
typedef struct VkColorBlendEquationEXT {
    VkBlendFactor    srcColorBlendFactor;
    VkBlendFactor    dstColorBlendFactor;
    VkBlendOp        colorBlendOp;
    VkBlendFactor    srcAlphaBlendFactor;
    VkBlendFactor    dstAlphaBlendFactor;
    VkBlendOp        alphaBlendOp;
} VkColorBlendEquationEXT;
```

- `srcColorBlendFactor` selects which blend factor is used to determine the source factors (S_r,S_g,S_b).
- `dstColorBlendFactor` selects which blend factor is used to determine the destination factors (D_r,D_g,D_b).
- `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor S_a.
- `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor D_a.
- `alphaBlendOp` selects which blend operation is use to calculate the alpha values to write to the color attachment.

Valid Usage

- VUID-VkColorBlendEquationEXT-dualSrcBlend-07357
  If the `dualSrcBlend` feature is not enabled, `srcColorBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkColorBlendEquationEXT-dualSrcBlend-07358
  If the `dualSrcBlend` feature is not enabled, `dstColorBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkColorBlendEquationEXT-dualSrcBlend-07359
  If the `dualSrcBlend` feature is not enabled, `srcAlphaBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkColorBlendEquationEXT-dualSrcBlend-07360
  If the `dualSrcBlend` feature is not enabled, `dstAlphaBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkColorBlendEquationEXT-colorBlendOp-07361
  `colorBlendOp` and `alphaBlendOp` **must** not be `VK_BLEND_OP_ZERO_EXT`, `VK_BLEND_OP_SRC_EXT`, `VK_BLEND_OP_DST_EXT`, `VK_BLEND_OP_SRC_OVER_EXT`, `VK_BLEND_OP_DST_OVER_EXT`, `VK_BLEND_OP_SRC_IN_EXT`, `VK_BLEND_OP_DST_IN_EXT`, `VK_BLEND_OP_SRC_OUT_EXT`, `VK_BLEND_OP_DST_OUT_EXT`, `VK_BLEND_OP_SRC_ATOP_EXT`, `VK_BLEND_OP_DST_ATOP_EXT`, `VK_BLEND_OP_XOR_EXT`, `VK_BLEND_OP_MULTIPLY_EXT`, `VK_BLEND_OP_SCREEN_EXT`, `VK_BLEND_OP_OVERLAY_EXT`, `VK_BLEND_OP_DARKEN_EXT`, `VK_BLEND_OP_LIGHTEN_EXT`, `VK_BLEND_OP_COLORDODGE_EXT`, `VK_BLEND_OP_COLORBURN_EXT`, `VK_BLEND_OP_HARDLIGHT_EXT`, `VK_BLEND_OP_SOFTLIGHT_EXT`, `VK_BLEND_OP_DIFFERENCE_EXT`, `VK_BLEND_OP_EXCLUSION_EXT`, `VK_BLEND_OP_INVERT_EXT`, `VK_BLEND_OP_INVERT_RGB_EXT`, `VK_BLEND_OP_LINEARDODGE_EXT`, `VK_BLEND_OP_LINEARBURN_EXT`, `VK_BLEND_OP_VIVIDLIGHT_EXT`, `VK_BLEND_OP_LINEARLIGHT_EXT`, `VK_BLEND_OP_PINLIGHT_EXT`, `VK_BLEND_OP_HARDMIX_EXT`, `VK_BLEND_OP_HSL_HUE_EXT`, `VK_BLEND_OP_HSL_SATURATION_EXT`, `VK_BLEND_OP_HSL_COLOR_EXT`, `VK_BLEND_OP_HSL_LUMINOSITY_EXT`, `VK_BLEND_OP_PLUS_EXT`, `VK_BLEND_OP_PLUS_CLAMPED_EXT`, `VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT`, `VK_BLEND_OP_PLUS_DARKER_EXT`, `VK_BLEND_OP_MINUS_EXT`, `VK_BLEND_OP_MINUS_CLAMPED_EXT`, `VK_BLEND_OP_CONTRAST_EXT`, `VK_BLEND_OP_INVERT_OVG_EXT`,

VK_BLEND_OP_RED_EXT, VK_BLEND_OP_GREEN_EXT, or VK_BLEND_OP_BLUE_EXT

- VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07362
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, srcColorBlendFactor **must** not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA
- VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07363
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, dstColorBlendFactor **must** not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

Valid Usage (Implicit)

- VUID-VkColorBlendEquationEXT-srcColorBlendFactor-parameter
  srcColorBlendFactor **must** be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-dstColorBlendFactor-parameter
  dstColorBlendFactor **must** be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-colorBlendOp-parameter
  colorBlendOp **must** be a valid VkBlendOp value
- VUID-VkColorBlendEquationEXT-srcAlphaBlendFactor-parameter
  srcAlphaBlendFactor **must** be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-dstAlphaBlendFactor-parameter
  dstAlphaBlendFactor **must** be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-alphaBlendOp-parameter
  alphaBlendOp **must** be a valid VkBlendOp value

To dynamically set the color write masks, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorWriteMaskEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    firstAttachment,
    uint32_t                                    attachmentCount,
    const VkColorComponentFlags*                pColorWriteMasks);
```

- commandBuffer is the command buffer into which the command will be recorded.
- firstAttachment the first color attachment the color write masks apply to.
- attachmentCount the number of VkColorComponentFlags values in the pColorWriteMasks array.
- pColorWriteMasks an array of VkColorComponentFlags values that specify the color write masks of the corresponding attachments.

This command sets the color write masks of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendAttachmentState::colorWriteMask values used to create the currently active pipeline.

NOTE	Formats with bits that are shared between components specified by VkColorComponentFlagBits, such as VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, cannot have their channels individually masked by this functionality; either all components that share bits have to be enabled, or none of them.

Valid Usage

- VUID-vkCmdSetColorWriteMaskEXT-None-09423
  At least one of the following **must** be true:
  - The extendedDynamicState3ColorWriteMask feature is enabled
  - The shaderObject feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-parameter
  pColorWriteMasks **must** be a valid pointer to an array of attachmentCount valid combinations of VkColorComponentFlagBits values
- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetColorWriteMaskEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorWriteMaskEXT-attachmentCount-arraylength
  attachmentCount **must** be greater than 0

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

28.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:

```
// Provided by VK_VERSION_1_0
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;
```

The semantics of the enum values are described in the table below:

Table 34. Blend Factors

VkBlendFactor	RGB Blend Factors (S_r,S_g,S_b) or (D_r,D_g,D_b)	Alpha Blend Factor (S_a or D_a)
VK_BLEND_FACTOR_ZERO	(0,0,0)	0
VK_BLEND_FACTOR_ONE	(1,1,1)	1
VK_BLEND_FACTOR_SRC_COLOR	(R_{s0},G_{s0},B_{s0})	A_{s0}

VkBlendFactor	RGB Blend Factors (S_r,S_g,S_b) or (D_r,D_g,D_b)	Alpha Blend Factor (S_a or D_a)
VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR	$(1-R_{s0},1-G_{s0},1-B_{s0})$	$1-A_{s0}$
VK_BLEND_FACTOR_DST_COLOR	(R_d,G_d,B_d)	A_d
VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR	$(1-R_d,1-G_d,1-B_d)$	$1-A_d$
VK_BLEND_FACTOR_SRC_ALPHA	(A_{s0},A_{s0},A_{s0})	A_{s0}
VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA	$(1-A_{s0},1-A_{s0},1-A_{s0})$	$1-A_{s0}$
VK_BLEND_FACTOR_DST_ALPHA	(A_d,A_d,A_d)	A_d
VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA	$(1-A_d,1-A_d,1-A_d)$	$1-A_d$
VK_BLEND_FACTOR_CONSTANT_COLOR	(R_c,G_c,B_c)	A_c
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR	$(1-R_c,1-G_c,1-B_c)$	$1-A_c$
VK_BLEND_FACTOR_CONSTANT_ALPHA	(A_c,A_c,A_c)	A_c
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA	$(1-A_c,1-A_c,1-A_c)$	$1-A_c$
VK_BLEND_FACTOR_SRC_ALPHA_SATURATE	(f,f,f); $f = \min(A_{s0},1-A_d)$	1
VK_BLEND_FACTOR_SRC1_COLOR	(R_{s1},G_{s1},B_{s1})	A_{s1}
VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR	$(1-R_{s1},1-G_{s1},1-B_{s1})$	$1-A_{s1}$
VK_BLEND_FACTOR_SRC1_ALPHA	(A_{s1},A_{s1},A_{s1})	A_{s1}
VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA	$(1-A_{s1},1-A_{s1},1-A_{s1})$	$1-A_{s1}$

In this table, the following conventions are used:

- R_{s0},G_{s0},B_{s0} and A_{s0} represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.
- R_{s1},G_{s1},B_{s1} and A_{s1} represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.
- R_d,G_d,B_d and A_d represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- R_c,G_c,B_c and A_c represent the blend constant R, G, B, and A components, respectively.

To dynamically set and change the blend constants, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer                             commandBuffer,
    const float                                 blendConstants[4]);
```

- commandBuffer is the command buffer into which the command will be recorded.

- `blendConstants` is a pointer to an array of four values specifying the R_c, G_c, B_c, and A_c components of the blend constant color used in blending, depending on the blend factor.

This command sets blend constants for subsequent drawing commands when when drawing using shader objects, or the graphics pipeline is created with `VK_DYNAMIC_STATE_BLEND_CONSTANTS` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the VkPipelineColorBlendStateCreateInfo::`blendConstants` values used to create the currently active pipeline.

Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetBlendConstants-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetBlendConstants-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

28.1.2. Dual-Source Blending

Blend factors that use the secondary color input (R_{s1},G_{s1},B_{s1},A_{s1}) (`VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, and `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`) **may** consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that **can** be used in a framebuffer **may** be lower when using dual-source blending.

Dual-source blending is only supported if the `dualSrcBlend` feature is enabled.

The maximum number of color attachments that **can** be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the `maxFragmentDualSrcAttachments` member of `VkPhysicalDeviceLimits`.

Color outputs **can** be bound to the first and second inputs of the blender using the `Index` decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the value of the second input is undefined.

28.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components **can** use different operations. Possible values of VkBlendOp, specifying the operations, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_ZERO_EXT = 1000148000,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_EXT = 1000148001,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_EXT = 1000148002,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_OVER_EXT = 1000148003,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_OVER_EXT = 1000148004,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_IN_EXT = 1000148005,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_IN_EXT = 1000148006,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_OUT_EXT = 1000148007,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_OUT_EXT = 1000148008,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_ATOP_EXT = 1000148009,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_ATOP_EXT = 1000148010,
  // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_XOR_EXT = 1000148011,
  // Provided by VK_EXT_blend_operation_advanced

} VkBlendOp;
```

The semantics of the basic blend operations are described in the table below:

Table 35. Basic Blend Operations

VkBlendOp	RGB Components	Alpha Component
VK_BLEND_OP_ADD	$R = R_{s0} \times S_r + R_d \times D_r$ $G = G_{s0} \times S_g + G_d \times D_g$ $B = B_{s0} \times S_b + B_d \times D_b$	$A = A_{s0} \times S_a + A_d \times D_a$
VK_BLEND_OP_SUBTRACT	$R = R_{s0} \times S_r - R_d \times D_r$ $G = G_{s0} \times S_g - G_d \times D_g$ $B = B_{s0} \times S_b - B_d \times D_b$	$A = A_{s0} \times S_a - A_d \times D_a$
VK_BLEND_OP_REVERSE_SUBTRACT	$R = R_d \times D_r - R_{s0} \times S_r$ $G = G_d \times D_g - G_{s0} \times S_g$ $B = B_d \times D_b - B_{s0} \times S_b$	$A = A_d \times D_a - A_{s0} \times S_a$
VK_BLEND_OP_MIN	$R = \min(R_{s0},R_d)$ $G = \min(G_{s0},G_d)$ $B = \min(B_{s0},B_d)$	$A = \min(A_{s0},A_d)$
VK_BLEND_OP_MAX	$R = \max(R_{s0},R_d)$ $G = \max(G_{s0},G_d)$ $B = \max(B_{s0},B_d)$	$A = \max(A_{s0},A_d)$

In this table, the following conventions are used:

- R_{s0}, G_{s0}, B_{s0} and A_{s0} represent the first source color R, G, B, and A components, respectively.
- R_d, G_d, B_d and A_d represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- S_r, S_g, S_b and S_a represent the source blend factor R, G, B, and A components, respectively.
- D_r, D_g, D_b and D_a represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B and A are assigned R_{s0}, G_{s0}, B_{s0} and A_{s0}, respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to [0,1] or [-1,1] respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final R, G and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB $EOTF^{-1}$” section of the Khronos Data Format

Specification.

If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting c_s values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is VK_ATTACHMENT_UNUSED, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the VkSubpassDescription::colorAttachmentCount or VkSubpassDescription2::colorAttachmentCount value.

28.1.4. Advanced Blend Operations

The *advanced blend operations* are those listed in tables f/X/Y/Z Advanced Blend Operations, Hue-Saturation-Luminosity Advanced Blend Operations, and Additional RGB Blend Operations.

If the pNext chain of VkPipelineColorBlendStateCreateInfo includes a VkPipelineColorBlendAdvancedStateCreateInfoEXT structure, then that structure includes parameters that affect advanced blend operations.

The VkPipelineColorBlendAdvancedStateCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkBool32             srcPremultiplied;
    VkBool32             dstPremultiplied;
    VkBlendOverlapEXT    blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- srcPremultiplied specifies whether the source color of the blend operation is treated as premultiplied.
- dstPremultiplied specifies whether the destination color of the blend operation is treated as premultiplied.
- blendOverlap is a VkBlendOverlapEXT value specifying how the source and destination sample's coverage is correlated.

If this structure is not present, srcPremultiplied and dstPremultiplied are both considered to be VK_TRUE, and blendOverlap is considered to be VK_BLEND_OVERLAP_UNCORRELATED_EXT.

Valid Usage

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424
  If the non-premultiplied source color property is not supported, srcPremultiplied **must** be

VK_TRUE

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-dstPremultiplied-01425
  If the non-premultiplied destination color property is not supported, dstPremultiplied **must** be VK_TRUE
- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-01426
  If the correlated overlap property is not supported, blendOverlap **must** be VK_BLEND_OVERLAP_UNCORRELATED_EXT

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT
- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-parameter
  blendOverlap **must** be a valid VkBlendOverlapEXT value

To dynamically set the advanced blend state, call:

```
// Provided by VK_EXT_blend_operation_advanced with VK_EXT_extended_dynamic_state3,
VK_EXT_blend_operation_advanced with VK_EXT_shader_object
void vkCmdSetColorBlendAdvancedEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    firstAttachment,
    uint32_t                                    attachmentCount,
    const VkColorBlendAdvancedEXT*              pColorBlendAdvanced);
```

- commandBuffer is the command buffer into which the command will be recorded.
- firstAttachment the first color attachment the advanced blend parameters apply to.
- attachmentCount the number of VkColorBlendAdvancedEXT elements in the pColorBlendAdvanced array.
- pColorBlendAdvanced an array of VkColorBlendAdvancedEXT structs that specify the advanced color blend parameters for the corresponding attachments.

This command sets the advanced blend operation parameters of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied, VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied, and VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorBlendAdvancedEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendAdvanced` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetColorBlendAdvancedEXT-pColorBlendAdvanced-parameter
  `pColorBlendAdvanced` **must** be a valid pointer to an array of `attachmentCount` valid VkColorBlendAdvancedEXT structures
- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetColorBlendAdvancedEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorBlendAdvancedEXT-attachmentCount-arraylength
  `attachmentCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

The `VkColorBlendAdvancedEXT` structure is defined as:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
typedef struct VkColorBlendAdvancedEXT {
    VkBlendOp            advancedBlendOp;
    VkBool32             srcPremultiplied;
    VkBool32             dstPremultiplied;
    VkBlendOverlapEXT    blendOverlap;
    VkBool32             clampResults;
} VkColorBlendAdvancedEXT;
```

- `advancedBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcPremultiplied` specifies whether the source color of the blend operation is treated as premultiplied.
- `dstPremultiplied` specifies whether the destination color of the blend operation is treated as premultiplied.
- `blendOverlap` is a VkBlendOverlapEXT value specifying how the source and destination sample's coverage is correlated.
- `clampResults` specifies that results **must** be clamped to the [0,1] range before writing to the attachment, which is useful when the attachment format is not normalized fixed-point.

Valid Usage

- VUID-VkColorBlendAdvancedEXT-srcPremultiplied-07505
  If the non-premultiplied source color property is not supported, `srcPremultiplied` **must** be `VK_TRUE`
- VUID-VkColorBlendAdvancedEXT-dstPremultiplied-07506
  If the non-premultiplied destination color property is not supported, `dstPremultiplied` **must** be `VK_TRUE`
- VUID-VkColorBlendAdvancedEXT-blendOverlap-07507
  If the correlated overlap property is not supported, `blendOverlap` **must** be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`

Valid Usage (Implicit)

- VUID-VkColorBlendAdvancedEXT-advancedBlendOp-parameter
  `advancedBlendOp` **must** be a valid VkBlendOp value
- VUID-VkColorBlendAdvancedEXT-blendOverlap-parameter
  `blendOverlap` **must** be a valid VkBlendOverlapEXT value

When using one of the operations in table f/X/Y/Z Advanced Blend Operations or Hue-Saturation-Luminosity Advanced Blend Operations, blending is performed according to the following equations:

$$
\begin{aligned}
R = \quad & f(R_s', R_d') * p_0(A_s, A_d) + \quad Y * R_s' * p_1(A_s, A_d) + \quad Z * R_d' * p_2(A_s, A_d) \\
G = \quad & f(G_s', G_d') * p_0(A_s, A_d) + \quad Y * G_s' * p_1(A_s, A_d) + \quad Z * G_d' * p_2(A_s, A_d) \\
B = \quad & f(B_s', B_d') * p_0(A_s, A_d) + \quad Y * B_s' * p_1(A_s, A_d) + \quad Z * B_d' * p_2(A_s, A_d) \\
A = \quad & X * p_0(A_s, A_d) + \quad Y * p_1(A_s, A_d) + \quad Z * p_2(A_s, A_d)
\end{aligned}
$$

where the function f and terms X, Y, and Z are specified in the table. The R, G, and B components of the source color used for blending are derived according to `srcPremultiplied`. If `srcPremultiplied` is `VK_TRUE`, the fragment color components are considered to have been premultiplied by the A component prior to blending. The base source color (R_s',G_s',B_s') is obtained by dividing through by the A component:

$$
(R_s', G_s', B_s') = \begin{cases} (0, 0, 0) & A_s = 0 \\ (\frac{R_s}{A_s}, \frac{G_s}{A_s}, \frac{B_s}{A_s}) & \text{otherwise} \end{cases}
$$

If `srcPremultiplied` is `VK_FALSE`, the fragment color components are used as the base color:

$$
(R_s', G_s', B_s') = (R_s, G_s, B_s)
$$

The R, G, and B components of the destination color used for blending are derived according to `dstPremultiplied`. If `dstPremultiplied` is `VK_TRUE`, the destination components are considered to have been premultiplied by the A component prior to blending. The base destination color (R_d',G_d',B_d') is obtained by dividing through by the A component:

$$
(R_d', G_d', B_d') = \begin{cases} (0, 0, 0) & A_d = 0 \\ (\frac{R_d}{A_d}, \frac{G_d}{A_d}, \frac{B_d}{A_d}) & \text{otherwise} \end{cases}
$$

If `dstPremultiplied` is `VK_FALSE`, the destination color components are used as the base color:

$$
(R_d', G_d', B_d') = (R_d, G_d, B_d)
$$

When blending using advanced blend operations, we expect that the R, G, and B components of premultiplied source and destination color inputs be stored as the product of non-premultiplied R, G, and B component values and the A component of the color. If any R, G, or B component of a premultiplied input color is non-zero and the A component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If `dstPremultiplied` is `VK_FALSE`, that result color's R, G, and B components are divided by the A component before being written to the framebuffer. If any R, G, or B component of the color is non-zero and the A component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions p_0, p_1, and p_2 are defined in table Advanced Blend Overlap Modes. In these

functions, the A components of the source and destination colors are taken to indicate the portion of the pixel covered by the fragment (source) and the fragments previously accumulated in the pixel (destination). The functions p_0, p_1, and p_2 approximate the relative portion of the pixel covered by the intersection of the source and destination, covered only by the source, and covered only by the destination, respectively.

Possible values of VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap, specifying the blend overlap functions, are:

```
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- VK_BLEND_OVERLAP_UNCORRELATED_EXT specifies that there is no correlation between the source and destination coverage.
- VK_BLEND_OVERLAP_CONJOINT_EXT specifies that the source and destination coverage are considered to have maximal overlap.
- VK_BLEND_OVERLAP_DISJOINT_EXT specifies that the source and destination coverage are considered to have minimal overlap.

Table 36. Advanced Blend Overlap Modes

Overlap Mode	Weighting Equations
VK_BLEND_OVERLAP_UNCORRELATED_EXT	$p_0(A_s, A_d) = A_s A_d$ $p_1(A_s, A_d) = A_s(1 - A_d)$ $p_2(A_s, A_d) = A_d(1 - A_s)$
VK_BLEND_OVERLAP_CONJOINT_EXT	$p_0(A_s, A_d) = min(A_s, A_d)$ $p_1(A_s, A_d) = max(A_s - A_d, 0)$ $p_2(A_s, A_d) = max(A_d - A_s, 0)$
VK_BLEND_OVERLAP_DISJOINT_EXT	$p_0(A_s, A_d) = max(A_s + A_d - 1, 0)$ $p_1(A_s, A_d) = min(A_s, 1 - A_d)$ $p_2(A_s, A_d) = min(A_d, 1 - A_s)$

Table 37. f/X/Y/Z Advanced Blend Operations

Mode	Blend Coefficients
VK_BLEND_OP_ZERO_EXT	$(X, Y, Z) = (0, 0, 0)$ $f(C_s, C_d) = 0$
VK_BLEND_OP_SRC_EXT	$(X, Y, Z) = (1, 1, 0)$ $f(C_s, C_d) = C_s$

Mode	Blend Coefficients
VK_BLEND_OP_DST_EXT	$(X, Y, Z) = (1, 0, 1)$ $f(C_s, C_d) = C_d$
VK_BLEND_OP_SRC_OVER_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = C_s$
VK_BLEND_OP_DST_OVER_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = C_d$
VK_BLEND_OP_SRC_IN_EXT	$(X, Y, Z) = (1, 0, 0)$ $f(C_s, C_d) = C_s$
VK_BLEND_OP_DST_IN_EXT	$(X, Y, Z) = (1, 0, 0)$ $f(C_s, C_d) = C_d$
VK_BLEND_OP_SRC_OUT_EXT	$(X, Y, Z) = (0, 1, 0)$ $f(C_s, C_d) = 0$
VK_BLEND_OP_DST_OUT_EXT	$(X, Y, Z) = (0, 0, 1)$ $f(C_s, C_d) = 0$
VK_BLEND_OP_SRC_ATOP_EXT	$(X, Y, Z) = (1, 0, 1)$ $f(C_s, C_d) = C_s$
VK_BLEND_OP_DST_ATOP_EXT	$(X, Y, Z) = (1, 1, 0)$ $f(C_s, C_d) = C_d$

VK_BLEND_OP_DIFFERENCE_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = \lvert C_d - C_s \rvert$
VK_BLEND_OP_EXCLUSION_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = C_s + C_d - 2C_sC_d$
VK_BLEND_OP_INVERT_EXT	$(X, Y, Z) = (1, 0, 1)$ $f(C_s, C_d) = 1 - C_d$
VK_BLEND_OP_INVERT_RGB_EXT	$(X, Y, Z) = (1, 0, 1)$ $f(C_s, C_d) = C_s(1 - C_d)$
VK_BLEND_OP_LINEARDODGE_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = \begin{cases} C_s + C_d & C_s + C_d \leq 1 \\ 1 & \text{otherwise} \end{cases}$
VK_BLEND_OP_LINEARBURN_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = \begin{cases} C_s + C_d - 1 & C_s + C_d > 1 \\ 0 & \text{otherwise} \end{cases}$
VK_BLEND_OP_VIVIDLIGHT_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = \begin{cases} 1 - min(1, \frac{1-C_d}{2C_s}) & 0 < C_s < 0.5 \\ 0 & C_s \leq 0 \\ min(1, \frac{C_d}{2(1-C_s)}) & 0.5 \leq C_s < 1 \\ 1 & C_s \geq 1 \end{cases}$
VK_BLEND_OP_LINEARLIGHT_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = \begin{cases} 1 & 2C_s + C_d > 2 \\ 2C_s + C_d - 1 & 1 < 2C_s + C_d \leq 2 \\ 0 & 2C_s + C_d \leq 1 \end{cases}$
VK_BLEND_OP_PINLIGHT_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = \begin{cases} 0 & 2C_s - 1 > C_d \text{and} C_s < 0.5 \\ 2C_s - 1 & 2C_s - 1 > C_d \text{and} C_s \geq 0.5 \\ 2C_s & 2C_s - 1 \leq C_d \text{and} C_s < 0.5 C_d \\ C_d & 2C_s - 1 \leq C_d \text{and} C_s \geq 0.5 C_d \end{cases}$
VK_BLEND_OP_HARDMIX_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = \begin{cases} 0 & C_s + C_d < 1 \\ 1 & \text{otherwise} \end{cases}$

When using one of the HSL blend operations in table Hue-Saturation-Luminosity Advanced Blend

Operations as the blend operation, the RGB color components produced by the function f are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:

```
float minv3(vec3 c) {
  return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
  return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
  return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
  return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 ClipColor(vec3 color) {
  float lum = lumv3(color);
  float mincol = minv3(color);
  float maxcol = maxv3(color);
  if (mincol < 0.0) {
    color = lum + ((color-lum)*lum) / (lum-mincol);
  }
  if (maxcol > 1.0) {
    color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
  }
  return color;
}

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {
  float lbase = lumv3(cbase);
  float llum = lumv3(clum);
  float ldiff = llum - lbase;
  vec3 color = cbase + vec3(ldiff);
  return ClipColor(color);
}

// Take the base RGB color <cbase> and override its saturation with
// that of the RGB color <csat>.  The override the luminosity of the
// result with that of the RGB color <clum>.
vec3 SetLumSat(vec3 cbase, vec3 csat, vec3 clum)
{
```

```
    float minbase = minv3(cbase);
    float sbase = satv3(cbase);
    float ssat = satv3(csat);
    vec3 color;
    if (sbase > 0) {
      // Equivalent (modulo rounding errors) to setting the
      // smallest (R,G,B) component to 0, the largest to <ssat>,
      // and interpolating the "middle" component based on its
      // original value relative to the smallest/largest.
      color = (cbase - minbase) * ssat / sbase;
    } else {
      color = vec3(0.0);
    }
    return SetLum(color, clum);
  }
```

Table 38. Hue-Saturation-Luminosity Advanced Blend Operations

Mode	Result
VK_BLEND_OP_HSL_HUE_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = SetLumSat(C_s, C_d, C_d)$
VK_BLEND_OP_HSL_SATURATION_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = SetLumSat(C_d, C_s, C_d)$
VK_BLEND_OP_HSL_COLOR_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = SetLum(C_s, C_d)$
VK_BLEND_OP_HSL_LUMINOSITY_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = SetLum(C_d, C_s)$

When using one of the operations in table Additional RGB Blend Operations as the blend operation, the source and destination colors used by these blending operations are interpreted according to srcPremultiplied and dstPremultiplied. The blending operations below are evaluated where the RGB source and destination color components are both considered to have been premultiplied by the corresponding A component.

$$(R_s', G_s', B_s') = \begin{cases} (R_s, G_s, B_s) & \text{if srcPremultiplied is VK_TRUE} \\ (R_s A_s, G_s A_s, B_s A_s) & \text{if srcPremultiplied is VK_FALSE} \end{cases}$$

$$(R_d', G_d', B_d') = \begin{cases} (R_d, G_d, B_d) & \text{if dstPremultiplied is VK_TRUE} \\ (R_d A_d, G_d A_d, B_d A_d) & \text{if dstPremultiplied is VK_FALSE} \end{cases}$$

VK_BLEND_OP_GREEN_EXT	$(R, G, B, A) = (R_d', G_s', B_d', A_d)$
VK_BLEND_OP_BLUE_EXT	$(R, G, B, A) = (R_d', G_d', B_s', A_d)$

28.2. Logical Operations

The application **can** enable a *logical operation* between the fragment's color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of VkPipelineColorBlendStateCreateInfo. The `logicOpEnable` state can also be controlled by vkCmdSetLogicOpEnableEXT if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment's corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

```
// Provided by VK_VERSION_1_0
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR_REVERSE = 11,
    VK_LOGIC_OP_COPY_INVERTED = 12,
    VK_LOGIC_OP_OR_INVERTED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
```

The logical operations supported by Vulkan are summarized in the following table in which

- ¬ is bitwise invert,
- ∧ is bitwise and,
- ∨ is bitwise or,
- ⊕ is bitwise exclusive or,
- s is the fragment's R_{s0}, G_{s0}, B_{s0} or A_{s0} component value for the fragment output corresponding to the color attachment being updated, and
- d is the color attachment's R, G, B or A component value:

Table 40. Logical Operations

Mode	Operation
VK_LOGIC_OP_CLEAR	0
VK_LOGIC_OP_AND	s ∧ d
VK_LOGIC_OP_AND_REVERSE	s ∧ ¬ d
VK_LOGIC_OP_COPY	s
VK_LOGIC_OP_AND_INVERTED	¬ s ∧ d
VK_LOGIC_OP_NO_OP	d
VK_LOGIC_OP_XOR	s ⊕ d
VK_LOGIC_OP_OR	s ∨ d
VK_LOGIC_OP_NOR	¬ (s ∨ d)
VK_LOGIC_OP_EQUIVALENT	¬ (s ⊕ d)
VK_LOGIC_OP_INVERT	¬ d
VK_LOGIC_OP_OR_REVERSE	s ∨ ¬ d
VK_LOGIC_OP_COPY_INVERTED	¬ s
VK_LOGIC_OP_OR_INVERTED	¬ s ∨ d
VK_LOGIC_OP_NAND	¬ (s ∧ d)
VK_LOGIC_OP_SET	all 1s

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set whether logical operations are enabled, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetLogicOpEnableEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    logicOpEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOpEnable` specifies whether logical operations are enabled.

This command sets whether logical operations are enabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, this state is specified by the VkPipelineColorBlendStateCreateInfo::`logicOpEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLogicOpEnableEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3LogicOpEnable` feature is enabled
  - The `shaderObject` feature is enabled
- VUID-vkCmdSetLogicOpEnableEXT-logicOp-07366
  If the `logicOp` feature is not enabled, `logicOpEnable` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetLogicOpEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

To dynamically set the logical operation to apply for blend state, call:

```
// Provided by VK_EXT_shader_object
void vkCmdSetLogicOpEXT(
    VkCommandBuffer                             commandBuffer,
    VkLogicOp                                   logicOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the VkPipelineColorBlendStateCreateInfo::`logicOp` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-09422
  At least one of the following **must** be true:
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` **must** be a valid VkLogicOp value
- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetLogicOpEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

28.3. Color Write Mask

Bits which **can** be set in VkPipelineColorBlendAttachmentState::`colorWriteMask`, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- `VK_COLOR_COMPONENT_R_BIT` specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_G_BIT` specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_B_BIT` specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_A_BIT` specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if Color Write Enable is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the attachment are disabled.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

VkColorComponentFlags is a bitmask type for setting a mask of zero or more VkColorComponentFlagBits.

28.4. Color Write Enable

The VkPipelineColorWriteCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachmentCount;
    const VkBool32*    pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- attachmentCount is the number of VkBool32 elements in pColorWriteEnables.
- pColorWriteEnables is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the pNext chain of VkPipelineColorBlendStateCreateInfo, it defines per-attachment color write state. If this structure is not included in the pNext chain, it is equivalent to specifying this structure with attachmentCount equal to the attachmentCount member of VkPipelineColorBlendStateCreateInfo, and pColorWriteEnables pointing to an array of as many VK_TRUE values.

If the colorWriteEnable feature is not enabled, all VkBool32 elements in the pColorWriteEnables array **must** be VK_TRUE.

Color Write Enable interacts with the Color Write Mask as follows:

- If colorWriteEnable is VK_TRUE, writes to the attachment are determined by the colorWriteMask.
- If colorWriteEnable is VK_FALSE, the colorWriteMask is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a colorWriteMask of 0.

Valid Usage

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
  If the colorWriteEnable feature is not enabled, all elements of pColorWriteEnables **must** be VK_TRUE
- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-07608

If the pipeline is being created with VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, or VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic states not set, attachmentCount **must** be equal to the attachmentCount member of the VkPipelineColorBlendStateCreateInfo structure specified during pipeline creation

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-06655
  attachmentCount **must** be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

- VUID-VkPipelineColorWriteCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT
- VUID-VkPipelineColorWriteCreateInfoEXT-pColorWriteEnables-parameter
  If attachmentCount is not 0, pColorWriteEnables **must** be a valid pointer to an array of attachmentCount VkBool32 values

To dynamically enable or disable writes to a color attachment, call:

```
// Provided by VK_EXT_color_write_enable
void                                        vkCmdSetColorWriteEnableEXT(
    VkCommandBuffer                                 commandBuffer,
    uint32_t                                        attachmentCount,
    const VkBool32*                                 pColorWriteEnables);
```

- commandBuffer is the command buffer into which the command will be recorded.
- attachmentCount is the number of VkBool32 elements in pColorWriteEnables.
- pColorWriteEnables is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the color write enables for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorWriteCreateInfoEXT::pColorWriteEnables values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorWriteEnableEXT-None-04803
  The colorWriteEnable feature **must** be enabled
- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-06656
  attachmentCount **must** be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter
  `pColorWriteEnables` **must** be a valid pointer to an array of `attachmentCount` VkBool32 values
- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetColorWriteEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength
  `attachmentCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

Chapter 29. Dispatching Commands

The *dispatching commands* described in this chapter provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline **must** be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    groupCountX,
    uint32_t                                    groupCountY,
    uint32_t                                    groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX` × `groupCountY` × `groupCountZ` local workgroups is assembled.

Valid Usage

- VUID-vkCmdDispatch-magFilter-04553
  If a VkSampler created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatch-mipmapMode-04770
  If a VkSampler created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatch-unnormalizedCoordinates-09635
  If a VkSampler created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a VkImageView as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDispatch-unnormalizedCoordinates-09636
  If a VkSampler created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a VkImageView as a result of this command, then the image view's `viewType` **must** be

VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D

- VUID-vkCmdDispatch-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features **must** contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT
- VUID-vkCmdDispatch-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT
- VUID-vkCmdDispatch-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT
- VUID-vkCmdDispatch-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT
- VUID-vkCmdDispatch-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it **must** not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY
- VUID-vkCmdDispatch-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdDispatch-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command **must** have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdDispatch-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdDispatch-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdDispatch-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatch-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`
- VUID-vkCmdDispatch-None-08600
  For each set *n* that is statically used by a bound shader, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a VkPipelineLayout that is compatible for set *n*, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdDispatch-None-08601
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdDispatch-None-10068
  For each array of resources that is used by a bound shader, the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdDispatch-maintenance4-08602
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdDispatch-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, **must** be valid as described by descriptor validity if they are statically used by a bound shader
- VUID-vkCmdDispatch-None-08606
  If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdDispatch-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdDispatch-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- VUID-vkCmdDispatch-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage
- VUID-vkCmdDispatch-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- VUID-vkCmdDispatch-None-08607
  If the `shaderObject` feature is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command
- VUID-vkCmdDispatch-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatch-None-08612
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatch-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatch-None-08613
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatch-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions
- VUID-vkCmdDispatch-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- VUID-vkCmdDispatch-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types
- VUID-vkCmdDispatch-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match
- VUID-vkCmdDispatch-OpImageWrite-08795
  If a VkImageView created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdDispatch-OpImageWrite-08796
  If a VkImageView created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components
- VUID-vkCmdDispatch-OpImageWrite-04469
  If a VkBufferView is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdDispatch-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDispatch-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDispatch-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDispatch-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDispatch-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, VkImage objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatch-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, VkBuffer objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDispatch-None-07288
  Any shader invocation executed by this command **must** terminate
- VUID-vkCmdDispatch-None-09600
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDispatch-groupCountX-00386
  `groupCountX` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount`[0]
- VUID-vkCmdDispatch-groupCountY-00387
  `groupCountY` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount`[1]
- VUID-vkCmdDispatch-groupCountZ-00388
  `groupCountZ` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount`[2]

Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdDispatch-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdDispatch-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdDispatch-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdDispatch-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

To record an indirect dispatching command, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    buffer,
    VkDeviceSize                                offset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `buffer` is the buffer containing dispatch parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDispatchIndirect` behaves similarly to vkCmdDispatch except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a VkDispatchIndirectCommand structure taken from `buffer` starting at `offset`.

Valid Usage

- VUID-vkCmdDispatchIndirect-magFilter-04553
  If a VkSampler created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchIndirect-mipmapMode-04770
  If a VkSampler created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchIndirect-unnormalizedCoordinates-09635
  If a VkSampler created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a VkImageView as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDispatchIndirect-unnormalizedCoordinates-09636
  If a VkSampler created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a VkImageView as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDispatchIndirect-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features **must** contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT
- VUID-vkCmdDispatchIndirect-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT
- VUID-vkCmdDispatchIndirect-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT
- VUID-vkCmdDispatchIndirect-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT
- VUID-vkCmdDispatchIndirect-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it **must** not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY
- VUID-vkCmdDispatchIndirect-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdDispatchIndirect-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command **must** have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdDispatchIndirect-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdDispatchIndirect-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdDispatchIndirect-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdDispatchIndirect-OpTypeImage-07030

Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatchIndirect-None-08600
  For each set *n* that is statically used by a bound shader, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a VkPipelineLayout that is compatible for set *n*, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdDispatchIndirect-None-08601
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdDispatchIndirect-None-10068
  For each array of resources that is used by a bound shader, the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdDispatchIndirect-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdDispatchIndirect-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, **must** be valid as described by descriptor validity if they are statically used by a bound shader
- VUID-vkCmdDispatchIndirect-None-08606
  If the shaderObject feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdDispatchIndirect-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdDispatchIndirect-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDispatchIndirect-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage
- VUID-vkCmdDispatchIndirect-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- VUID-vkCmdDispatchIndirect-None-08607
  If the `shaderObject` feature is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command
- VUID-vkCmdDispatchIndirect-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchIndirect-None-08612
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchIndirect-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchIndirect-None-08613
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchIndirect-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions
- VUID-vkCmdDispatchIndirect-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- VUID-vkCmdDispatchIndirect-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types
- VUID-vkCmdDispatchIndirect-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match
- VUID-vkCmdDispatchIndirect-OpImageWrite-08795
  If a VkImageView created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdDispatchIndirect-OpImageWrite-08796
  If a VkImageView created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components
- VUID-vkCmdDispatchIndirect-OpImageWrite-04469
  If a VkBufferView is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdDispatchIndirect-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDispatchIndirect-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDispatchIndirect-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDispatchIndirect-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, VkImage objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, VkBuffer objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDispatchIndirect-None-07288
  Any shader invocation executed by this command **must** terminate
- VUID-vkCmdDispatchIndirect-None-09600
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDispatchIndirect-buffer-02708
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdDispatchIndirect-buffer-02709
  `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- VUID-vkCmdDispatchIndirect-offset-02710
  `offset` **must** be a multiple of `4`
- VUID-vkCmdDispatchIndirect-offset-00407
  The sum of `offset` and the size of `VkDispatchIndirectCommand` **must** be less than or equal to the size of `buffer`

Valid Usage (Implicit)

- VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdDispatchIndirect-buffer-parameter
  `buffer` **must** be a valid VkBuffer handle
- VUID-vkCmdDispatchIndirect-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdDispatchIndirect-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdDispatchIndirect-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdDispatchIndirect-commonparent
  Both of `buffer`, and `commandBuffer` **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

The VkDispatchIndirectCommand structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t    x;
    uint32_t    y;
    uint32_t    z;
} VkDispatchIndirectCommand;
```

- x is the number of local workgroups to dispatch in the X dimension.
- y is the number of local workgroups to dispatch in the Y dimension.
- z is the number of local workgroups to dispatch in the Z dimension.

The members of VkDispatchIndirectCommand have the same meaning as the corresponding parameters of vkCmdDispatch.

Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
  x **must** be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]
- VUID-VkDispatchIndirectCommand-y-00418
  y **must** be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]
- VUID-VkDispatchIndirectCommand-z-00419
  z **must** be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

To record a dispatch using non-zero base values for the components of WorkgroupId, call:

```
// Provided by VK_KHR_device_group
void vkCmdDispatchBaseKHR(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    baseGroupX,
    uint32_t                                    baseGroupY,
    uint32_t                                    baseGroupZ,
    uint32_t                                    groupCountX,
    uint32_t                                    groupCountY,
    uint32_t                                    groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `baseGroupX` is the start value for the X component of `WorkgroupId`.
- `baseGroupY` is the start value for the Y component of `WorkgroupId`.
- `baseGroupZ` is the start value for the Z component of `WorkgroupId`.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX` × `groupCountY` × `groupCountZ` local workgroups is assembled, with `WorkgroupId` values ranging from [`baseGroup*`, `baseGroup*` + `groupCount*`) in each component. vkCmdDispatch is equivalent to `vkCmdDispatchBase(0,0,0,groupCountX,groupCountY,groupCountZ)`.

Valid Usage

- VUID-vkCmdDispatchBase-magFilter-04553
  If a VkSampler created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchBase-mipmapMode-04770
  If a VkSampler created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchBase-unnormalizedCoordinates-09635
  If a VkSampler created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a VkImageView as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDispatchBase-unnormalizedCoordinates-09636
  If a VkSampler created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a VkImageView as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDispatchBase-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features **must** contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT
- VUID-vkCmdDispatchBase-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT
- VUID-vkCmdDispatchBase-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT
- VUID-vkCmdDispatchBase-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT
- VUID-vkCmdDispatchBase-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it **must** not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY
- VUID-vkCmdDispatchBase-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdDispatchBase-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command **must** have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdDispatchBase-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdDispatchBase-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdDispatchBase-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdDispatchBase-OpTypeImage-07030

Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatchBase-None-08600
  For each set *n* that is statically used by a bound shader, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a VkPipelineLayout that is compatible for set *n*, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdDispatchBase-None-08601
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdDispatchBase-None-10068
  For each array of resources that is used by a bound shader, the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdDispatchBase-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdDispatchBase-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, **must** be valid as described by descriptor validity if they are statically used by a bound shader
- VUID-vkCmdDispatchBase-None-08606
  If the shaderObject feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdDispatchBase-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdDispatchBase-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDispatchBase-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage
- VUID-vkCmdDispatchBase-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- VUID-vkCmdDispatchBase-None-08607
  If the `shaderObject` feature is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command
- VUID-vkCmdDispatchBase-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchBase-None-08612
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchBase-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchBase-None-08613
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchBase-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions
- VUID-vkCmdDispatchBase-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- VUID-vkCmdDispatchBase-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types
- VUID-vkCmdDispatchBase-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match
- VUID-vkCmdDispatchBase-OpImageWrite-08795
  If a VkImageView created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdDispatchBase-OpImageWrite-08796
  If a VkImageView created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components
- VUID-vkCmdDispatchBase-OpImageWrite-04469
  If a VkBufferView is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdDispatchBase-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDispatchBase-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDispatchBase-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDispatchBase-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, VkImage objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, VkBuffer objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDispatchBase-None-07288
  Any shader invocation executed by this command **must** terminate
- VUID-vkCmdDispatchBase-None-09600
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDispatchBase-baseGroupX-00421
  `baseGroupX` **must** be less than `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[0]
- VUID-vkCmdDispatchBase-baseGroupX-00422
  `baseGroupY` **must** be less than `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[1]
- VUID-vkCmdDispatchBase-baseGroupZ-00423
  `baseGroupZ` **must** be less than `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[2]
- VUID-vkCmdDispatchBase-groupCountX-00424
  `groupCountX` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[0] minus `baseGroupX`
- VUID-vkCmdDispatchBase-groupCountY-00425
  `groupCountY` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[1] minus `baseGroupY`
- VUID-vkCmdDispatchBase-groupCountZ-00426
  `groupCountZ` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[2] minus `baseGroupZ`
- VUID-vkCmdDispatchBase-baseGroupX-00427
  If any of `baseGroupX`, `baseGroupY`, or `baseGroupZ` are not zero, then the bound compute pipeline **must** have been created with the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag or the bound compute shader object **must** have been created with the `VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT` flag

Valid Usage (Implicit)

- VUID-vkCmdDispatchBase-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdDispatchBase-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdDispatchBase-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdDispatchBase-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdDispatchBase-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

Chapter 30. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define a layout describing the sequence of commands which should be generated.
- Optionally set up device-bindable shaders.
- Retrieve device addresses by `vkGetBufferDeviceAddressEXT` for setting buffers on the device.
- Fill one or more `VkBuffer` with the appropriate content that gets interpreted by the command layout.
- Create a `preprocess` `VkBuffer` using the device-queried allocation information.
- Optionally preprocess the input data in a separate action.
- Generate and execute the actual commands.

The preprocessing step executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they **must** be explicitly synchronized against the command execution. When not preprocessing in a separate step, the preprocessing is automatically synchronized against the command execution.

30.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```
// Provided by VK_EXT_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutEXT)
```

Each indirect command layout **must** have exactly one action command token and it **must** be the last token in the sequence.

NOTE	If the indirect commands layout contains only 1 token, it will be an action command token, and the contents of the indirect buffer will be a sequence of indirect command structures, similar to the ones used for indirect draws and dispatches. On some implementations, using indirect draws and dispatches for these cases will result in increased performance compared to using device-generated commands, due to the overhead that results from using the latter.

30.1.1. Creation and Deletion

Indirect command layouts for `VK_EXT_device_generated_commands` are created by:

```
// Provided by VK_EXT_device_generated_commands
VkResult vkCreateIndirectCommandsLayoutEXT(
    VkDevice                                    device,
    const VkIndirectCommandsLayoutCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkIndirectCommandsLayoutEXT*                pIndirectCommandsLayout);
```

- `device` is the logical device that creates the indirect command layout.
- `pCreateInfo` is a pointer to a VkIndirectCommandsLayoutCreateInfoEXT structure containing parameters affecting creation of the indirect command layout.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pIndirectCommandsLayout` is a pointer to a `VkIndirectCommandsLayoutEXT` handle in which the resulting indirect command layout is returned.

Valid Usage

- VUID-vkCreateIndirectCommandsLayoutEXT-deviceGeneratedCommands-11089
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateIndirectCommandsLayoutEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateIndirectCommandsLayoutEXT-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkIndirectCommandsLayoutCreateInfoEXT structure
- VUID-vkCreateIndirectCommandsLayoutEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateIndirectCommandsLayoutEXT-pIndirectCommandsLayout-parameter
  `pIndirectCommandsLayout` **must** be a valid pointer to a VkIndirectCommandsLayoutEXT handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The VkIndirectCommandsLayoutCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsLayoutCreateInfoEXT {
    VkStructureType                                 sType;
    const void*                                     pNext;
    VkIndirectCommandsLayoutUsageFlagsEXT           flags;
    VkShaderStageFlags                              shaderStages;
    uint32_t                                        indirectStride;
    VkPipelineLayout                                pipelineLayout;
    uint32_t                                        tokenCount;
    const VkIndirectCommandsLayoutTokenEXT*         pTokens;
} VkIndirectCommandsLayoutCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkIndirectCommandsLayoutUsageFlagBitsEXT specifying usage rules for this layout.
- shaderStages is the VkShaderStageFlags that this layout supports.
- indirectStride is the distance in bytes between sequences in the indirect buffer
- pipelineLayout is the optional VkPipelineLayout that tokens in this layout use. If the dynamicGeneratedPipelineLayout feature is enabled, pipelineLayout **can** be VK_NULL_HANDLE and the layout **must** be specified by chaining the VkPipelineLayoutCreateInfo structure off the pNext
- tokenCount is the length of the individual command sequence.
- pTokens is a pointer to an array of VkIndirectCommandsLayoutTokenEXT describing each command token in detail.

The following code illustrates some of the flags:

```
void cmdProcessAllSequences(cmd, indirectExecutionSet, indirectCommandsLayout,
indirectAddress, sequencesCount)
{
  for (s = 0; s < sequencesCount; s++)
  {
    sUsed = s;

    if (indirectCommandsLayout.flags &
VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT) {
      sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
    }

    cmdProcessSequence( cmd, indirectExecutionSet, indirectCommandsLayout,
indirectAddress, sUsed );
  }
```

```
}
```

When tokens are consumed, an offset is computed based on token offset and stream stride. The resulting offset is required to be aligned. The alignment for a specific token is equal to the scalar alignment of the data type as defined in Alignment Requirements, or 4, whichever is lower.

Valid Usage

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-indirectStride-11090
  `indirectStride` **must** be less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`maxIndirectCommandsIndirectStride`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11091
  `shaderStages` **must** only contain stages supported by VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`supportedIndirectCommandsShaderStages`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-tokenCount-11092
  `tokenCount` **must** less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`maxIndirectCommandsTokenCount`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11093
  The number of tokens in the `pTokens` array with `type` equal to `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` **must** be less than or equal to `1`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11145
  The number of tokens in the `pTokens` array with `type` equal to `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT` **must** be less than or equal to `1`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11094
  The number of tokens in the `pTokens` array with `type` equal to `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT` **must** be less than or equal to `1`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11095
  If the action command token in the `pTokens` array is not an indexed draw token, then `pTokens` **must** not contain a member with `type` set to `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11096
  If the action command token in the `pTokens` array is not a non-mesh draw token, then `pTokens` **must** not contain a member with `type` set to `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11097
  If the `pTokens` array contains multiple tokens with `type` equal to `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT`, then there **must** be no duplicate VkIndirectCommandsVertexBufferTokenEXT::`vertexBindingUnit` values
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11099
  For all `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT` and

VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT type tokens in pTokens, there **must** be no overlapping ranges between any specified push constant ranges

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11100
  The action command token **must** be the last token in the pTokens array
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11139
  If the pTokens array contains a VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT token, then this token **must** be the first token in the array
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11101
  For any element of pTokens, if type is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT or VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT and the dynamicGeneratedPipelineLayout feature is not enabled, then the pipelineLayout **must** not be VK_NULL_HANDLE
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11102
  For any element of pTokens, if type is either VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT or VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT and pipelineLayout is VK_NULL_HANDLE, then the pNext chain **must** include a VkPipelineLayoutCreateInfo struct
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11103
  For any element of pTokens, the offset **must** be greater than or equal to the offset member of the previous tokens
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11104
  For any element of pTokens, if type is VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT, VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT, VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_COUNT_EXT, VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_EXT, or VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_EXT, then shaderStages **must** contain graphics stages
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11105
  For any element of pTokens, if type is VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT, then shaderStages **must** be VK_SHADER_STAGE_COMPUTE_BIT
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11108
  For any element of pTokens, if type is VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT, then shaderStages **must** contain ray tracing stages
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11109
  If shaderStages contains graphics stages then the state tokens in pTokens **must** not include VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT, VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11110
  If shaderStages is VK_SHADER_STAGE_COMPUTE_BIT then the state tokens in pTokens **must** only include VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT, VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT, VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT, or VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11111
  If `shaderStages` contains ray tracing stages then the state tokens in `pTokens` **must** only include `VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT`, or `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11112
  The `shaderStages` **must** only contain stages from one of the following:
  - graphics stages
  - `VK_SHADER_STAGE_COMPUTE_BIT`
  - ray tracing stages
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11113
  If `shaderStages` contains `VK_SHADER_STAGE_FRAGMENT_BIT`, then `shaderStages` **must** also contain `VK_SHADER_STAGE_VERTEX_BIT`

Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_EXT`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkPipelineLayoutCreateInfo
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-flags-parameter
  `flags` **must** be a valid combination of VkIndirectCommandsLayoutUsageFlagBitsEXT values
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-parameter
  `shaderStages` **must** be a valid combination of VkShaderStageFlagBits values
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-requiredbitmask
  `shaderStages` **must** not be `0`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pipelineLayout-parameter
  If `pipelineLayout` is not VK_NULL_HANDLE, `pipelineLayout` **must** be a valid VkPipelineLayout handle
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-parameter
  `pTokens` **must** be a valid pointer to an array of `tokenCount` valid VkIndirectCommandsLayoutTokenEXT structures
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-tokenCount-arraylength
  `tokenCount` **must** be greater than `0`

Bits which **can** be set in VkIndirectCommandsLayoutCreateInfoEXT::`flags`, specifying usage hints of an indirect command layout, are:

```
// Provided by VK_EXT_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsEXT {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT = 0x00000002,
} VkIndirectCommandsLayoutUsageFlagBitsEXT;
```

- VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT specifies that the layout is always used with the manual preprocessing step through calling vkCmdPreprocessGeneratedCommandsEXT and executed by vkCmdExecuteGeneratedCommandsEXT with isPreprocessed set to VK_TRUE.
- VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT specifies that the processing of sequences will happen at an implementation-dependent order, which is not guaranteed to be deterministic using the same input data. This flag is ignored when the shaderStages is VK_SHADER_STAGE_COMPUTE_BIT as it is implied that the dispatch sequence is always unordered.

```
// Provided by VK_EXT_device_generated_commands
typedef VkFlags VkIndirectCommandsLayoutUsageFlagsEXT;
```

VkIndirectCommandsLayoutUsageFlagsEXT is a bitmask type for setting a mask of zero or more VkIndirectCommandsLayoutUsageFlagBitsEXT.

Indirect command layouts for VK_EXT_device_generated_commands are destroyed by:

```
// Provided by VK_EXT_device_generated_commands
void vkDestroyIndirectCommandsLayoutEXT(
    VkDevice                                    device,
    VkIndirectCommandsLayoutEXT                 indirectCommandsLayout,
    const VkAllocationCallbacks*                pAllocator);
```

- device is the logical device that destroys the layout.
- indirectCommandsLayout is the layout to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-11114
  All submitted commands that refer to indirectCommandsLayout **must** have completed execution
- VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-11115
  If VkAllocationCallbacks were provided when indirectCommandsLayout was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-11116
  If no VkAllocationCallbacks were provided when indirectCommandsLayout was created,

pAllocator **must** be NULL

Valid Usage (Implicit)

- VUID-vkDestroyIndirectCommandsLayoutEXT-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-parameter
  If indirectCommandsLayout is not VK_NULL_HANDLE, indirectCommandsLayout **must** be a valid VkIndirectCommandsLayoutEXT handle
- VUID-vkDestroyIndirectCommandsLayoutEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-parent
  If indirectCommandsLayout is a valid handle, it **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to indirectCommandsLayout **must** be externally synchronized

30.1.2. Token Input Streams

For VK_EXT_device_generated_commands, the input streams **can** contain raw uint32_t values, existing indirect commands such as:

- VkDrawIndirectCommand
- VkDrawIndexedIndirectCommand
- VkDispatchIndirectCommand
- VkTraceRaysIndirectCommandKHR
- VkTraceRaysIndirectCommand2KHR

or additional commands as listed below. How the data is used is described in the next section.

The VkBindIndexBufferIndirectCommandEXT structure specifies the input data for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandEXT {
    VkDeviceAddress    bufferAddress;
    uint32_t           size;
    VkIndexType        indexType;
} VkBindIndexBufferIndirectCommandEXT;
```

- `bufferAddress` specifies a physical address of the VkBuffer used as index buffer.
- `size` is the byte size range which is available for this operation from the provided address.
- `indexType` is a VkIndexType value specifying how indices are treated.

Valid Usage

- VUID-VkBindIndexBufferIndirectCommandEXT-None-11117
  The buffer's usage flags from which the address was acquired **must** have the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` bit set
- VUID-VkBindIndexBufferIndirectCommandEXT-bufferAddress-11118
  The `bufferAddress` **must** be aligned to the VkIndexType of the `indexType` used
- VUID-VkBindIndexBufferIndirectCommandEXT-None-11119
  Each element of the buffer from which the address was acquired and that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Valid Usage (Implicit)

- VUID-VkBindIndexBufferIndirectCommandEXT-indexType-parameter
  `indexType` **must** be a valid VkIndexType value

The `VkBindVertexBufferIndirectCommandEXT` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT` token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkBindVertexBufferIndirectCommandEXT {
    VkDeviceAddress    bufferAddress;
    uint32_t           size;
    uint32_t           stride;
} VkBindVertexBufferIndirectCommandEXT;
```

- `bufferAddress` specifies a physical address of the VkBuffer used as vertex input binding.
- `size` is the byte size range which is available for this operation from the provided address.
- `stride` is the byte size stride for this vertex input binding as in `VkVertexInputBindingDescription` ::`stride`.

Valid Usage

- VUID-VkBindVertexBufferIndirectCommandEXT-None-11120
  The buffer's usage flag from which the address was acquired **must** have the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` bit set
- VUID-VkBindVertexBufferIndirectCommandEXT-None-11121
  Each element of the buffer from which the address was acquired and that is non-sparse

must be bound completely and contiguously to a single VkDeviceMemory object

The VkDrawIndirectCountIndirectCommandEXT structure specifies the input data for all draw-type tokens.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkDrawIndirectCountIndirectCommandEXT {
    VkDeviceAddress    bufferAddress;
    uint32_t           stride;
    uint32_t           commandCount;
} VkDrawIndirectCountIndirectCommandEXT;
```

- bufferAddress specifies a physical address of the VkBuffer used for draw commands.
- stride is the byte size stride for the command arguments
- commandCount is the number of commands to execute

The corresponding indirect draw struct data will be read from the buffer address.

Valid Usage

- VUID-VkDrawIndirectCountIndirectCommandEXT-None-11122
  The buffer's usage flag from which the address was acquired **must** have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set
- VUID-VkDrawIndirectCountIndirectCommandEXT-None-11123
  Each element of the buffer from which the address was acquired and that is non-sparse **must** be bound completely and contiguously to a single VkDeviceMemory object

30.1.3. Tokenized Command Processing

The processing for VK_EXT_device_generated_commands is in principle illustrated below:

```
void cmdProcessSequence(cmd, indirectExecutionSet, indirectCommandsLayout,
indirectAddress, s)
{
  for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
  {
    uint32_t offset  = indirectCommandsLayout.pTokens[t].offset;
    uint32_t stride  = indirectCommandsLayout.indirectStride;
    VkDeviceAddress streamData = indirectAddress;
    const void* input = streamData + stride * s + offset;

    // further details later
    indirectCommandsLayout.pTokens[t].command (cmd, indirectExecutionSet, input, s);
  }
}
```

```
void cmdProcessAllSequences(cmd, indirectExecutionSet, indirectCommandsLayout,
indirectAddress, sequencesCount)
{
  for (s = 0; s < sequencesCount; s++)
  {
    sUsed = s;

    if (indirectCommandsLayout.flags &
VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT) {
      sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
    }

    cmdProcessSequence( cmd, indirectExecutionSet, indirectCommandsLayout,
indirectAddress, sUsed );
  }
}
```

The processing of each sequence is considered stateless, therefore all state changes **must** occur prior to action commands within the sequence. A single sequence is strictly targeting the VkShaderStageFlags it was created with.

The primary input data for each token is provided through VkBuffer content at preprocessing using vkCmdPreprocessGeneratedCommandsEXT or execution time using vkCmdExecuteGeneratedCommandsEXT, however some functional arguments, for example push constant layouts, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the VkIndirectCommandsLayoutCreateInfoEXT::pTokens array specifying command tokens (other elements of the array specify command parameters) are:

```
// Provided by VK_EXT_device_generated_commands
typedef enum VkIndirectCommandsTokenTypeEXT {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_EXT = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_EXT = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_COUNT_EXT = 7,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_COUNT_EXT = 8,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT = 9,
  // Provided by VK_KHR_ray_tracing_maintenance1 with VK_EXT_device_generated_commands
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT = 1000386004,
} VkIndirectCommandsTokenTypeEXT;
```

Table 41. Supported Indirect Command Tokens

Common Tokens	Command Data
VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT	u32[] array of indices into the indirect execution set
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT	u32[] raw data
VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT	u32 placeholder data (not accessed by shader)
Compute Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT	VkDispatchIndirectCommand
Ray Tracing Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT	VkTraceRaysIndirectCommand2KHR
Graphics State Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT	VkBindIndexBufferIndirectCommandEXT
VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT	VkBindVertexBufferIndirectCommandEXT
Graphics Draw Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_EXT	VkDrawIndexedIndirectCommand
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_EXT	VkDrawIndirectCommand
Graphics Draw Count Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_COUNT_EXT	VkDrawIndirectCountIndirectCommandEXT with VkDrawIndexedIndirectCommand
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_COUNT_EXT	VkDrawIndirectCountIndirectCommandEXT with VkDrawIndirectCommand

The VkIndirectCommandsLayoutTokenEXT structure specifies details to the function arguments that need to be known at layout creation time:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsLayoutTokenEXT {
    VkStructureType                    sType;
    const void*                        pNext;
    VkIndirectCommandsTokenTypeEXT     type;
    VkIndirectCommandsTokenDataEXT     data;
    uint32_t                           offset;
} VkIndirectCommandsLayoutTokenEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` specifies the VkIndirectCommandsTokenTypeEXT for `data`.
- `data` specifies a VkIndirectCommandsTokenDataEXT containing token-specific details for command execution. It is ignored if `type` does not match any member of the VkIndirectCommandsTokenDataEXT union.
- `offset` is the relative byte offset for the token within one sequence of the indirect buffer. The data stored at that offset is the command data for the token, e.g. `VkDispatchIndirectCommand`.

Valid Usage

- VUID-VkIndirectCommandsLayoutTokenEXT-offset-11124
  `offset` **must** be less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`maxIndirectCommandsTokenOffset`
- VUID-VkIndirectCommandsLayoutTokenEXT-offset-11125
  `offset` **must** be aligned to `4`
- VUID-VkIndirectCommandsLayoutTokenEXT-rayTracingMaintenance1-11128
  If the `rayTracingMaintenance1` feature is not enabled, `type` **must** not be `VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT`
- VUID-VkIndirectCommandsLayoutTokenEXT-deviceGeneratedCommandsMultiDrawIndirectCount-11129
  If VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`deviceGeneratedCommandsMultiDrawIndirectCount` is not supported, `type` **must** not be `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_COUNT_EXT` or `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_COUNT_EXT`

Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutTokenEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_EXT`
- VUID-VkIndirectCommandsLayoutTokenEXT-type-parameter
  `type` **must** be a valid VkIndirectCommandsTokenTypeEXT value

- VUID-VkIndirectCommandsLayoutTokenEXT-pPushConstant-parameter
  If `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT`,VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT, the `pPushConstant` member of `data` **must** be a valid pointer to a valid VkIndirectCommandsPushConstantTokenEXT structure
- VUID-VkIndirectCommandsLayoutTokenEXT-pVertexBuffer-parameter
  If `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT`, the `pVertexBuffer` member of `data` **must** be a valid pointer to a valid VkIndirectCommandsVertexBufferTokenEXT structure
- VUID-VkIndirectCommandsLayoutTokenEXT-pIndexBuffer-parameter
  If `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT`, the `pIndexBuffer` member of `data` **must** be a valid pointer to a valid VkIndirectCommandsIndexBufferTokenEXT structure
- VUID-VkIndirectCommandsLayoutTokenEXT-pExecutionSet-parameter
  If `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT`, the `pExecutionSet` member of `data` **must** be a valid pointer to a valid VkIndirectCommandsExecutionSetTokenEXT structure

The `VkIndirectCommandsTokenDataEXT` structure provides token-specific details used to generate the indirect execution layout.

```
// Provided by VK_EXT_device_generated_commands
typedef union VkIndirectCommandsTokenDataEXT {
    const VkIndirectCommandsPushConstantTokenEXT*    pPushConstant;
    const VkIndirectCommandsVertexBufferTokenEXT*    pVertexBuffer;
    const VkIndirectCommandsIndexBufferTokenEXT*     pIndexBuffer;
    const VkIndirectCommandsExecutionSetTokenEXT*    pExecutionSet;
} VkIndirectCommandsTokenDataEXT;
```

- `pPushConstant` is a pointer to a VkIndirectCommandsPushConstantTokenEXT struct needed for `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT` and `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT` tokens
- `pVertexBuffer` is a pointer to a VkIndirectCommandsVertexBufferTokenEXT struct needed for `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT` tokens
- `pIndexBuffer` is a pointer to a VkIndirectCommandsIndexBufferTokenEXT struct needed for `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT` tokens
- `pExecutionSet` is a pointer to a VkIndirectCommandsExecutionSetTokenEXT struct needed for `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` tokens

The appropriate member of the union **must** be set for each token.

The following code provides detailed information on how an individual sequence is processed. For valid usage, all restrictions from the regular commands apply.

```
void cmdProcessSequence(cmd, indirectExecutionSet, indirectCommandsLayout,
indirectAddress, s)
{
  for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++) {
    VkIndirectCommandsLayoutTokenEXT *token = &indirectCommandsLayout.pTokens[t];

    uint32_t offset  = token->offset;
    uint32_t stride  = indirectCommandsLayout.indirectStride;
    VkDeviceAddress streamData = indirectAddress;
    const void* input = streamData + stride * s + offset;

    switch (token->tokenType) {
    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT:
      uint32_t *bind = input;
      VkIndirectCommandsExecutionSetTokenEXT *info = token->data.pExecutionSet;

      if (info->type == VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT) {
        vkCmdBindPipeline(cmd, indirectExecutionSet.pipelineBindPoint,
indirectExecutionSet.pipelines[*bind]);
      } else {
        VkShaderStageFlagBits stages[];
        VkShaderEXT shaders[];
        uint32_t i = 0;
        IterateBitmaskLSBToMSB(iter, info->shaderStages) {
            stages[i] = iter;
            shaders[i] = indirectExecutionSet.shaders[bind[i]].shaderObject;
            i++;
        }
        vkCmdBindShadersEXT(cmd, i, stages, shaders);
      }
      break;

    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT:
      uint32_t* data = input;
      VkPushConstantsInfoKHR info = {
        VK_STRUCTURE_TYPE_PUSH_CONSTANTS_INFO_KHR,
        // this can also use `dynamicGeneratedPipelineLayout' to pass a
VkPipelineLayoutCreateInfo from pNext
        indirectCommandsLayout.pipelineLayout,
        token->token.pushConstant.updateRange.shaderStages,
        token->token.pushConstant.updateRange.offset,
        token->token.pushConstant.updateRange.size,
        data
      };

      vkCmdPushConstants2KHR(cmd, &info);
      break;

    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT:
      VkPushConstantsInfoKHR info = {
```

```
        VK_STRUCTURE_TYPE_PUSH_CONSTANTS_INFO_KHR,
        // this can also use `dynamicGeneratedPipelineLayout' to pass a
VkPipelineLayoutCreateInfo from pNext
        indirectCommandsLayout.pipelineLayout,
        token->token.pushConstant.updateRange.shaderStages,
        token->token.pushConstant.updateRange.offset,
        // this must be 4
        token->token.pushConstant.updateRange.size,
        // this just updates the sequence index
        &s
      };

      vkCmdPushConstants2KHR(cmd, &info);
      break;

    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT:

```

```
      break;
    }
  }
}
```

The VkIndirectCommandsPushConstantTokenEXT structure specifies the layout token info for VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT and VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT tokens.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsPushConstantTokenEXT {
    VkPushConstantRange    updateRange;
} VkIndirectCommandsPushConstantTokenEXT;
```

- updateRange is the push constant range that will be updated by the token.

The stageFlags member of updateRange is ignored.

Valid Usage

- VUID-VkIndirectCommandsPushConstantTokenEXT-updateRange-11132
  updateRange **must** be contained within the push constant info used by VkIndirectCommandsLayoutCreateInfoEXT
- VUID-VkIndirectCommandsPushConstantTokenEXT-size-11133
  If the token type is VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT, the size member of updateRange **must** be 4

Valid Usage (Implicit)

- VUID-VkIndirectCommandsPushConstantTokenEXT-updateRange-parameter
  updateRange **must** be a valid VkPushConstantRange structure

The VkIndirectCommandsVertexBufferTokenEXT structure specifies the layout token info for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsVertexBufferTokenEXT {
    uint32_t    vertexBindingUnit;
} VkIndirectCommandsVertexBufferTokenEXT;
```

- vertexBindingUnit is the vertex input binding number to be bound.

Valid Usage

- VUID-VkIndirectCommandsVertexBufferTokenEXT-vertexBindingUnit-11134
  `vertexBindingUnit` **must** be less than the total number of vertex input bindings in use by the current graphics state

The `VkIndirectCommandsIndexBufferTokenEXT` structure specifies the layout token info for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT` token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsIndexBufferTokenEXT {
    VkIndirectCommandsInputModeFlagBitsEXT    mode;
} VkIndirectCommandsIndexBufferTokenEXT;
```

- `mode` specifies the mode to use with this token.

This allows for easy layering of Vulkan atop other APIs. When `VK_INDIRECT_COMMANDS_INPUT_MODE_DXGI_INDEX_BUFFER_EXT` is specified, the indirect buffer can contain a `D3D12_INDEX_BUFFER_VIEW` instead of VkBindIndexBufferIndirectCommandEXT as D3D's DXGI format value is mapped to the VkIndexType. It works as both structs are otherwise binary compatible.

Valid Usage

- VUID-VkIndirectCommandsIndexBufferTokenEXT-mode-11135
  `mode` **must** be non-zero
- VUID-VkIndirectCommandsIndexBufferTokenEXT-mode-11136
  `mode` **must** be one of the bits supported in VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`supportedIndirectCommandsInputModes`

Valid Usage (Implicit)

- VUID-VkIndirectCommandsIndexBufferTokenEXT-mode-parameter
  `mode` **must** be a valid VkIndirectCommandsInputModeFlagBitsEXT value

Bits which are set in VkIndirectCommandsIndexBufferTokenEXT::`mode`, specifying how an index buffer is used, are:

```
// Provided by VK_EXT_device_generated_commands
typedef enum VkIndirectCommandsInputModeFlagBitsEXT {
    VK_INDIRECT_COMMANDS_INPUT_MODE_VULKAN_INDEX_BUFFER_EXT = 0x00000001,
    VK_INDIRECT_COMMANDS_INPUT_MODE_DXGI_INDEX_BUFFER_EXT = 0x00000002,
} VkIndirectCommandsInputModeFlagBitsEXT;
```

- VK_INDIRECT_COMMANDS_INPUT_MODE_VULKAN_INDEX_BUFFER_EXT specifies that the indirect buffer contains VkBindIndexBufferIndirectCommandEXT.
- VK_INDIRECT_COMMANDS_INPUT_MODE_DXGI_INDEX_BUFFER_EXT specifies that the indirect buffer contains D3D12_INDEX_BUFFER_VIEW.

```
// Provided by VK_EXT_device_generated_commands
typedef VkFlags VkIndirectCommandsInputModeFlagsEXT;
```

VkIndirectCommandsInputModeFlagsEXT is a bitmask type for setting a mask of zero or more VkIndirectCommandsInputModeFlagBitsEXT.

The VkIndirectCommandsExecutionSetTokenEXT structure specifies the input data for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsExecutionSetTokenEXT {
    VkIndirectExecutionSetInfoTypeEXT    type;
    VkShaderStageFlags                   shaderStages;
} VkIndirectCommandsExecutionSetTokenEXT;
```

- type describes the type of indirect execution set in use.
- shaderStages specifies the shaders that will be changed by this token.

Valid Usage

- VUID-VkIndirectCommandsExecutionSetTokenEXT-shaderStages-11137
  Each bit in shaderStages **must** be supported by VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStagesPipelineBinding or VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStagesShaderBinding

Valid Usage (Implicit)

- VUID-VkIndirectCommandsExecutionSetTokenEXT-type-parameter
  type **must** be a valid VkIndirectExecutionSetInfoTypeEXT value
- VUID-VkIndirectCommandsExecutionSetTokenEXT-shaderStages-parameter

`shaderStages` **must** be a valid combination of VkShaderStageFlagBits values

- VUID-VkIndirectCommandsExecutionSetTokenEXT-shaderStages-requiredbitmask
  `shaderStages` **must** not be `0`

30.2. Indirect Commands Generation and Execution

The generation of commands on the device requires a `preprocess` buffer.

With `VK_EXT_device_generated_commands`, to retrieve the memory size and alignment requirements of a particular execution state call:

```
// Provided by VK_EXT_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsEXT(
    VkDevice                                    device,
    const VkGeneratedCommandsMemoryRequirementsInfoEXT* pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a VkGeneratedCommandsMemoryRequirementsInfoEXT structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the buffer object are returned.

If the size returned is zero, the preprocessing step can be skipped for this layout.

Valid Usage (Implicit)

- VUID-vkGetGeneratedCommandsMemoryRequirementsEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetGeneratedCommandsMemoryRequirementsEXT-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkGeneratedCommandsMemoryRequirementsInfoEXT structure
- VUID-vkGetGeneratedCommandsMemoryRequirementsEXT-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements2 structure

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkGeneratedCommandsMemoryRequirementsInfoEXT {
    VkStructureType                sType;
    const void*                    pNext;
    VkIndirectExecutionSetEXT      indirectExecutionSet;
    VkIndirectCommandsLayoutEXT    indirectCommandsLayout;
    uint32_t                       maxSequenceCount;
    uint32_t                       maxDrawCount;
} VkGeneratedCommandsMemoryRequirementsInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `indirectExecutionSet` is the indirect execution set to be used for binding shaders.
- `indirectCommandsLayout` is the VkIndirectCommandsLayoutEXT that this buffer memory is intended to be used with.
- `maxSequenceCount` is the maximum number of sequences that this buffer memory can be used with.
- `maxDrawCount` is the maximum number of indirect draws that can be executed by any COUNT-type multi-draw indirect tokens. The draw count in the indirect buffer is clamped to this value for these token types.

If the action command token for the layout is not a COUNT-type multi-draw indirect token, `maxDrawCount` is ignored.

Valid Usage

- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-maxSequencesCount-11009
  `maxSequencesCount` **must** be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`maxIndirectSequenceCount`
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectCommandsLayout-11010
  If `indirectCommandsLayout` was created with a token sequence that contained the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, `indirectExecutionSet` **must** not be VK_NULL_HANDLE
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectCommandsLayout-11151
  If `indirectCommandsLayout` was created with a token sequence that contained the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the shader stages used to create the initial shader state of `indirectExecutionSet` **must** equal the VkIndirectCommandsExecutionSetTokenEXT::`shaderStages` used to create `indirectCommandsLayout`
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectCommandsLayout-11011
  If `indirectCommandsLayout` was not created with a token sequence that contained the

VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT token, indirectExecutionSet **must** be VK_NULL_HANDLE

- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-maxDrawCount-11146
  When not ignored, maxDrawCount × maxSequenceCount **must** be less than 2^24
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectExecutionSet-11012
  If indirectExecutionSet is VK_NULL_HANDLE, either a VkGeneratedCommandsPipelineInfoEXT or a VkGeneratedCommandsShaderInfoEXT **must** be included in the pNext chain

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_EXT
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkGeneratedCommandsPipelineInfoEXT or VkGeneratedCommandsShaderInfoEXT
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-sType-unique
  The sType value of each struct in the pNext chain **must** be unique
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectExecutionSet-parameter
  If indirectExecutionSet is not VK_NULL_HANDLE, indirectExecutionSet **must** be a valid VkIndirectExecutionSetEXT handle
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectCommandsLayout-parameter
  indirectCommandsLayout **must** be a valid VkIndirectCommandsLayoutEXT handle
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-commonparent
  Both of indirectCommandsLayout, and indirectExecutionSet that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkGeneratedCommandsPipelineInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    VkPipeline         pipeline;
} VkGeneratedCommandsPipelineInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pipeline is a valid pipeline object.

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsPipelineInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_PIPELINE_INFO_EXT`
- VUID-VkGeneratedCommandsPipelineInfoEXT-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkGeneratedCommandsShaderInfoEXT {
    VkStructureType       sType;
    void*                 pNext;
    uint32_t              shaderCount;
    const VkShaderEXT*    pShaders;
} VkGeneratedCommandsShaderInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderCount` is the size of the `pShaders` array.
- `pShaders` is a pointer to an array of shader objects.

Valid Usage

- VUID-VkGeneratedCommandsShaderInfoEXT-pShaders-11127
  `pShaders` **must** not contain more than one shader object for a given VkShaderStageFlagBits stage

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsShaderInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_SHADER_INFO_EXT`
- VUID-VkGeneratedCommandsShaderInfoEXT-pShaders-parameter
  `pShaders` **must** be a valid pointer to an array of `shaderCount` valid VkShaderEXT handles
- VUID-VkGeneratedCommandsShaderInfoEXT-shaderCount-arraylength
  `shaderCount` **must** be greater than `0`

30.2.1. Indirect Execution Sets

Indirect Execution Sets contain sets of pipelines or shader objects which can be bound individually.

```
// Provided by VK_EXT_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectExecutionSetEXT)
```

Indirect Execution Sets allow the device to bind different shaders and pipeline states using Device-Generated Commands.

Indirect Execution Sets are created by calling:

```
// Provided by VK_EXT_device_generated_commands
VkResult vkCreateIndirectExecutionSetEXT(
    VkDevice                                    device,
    const VkIndirectExecutionSetCreateInfoEXT*  pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkIndirectExecutionSetEXT*                  pIndirectExecutionSet);
```

- `device` is the logical device that creates the indirect execution set.
- `pCreateInfo` is a pointer to a VkIndirectExecutionSetCreateInfoEXT structure containing parameters affecting creation of the indirect execution set.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pIndirectExecutionSet` is a pointer to a VkIndirectExecutionSetEXT handle in which the resulting indirect execution set is returned.

Valid Usage

- VUID-vkCreateIndirectExecutionSetEXT-deviceGeneratedCommands-11013
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateIndirectExecutionSetEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateIndirectExecutionSetEXT-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkIndirectExecutionSetCreateInfoEXT structure
- VUID-vkCreateIndirectExecutionSetEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateIndirectExecutionSetEXT-pIndirectExecutionSet-parameter
  `pIndirectExecutionSet` **must** be a valid pointer to a VkIndirectExecutionSetEXT handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkIndirectExecutionSetCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectExecutionSetCreateInfoEXT {
    VkStructureType                       sType;
    const void*                           pNext;
    VkIndirectExecutionSetInfoTypeEXT     type;
    VkIndirectExecutionSetInfoEXT         info;
} VkIndirectExecutionSetCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- type is a VkIndirectExecutionSetInfoTypeEXT describing the type of set being created and determining which field of the info union will be used.
- info is a VkIndirectExecutionSetInfoEXT union containing layout information for the set.

Valid Usage

- VUID-VkIndirectExecutionSetCreateInfoEXT-maxIndirectShaderObjectCount-11014
  If VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectShaderObjectCount is zero or the shaderObject feature is not enabled type **must** not be VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT

Valid Usage (Implicit)

- VUID-VkIndirectExecutionSetCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_INDIRECT_EXECUTION_SET_CREATE_INFO_EXT
- VUID-VkIndirectExecutionSetCreateInfoEXT-type-parameter
  type **must** be a valid VkIndirectExecutionSetInfoTypeEXT value
- VUID-VkIndirectExecutionSetCreateInfoEXT-pPipelineInfo-parameter
  If type is VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT, the pPipelineInfo member of info **must** be a valid pointer to a valid VkIndirectExecutionSetPipelineInfoEXT structure

- VUID-VkIndirectExecutionSetCreateInfoEXT-pShaderInfo-parameter
  If `type` is `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT`, the `pShaderInfo` member of `info` **must** be a valid pointer to a valid VkIndirectExecutionSetShaderInfoEXT structure

Values which **can** be set in VkIndirectExecutionSetCreateInfoEXT::`type`, specifying contents of an indirect execution set, are:

```
// Provided by VK_EXT_device_generated_commands
typedef enum VkIndirectExecutionSetInfoTypeEXT {
    VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT = 0,
    VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT = 1,
} VkIndirectExecutionSetInfoTypeEXT;
```

- `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT` specifies that the indirect execution set contains VkPipeline objects.
- `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT` specifies that the indirect execution set contains VkShaderEXT objects.

The `VkIndirectExecutionSetInfoEXT` union is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef union VkIndirectExecutionSetInfoEXT {
    const VkIndirectExecutionSetPipelineInfoEXT*    pPipelineInfo;
    const VkIndirectExecutionSetShaderInfoEXT*      pShaderInfo;
} VkIndirectExecutionSetInfoEXT;
```

- `pPipelineInfo` is a pointer to a VkIndirectExecutionSetPipelineInfoEXT struct containing pipeline layout information for the set.
- `pShaderInfo` is a pointer to a VkIndirectExecutionSetShaderInfoEXT struct containing shader object layout information for the set.

The `VkIndirectExecutionSetPipelineInfoEXT` structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectExecutionSetPipelineInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkPipeline         initialPipeline;
    uint32_t           maxPipelineCount;
} VkIndirectExecutionSetPipelineInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `initialPipeline` is the initial pipeline for the set. This pipeline will be automatically added to the set at index `0`.
- `maxPipelineCount` is the maximum number of pipelines stored in the set.

The characteristics of `initialPipeline` will be used to validate all pipelines added to the set even if they are removed from the set or destroyed.

When an Indirect Execution Set created with pipelines is used, `initialPipeline` constitutes the initial shader state.

Valid Usage

- VUID-VkIndirectExecutionSetPipelineInfoEXT-supportedIndirectCommandsShaderStagesPipelineBinding-11015
  If VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`supportedIndirectCommandsShaderStagesPipelineBinding` does not contain `VK_SHADER_STAGE_COMPUTE_BIT`, the `VkPipelineBindPoint` of `initialPipeline` **must** not be `VK_PIPELINE_BIND_POINT_COMPUTE`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-supportedIndirectCommandsShaderStagesPipelineBinding-11016
  If VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`supportedIndirectCommandsShaderStagesPipelineBinding` does not contain `VK_SHADER_STAGE_FRAGMENT_BIT`, the `VkPipelineBindPoint` of `initialPipeline` **must** not be `VK_PIPELINE_BIND_POINT_GRAPHICS`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-supportedIndirectCommandsShaderStagesPipelineBinding-11017
  If VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`supportedIndirectCommandsShaderStagesPipelineBinding` does not contain ray tracing stages, the `VkPipelineBindPoint` of `initialPipeline` **must** not be `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-maxPipelineCount-11018
  `maxPipelineCount` **must** be between `1` and `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT`::`maxIndirectPipelineCount`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-initialPipeline-11019
  `initialPipeline` **must** not use descriptors of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-initialPipeline-11153
  `initialPipeline` **must** have been created with `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT`

Valid Usage (Implicit)

- VUID-VkIndirectExecutionSetPipelineInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_EXECUTION_SET_PIPELINE_INFO_EXT`

- VUID-VkIndirectExecutionSetPipelineInfoEXT-initialPipeline-parameter
  `initialPipeline` **must** be a valid VkPipeline handle

The `VkIndirectExecutionSetShaderInfoEXT` structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectExecutionSetShaderInfoEXT {
    VkStructureType                                 sType;
    const void*                                     pNext;
    uint32_t                                        shaderCount;
    const VkShaderEXT*                              pInitialShaders;
    const VkIndirectExecutionSetShaderLayoutInfoEXT*    pSetLayoutInfos;
    uint32_t                                        maxShaderCount;
    uint32_t                                        pushConstantRangeCount;
    const VkPushConstantRange*                      pPushConstantRanges;
} VkIndirectExecutionSetShaderInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderCount` is the number of members in the `pInitialShaders` and `pSetLayoutInfos` arrays.
- `pInitialShaders` is a pointer to an array containing a VkShaderEXT object for each shader stage that will be used in the set. These shaders will be automatically added to the set beginning at index `0`.
- `pSetLayoutInfos` is a pointer to an array containing a VkIndirectExecutionSetShaderLayoutInfoEXT used by each corresponding `pInitialShaders` shader stage in the set.
- `maxShaderCount` is the maximum number of shader objects stored in the set.
- `pushConstantRangeCount` is the number of members in the `pPushConstantRanges` array.
- `pPushConstantRanges` is a pointer to the array of VkPushConstantRange ranges used by all shaders in the set.

The characteristics of `pInitialShaders` will be used to validate all shaders added to the set even if they are removed from the set or destroyed.

When an Indirect Execution Set created with shader objects is used, `pInitialShaders` constitutes the initial shader state.

Valid Usage

- VUID-VkIndirectExecutionSetShaderInfoEXT-pInitialShaders-11020
  All members of `pInitialShaders` **must** have a `stage` supported by VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`supportedIndirectCommandsShaderStagesShaderBinding`
- VUID-VkIndirectExecutionSetShaderInfoEXT-maxShaderCount-11021

maxShaderCount **must** not be zero

- VUID-VkIndirectExecutionSetShaderInfoEXT-maxShaderCount-11022
  maxShaderCount **must** be less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectShaderObjectCount
- VUID-VkIndirectExecutionSetShaderInfoEXT-maxShaderCount-11036
  maxShaderCount **must** be greater than or equal to shaderCount
- VUID-VkIndirectExecutionSetShaderInfoEXT-stage-11023
  The stage of each element in the pInitialShaders array **must** be unique
- VUID-VkIndirectExecutionSetShaderInfoEXT-pInitialShaders-11154
  Each member of pInitialShaders **must** have been created with VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT

Valid Usage (Implicit)

- VUID-VkIndirectExecutionSetShaderInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_INDIRECT_EXECUTION_SET_SHADER_INFO_EXT
- VUID-VkIndirectExecutionSetShaderInfoEXT-pInitialShaders-parameter
  pInitialShaders **must** be a valid pointer to an array of shaderCount valid VkShaderEXT handles
- VUID-VkIndirectExecutionSetShaderInfoEXT-pSetLayoutInfos-parameter
  If pSetLayoutInfos is not NULL, pSetLayoutInfos **must** be a valid pointer to an array of shaderCount valid VkIndirectExecutionSetShaderLayoutInfoEXT structures
- VUID-VkIndirectExecutionSetShaderInfoEXT-pPushConstantRanges-parameter
  If pushConstantRangeCount is not 0, pPushConstantRanges **must** be a valid pointer to an array of pushConstantRangeCount valid VkPushConstantRange structures
- VUID-VkIndirectExecutionSetShaderInfoEXT-shaderCount-arraylength
  shaderCount **must** be greater than 0

The VkIndirectExecutionSetShaderLayoutInfoEXT structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectExecutionSetShaderLayoutInfoEXT {
    VkStructureType                 sType;
    const void*                     pNext;
    uint32_t                        setLayoutCount;
    const VkDescriptorSetLayout*    pSetLayouts;
} VkIndirectExecutionSetShaderLayoutInfoEXT;
```

- setLayoutCount is the number of members in the pSetLayouts array
- pSetLayouts is a pointer to an array containing VkDescriptorSetLayout objects used by the shader stage.

Valid Usage

- VUID-VkIndirectExecutionSetShaderLayoutInfoEXT-pSetLayouts-11024
  All members of `pSetLayouts` **must** not contain descriptors of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`

Valid Usage (Implicit)

- VUID-VkIndirectExecutionSetShaderLayoutInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_EXECUTION_SET_SHADER_LAYOUT_INFO_EXT`
- VUID-VkIndirectExecutionSetShaderLayoutInfoEXT-pSetLayouts-parameter
  If `setLayoutCount` is not `0`, `pSetLayouts` **must** be a valid pointer to an array of `setLayoutCount` valid or VK_NULL_HANDLE VkDescriptorSetLayout handles

Destroy an Indirect Execution Set by calling:

```
// Provided by VK_EXT_device_generated_commands
void vkDestroyIndirectExecutionSetEXT(
    VkDevice                                    device,
    VkIndirectExecutionSetEXT                   indirectExecutionSet,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that owns the indirect execution set.
- `indirectExecutionSet` is the indirect execution set to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyIndirectExecutionSetEXT-indirectExecutionSet-11025
  All submitted commands that refer to `indirectExecutionSet` **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyIndirectExecutionSetEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyIndirectExecutionSetEXT-indirectExecutionSet-parameter
  If `indirectExecutionSet` is not VK_NULL_HANDLE, `indirectExecutionSet` **must** be a valid VkIndirectExecutionSetEXT handle
- VUID-vkDestroyIndirectExecutionSetEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid

VkAllocationCallbacks structure

- VUID-vkDestroyIndirectExecutionSetEXT-indirectExecutionSet-parent
  If `indirectExecutionSet` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `indirectExecutionSet` **must** be externally synchronized

The `VkWriteIndirectExecutionSetPipelineEXT` struct is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkWriteIndirectExecutionSetPipelineEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           index;
    VkPipeline         pipeline;
} VkWriteIndirectExecutionSetPipelineEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `index` is the element of the set to update
- `pipeline` is the pipeline to store in the indirect execution set

Valid Usage

- VUID-VkWriteIndirectExecutionSetPipelineEXT-index-11026
  `index` **must** be less than the value of `VkIndirectExecutionSetPipelineInfoEXT::maxPipelineCount` used to create the set
- VUID-VkWriteIndirectExecutionSetPipelineEXT-pipeline-11027
  `pipeline` **must** have been created with `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT`
- VUID-VkWriteIndirectExecutionSetPipelineEXT-index-11029
  `index` **must** not be referenced by submitted command buffers
- VUID-VkWriteIndirectExecutionSetPipelineEXT-pipeline-11030
  The shader stages contained in `pipeline` **must** be supported by VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`supportedIndirectCommandsShaderStagesPipelineBinding`

Valid Usage (Implicit)

- VUID-VkWriteIndirectExecutionSetPipelineEXT-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_WRITE_INDIRECT_EXECUTION_SET_PIPELINE_EXT`

- VUID-VkWriteIndirectExecutionSetPipelineEXT-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle

The `VkWriteIndirectExecutionSetShaderEXT` struct is defined as:

```
// Provided by VK_EXT_device_generated_commands with VK_EXT_shader_object
typedef struct VkWriteIndirectExecutionSetShaderEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           index;
    VkShaderEXT        shader;
} VkWriteIndirectExecutionSetShaderEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `index` is the element of the set to update
- `shader` is the shader to store in the indirect execution set

Shaders need not be stored in the Indirect Execution Set according to their stage. The only restriction for shader indices within a set is that the value of the index **must** be less than the maximum number of shaders in the set.

Valid Usage

- VUID-VkWriteIndirectExecutionSetShaderEXT-index-11031
  `index` **must** be less than `VkIndirectExecutionSetShaderInfoEXT`::`maxShaderCount`
- VUID-VkWriteIndirectExecutionSetShaderEXT-shader-11032
  `shader` **must** have been created with `VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT`
- VUID-VkWriteIndirectExecutionSetShaderEXT-pInitialShaders-11033
  A shader created with the same VkShaderStageFlagBits **must** have been passed in the `VkIndirectExecutionSetShaderInfoEXT`::`pInitialShaders` array
- VUID-VkWriteIndirectExecutionSetShaderEXT-index-11034
  `index` **must** not be in use by submitted command buffers

Valid Usage (Implicit)

- VUID-VkWriteIndirectExecutionSetShaderEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_WRITE_INDIRECT_EXECUTION_SET_SHADER_EXT`
- VUID-VkWriteIndirectExecutionSetShaderEXT-shader-parameter
  `shader` **must** be a valid VkShaderEXT handle

Pipeline elements in an Indirect Execution Set can be updated by calling:

```
// Provided by VK_EXT_device_generated_commands
void vkUpdateIndirectExecutionSetPipelineEXT(
    VkDevice                                    device,
    VkIndirectExecutionSetEXT                   indirectExecutionSet,
    uint32_t                                    executionSetWriteCount,
    const VkWriteIndirectExecutionSetPipelineEXT* pExecutionSetWrites);
```

- `device` is the logical device that owns the indirect execution set.
- `indirectExecutionSet` is the indirect execution set being updated.
- `executionSetWriteCount` is the number of elements in the `pExecutionSetWrites` array.
- `pExecutionSetWrites` is a pointer to an array of VkWriteIndirectExecutionSetPipelineEXT structures describing the elements to update.

Valid Usage

- VUID-vkUpdateIndirectExecutionSetPipelineEXT-indirectExecutionSet-11035
  `indirectExecutionSet` **must** have been created with type `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT`
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-executionSetWriteCount-11037
  `executionSetWriteCount` **must** be less than or equal to `VkIndirectExecutionSetPipelineInfoEXT`::`maxPipelineCount`
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-pExecutionSetWrites-11042
  Each element in the `pExecutionSetWrites` array must have a unique `VkWriteIndirectExecutionSetPipelineEXT`::`index`
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-None-11038
  Each member of the Indirect Execution Set referenced by the update command **must** not be in use by the device
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-None-11039
  The layout of each pipeline in `pExecutionSetWrites` **must** be compatible with the `initialPipeline` used to create the Indirect Execution Set
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-None-11040
  Each pipeline in the Indirect Execution Set **must** have identically defined static and dynamic state values to the `initialPipeline` used to create the Indirect Execution Set
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11147
  Each pipeline in the Indirect Execution Set **must** have identically defined fragment outputs interface to the `initialPipeline` used to create the Indirect Execution Set
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11152
  Each pipeline in the Indirect Execution Set **must** match the `initialPipeline` used to create the Indirect Execution Set in its included shader stages
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11098
  Each pipeline in the Indirect Execution Set **must** match the `initialPipeline` used to create

the Indirect Execution Set in its use of `FragDepth`

- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11086
  Each pipeline in the Indirect Execution Set **must** match the `initialPipeline` used to create the Indirect Execution Set in its use of `SampleMask`
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11085
  Each pipeline in the Indirect Execution Set **must** match the `initialPipeline` used to create the Indirect Execution Set in its use of `StencilExportEXT`

Valid Usage (Implicit)

- VUID-vkUpdateIndirectExecutionSetPipelineEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-indirectExecutionSet-parameter
  `indirectExecutionSet` **must** be a valid VkIndirectExecutionSetEXT handle
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-pExecutionSetWrites-parameter
  `pExecutionSetWrites` **must** be a valid pointer to an array of `executionSetWriteCount` valid VkWriteIndirectExecutionSetPipelineEXT structures
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-executionSetWriteCount-arraylength
  `executionSetWriteCount` **must** be greater than `0`
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-indirectExecutionSet-parent
  `indirectExecutionSet` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `indirectExecutionSet` **must** be externally synchronized

Shader object elements in an Indirect Execution Set can be updated by calling:

```
// Provided by VK_EXT_device_generated_commands
void vkUpdateIndirectExecutionSetShaderEXT(
    VkDevice                                    device,
    VkIndirectExecutionSetEXT                   indirectExecutionSet,
    uint32_t                                    executionSetWriteCount,
    const VkWriteIndirectExecutionSetShaderEXT* pExecutionSetWrites);
```

- `device` is the logical device that owns the indirect execution set.
- `indirectExecutionSet` is the indirect execution set being updated.
- `executionSetWriteCount` is the number of elements in the `pExecutionSetWrites` array.
- `pExecutionSetWrites` is a pointer to an array of VkWriteIndirectExecutionSetShaderEXT structures describing the elements to update.

Valid Usage

- VUID-vkUpdateIndirectExecutionSetShaderEXT-indirectExecutionSet-11041
  `indirectExecutionSet` **must** have been created with type `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT`
- VUID-vkUpdateIndirectExecutionSetShaderEXT-pExecutionSetWrites-11043
  Each element in the `pExecutionSetWrites` array must have a unique `VkWriteIndirectExecutionSetShaderEXT`::`index`
- VUID-vkUpdateIndirectExecutionSetShaderEXT-None-11044
  Each member of the Indirect Execution Set referenced by the update command **must** not be in use by the device
- VUID-vkUpdateIndirectExecutionSetShaderEXT-pExecutionSetWrites-11140
  The descriptor layout of each shader in `pExecutionSetWrites` **must** be compatible with the initial layout info used to create the Indirect Execution Set
- VUID-vkUpdateIndirectExecutionSetShaderEXT-None-11148
  Each fragment shader element in the Indirect Execution Set **must** have identically defined fragment outputs interface to the initial shader state used to create the Indirect Execution Set
- VUID-vkUpdateIndirectExecutionSetShaderEXT-FragDepth-11054
  Each fragment shader element in the Indirect Execution Set **must** match the initial shader state used to create the Indirect Execution Set in its use of `FragDepth`
- VUID-vkUpdateIndirectExecutionSetShaderEXT-SampleMask-11050
  Each fragment shader element in the Indirect Execution Set **must** match the initial shader state used to create the Indirect Execution Set in its use of `SampleMask`
- VUID-vkUpdateIndirectExecutionSetShaderEXT-StencilExportEXT-11003
  Each fragment shader element in the Indirect Execution Set **must** match the initial shader state used to create the Indirect Execution Set in its use of `StencilExportEXT`

Valid Usage (Implicit)

- VUID-vkUpdateIndirectExecutionSetShaderEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkUpdateIndirectExecutionSetShaderEXT-indirectExecutionSet-parameter
  `indirectExecutionSet` **must** be a valid VkIndirectExecutionSetEXT handle
- VUID-vkUpdateIndirectExecutionSetShaderEXT-pExecutionSetWrites-parameter
  `pExecutionSetWrites` **must** be a valid pointer to an array of `executionSetWriteCount` valid VkWriteIndirectExecutionSetShaderEXT structures
- VUID-vkUpdateIndirectExecutionSetShaderEXT-executionSetWriteCount-arraylength
  `executionSetWriteCount` **must** be greater than `0`
- VUID-vkUpdateIndirectExecutionSetShaderEXT-indirectExecutionSet-parent
  `indirectExecutionSet` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `indirectExecutionSet` **must** be externally synchronized

It is legal to update an Indirect Execution Set that is in flight as long as the element indices in `pExecutionSetWrites` are not in use. Any change to an indirect execution set requires recalculating memory requirements by calling vkGetGeneratedCommandsMemoryRequirementsEXT for commands that use that modified state. Commands that are in flight or those not using updated elements require no changes.

The lifetimes of pipelines and shader objects contained in a set **must** match or exceed the lifetime of the set.

With `VK_EXT_device_generated_commands`, the actual generation of commands as well as their execution on the device is handled as single action with:

```
// Provided by VK_EXT_device_generated_commands
void vkCmdExecuteGeneratedCommandsEXT(
    VkCommandBuffer                             commandBuffer,
    VkBool32                                    isPreprocessed,
    const VkGeneratedCommandsInfoEXT*           pGeneratedCommandsInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `isPreprocessed` represents whether the input data has already been preprocessed on the device. If it is `VK_FALSE` this command will implicitly trigger the preprocessing step, otherwise not.
- `pGeneratedCommandsInfo` is a pointer to a VkGeneratedCommandsInfoEXT structure containing parameters affecting the generation of commands.

If the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT` flag was used to create the VkGeneratedCommandsInfoEXT::`indirectCommandsLayout` then the execution of sequences through this command **may** use implementation-defined ordering which is not guaranteed to be coherent using the same input data. It does not affect the order of token processing within a sequence. This is the implied ordering with `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT`.

After a call to `vkCmdExecuteGeneratedCommandsEXT`, command buffer state will become undefined according to the tokens executed. This table specifies the relationship between tokens used and state invalidation.

Table 42. Indirect Execution State Invalidation

Common Tokens	States Invalidated
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT`	Bound shaders and pipelines
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT`	Push constant data
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT`	Push constant data

Common Tokens	States Invalidated
VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT	Index buffer
VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT	Vertex buffer

Valid Usage

- VUID-vkCmdExecuteGeneratedCommandsEXT-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR, and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR, and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-unnormalizedCoordinates-09635
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's levelCount and layerCount **must** be 1
- VUID-vkCmdExecuteGeneratedCommandsEXT-unnormalizedCoordinates-09636
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's viewType **must** be VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features **must** contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it **must** not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdExecuteGeneratedCommandsEXT-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdExecuteGeneratedCommandsEXT-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command **must** have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08600
  For each set *n* that is statically used by a bound shader, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a VkPipelineLayout that is compatible for set *n*, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08601
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10068
  For each array of resources that is used by a bound shader, the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdExecuteGeneratedCommandsEXT-maintenance4-08602
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, **must** be valid as described by descriptor validity if they are statically used by a bound shader
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08606
  If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08607
  If the `shaderObject` feature is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled,

that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08612
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdExecuteGeneratedCommandsEXT-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08613
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions
- VUID-vkCmdExecuteGeneratedCommandsEXT-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** not use the `ConstOffset` and `Offset` operands
- VUID-vkCmdExecuteGeneratedCommandsEXT-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types
- VUID-vkCmdExecuteGeneratedCommandsEXT-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpImageWrite-08795
  If a VkImageView created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpImageWrite-08796
  If a VkImageView created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpImageWrite-04469
  If a VkBufferView is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdExecuteGeneratedCommandsEXT-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64
- VUID-vkCmdExecuteGeneratedCommandsEXT-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 32
- VUID-vkCmdExecuteGeneratedCommandsEXT-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64
- VUID-vkCmdExecuteGeneratedCommandsEXT-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 32
- VUID-vkCmdExecuteGeneratedCommandsEXT-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag **must** not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag **must** not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07288
  Any shader invocation executed by this command **must** terminate
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09600
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdExecuteGeneratedCommandsEXT-renderPass-02684
  The current render pass **must** be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS
- VUID-vkCmdExecuteGeneratedCommandsEXT-subpass-02685
  The subpass index of the current render pass **must** be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07748
  If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07468

If any shader executed by this pipeline accesses an OpTypeImage variable with a Dim operand of SubpassData, it **must** be decorated with an InputAttachmentIndex that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07469
  Input attachment views accessed in a subpass **must** be created with the same VkFormat as the corresponding subpass definition, and be created with a VkImageView that is compatible with the attachment referenced by the subpass' pInputAttachments [InputAttachmentIndex] in the bound VkFramebuffer as specified by Fragment Input Attachment Compatibility
- VUID-vkCmdExecuteGeneratedCommandsEXT-pDepthInputAttachmentIndex-09595
  Input attachment views accessed in a dynamic render pass with a InputAttachmentIndex referenced by VkRenderingInputAttachmentIndexInfoKHR, or no InputAttachmentIndex if VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex or VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex are NULL, **must** be created with a VkImageView that is compatible with the corresponding color, depth, or stencil attachment in VkRenderingInfo
- VUID-vkCmdExecuteGeneratedCommandsEXT-pDepthInputAttachmentIndex-09596
  Input attachment views accessed in a dynamic render pass via a shader object **must** have an InputAttachmentIndex if both VkRenderingInputAttachmentIndexInfoKHR :pDepthInputAttachmentIndex and VkRenderingInputAttachmentIndexInfoKHR :pStencilInputAttachmentIndex are non-NULL
- VUID-vkCmdExecuteGeneratedCommandsEXT-InputAttachmentIndex-09597
  If an input attachment view accessed in a dynamic render pass via a shader object has an InputAttachmentIndex, the InputAttachmentIndex **must** match an index in VkRenderingInputAttachmentIndexInfoKHR
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06537
  Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:
  - the VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the bound pipeline or
  - the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_COLOR_BIT and
    - there is no bound graphics pipeline or
    - the bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT

  it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load,

store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

  - the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the bound pipeline or
  - the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_DEPTH_BIT and
    - there is no bound graphics pipeline or
    - the bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT

  it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

  - the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the bound pipeline or
  - the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_STENCIL_BIT and
    - there is no bound graphics pipeline or
    - the bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT

  it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes **must** be disabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops **must** be VK_STENCIL_OP_KEEP
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport **must** have been called and not

subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, vkCmdSetLineWidth **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopologyEXT in the current command buffer set primitiveTopology to any line topology, vkCmdSetLineWidth **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08619
  If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, vkCmdSetLineWidth **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07834
  If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of depthBiasEnable is VK_TRUE, then vkCmdSetDepthBounds or vkCmdSetDepthBias2EXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07835
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08621
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set

rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer set any element of pColorBlendEnables to VK_TRUE, and the most recent call to vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07836
  If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of depthBoundsTestEnable is VK_TRUE, then vkCmdSetDepthBounds **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07837
  If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of stencilTestEnable is VK_TRUE, then vkCmdSetStencilCompareMask **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07838
  If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of stencilTestEnable is VK_TRUE, then vkCmdSetStencilWriteMask **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07839
  If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, the current value of and rasterizerDiscardEnable is VK_FALSE, the current value of stencilTestEnable is VK_TRUE, then vkCmdSetStencilReference **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and

the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07634
  If the VK_EXT_sample_locations extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetSampleLocationsEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06666
  If the VK_EXT_sample_locations extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of sampleLocationsEnable is VK_TRUE, then vkCmdSetSampleLocationsEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState **must** be VK_FALSE
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08643
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then for each color attachment in the render pass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the corresponding member of pColorBlendEnables in the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer that affected that attachment index **must** have been VK_FALSE
- VUID-vkCmdExecuteGeneratedCommandsEXT-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline,

  then rasterizationSamples for the bound graphics pipeline **must** be the same as the current subpass color and/or depth/stencil attachments
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08644
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE,

  then the most recent call to vkCmdSetRasterizationSamplesEXT in the current command buffer **must** have set rasterizationSamples to be the same as the number of samples for the current render pass color and/or depth/stencil attachments
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08876

If a shader object is bound to any graphics stage, the current render pass instance **must** have been begun with vkCmdBeginRenderingKHR

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the `imageView` member of `pDepthAttachment` is not VK_NULL_HANDLE, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment
- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the `imageView` member of `pStencilAttachment` is not VK_NULL_HANDLE, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment
- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the `imageView` member of `pDepthAttachment` is not VK_NULL_HANDLE, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment
- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the `imageView` member of `pStencilAttachment` is not VK_NULL_HANDLE, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment
- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the `imageView` member of `pDepthAttachment` is not VK_NULL_HANDLE, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment
- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the `imageView` member of `pStencilAttachment` is not VK_NULL_HANDLE, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment
- VUID-vkCmdExecuteGeneratedCommandsEXT-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the bound graphics pipeline **must** have been created with a VkPipelineRenderingCreateInfo ::`viewMask` equal to VkRenderingInfo::`viewMask`
- VUID-vkCmdExecuteGeneratedCommandsEXT-colorAttachmentCount-06179
  If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with vkCmdBeginRenderingKHR, the bound graphics pipeline **must** have been created with a VkPipelineRenderingCreateInfo::`colorAttachmentCount` equal to VkRenderingInfo::`colorAttachmentCount`
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08910

If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRenderingKHR and VkRenderingInfo ::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo ::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE **must** have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08912
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRenderingKHR and VkRenderingInfo ::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo ::pColorAttachments array with an imageView equal to VK_NULL_HANDLE **must** have the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the bound pipeline equal to VK_FORMAT_UNDEFINED
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08911
  If the dynamicRenderingUnusedAttachments feature is enabled, and the current render pass instance was begun with vkCmdBeginRenderingKHR and VkRenderingInfo ::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo ::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE **must** have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the bound graphics pipeline, or the corresponding element of VkPipelineRenderingCreateInfo ::pColorAttachmentFormats, if it exists, **must** be VK_FORMAT_UNDEFINED
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07749
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then vkCmdSetColorWriteEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08646
  If the colorWriteEnable feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorWriteEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-attachmentCount-07750
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then the attachmentCount parameter of vkCmdSetColorWriteEnableEXT **must** be greater than or equal to the VkPipelineColorBlendStateCreateInfo::attachmentCount of the bound graphics pipeline
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08647
  If the colorWriteEnable feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to

vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then the attachmentCount parameter of most recent call to vkCmdSetColorWriteEnableEXT in the current command buffer **must** be greater than or equal to the number of color attachments in the current render pass instance

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07751
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state enabled then vkCmdSetDiscardRectangleEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07880
  If the VK_EXT_discard_rectangles extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetDiscardRectangleEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07881
  If the VK_EXT_discard_rectangles extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of discardRectangleEnable is VK_TRUE, then vkCmdSetDiscardRectangleModeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizerDiscardEnable-09236
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDiscardRectangleEnableEXT in the current command buffer set discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08913
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the bound graphics pipeline **must** be equal to VK_FORMAT_UNDEFINED
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08914
  If current render pass instance was begun with vkCmdBeginRenderingKHR, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the bound graphics

pipeline **must** be equal to the VkFormat used to create VkRenderingInfo ::pDepthAttachment->imageView

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08915
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo ::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo ::pDepthAttachment->imageView, the value of the format **must** be VK_FORMAT_UNDEFINED
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08916
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo ::pStencilAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the bound graphics pipeline **must** be equal to VK_FORMAT_UNDEFINED
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08917
  If current render pass instance was begun with vkCmdBeginRenderingKHR, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo ::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the bound graphics pipeline **must** be equal to the VkFormat used to create VkRenderingInfo ::pStencilAttachment->imageView
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08918
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo ::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo ::pStencilAttachment->imageView, the value of the format **must** be VK_FORMAT_UNDEFINED
- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRenderingKHR and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the bound graphics pipeline **must** have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06184
  If the current render pass instance was begun with vkCmdBeginRenderingKHR and VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the bound graphics pipeline **must** have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-multisampledRenderToSingleSampled-07285

If the current render pass instance was begun with vkCmdBeginRenderingKHR with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE **must** have been created with a sample count equal to the value of rasterizationSamples for the bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsEXT-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the bound graphics pipeline **must** be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView
- VUID-vkCmdExecuteGeneratedCommandsEXT-multisampledRenderToSingleSampled-07287
  If VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the bound graphics pipeline **must** be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView
- VUID-vkCmdExecuteGeneratedCommandsEXT-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, the bound pipeline **must** have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE
- VUID-vkCmdExecuteGeneratedCommandsEXT-pColorAttachments-08963
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline **must** not be VK_FORMAT_UNDEFINED
- VUID-vkCmdExecuteGeneratedCommandsEXT-pDepthAttachment-08964
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline **must** not be VK_FORMAT_UNDEFINED
- VUID-vkCmdExecuteGeneratedCommandsEXT-pStencilAttachment-08965
  If the current render pass instance was begun with vkCmdBeginRenderingKHR, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the pipeline **must** not be VK_FORMAT_UNDEFINED
- VUID-vkCmdExecuteGeneratedCommandsEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708
  If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard **must** not be enabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-primitivesGeneratedQueryWithNonZeroStreams-06709

If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, the bound graphics pipeline **must** not have been created with a non-zero value in VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07619
  If a shader object is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT dynamic state enabled, then vkCmdSetTessellationDomainOriginEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07620
  If the depthClamp feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetDepthClampEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07621
  If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_POLYGON_MODE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetPolygonModeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07622
  If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetRasterizationSamplesEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07623
  If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetSampleMaskEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-alphaToCoverageEnable-08919
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic state enabled, and alphaToCoverageEnable was VK_TRUE in the last call to vkCmdSetAlphaToCoverageEnableEXT, then the Fragment Output Interface **must** contain a variable for the alpha Component word in Location 0 at Index 0
- VUID-vkCmdExecuteGeneratedCommandsEXT-alphaToCoverageEnable-08920
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetAlphaToCoverageEnableEXT in the current command buffer set alphaToCoverageEnable to VK_TRUE, then the Fragment Output Interface **must** contain a

variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07624
  If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetAlphaToCoverageEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07625
  If the alphaToOne feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetAlphaToOneEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07626
  If the logicOp feature is enabled, a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetLogicOpEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07627
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08657
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorBlendEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07628
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08658
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT for any attachment set that attachment's value in pColorBlendEnables to VK_TRUE, then vkCmdSetColorBlendEquationEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07629
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then vkCmdSetColorWriteMaskEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08659
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorWriteMaskEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07630
  If the geometryStreams feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_GEOMETRY_BIT stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT dynamic state enabled, then vkCmdSetRasterizationStreamEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07631
  If the VK_EXT_conservative_rasterization extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetConservativeRasterizationModeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07632
  If the VK_EXT_conservative_rasterization extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of conservativeRasterizationMode is VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT, then vkCmdSetExtraPrimitiveOverestimationSizeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07633
  If the depthClipEnable feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT dynamic state, then vkCmdSetDepthClipEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07635
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT dynamic state enabled then vkCmdSetColorBlendAdvancedEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizerDiscardEnable-09416
  If the VK_EXT_blend_operation_advanced extension is enabled, and a shader object is bound

to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then at least one of vkCmdSetColorBlendEquationEXT and vkCmdSetColorBlendAdvancedEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07636
  If the VK_EXT_provoking_vertex extension is enabled, a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetProvokingVertexModeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07637
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic state enabled then vkCmdSetLineRasterizationModeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08666
  If any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features are enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineRasterizationModeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08667
  If any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features are enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopologyEXT in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineRasterizationModeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08668
  If any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features are enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineRasterizationModeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07638

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT dynamic state enabled then vkCmdSetLineStippleEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08669
  If any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features are enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineStippleEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08670
  If any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features are enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopologyEXT in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineStippleEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08671
  If any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features are enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineStippleEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07849
  If any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features are enabled and a shader object is bound to any graphics stage, or a bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_KHR dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of stippledLineEnable is VK_TRUE, then vkCmdSetLineStippleKHR **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07639
  If the depthClipControl feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT dynamic state enabled, then vkCmdSetDepthClipNegativeOneToOneEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09650
  If the depthClampControl feature is enabled, and a shader object is bound to any graphics

stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT dynamic state enabled, and the current value of depthClampEnable is VK_TRUE, then vkCmdSetDepthClampRangeEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-pColorBlendEnables-07470
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT state enabled and the last call to vkCmdSetColorBlendEnableEXT set pColorBlendEnables for any attachment to VK_TRUE, then for those attachments in the subpass the corresponding image view's format features **must** contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizationSamples-07471
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT **must** follow the rules for a zero-attachment subpass
- VUID-vkCmdExecuteGeneratedCommandsEXT-samples-07472
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT **must** be greater or equal to the VkPipelineMultisampleStateCreateInfo::rasterizationSamples parameter used to create the bound graphics pipeline
- VUID-vkCmdExecuteGeneratedCommandsEXT-samples-07473
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state and VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT **must** be greater or equal to the rasterizationSamples parameter in the last call to vkCmdSetRasterizationSamplesEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizationSamples-07474
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT **must** be the same as the current subpass color and/or depth/stencil attachments
- VUID-vkCmdExecuteGeneratedCommandsEXT-firstAttachment-07476
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls **must** specify an enable for all active color attachments in the current subpass
- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizerDiscardEnable-09417

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls **must** specify an enable for all active color attachments in the current subpass

- VUID-vkCmdExecuteGeneratedCommandsEXT-firstAttachment-07477
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls **must** specify the blend equations for all active color attachments in the current subpass where blending is enabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizerDiscardEnable-09418
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorBlendEquationEXT **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls **must** specify the blend equations for all active color attachments in the current subpass where blending is enabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-firstAttachment-07478
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then vkCmdSetColorWriteMaskEXT **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorWriteMaskEXT calls **must** specify the color write mask for all active color attachments in the current subpass
- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizerDiscardEnable-09419
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnableEXT in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorWriteMaskEXT **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorWriteMaskEXT calls **must** specify the color write mask for all active color attachments in the current subpass
- VUID-vkCmdExecuteGeneratedCommandsEXT-firstAttachment-07479
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT dynamic state enabled then vkCmdSetColorBlendAdvancedEXT **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendAdvancedEXT calls **must** specify the advanced blend equations for all active color attachments in the current subpass where

blending is enabled

- VUID-vkCmdExecuteGeneratedCommandsEXT-advancedBlendMaxColorAttachments-07480
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT and VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic states enabled and the last calls to vkCmdSetColorBlendEnableEXT and vkCmdSetColorBlendAdvancedEXT have enabled advanced blending, then the number of active color attachments in the current subpass **must** not exceed advancedBlendMaxColorAttachments
- VUID-vkCmdExecuteGeneratedCommandsEXT-primitivesGeneratedQueryWithNonZeroStreams-07481
  If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, and the bound graphics pipeline was created with VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT state enabled, the last call to vkCmdSetRasterizationStreamEXT **must** have set the rasterizationStream to zero
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsPerPixel-07482
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, and the current value of sampleLocationsEnable is VK_TRUE, then the sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to vkCmdSetSampleLocationsEXT **must** equal the rasterizationSamples member of the VkPipelineMultisampleStateCreateInfo structure the bound graphics pipeline has been created with
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsPerPixel-07483
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current value of sampleLocationsEnable is VK_TRUE, then the sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to vkCmdSetSampleLocationsEXT **must** equal the rasterizationSamples parameter of the last call to vkCmdSetRasterizationSamplesEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07484
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07485
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.width in the last call to vkCmdSetSampleLocationsEXT **must** evenly divide VkMultisamplePropertiesEXT

::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07486
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.height in the last call to vkCmdSetSampleLocationsEXT **must** evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07487
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, the fragment shader code **must** not statically use the extended instruction InterpolateAtSample
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07936
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current value of sampleLocationsEnable is VK_TRUE, then sampleLocationsInfo.sampleLocationGridSize.width **must** evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07937
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current value of sampleLocationsEnable is VK_TRUE, then sampleLocationsInfo.sampleLocationGridSize.height **must** evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07938
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current value of sampleLocationsEnable is VK_TRUE, then sampleLocationsInfo.sampleLocationsPerPixel **must** equal rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-stippledLineEnable-07495

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the stippledRectangularLines feature **must** be enabled

- VUID-vkCmdExecuteGeneratedCommandsEXT-stippledLineEnable-07496
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the stippledBresenhamLines feature **must** be enabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-stippledLineEnable-07497
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the stippledSmoothLines feature **must** be enabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-stippledLineEnable-07498
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR, then the stippledRectangularLines feature **must** be enabled and VkPhysicalDeviceLimits::strictLines **must** be VK_TRUE
- VUID-vkCmdExecuteGeneratedCommandsEXT-conservativePointAndLineRasterization-07499
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT dynamic state enabled, conservativePointAndLineRasterization is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the conservativeRasterizationMode set by the last call to vkCmdSetConservativeRasterizationModeEXT **must** be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08877
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetAttachmentFeedbackLoopEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08684
  If there is no bound graphics pipeline, vkCmdBindShadersEXT **must** have been called in the

current command buffer with pStages with an element of VK_SHADER_STAGE_VERTEX_BIT

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08685
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled, vkCmdBindShadersEXT **must** have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08686
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled, vkCmdBindShadersEXT **must** have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08687
  If there is no bound graphics pipeline, and the geometryShader feature is enabled, vkCmdBindShadersEXT **must** have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_GEOMETRY_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08688
  If there is no bound graphics pipeline, vkCmdBindShadersEXT **must** have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_FRAGMENT_BIT
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08698
  If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, then all shaders created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag in the same vkCreateShadersEXT call **must** also be bound
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08699
  If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, any stages in between stages whose shaders which did not create a shader with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag as part of the same vkCreateShadersEXT call **must** not have any VkShaderEXT bound
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08878
  All bound graphics shader objects **must** have been created with identical or identically defined push constant ranges
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08879
  All bound graphics shader objects **must** have been created with identical or identically defined arrays of descriptor set layouts
- VUID-vkCmdExecuteGeneratedCommandsEXT-pDynamicStates-08715
  If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in VkPipelineDynamicStateCreateInfo ::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable parameter in the last call to vkCmdSetDepthWriteEnableEXT **must** be VK_FALSE
- VUID-vkCmdExecuteGeneratedCommandsEXT-pDynamicStates-08716
  If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo ::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask **must** be 0

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09116
  If a shader object is bound to any graphics stage or the bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT **must** either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them
- VUID-vkCmdExecuteGeneratedCommandsEXT-maxFragmentDualSrcAttachments-09239
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command **must** be less than maxFragmentDualSrcAttachments
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09548
  If the current render pass was begun with vkCmdBeginRenderingKHR, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations set by vkCmdSetRenderingAttachmentLocationsKHR **must** match the value set for the corresponding element in the bound pipeline
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09549
  If the current render pass was begun with vkCmdBeginRenderingKHR, and there is no shader object bound to any graphics stage, input attachment index mappings in the bound pipeline **must** match those set for the current render pass instance via VkRenderingInputAttachmentIndexInfoKHR
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11046
  If isPreprocessed is VK_TRUE and vkGetGeneratedCommandsMemoryRequirementsEXT did not return a required size of zero then vkCmdPreprocessGeneratedCommandsEXT **must** have already been executed on the device before this command executes, and the preprocessing command **must** have used the same pGeneratedCommandsInfo content as well as the content of the input buffers it references (all except VkGeneratedCommandsInfoEXT::preprocessBuffer)
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11047
  If isPreprocessed is VK_TRUE then the indirectCommandsLayout member of pGeneratedCommandsInfo **must** have been created with the VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT bit set
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-11141
  If the indirectCommandsLayout member of pGeneratedCommandsInfo was created with the VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT bit set, then isPreprocessed **must** be VK_TRUE
- VUID-vkCmdExecuteGeneratedCommandsEXT-preprocessAddress-11142
  The contents of the preprocessAddress member of pGeneratedCommandsInfo **must** not have been previously used to record another vkCmdExecuteGeneratedCommandsEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11048
  If isPreprocessed is VK_TRUE then the bound descriptor sets and push constants **must** match identically with those bound during recording of the corresponding call to

vkCmdPreprocessGeneratedCommandsEXT

- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-10198
  If isPreprocessed is VK_TRUE then the conditional render state and its predicate value **must** match identically with the state and value set during execution of the corresponding call to vkCmdPreprocessGeneratedCommandsEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11049
  If isPreprocessed is VK_TRUE and the indirectCommandsLayout member of pGeneratedCommandsInfo contains a draw token, then the graphics state bound on commandBuffer **must** match identically with the graphics state bound on the stateCommandBuffer passed to vkCmdPreprocessGeneratedCommandsEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11149
  If isPreprocessed is VK_TRUE, then the queue family index of commandBuffer **must** be the same as the queue family index used to allocate the stateCommandBuffer passed to vkCmdPreprocessGeneratedCommandsEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11051
  If isPreprocessed is VK_TRUE and the indirectCommandsLayout member of pGeneratedCommandsInfo contains a dispatch token, then the compute state bound on commandBuffer **must** match identically with the compute state bound on the stateCommandBuffer passed to vkCmdPreprocessGeneratedCommandsEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11052
  If isPreprocessed is VK_TRUE and the indirectCommandsLayout member of pGeneratedCommandsInfo contains a ray tracing token, then the ray tracing state bound on commandBuffer **must** match identically with the ray tracing state bound on the stateCommandBuffer passed to vkCmdPreprocessGeneratedCommandsEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11150
  If isPreprocessed is VK_TRUE and the indirectCommandsLayout member of pGeneratedCommandsInfo contains a ray tracing token, the queue family index commandBuffer was allocated from **must** be the same queue family index used to allocate the stateCommandBuffer passed to vkCmdPreprocessGeneratedCommandsEXT
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-11053
  If the token sequence of the passed VkGeneratedCommandsInfoEXT ::indirectCommandsLayout contains a VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT token, the initial shader state of VkGeneratedCommandsInfoEXT::indirectExecutionSet **must** be bound on commandBuffer
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-11004
  If indirectCommandsLayout was created with a token sequence that contained the VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT token and indirectExecutionSet was created using VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT, every executed VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT token **must** bind all the shader stages set in the VkIndirectCommandsExecutionSetTokenEXT::shaderStages used to create indirectCommandsLayout
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11055
  If isPreprocessed is VK_TRUE and the token sequence of the passed VkGeneratedCommandsInfoEXT::indirectCommandsLayout contains a

VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT token, the members of VkGeneratedCommandsInfoEXT::indirectExecutionSet accessed by this command **must** not have been modified since the preprocess buffer was generated

- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-11056
  If the indirectCommandsLayout member of pGeneratedCommandsInfo contains a draw token, then the active render pass **must** not have a specified fragment density map
- VUID-vkCmdExecuteGeneratedCommandsEXT-deviceGeneratedCommandsTransformFeedback-11057
  If deviceGeneratedCommandsTransformFeedback is not supported on device, transform feedback **must** not be active
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectExecutionSet-11058
  If transform feedback is active, VkGeneratedCommandsInfoEXT::indirectExecutionSet **must** be VK_NULL_HANDLE
- VUID-vkCmdExecuteGeneratedCommandsEXT-deviceGeneratedCommands-11059
  The VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands feature **must** be enabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-supportedIndirectCommandsShaderStages-11060
  The bound shader stages **must** be supported by VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStages
- VUID-vkCmdExecuteGeneratedCommandsEXT-supportedIndirectCommandsShaderStages-11061
  Only stages specified in VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStages **can** be set in pGeneratedCommandsInfo->shaderStages
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11062
  If a rendering pass is currently active, the view mask **must** be 0
- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-11143
  commandBuffer **must** not have been created with VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT

Valid Usage (Implicit)

- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdExecuteGeneratedCommandsEXT-pGeneratedCommandsInfo-parameter
  pGeneratedCommandsInfo **must** be a valid pointer to a valid VkGeneratedCommandsInfoEXT structure
- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-cmdpool

The VkCommandPool that commandBuffer was allocated from **must** support graphics, or compute operations

- VUID-vkCmdExecuteGeneratedCommandsEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdExecuteGeneratedCommandsEXT-bufferlevel
  commandBuffer **must** be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Both	Outside	Graphics Compute	Action Indirection

The VkGeneratedCommandsInfoEXT is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkGeneratedCommandsInfoEXT {
    VkStructureType                 sType;
    const void*                     pNext;
    VkShaderStageFlags              shaderStages;
    VkIndirectExecutionSetEXT       indirectExecutionSet;
    VkIndirectCommandsLayoutEXT     indirectCommandsLayout;
    VkDeviceAddress                 indirectAddress;
    VkDeviceSize                    indirectAddressSize;
    VkDeviceAddress                 preprocessAddress;
    VkDeviceSize                    preprocessSize;
    uint32_t                        maxSequenceCount;
    VkDeviceAddress                 sequenceCountAddress;
    uint32_t                        maxDrawCount;
} VkGeneratedCommandsInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- shaderStages is the mask of shader stages used by the commands.
- indirectExecutionSet is the indirect execution set to be used for binding shaders.

- `indirectCommandsLayout` is the VkIndirectCommandsLayoutEXT that specifies the command sequence data.
- `indirectAddress` is an address that holds the indirect buffer data.
- `indirectAddressSize` is the size in bytes of indirect buffer data starting at `indirectAddress`.
- `preprocessAddress` specifies a physical address of the `VkBuffer` used for preprocessing the input data for execution. If this structure is used with vkCmdExecuteGeneratedCommandsEXT with its `isPreprocessed` set to `VK_TRUE`, then the preprocessing step is skipped but data in this address **may** still be modified. The contents and the layout of this address are opaque to applications and **must** not be modified outside functions related to device-generated commands or copied to another buffer for reuse.
- `preprocessSize` is the maximum byte size within `preprocessAddress` that is available for preprocessing.
- `maxSequenceCount` is used to determine the number of sequences to execute.
- `sequenceCountAddress` specifies an optional physical address of a single `uint32_t` value containing the requested number of sequences to execute.
- `maxDrawCount` is the maximum number of indirect draws that can be executed by any COUNT-type multi-draw indirect tokens. The draw count in the indirect buffer is clamped to this value for these token types.

If `sequenceCountAddress` is not `NULL`, then `maxSequenceCount` is the maximum number of sequences that can be executed. The actual number is `min(maxSequenceCount, *sequenceCountAddress)`. If `sequenceCountAddress` is `NULL`, then `maxSequenceCount` is the exact number of sequences to execute.

If the action command token for the layout is not a COUNT-type multi-draw indirect token, `maxDrawCount` is ignored.

Valid Usage

- VUID-VkGeneratedCommandsInfoEXT-preprocessAddress-11063
  If vkGetGeneratedCommandsMemoryRequirementsEXT returns a non-zero size, `preprocessAddress` **must** not be `NULL`
- VUID-VkGeneratedCommandsInfoEXT-preprocessAddress-11064
  `VkDeviceMemory` objects bound to the underlying buffer for `preprocessAddress` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the VkMemoryRequirements structure returned by vkGetGeneratedCommandsMemoryRequirementsEXT
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11065
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT`, then the `indirectExecutionSet`'s push constant layout **must** contain the `updateRange` specified in VkIndirectCommandsPushConstantTokenEXT
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11066
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT`, then the `indirectExecutionSet`'s

push constant layout **must** contain the `updateRange` specified in VkIndirectCommandsPushConstantTokenEXT

- VUID-VkGeneratedCommandsInfoEXT-maxSequenceCount-11067
  `maxSequenceCount` **must** be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`maxIndirectSequenceCount` and VkGeneratedCommandsMemoryRequirementsInfoEXT::`maxSequencesCount` that was used to determine the `preprocessSize`
- VUID-VkGeneratedCommandsInfoEXT-sequenceCountAddress-11068
  If `sequenceCountAddress` is not `NULL`, the value contained in the address **must** be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::`maxIndirectSequenceCount` and VkGeneratedCommandsMemoryRequirementsInfoEXT::`maxSequencesCount` that was used to determine the `preprocessSize`
- VUID-VkGeneratedCommandsInfoEXT-maxSequenceCount-10246
  `maxSequenceCount` **must** not be zero
- VUID-VkGeneratedCommandsInfoEXT-preprocessAddress-11069
  The underlying buffer for `preprocessAddress` **must** have the `VK_BUFFER_USAGE_2_PREPROCESS_BUFFER_BIT_EXT` bit set in its usage flag
- VUID-VkGeneratedCommandsInfoEXT-preprocessAddress-11070
  If the underlying buffer for `preprocessAddress` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11144
  If the `indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, then the descriptor and push constant layout info provided either by `pipelineLayout` or through a VkPipelineLayoutCreateInfo in `pNext` of the VkIndirectCommandsLayoutCreateInfoEXT used to create `indirectCommandsLayout` **must** be compatible with the descriptor and push constant layout info used by `indirectExecutionSet`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11002
  If `indirectCommandsLayout` was created with a token sequence that contained the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the shader stages used to create the initial shader state of `indirectExecutionSet` **must** equal the VkIndirectCommandsExecutionSetTokenEXT::`shaderStages` used to create `indirectCommandsLayout`
- VUID-VkGeneratedCommandsInfoEXT-preprocessSize-11071
  `preprocessSize` **must** be greater than or equal to the memory requirement's size returned by vkGetGeneratedCommandsMemoryRequirementsEXT using the matching inputs (`indirectCommandsLayout`, ...) as within this structure
- VUID-VkGeneratedCommandsInfoEXT-sequenceCountAddress-11072
  The underlying buffer for `sequenceCountAddress` **must** have the `VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT_KHR` bit set in its usage flag
- VUID-VkGeneratedCommandsInfoEXT-sequenceCountAddress-11073
  If `sequenceCountAddress` is not `NULL`, `sequenceCountAddress` **must** be aligned to `4`
- VUID-VkGeneratedCommandsInfoEXT-indirectAddress-11074

`indirectAddress` **must** be aligned to `4`

- VUID-VkGeneratedCommandsInfoEXT-sequenceCountAddress-11075
  If the underlying buffer for `sequenceCountAddress` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkGeneratedCommandsInfoEXT-indirectAddress-11076
  `indirectAddress` **must** not be `NULL`
- VUID-VkGeneratedCommandsInfoEXT-indirectAddressSize-11077
  `indirectAddressSize` **must** be greater than zero
- VUID-VkGeneratedCommandsInfoEXT-maxDrawCount-11078
  When not ignored, `maxDrawCount` × `maxSequenceCount` **must** be less than 2^24
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11079
  If `indirectCommandsLayout` was created using a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT` token and shader objects are not bound then the bound graphics pipeline **must** have been created with `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` in `pDynamicStates`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11083
  If the token sequence of the passed `indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the `indirectExecutionSet` **must** not be VK_NULL_HANDLE
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-10241
  If the token sequence of the passed `indirectCommandsLayout` does not contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the `indirectExecutionSet` **must** be VK_NULL_HANDLE
- VUID-VkGeneratedCommandsInfoEXT-indirectExecutionSet-11080
  If `indirectExecutionSet` is VK_NULL_HANDLE, a VkGeneratedCommandsPipelineInfoEXT or VkGeneratedCommandsShaderInfoEXT **must** be included in the `pNext` chain

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_EXT`
- VUID-VkGeneratedCommandsInfoEXT-shaderStages-parameter
  `shaderStages` **must** be a valid combination of VkShaderStageFlagBits values
- VUID-VkGeneratedCommandsInfoEXT-shaderStages-requiredbitmask
  `shaderStages` **must** not be `0`
- VUID-VkGeneratedCommandsInfoEXT-indirectExecutionSet-parameter
  If `indirectExecutionSet` is not VK_NULL_HANDLE, `indirectExecutionSet` **must** be a valid VkIndirectExecutionSetEXT handle
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-parameter
  `indirectCommandsLayout` **must** be a valid VkIndirectCommandsLayoutEXT handle
- VUID-VkGeneratedCommandsInfoEXT-commonparent
  Both of `indirectCommandsLayout`, and `indirectExecutionSet` that are valid handles of non-

ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Referencing the functions defined in Indirect Commands Layout, `vkCmdExecuteGeneratedCommandsEXT` behaves as:

```
uint32_t sequencesCount = sequenceCountAddress ?
      min(maxSequenceCount, sequenceCountAddress.load_uint32()) :
      maxSequenceCount;

cmdProcessAllSequences(commandBuffer, indirectExecutionSet,
                       indirectCommandsLayout, indirectAddress,
                       sequencesCount);

// The stateful commands within indirectCommandsLayout will not
// affect the state of subsequent commands in the target
// command buffer (cmd)
```

NOTE

Note

It is important to note that the affected values of all state related to the `shaderStages` used are undefined after this command. This means that e.g., if this command indirectly alters push constants, the push constant state becomes undefined.

Commands **can** be preprocessed prior execution using the following command:

```
// Provided by VK_EXT_device_generated_commands
void vkCmdPreprocessGeneratedCommandsEXT(
    VkCommandBuffer                             commandBuffer,
    const VkGeneratedCommandsInfoEXT*           pGeneratedCommandsInfo,
    VkCommandBuffer                             stateCommandBuffer);
```

- `commandBuffer` is the command buffer which does the preprocessing.
- `pGeneratedCommandsInfo` is a pointer to a VkGeneratedCommandsInfoEXT structure containing parameters affecting the preprocessing step.
- `stateCommandBuffer` is a command buffer from which to snapshot current states affecting the preprocessing step. When a graphics command action token is used, graphics state is snapshotted. When a compute action command token is used, compute state is snapshotted. When a ray tracing action command token is used, ray tracing state is snapshotted. It can be deleted at any time after this command has been recorded.

NOTE

Note

`stateCommandBuffer` access is not synchronized by the driver, meaning that this command buffer **must** not be modified between threads in an unsafe manner.

Valid Usage

- VUID-vkCmdPreprocessGeneratedCommandsEXT-pGeneratedCommandsInfo-11082
  `pGeneratedCommandsInfo`'s `indirectCommandsLayout` **must** have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT` bit set
- VUID-vkCmdPreprocessGeneratedCommandsEXT-indirectCommandsLayout-11084
  If the token sequence of the passed VkGeneratedCommandsInfoEXT ::`indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the initial shader state of VkGeneratedCommandsInfoEXT::`indirectExecutionSet` **must** be bound on `stateCommandBuffer`
- VUID-vkCmdPreprocessGeneratedCommandsEXT-stateCommandBuffer-11138
  `stateCommandBuffer` **must** be in the recording state
- VUID-vkCmdPreprocessGeneratedCommandsEXT-deviceGeneratedCommands-11087
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT`::`deviceGeneratedCommands` feature **must** be enabled
- VUID-vkCmdPreprocessGeneratedCommandsEXT-supportedIndirectCommandsShaderStages-11088
  Only stages specified in VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT ::`supportedIndirectCommandsShaderStages` **can** be set in `pGeneratedCommandsInfo->shaderStages`

Valid Usage (Implicit)

- VUID-vkCmdPreprocessGeneratedCommandsEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdPreprocessGeneratedCommandsEXT-pGeneratedCommandsInfo-parameter
  `pGeneratedCommandsInfo` **must** be a valid pointer to a valid VkGeneratedCommandsInfoEXT structure
- VUID-vkCmdPreprocessGeneratedCommandsEXT-stateCommandBuffer-parameter
  `stateCommandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdPreprocessGeneratedCommandsEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdPreprocessGeneratedCommandsEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- VUID-vkCmdPreprocessGeneratedCommandsEXT-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdPreprocessGeneratedCommandsEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdPreprocessGeneratedCommandsEXT-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`

- VUID-vkCmdPreprocessGeneratedCommandsEXT-commonparent
  Both of `commandBuffer`, and `stateCommandBuffer` **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to `stateCommandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Outside	Graphics Compute	Action

The bound descriptor sets and push constants that will be used with indirect command generation **must** already be specified on `stateCommandBuffer` at the time of preprocessing commands with vkCmdPreprocessGeneratedCommandsEXT. They **must** match the bound descriptor sets and push constants used in the execution of indirect commands with vkCmdExecuteGeneratedCommandsEXT.

If push constants for shader stages are also specified in the VkGeneratedCommandsInfoEXT ::`indirectCommandsLayout` with a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT` or `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT` token, then those values override the push constants that were previously pushed.

All state bound on `stateCommandBuffer` will be used. All state bound on `stateCommandBuffer` **must** be identical to the state bound at the time vkCmdExecuteGeneratedCommandsEXT is recorded. The queue family index `stateCommandBuffer` was allocated from **must** be the same as the queue family index of the command buffer used in vkCmdExecuteGeneratedCommandsEXT.

On some implementations, preprocessing **may** have no effect on performance.

vkCmdExecuteGeneratedCommandsEXT **may** write to the preprocess buffer, no matter the isPreprocess parameter. In this case, the implementation **must** insert appropriate synchronization automatically, which corresponds to the following pseudocode:

- Barrier
  - srcStageMask = DRAW_INDIRECT
  - srcAccesMask = 0

    - dstStageMask = COMMAND_PREPROCESS_BIT
    - dstAccessMask = COMMAND_PREPROCESS_WRITE_BIT | COMMAND_PREPROCESS_READ_BIT
- Do internal writes
- Barrier
    - srcStageMask = COMMAND_PREPROCESS_BIT
    - srcAccesMask = COMMAND_PREPROCESS_WRITE_BIT
    - dstStageMask = DRAW_INDIRECT
    - dstAccessMask = INDIRECT_COMMAND_READ_BIT
- Execute

Chapter 31. Sparse Resources

As documented in Resource Memory Association, `VkBuffer` and `VkImage` resources in Vulkan **must** be bound completely and contiguously to a single `VkDeviceMemory` object. This binding **must** be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources **can** be bound non-contiguously to one or more `VkDeviceMemory` allocations.
- Sparse resources **can** be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources **can** have descriptors generated and used orthogonally with memory binding commands.

31.1. Sparse Resource Features

Sparse resources have several features that **must** be enabled explicitly at resource creation time. The features are enabled by including bits in the `flags` parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

- The `sparseBinding` feature is the base, and provides the following capabilities:
  - Resources **can** be bound at some defined (sparse block) granularity.
  - The entire resource **must** be bound to memory before use regardless of regions actually accessed.
  - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  - Requested via the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` and `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits.
  - A sparse image created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (but not `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) supports all formats that non-sparse usage supports, and supports both `VK_IMAGE_TILING_OPTIMAL` and `VK_IMAGE_TILING_LINEAR` tiling.
- *Sparse Residency* builds on (and requires) the `sparseBinding` feature. It includes the following capabilities:
  - Resources do not have to be completely bound to memory before use on the device.
  - Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  - Consistency of access to unbound regions of the resource is defined by the absence or presence of `VkPhysicalDeviceSparseProperties`::`residencyNonResidentStrict`. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the

data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

  - Requested via the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT and VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT bits.
  - Sparse residency support is advertised on a finer grain via the following features:
    - The sparseResidencyBuffer feature provides support for creating VkBuffer objects with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT.
    - The sparseResidencyImage2D feature provides support for creating 2D single-sampled VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
    - The sparseResidencyImage3D feature provides support for creating 3D VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
    - The sparseResidency2Samples feature provides support for creating 2D VkImage objects with 2 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
    - The sparseResidency4Samples feature provides support for creating 2D VkImage objects with 4 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
    - The sparseResidency8Samples feature provides support for creating 2D VkImage objects with 8 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
    - The sparseResidency16Samples feature provides support for creating 2D VkImage objects with 16 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

      Implementations supporting sparseResidencyImage2D are only **required** to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is **optional** and **can** be enabled via sparseResidencyImage3D, sparseResidency2Samples, sparseResidency4Samples, sparseResidency8Samples, and sparseResidency16Samples.
  - A sparse image created using VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats **may** also be supported and **can** be queried via vkGetPhysicalDeviceSparseImageFormatProperties. VK_IMAGE_TILING_LINEAR tiling is not supported.
- The sparseResidencyAliased feature provides the following capability that **can** be enabled per resource:

  Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

  See Sparse Memory Aliasing for more information.

31.2. Sparse Buffers and Fully-Resident Images

Both VkBuffer and VkImage objects created with the VK_IMAGE_CREATE_SPARSE_BINDING_BIT or VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits **can** be thought of as a linear region of address space. In the VkImage case if VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT is not used, this linear region is entirely

opaque, meaning that there is no application-visible mapping between texel location and memory offset.

Unless VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT or VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT are also used, the entire resource **must** be bound to one or more VkDeviceMemory objects before use.

31.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as VkMemoryRequirements::alignment. alignment represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

31.3. Sparse Partially-Resident Buffers

VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT bit allow the buffer to be made only partially resident. Partially resident VkBuffer objects are allocated and bound identically to VkBuffer objects using only the VK_BUFFER_CREATE_SPARSE_BINDING_BIT feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

31.4. Sparse Partially-Resident Images

VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the mip tail) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

NOTE

Applications **can** use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application **can** unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application **can** also use this functionality to access subregions of the image in a “megatexture” fashion. The application **can** create a large image and only populate the region of the image that is currently being used in the scene.

31.4.1. Accessing Unbound Regions

The following member of VkPhysicalDeviceSparseProperties affects how data in unbound regions of sparse resources are handled by the implementation:

- residencyNonResidentStrict

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered *safe* and will not affect other resources or populated regions of the image.

If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

Image operations performed on unbound memory **may** still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

> Example: Reading the alpha component of an unbacked `VK_FORMAT_R8_UNORM` image will return a value of 1.0f.

See Physical Device Enumeration for instructions for retrieving physical device properties.

> **Implementor's Note**
>
> For implementations that **cannot** natively handle access to unbound regions of a resource, the implementation **may** allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.
>
> Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations **may** use the same physical memory for all unbound regions of multiple resources within the same process.

31.4.2. Mip Tail Regions

Sparse images created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (without also using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) have no specific mapping of image region or image subresource to memory offset defined, so the entire image **can** be thought of as a linear opaque address region. However, images created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` do have a prescribed sparse image block layout, and hence each image subresource **must** start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a *mip tail region*.

If the `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` flag is present in the `flags` member of `VkSparseImageFormatProperties`, for the image's `format`, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` **may** affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. **must** be bound using a VkSparseImageOpaqueMemoryBindInfo structure) and **may** be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.

An implementation **may** choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` in `VkSparseImageMemoryRequirements::flags`.

The following diagrams depict how `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` alter memory usage and requirements.

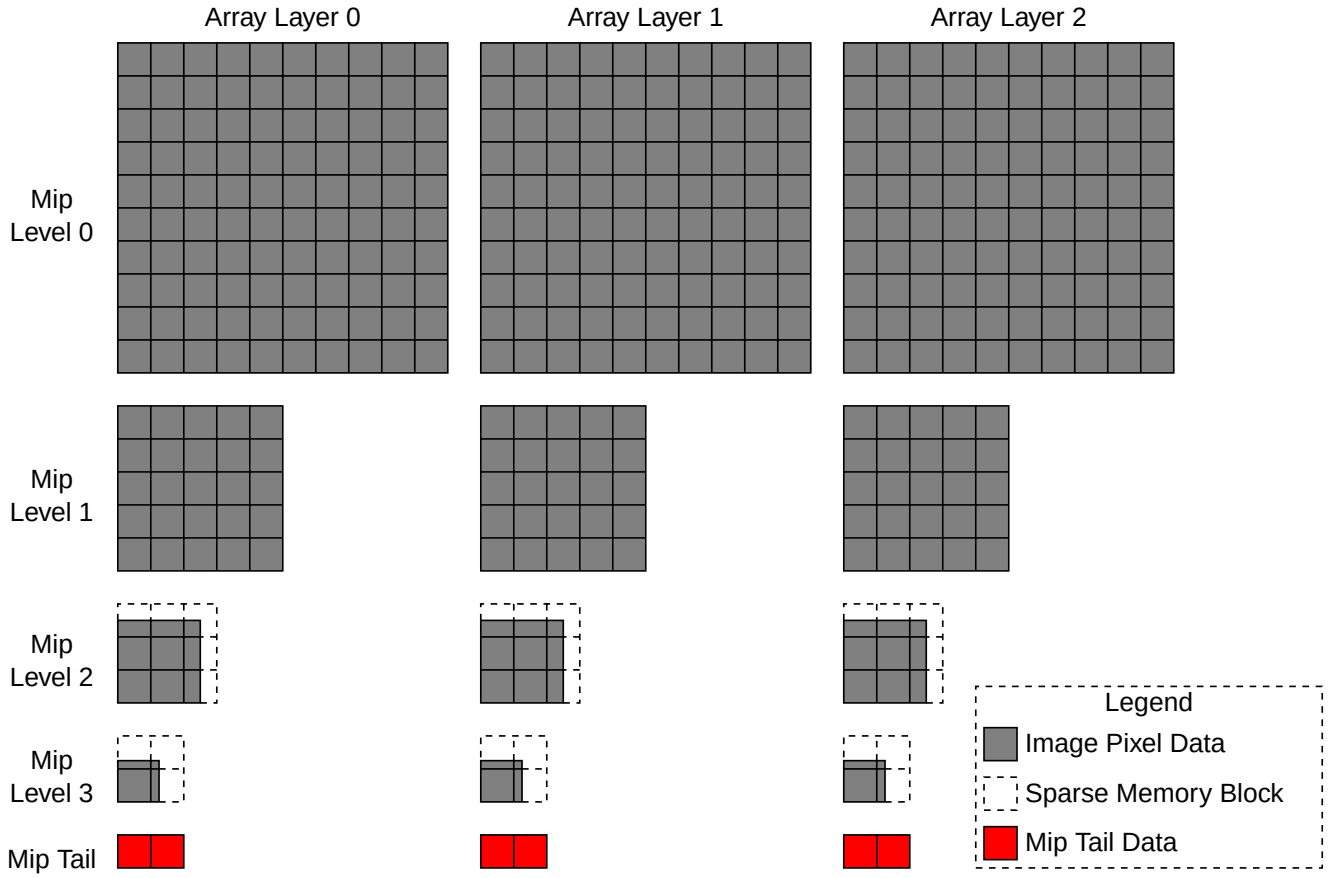

Figure 17. Sparse Image

In the absence of `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions **can** be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks **must** still have their full sparse block size in bytes allocated in memory.

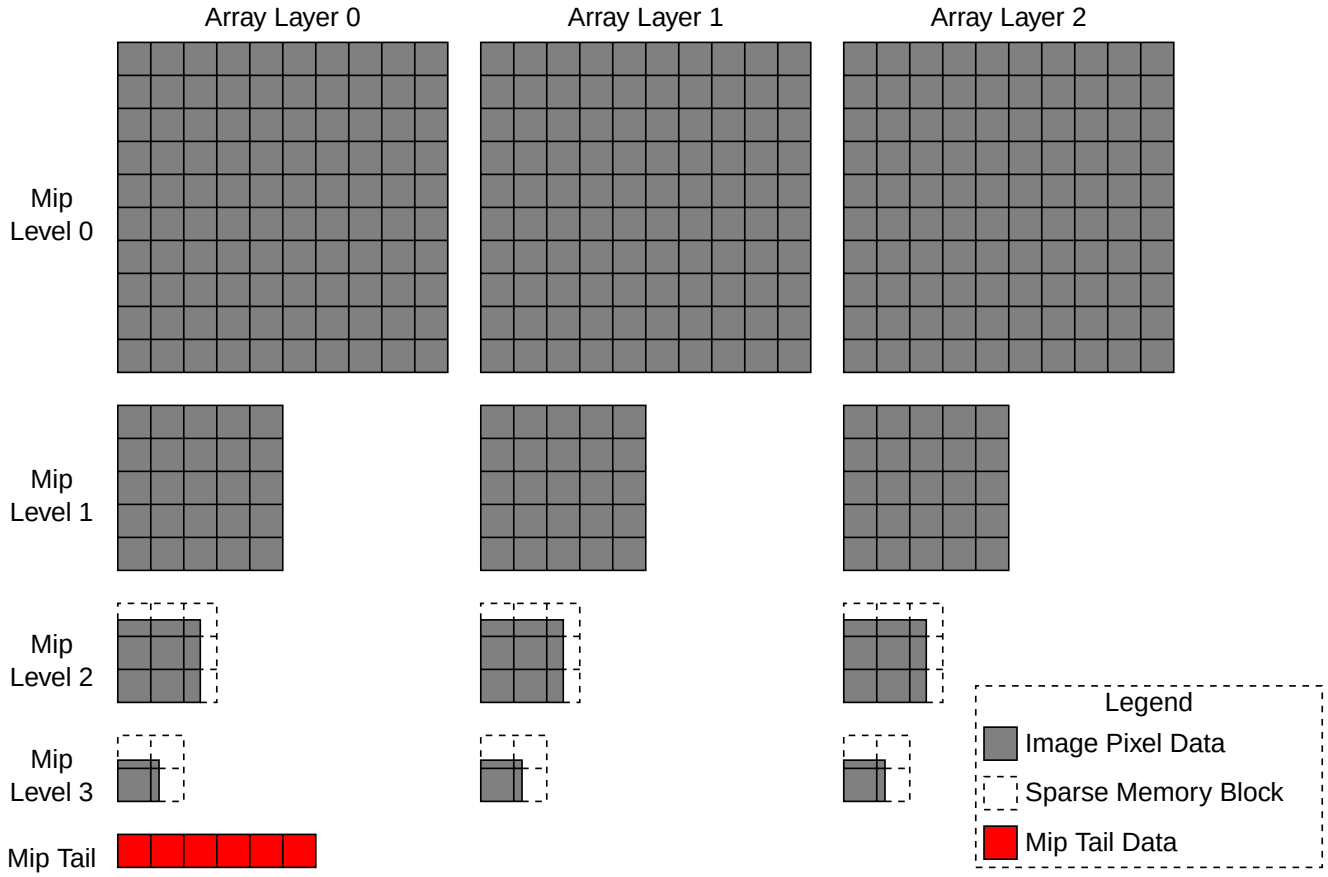

Figure 18. Sparse Image with Single Mip Tail

When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.

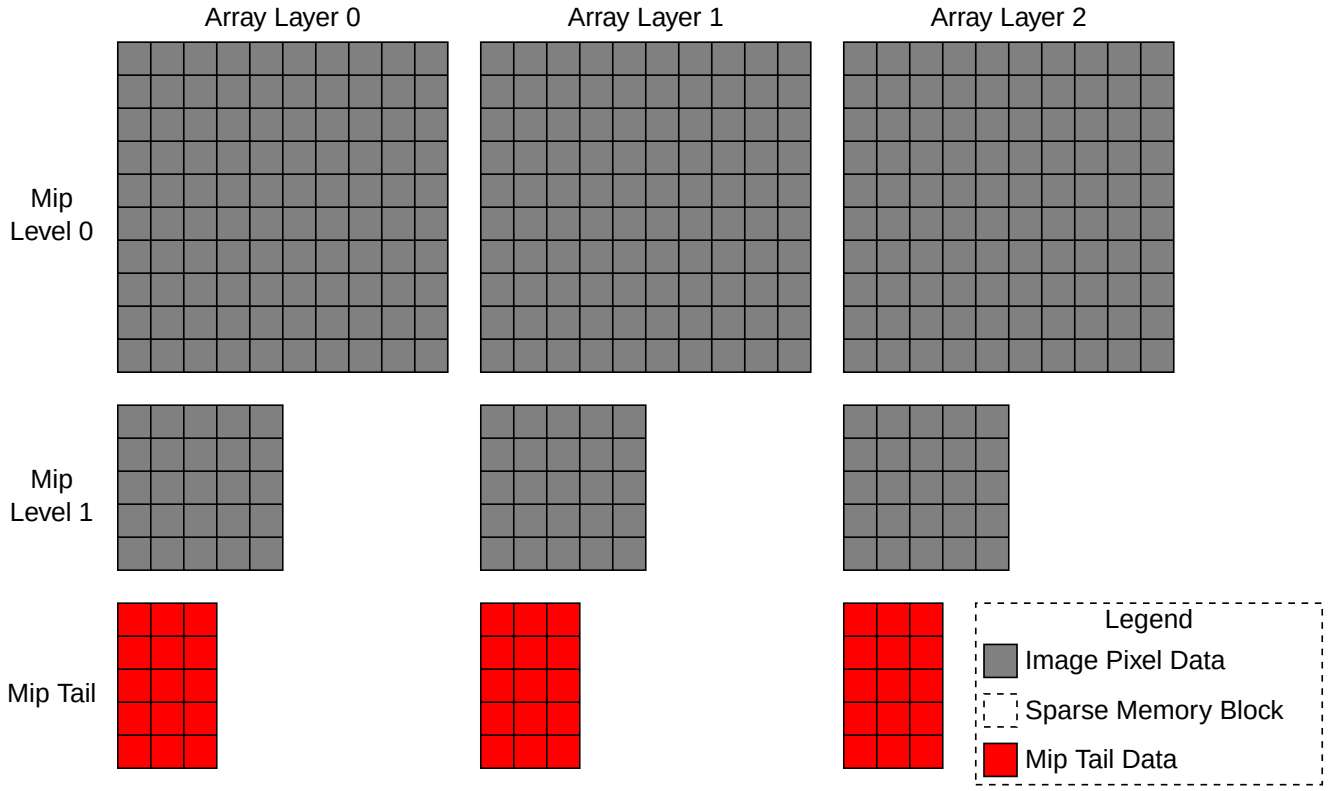

Figure 19. Sparse Image with Aligned Mip Size

NOTE The mip tail regions are presented here in 2D arrays simply for figure size reasons.

> Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first N mip levels whose dimensions are an exact multiple of the sparse image block dimensions **can** be bound and unbound on a sparse block basis.

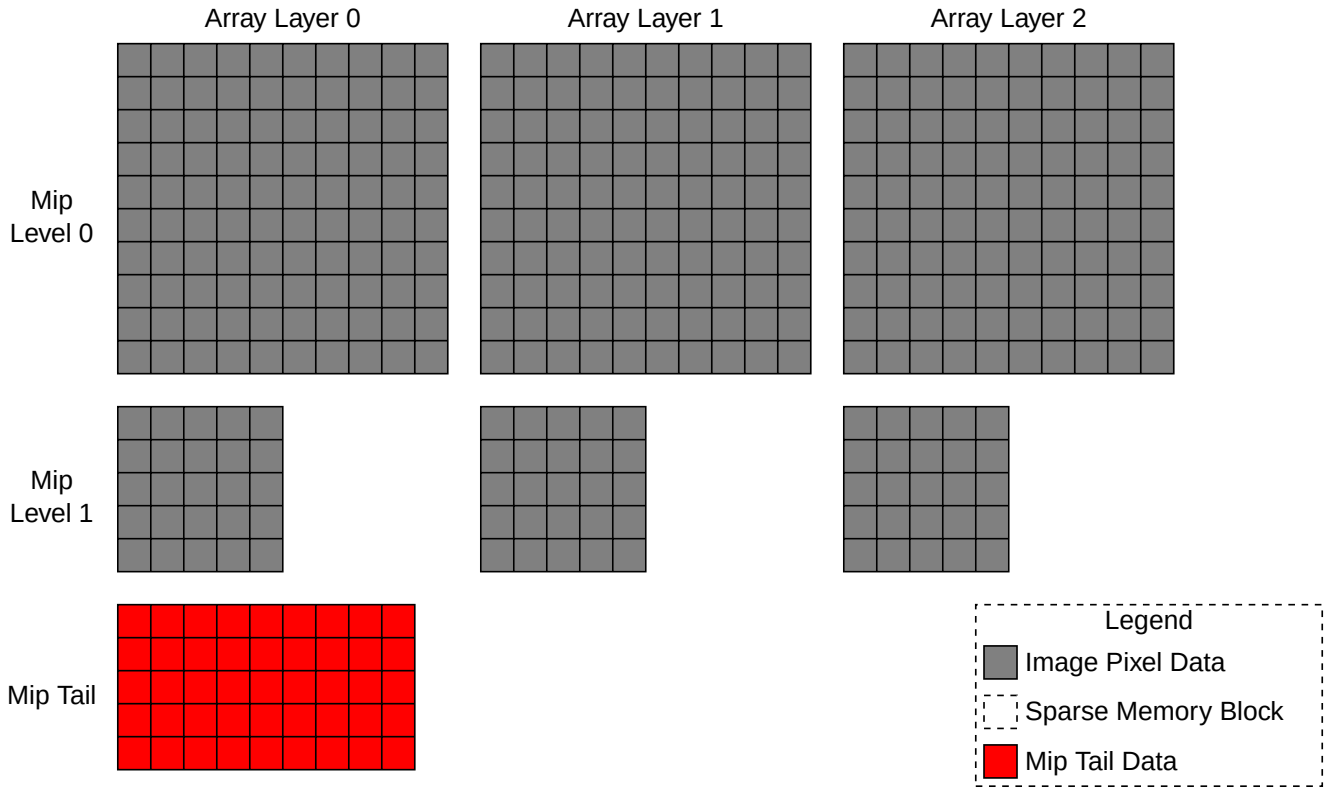

Figure 20. Sparse Image with Aligned Mip Size and Single Mip Tail

> **NOTE** The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT and VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT are present the constraints from each of these flags are in effect.

31.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. VK_FORMAT_BC5_UNORM_BLOCK), the texel size is the size of the compressed texel block (e.g. 128-bit for BC5) thus the dimensions of the standard sparse image block shapes apply in terms of compressed texel blocks.

NOTE For block-compressed formats, the dimensions of a sparse image block in terms of texels **can** be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.

Table 43. Standard Sparse Image Block Shapes (Single Sample)

TEXEL SIZE (bits)	Block Shape (2D)	Block Shape (3D)
8-Bit	256 × 256 × 1	64 × 32 × 32
16-Bit	256 × 128 × 1	32 × 32 × 32
32-Bit	128 × 128 × 1	32 × 32 × 16
64-Bit	128 × 64 × 1	32 × 16 × 16
128-Bit	64 × 64 × 1	16 × 16 × 16

Table 44. Standard Sparse Image Block Shapes (MSAA)

TEXEL SIZE (bits)	Block Shape (2X)	Block Shape (4X)	Block Shape (8X)	Block Shape (16X)
8-Bit	128 × 256 × 1	128 × 128 × 1	64 × 128 × 1	64 × 64 × 1
16-Bit	128 × 128 × 1	128 × 64 × 1	64 × 64 × 1	64 × 32 × 1
32-Bit	64 × 128 × 1	64 × 64 × 1	32 × 64 × 1	32 × 32 × 1
64-Bit	64 × 64 × 1	64 × 32 × 1	32 × 32 × 1	32 × 16 × 1
128-Bit	32 × 64 × 1	32 × 32 × 1	16 × 32 × 1	16 × 16 × 1

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables **may** advertise the following `VkPhysicalDeviceSparseProperties`:

- `residencyStandard2DBlockShape`
- `residencyStandard2DMultisampleBlockShape`
- `residencyStandard3DBlockShape`

Reporting each of these features does *not* imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

31.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image **may** choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in `VkSparseImageFormatProperties`::`imageGranularity`. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in `VkMemoryRequirements`::`alignment`.

Custom sparse image block dimensions are reported through `vkGetPhysicalDeviceSparseImageFormatProperties` and `vkGetImageSparseMemoryRequirements`.

An implementation **must** not support both the standard sparse image block shape and a custom

sparse image block shape for the same image. The standard sparse image block shape **must** be used if it is supported.

31.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private *metadata* associated with the image. See the figure below:

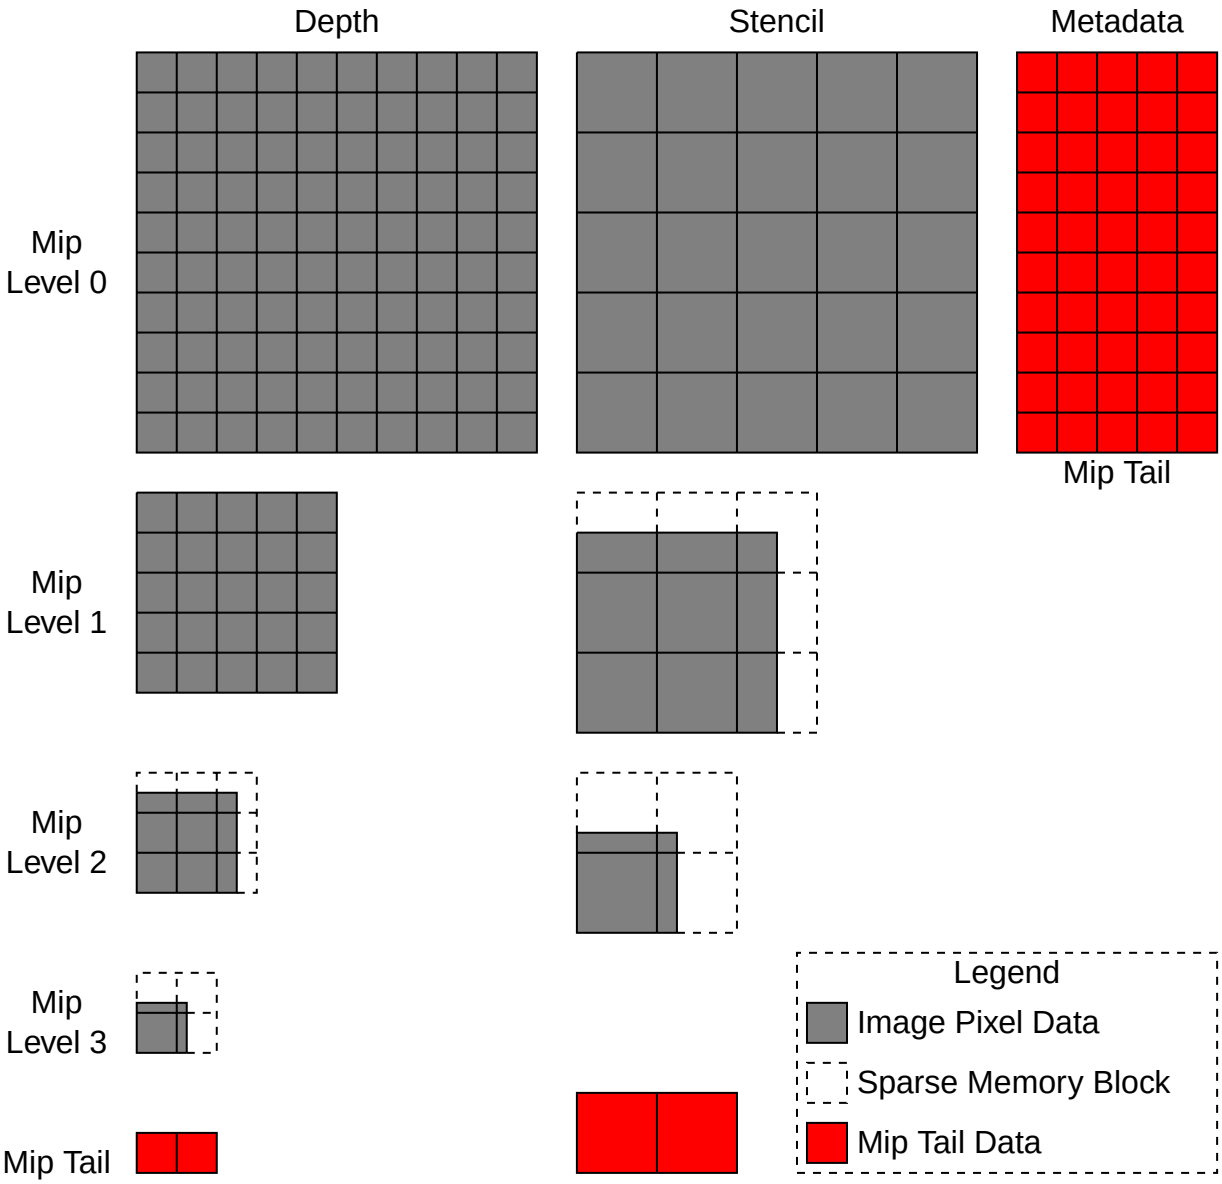

Figure 21. Multiple Aspect Sparse Image

NOTE The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The per-texel stencil data is ¼ the size of the depth data, hence the stencil sparse blocks include 4 × the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by

`VkMemoryRequirements::alignment`.

Metadata

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata **must** be bound prior to device use of the sparse image.

31.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See Memory Aliasing for more information.

`VkDevice` objects that have the `sparseResidencyAliased` feature enabled are able to use the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care **must** be taken when performing a write operation to aliased physical memory. Memory dependencies **must** be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing **must** abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory **must** be created with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` / `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flag.
- All resources that access aliased physical memory **must** interpret the memory in the same way. This implies the following:
  - Buffers and images **cannot** alias the same physical memory in a data consistent fashion. The physical memory ranges **must** be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  - Memory in sparse image mip tail regions **cannot** access aliased memory in a data consistent fashion.
  - Sparse images that alias the same physical memory **must** have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory **cannot** be accessed in a data consistent fashion.

NOTE	Enabling sparse resource memory aliasing **can** be a way to lower physical memory use, but it **may** reduce performance on some implementations. An application

> developer **can** test on their target HW and balance the memory / performance trade-offs measured.

31.6. Sparse Resource Implementation Guidelines (Informative)

This section is Informative. It is included to aid in implementors' understanding of sparse resources.

Device Virtual Address

The basic `sparseBinding` feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages **must** be bound to physical memory before the device accesses the resource.

The `sparseResidency` features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault **may** support `residencyNonResidentStrict`.

Not faulting on access to unbound pages is not enough to support `residencyNonResidentStrict`. An implementation **must** also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this **may** not always be possible.

Any implementation that does not fault, but does not guarantee correct read values **must** not support `residencyNonResidentStrict`.

Any implementation that **cannot** access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory **may** be bound to one (or more) "`placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process **must** not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations **may** allocate more often (per instance, per device, or per resource).

Binding Memory

The byte size reported in `VkMemoryRequirements`::`size` **must** be greater than or equal to the amount of physical memory **required** to fully populate the resource. Some implementations require "holes" in the device virtual address range that are never accessed. These holes **may** be included in the `size` reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how

the implementation provides support for VkSparseImageOpaqueMemoryBindInfo. This operation **must** be supported for all sparse images, even ones created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

- If the holes are included in the size, this bind function becomes very easy. In most cases the resourceOffset is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application **may** allocate more physical memory for the resource than it needs.
- If the holes are not included in the size, the application **can** allocate less physical memory than otherwise for the resource. However, in this case the implementation **must** account for the holes when mapping resourceOffset to the actual device virtual address intended to be mapped.

NOTE

If the application always uses VkSparseImageMemoryBindInfo to bind memory for the non-tail mip levels, any holes that are present in the resource size **may** never be bound.

Since VkSparseImageMemoryBindInfo uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

Binding Metadata Memory

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region **must** be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling VkSparseImageOpaqueMemoryBindInfo.

To make this easier on the implementation, the VK_SPARSE_MEMORY_BIND_METADATA_BIT explicitly specifies when metadata is bound with VkSparseImageOpaqueMemoryBindInfo. When this flag is not present, the resourceOffset **may** be treated as a strict device virtual address offset.

When VK_SPARSE_MEMORY_BIND_METADATA_BIT is present, the resourceOffset **must** have been derived explicitly from the imageMipTailOffset in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for imageMipTailOffset, the resourceOffset does not have to correlate directly to a device virtual address offset, and **may** instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.

31.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties

- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory

31.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in VkPhysicalDeviceFeatures. These features **must** be supported and enabled on the VkDevice object before applications **can** use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- sparseBinding: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT and VK_IMAGE_CREATE_SPARSE_BINDING_BIT flags, respectively.
- sparseResidencyBuffer: Support for creating VkBuffer objects with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag.
- sparseResidencyImage2D: Support for creating 2D single-sampled VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- sparseResidencyImage3D: Support for creating 3D VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- sparseResidency2Samples: Support for creating 2D VkImage objects with 2 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- sparseResidency4Samples: Support for creating 2D VkImage objects with 4 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- sparseResidency8Samples: Support for creating 2D VkImage objects with 8 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- sparseResidency16Samples: Support for creating 2D VkImage objects with 16 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- sparseResidencyAliased: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT flags, respectively.

31.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are reported in the VkPhysicalDeviceProperties::sparseProperties member, which is a VkPhysicalDeviceSparseProperties structure.

The VkPhysicalDeviceSparseProperties structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32    residencyStandard2DBlockShape;
    VkBool32    residencyStandard2DMultisampleBlockShape;
    VkBool32    residencyStandard3DBlockShape;
    VkBool32    residencyAlignedMipSize;
    VkBool32    residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- `residencyStandard2DBlockShape` is `VK_TRUE` if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.
- `residencyStandard2DMultisampleBlockShape` is `VK_TRUE` if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.
- `residencyStandard3DBlockShape` is `VK_TRUE` if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not **required** to match the standard sparse image block dimensions listed in the table.
- `residencyAlignedMipSize` is `VK_TRUE` if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block **may** be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the `flags` member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.
- `residencyNonResidentStrict` specifies whether the physical device **can** consistently access non-resident regions of a resource. If this property is `VK_TRUE`, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.

31.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, **may** be implementation-dependent, vkGetPhysicalDeviceSparseImageFormatProperties **can** be used to query for sparse image format properties prior to resource creation. This command is used

to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

Sparse Image Format Properties API

The VkSparseImageFormatProperties structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags          aspectMask;
    VkExtent3D                  imageGranularity;
    VkSparseImageFormatFlags    flags;
} VkSparseImageFormatProperties;
```

- aspectMask is a bitmask VkImageAspectFlagBits specifying which aspects of the image the properties apply to.
- imageGranularity is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- flags is a bitmask of VkSparseImageFormatFlagBits specifying additional information about the sparse resource.

Bits which **may** be set in VkSparseImageFormatProperties::flags, specifying additional information about the sparse resource, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT specifies that the image uses a single mip tail region for all array layers.
- VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT specifies that the image uses non-standard sparse image block dimensions, and the imageGranularity values do not match the standard sparse image block dimensions for the given format.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseImageFormatFlags;
```

VkSparseImageFormatFlags is a bitmask type for setting a mask of zero or more VkSparseImageFormatFlagBits.

vkGetPhysicalDeviceSparseImageFormatProperties returns an array of VkSparseImageFormatProperties. Each element describes properties for one set of image aspects that are bound simultaneously for a VkImage created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice                            physicalDevice,
    VkFormat                                    format,
    VkImageType                                 type,
    VkSampleCountFlagBits                       samples,
    VkImageUsageFlags                           usage,
    VkImageTiling                               tiling,
    uint32_t*                                   pPropertyCount,
    VkSparseImageFormatProperties*              pProperties);
```

- physicalDevice is the physical device from which to query the sparse image format properties.
- format is the image format.
- type is the dimensionality of the image.
- samples is a VkSampleCountFlagBits value specifying the number of samples per texel.
- usage is a bitmask describing the intended usage of the image.
- tiling is the tiling arrangement of the texel blocks in memory.
- pPropertyCount is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- pProperties is either NULL or a pointer to an array of VkSparseImageFormatProperties structures.

If pProperties is NULL, then the number of sparse format properties available is returned in pPropertyCount. Otherwise, pPropertyCount **must** point to a variable set by the application to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of sparse format properties available, at most pPropertyCount structures will be written.

If VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT is not supported for the given arguments, pPropertyCount will be zero upon return, and no data will be written to pProperties.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique VkSparseImageFormatProperties data.

Depth/stencil images with depth and stencil data interleaved into a single plane will return a single VkSparseImageFormatProperties structure with the aspectMask set to VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT.

Valid Usage

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094
  `samples` **must** be a valid VkSampleCountFlagBits value that is set in `VkImageFormatProperties`::`sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter
  `type` **must** be a valid VkImageType value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter
  `samples` **must** be a valid VkSampleCountFlagBits value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter
  `usage` **must** be a valid combination of VkImageUsageFlagBits values
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitmask
  `usage` **must** not be `0`
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter
  `tiling` **must** be a valid VkImageTiling value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkSparseImageFormatProperties structures

`vkGetPhysicalDeviceSparseImageFormatProperties2KHR` returns an array of VkSparseImageFormatProperties2. Each element describes properties for one set of image aspects that are bound simultaneously for a `VkImage` created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

```
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t*                                   pPropertyCount,
    VkSparseImageFormatProperties2*             pProperties);
```

- `physicalDevice` is the physical device from which to query the sparse image format properties.
- `pFormatInfo` is a pointer to a VkPhysicalDeviceSparseImageFormatInfo2 structure containing input parameters to the command.
- `pPropertyCount` is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of VkSparseImageFormatProperties2 structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2KHR` behaves identically to vkGetPhysicalDeviceSparseImageFormatProperties, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pProperties` parameter.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter
  `pFormatInfo` **must** be a valid pointer to a valid VkPhysicalDeviceSparseImageFormatInfo2 structure
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkSparseImageFormatProperties2 structures

The `VkPhysicalDeviceSparseImageFormatInfo2` structure is defined as:

```
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType          sType;
    const void*              pNext;
    VkFormat                 format;
    VkImageType              type;
    VkSampleCountFlagBits    samples;
    VkImageUsageFlags        usage;
    VkImageTiling            tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceSparseImageFormatInfo2
VkPhysicalDeviceSparseImageFormatInfo2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the image format.
- `type` is the dimensionality of the image.
- `samples` is a VkSampleCountFlagBits value specifying the number of samples per texel.
- `usage` is a bitmask describing the intended usage of the image.
- `tiling` is the tiling arrangement of the texel blocks in memory.

Valid Usage

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095
  `samples` **must** be a valid VkSampleCountFlagBits value that is set in `VkImageFormatProperties`::`sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2`
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter

`type` **must** be a valid VkImageType value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter
  `samples` **must** be a valid VkSampleCountFlagBits value
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter
  `usage` **must** be a valid combination of VkImageUsageFlagBits values
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-requiredbitmask
  `usage` **must** not be `0`
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter
  `tiling` **must** be a valid VkImageTiling value

The `VkSparseImageFormatProperties2` structure is defined as:

```
typedef struct VkSparseImageFormatProperties2 {
    VkStructureType                 sType;
    void*                           pNext;
    VkSparseImageFormatProperties   properties;
} VkSparseImageFormatProperties2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `properties` is a VkSparseImageFormatProperties structure which is populated with the same values as in vkGetPhysicalDeviceSparseImageFormatProperties.

Valid Usage (Implicit)

- VUID-VkSparseImageFormatProperties2-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2`
- VUID-VkSparseImageFormatProperties2-pNext-pNext
  `pNext` **must** be `NULL`

31.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the `VkPhysicalDeviceFeatures` structure described previously in the Physical Device Features section) when calling vkCreateDevice. When the appropriate device features are enabled, the `VK_BUFFER_CREATE_SPARSE_*` and `VK_IMAGE_CREATE_SPARSE_*` flags **can** be used. See vkCreateBuffer and vkCreateImage for details of the resource creation APIs.

NOTE	Specifying VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT requires specifying VK_BUFFER_CREATE_SPARSE_BINDING_BIT or VK_IMAGE_CREATE_SPARSE_BINDING_BIT, respectively, as well. This means that resources **must** be created with the appropriate *_SPARSE_BINDING_BIT to be used with the sparse binding command (vkQueueBindSparse).

31.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for VkBuffer objects and VkImage objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images **can** be bound to memory using only the data from VkMemoryRequirements. For all sparse resources the VkMemoryRequirements::alignment member specifies both the binding granularity in bytes and the **required** alignment of VkDeviceMemory.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the VkMemoryRequirements::alignment field specifies the binding granularity in bytes for the image.

Requesting sparse memory requirements for VkImage objects using vkGetImageSparseMemoryRequirements will return an array of one or more VkSparseImageMemoryRequirements structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image **must** have been created using the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag to retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The VkSparseImageMemoryRequirements structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties    formatProperties;
    uint32_t                         imageMipTailFirstLod;
    VkDeviceSize                     imageMipTailSize;
    VkDeviceSize                     imageMipTailOffset;
    VkDeviceSize                     imageMipTailStride;
} VkSparseImageMemoryRequirements;
```

- formatProperties is a VkSparseImageFormatProperties structure specifying properties of the image format.

- `imageMipTailFirstLod` is the first mip level at which image subresources are included in the mip tail region.
- `imageMipTailSize` is the memory size (in bytes) of the mip tail region. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.
- `imageMipTailOffset` is the opaque memory offset used with VkSparseImageOpaqueMemoryBindInfo to bind the mip tail region(s).
- `imageMipTailStride` is the offset stride between each array-layer's mip tail, if `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(
    VkDevice                                    device,
    VkImage                                     image,
    uint32_t*                                   pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements*            pSparseMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `image` is the VkImage object to get the memory requirements for.
- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements` structures.

If `pSparseMemoryRequirements` is `NULL`, then the number of sparse memory requirements available is returned in `pSparseMemoryRequirementCount`. Otherwise, `pSparseMemoryRequirementCount` **must** point to a variable set by the application to the number of elements in the `pSparseMemoryRequirements` array, and on return the variable is overwritten with the number of structures actually written to `pSparseMemoryRequirements`. If `pSparseMemoryRequirementCount` is less than the number of sparse memory requirements available, at most `pSparseMemoryRequirementCount` structures will be written.

If the image was not created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` then `pSparseMemoryRequirementCount` will be zero and `pSparseMemoryRequirements` will not be written to.

NOTE

It is legal for an implementation to report a larger value in `VkMemoryRequirements::size` than would be obtained by adding together memory sizes for all `VkSparseImageMemoryRequirements` returned by `vkGetImageSparseMemoryRequirements`. This **may** occur when the implementation requires unused padding in the address range describing the resource.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageSparseMemoryRequirements-image-parameter
  `image` **must** be a valid VkImage handle
- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
  `pSparseMemoryRequirementCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
  If the value referenced by `pSparseMemoryRequirementCount` is not `0`, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` **must** be a valid pointer to an array of `pSparseMemoryRequirementCount` VkSparseImageMemoryRequirements structures
- VUID-vkGetImageSparseMemoryRequirements-image-parent
  `image` **must** have been created, allocated, or retrieved from `device`

To query sparse memory requirements for an image, call:

```
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageSparseMemoryRequirements2KHR(
    VkDevice                                    device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t*                                   pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2*           pSparseMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `pInfo` is a pointer to a `VkImageSparseMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.
- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements2-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkImageSparseMemoryRequirementsInfo2 structure
- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-

parameter
pSparseMemoryRequirementCount **must** be a valid pointer to a uint32_t value

- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter
If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements **must** be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements2 structures

To determine the sparse memory requirements for an image resource without creating an object, call:

```
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageSparseMemoryRequirementsKHR(
    VkDevice                                    device,
    const VkDeviceImageMemoryRequirements*      pInfo,
    uint32_t*                                   pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2*           pSparseMemoryRequirements);
```

- device is the logical device intended to own the image.
- pInfo is a pointer to a VkDeviceImageMemoryRequirements structure containing parameters required for the memory requirements query.
- pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- pSparseMemoryRequirements is either NULL or a pointer to an array of VkSparseImageMemoryRequirements2 structures.

Valid Usage (Implicit)

- VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter
device **must** be a valid VkDevice handle
- VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter
pInfo **must** be a valid pointer to a valid VkDeviceImageMemoryRequirements structure
- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
pSparseMemoryRequirementCount **must** be a valid pointer to a uint32_t value
- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements **must** be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements2 structures

The VkImageSparseMemoryRequirementsInfo2 structure is defined as:

```
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- image is the image to query.

Valid Usage (Implicit)

- VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2
- VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext
  pNext **must** be NULL
- VUID-VkImageSparseMemoryRequirementsInfo2-image-parameter
  image **must** be a valid VkImage handle

The VkSparseImageMemoryRequirements2 structure is defined as:

```
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType                    sType;
    void*                              pNext;
    VkSparseImageMemoryRequirements    memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memoryRequirements is a VkSparseImageMemoryRequirements structure describing the memory

requirements of the sparse image.

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryRequirements2-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`
- VUID-VkSparseImageMemoryRequirements2-pNext-pNext
  `pNext` **must** be `NULL`

31.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing **must** not be changed. On the other hand, sparse resources **can** be bound to memory non-contiguously and these bindings **can** be altered during the lifetime of the resource.

NOTE It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications **must** not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit. Applications **must** use synchronization primitives to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

NOTE Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations **may** include `VK_QUEUE_SPARSE_BINDING_BIT` support in queue families that also include graphics and compute support, other implementations **may** only expose a `VK_QUEUE_SPARSE_BINDING_BIT`-only queue family. In either case, applications **must** use synchronization primitives to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the `VK_IMAGE_ASPECT_METADATA_BIT` the application **must** use the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` in the `VkSparseMemoryBind`::`flags` field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` flag.

Binding the mip tail for any aspect **must** only be performed using VkSparseImageOpaqueMemoryBindInfo. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, then it **can** be bound with a single

VkSparseMemoryBind structure, with resourceOffset = imageMipTailOffset and size = imageMipTailSize.

If formatProperties.flags does not contain VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT then the offset for the mip tail in each array layer is given as:

```
arrayMipTailOffset = imageMipTailOffset + arrayLayer * imageMipTailStride;
```

and the mip tail **can** be bound with layerCount VkSparseMemoryBind structures, each using size = imageMipTailSize and resourceOffset = arrayMipTailOffset as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

Sparse Memory Binding Functions

The VkSparseMemoryBind structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize               resourceOffset;
    VkDeviceSize               size;
    VkDeviceMemory             memory;
    VkDeviceSize               memoryOffset;
    VkSparseMemoryBindFlags    flags;
} VkSparseMemoryBind;
```

- resourceOffset is the offset into the resource.
- size is the size of the memory region to be bound.
- memory is the VkDeviceMemory object that the range of the resource is bound to. If memory is VK_NULL_HANDLE, the range is unbound.
- memoryOffset is the offset into the VkDeviceMemory object to bind the resource range to. If memory is VK_NULL_HANDLE, this value is ignored.
- flags is a bitmask of VkSparseMemoryBindFlagBits specifying usage of the binding operation.

The *binding range* [resourceOffset, resourceOffset + size) has different constraints based on flags. If flags contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range **must** be within the mip tail region of the metadata aspect. This metadata region is defined by:

$$\text{metadataRegion} = [\text{base}, \text{base} + \text{imageMipTailSize})$$

$$\text{base} = \text{imageMipTailOffset} + \text{imageMipTailStride} \times n$$

and imageMipTailOffset, imageMipTailSize, and imageMipTailStride values are from the VkSparseImageMemoryRequirements corresponding to the metadata aspect of the image, and n is a

valid array layer index for the image,

`imageMipTailStride` is considered to be zero for aspects where `VkSparseImageMemoryRequirements::formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`.

If `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range **must** be within the range [0,VkMemoryRequirements::`size`).

Valid Usage

- VUID-VkSparseMemoryBind-memory-01096
  If `memory` is not VK_NULL_HANDLE, `memory` and `memoryOffset` **must** match the memory requirements of the resource, as described in section Resource Memory Association
- VUID-VkSparseMemoryBind-resourceOffset-09491
  If the resource being bound is a `VkBuffer`, `resourceOffset`, `memoryOffset` and `size` **must** be an integer multiple of the `alignment` of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with the buffer resource
- VUID-VkSparseMemoryBind-resourceOffset-09492
  If the resource being bound is a `VkImage`, `resourceOffset` and `memoryOffset` **must** be an integer multiple of the `alignment` of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements with the image resource
- VUID-VkSparseMemoryBind-memory-01097
  If `memory` is not VK_NULL_HANDLE, `memory` **must** not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set
- VUID-VkSparseMemoryBind-size-01098
  `size` **must** be greater than `0`
- VUID-VkSparseMemoryBind-resourceOffset-01099
  `resourceOffset` **must** be less than the size of the resource
- VUID-VkSparseMemoryBind-size-01100
  `size` **must** be less than or equal to the size of the resource minus `resourceOffset`
- VUID-VkSparseMemoryBind-memoryOffset-01101
  `memoryOffset` **must** be less than the size of `memory`
- VUID-VkSparseMemoryBind-size-01102
  `size` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- VUID-VkSparseMemoryBind-memory-02730
  If `memory` was created with VkExportMemoryAllocateInfo::`handleTypes` not equal to `0`, at least one handle type it contained **must** also have been set in VkExternalMemoryBufferCreateInfo::`handleTypes` or VkExternalMemoryImageCreateInfo::`handleTypes` when the resource was created
- VUID-VkSparseMemoryBind-memory-02731
  If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in VkExternalMemoryBufferCreateInfo::`handleTypes` or VkExternalMemoryImageCreateInfo::`handleTypes` when the resource was created

Valid Usage (Implicit)

- VUID-VkSparseMemoryBind-memory-parameter
  If `memory` is not VK_NULL_HANDLE, `memory` **must** be a valid VkDeviceMemory handle
- VUID-VkSparseMemoryBind-flags-parameter
  `flags` **must** be a valid combination of VkSparseMemoryBindFlagBits values

Bits which **can** be set in VkSparseMemoryBind::`flags`, specifying usage of a sparse memory binding operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;
```

- `VK_SPARSE_MEMORY_BIND_METADATA_BIT` specifies that the memory being bound is only for the metadata aspect.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseMemoryBindFlags;
```

`VkSparseMemoryBindFlags` is a bitmask type for setting a mask of zero or more VkSparseMemoryBindFlagBits.

Memory is bound to `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer                     buffer;
    uint32_t                     bindCount;
    const VkSparseMemoryBind*    pBinds;
} VkSparseBufferMemoryBindInfo;
```

- `buffer` is the VkBuffer object to be bound.
- `bindCount` is the number of VkSparseMemoryBind structures in the `pBinds` array.
- `pBinds` is a pointer to an array of VkSparseMemoryBind structures.

Valid Usage (Implicit)

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter
  `buffer` **must** be a valid VkBuffer handle
- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter

`pBinds` **must** be a valid pointer to an array of `bindCount` valid VkSparseMemoryBind structures

- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength
  `bindCount` **must** be greater than `0`

Memory is bound to opaque regions of `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage                      image;
    uint32_t                     bindCount;
    const VkSparseMemoryBind*    pBinds;
} VkSparseImageOpaqueMemoryBindInfo;
```

- `image` is the VkImage object to be bound.
- `bindCount` is the number of VkSparseMemoryBind structures in the `pBinds` array.
- `pBinds` is a pointer to an array of VkSparseMemoryBind structures.

NOTE

This structure is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it **can** also be used to bind memory for the entire binding range of partially resident images.

If the `pBinds`[i].flags of an element *i* of `pBinds` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the `resourceOffset` is in the range [0, VkMemoryRequirements::`size`), This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the `resourceOffset` is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

If the `pBinds`[i].flags of an element *i* of `pBinds` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range specified **must** be within the mip tail region of the metadata aspect. In this case the `resourceOffset` is not **required** to be a simple device address offset within the resource. However, it *is* defined to be within [`imageMipTailOffset`, `imageMipTailOffset` + `imageMipTailSize`) for the metadata aspect. See VkSparseMemoryBind for the full constraints on binding region with this flag present.

Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103
  If the `flags` member of any element of `pBinds` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range defined **must** be within the mip

tail region of the metadata aspect of image

Valid Usage (Implicit)

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
  image **must** be a valid VkImage handle
- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
  pBinds **must** be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures
- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
  bindCount **must** be greater than 0

Memory **can** be bound to sparse image blocks of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBindInfo {
    VkImage                          image;
    uint32_t                         bindCount;
    const VkSparseImageMemoryBind*   pBinds;
} VkSparseImageMemoryBindInfo;
```

- image is the VkImage object to be bound
- bindCount is the number of VkSparseImageMemoryBind structures in pBinds array
- pBinds is a pointer to an array of VkSparseImageMemoryBind structures

Valid Usage

- VUID-VkSparseImageMemoryBindInfo-subresource-01722
  The subresource.mipLevel member of each element of pBinds **must** be less than the mipLevels specified in VkImageCreateInfo when image was created
- VUID-VkSparseImageMemoryBindInfo-subresource-01723
  The subresource.arrayLayer member of each element of pBinds **must** be less than the arrayLayers specified in VkImageCreateInfo when image was created
- VUID-VkSparseImageMemoryBindInfo-subresource-01106
  The subresource.aspectMask member of each element of pBinds **must** be valid for the format specified in VkImageCreateInfo when image was created
- VUID-VkSparseImageMemoryBindInfo-image-02901
  image **must** have been created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBindInfo-image-parameter
  `image` **must** be a valid VkImage handle
- VUID-VkSparseImageMemoryBindInfo-pBinds-parameter
  `pBinds` **must** be a valid pointer to an array of `bindCount` valid VkSparseImageMemoryBind structures
- VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength
  `bindCount` **must** be greater than `0`

The `VkSparseImageMemoryBind` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource         subresource;
    VkOffset3D                 offset;
    VkExtent3D                 extent;
    VkDeviceMemory             memory;
    VkDeviceSize               memoryOffset;
    VkSparseMemoryBindFlags    flags;
} VkSparseImageMemoryBind;
```

- `subresource` is the image *aspect* and region of interest in the image.
- `offset` are the coordinates of the first texel within the image subresource to bind.
- `extent` is the size in texels of the region within the image subresource to bind. The extent **must** be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it **can** instead be such that any coordinate of `offset` + `extent` equals the corresponding dimensions of the image subresource.
- `memory` is the VkDeviceMemory object that the sparse image blocks of the image are bound to. If `memory` is VK_NULL_HANDLE, the sparse image blocks are unbound.
- `memoryOffset` is an offset into VkDeviceMemory object. If `memory` is VK_NULL_HANDLE, this value is ignored.
- `flags` are sparse memory binding flags.

Valid Usage

- VUID-VkSparseImageMemoryBind-memory-01104
  If the `sparseResidencyAliased` feature is not enabled, and if any other resources are bound to ranges of `memory`, the range of `memory` being bound **must** not overlap with those bound ranges
- VUID-VkSparseImageMemoryBind-memory-01105
  `memory` and `memoryOffset` **must** match the memory requirements of the calling command's `image`, as described in section Resource Memory Association

- VUID-VkSparseImageMemoryBind-offset-01107
  `offset.x` **must** be a multiple of the sparse image block width (`VkSparseImageFormatProperties`::`imageGranularity.width`) of the image
- VUID-VkSparseImageMemoryBind-extent-09388
  `extent.width` **must** be greater than `0`
- VUID-VkSparseImageMemoryBind-extent-01108
  `extent.width` **must** either be a multiple of the sparse image block width of the image, or else (`extent.width` + `offset.x`) **must** equal the width of the image subresource
- VUID-VkSparseImageMemoryBind-offset-01109
  `offset.y` **must** be a multiple of the sparse image block height (`VkSparseImageFormatProperties`::`imageGranularity.height`) of the image
- VUID-VkSparseImageMemoryBind-extent-09389
  `extent.height` **must** be greater than `0`
- VUID-VkSparseImageMemoryBind-extent-01110
  `extent.height` **must** either be a multiple of the sparse image block height of the image, or else (`extent.height` + `offset.y`) **must** equal the height of the image subresource
- VUID-VkSparseImageMemoryBind-offset-01111
  `offset.z` **must** be a multiple of the sparse image block depth (`VkSparseImageFormatProperties`::`imageGranularity.depth`) of the image
- VUID-VkSparseImageMemoryBind-extent-09390
  `extent.depth` **must** be greater than `0`
- VUID-VkSparseImageMemoryBind-extent-01112
  `extent.depth` **must** either be a multiple of the sparse image block depth of the image, or else (`extent.depth` + `offset.z`) **must** equal the depth of the image subresource
- VUID-VkSparseImageMemoryBind-memory-02732
  If `memory` was created with VkExportMemoryAllocateInfo::`handleTypes` not equal to `0`, at least one handle type it contained **must** also have been set in VkExternalMemoryImageCreateInfo::`handleTypes` when the image was created
- VUID-VkSparseImageMemoryBind-memory-02733
  If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in VkExternalMemoryImageCreateInfo ::`handleTypes` when `image` was created

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBind-subresource-parameter
  `subresource` **must** be a valid VkImageSubresource structure
- VUID-VkSparseImageMemoryBind-memory-parameter
  If `memory` is not VK_NULL_HANDLE, `memory` **must** be a valid VkDeviceMemory handle
- VUID-VkSparseImageMemoryBind-flags-parameter
  `flags` **must** be a valid combination of VkSparseMemoryBindFlagBits values

To submit sparse binding operations to a queue, call:

```
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue                                     queue,
    uint32_t                                    bindInfoCount,
    const VkBindSparseInfo*                     pBindInfo,
    VkFence                                     fence);
```

- `queue` is the queue that the sparse binding operations will be submitted to.
- `bindInfoCount` is the number of elements in the `pBindInfo` array.
- `pBindInfo` is a pointer to an array of VkBindSparseInfo structures, each specifying a sparse binding submission batch.
- `fence` is an **optional** handle to a fence to be signaled. If `fence` is not VK_NULL_HANDLE, it defines a fence signal operation.

`vkQueueBindSparse` is a queue submission command, with each batch defined by an element of `pBindInfo` as a VkBindSparseInfo structure. Batches begin execution in the order they appear in `pBindInfo`, but **may** complete out of order.

Within a batch, a given range of a resource **must** not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application **must** guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to vkQueueBindSparse causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization chapter.

Valid Usage

- VUID-vkQueueBindSparse-fence-01113
  If `fence` is not VK_NULL_HANDLE, `fence` **must** be unsignaled
- VUID-vkQueueBindSparse-fence-01114
  If `fence` is not VK_NULL_HANDLE, `fence` **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkQueueBindSparse-pSignalSemaphores-01115
  Each element of the `pSignalSemaphores` member of each element of `pBindInfo` **must** be unsignaled when the semaphore signal operation it defines is executed on the device
- VUID-vkQueueBindSparse-pWaitSemaphores-01116
  When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pBindInfo` executes on `queue`,

there **must** be no other queues waiting on the same semaphore

- VUID-vkQueueBindSparse-pWaitSemaphores-03245
  All elements of the `pWaitSemaphores` member of all elements of `pBindInfo` referring to a semaphore created with a VkSemaphoreType of `VK_SEMAPHORE_TYPE_BINARY` **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends **must** have also been submitted for execution

Valid Usage (Implicit)

- VUID-vkQueueBindSparse-queue-parameter
  `queue` **must** be a valid VkQueue handle
- VUID-vkQueueBindSparse-pBindInfo-parameter
  If `bindInfoCount` is not `0`, `pBindInfo` **must** be a valid pointer to an array of `bindInfoCount` valid VkBindSparseInfo structures
- VUID-vkQueueBindSparse-fence-parameter
  If `fence` is not VK_NULL_HANDLE, `fence` **must** be a valid VkFence handle
- VUID-vkQueueBindSparse-queuetype
  The `queue` **must** support sparse binding operations
- VUID-vkQueueBindSparse-commonparent
  Both of `fence`, and `queue` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `queue` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	SPARSE_BINDING	-

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkBindSparseInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBindSparseInfo {
    VkStructureType                              sType;
    const void*                                  pNext;
    uint32_t                                     waitSemaphoreCount;
    const VkSemaphore*                           pWaitSemaphores;
    uint32_t                                     bufferBindCount;
    const VkSparseBufferMemoryBindInfo*          pBufferBinds;
    uint32_t                                     imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo*     pImageOpaqueBinds;
    uint32_t                                     imageBindCount;
    const VkSparseImageMemoryBindInfo*           pImageBinds;
    uint32_t                                     signalSemaphoreCount;
    const VkSemaphore*                           pSignalSemaphores;
} VkBindSparseInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- waitSemaphoreCount is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.
- pWaitSemaphores is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
- bufferBindCount is the number of sparse buffer bindings to perform in the batch.
- pBufferBinds is a pointer to an array of VkSparseBufferMemoryBindInfo structures.
- imageOpaqueBindCount is the number of opaque sparse image bindings to perform.
- pImageOpaqueBinds is a pointer to an array of VkSparseImageOpaqueMemoryBindInfo structures, indicating opaque sparse image bindings to perform.
- imageBindCount is the number of sparse image bindings to perform.
- pImageBinds is a pointer to an array of VkSparseImageMemoryBindInfo structures, indicating sparse image bindings to perform.
- signalSemaphoreCount is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.
- pSignalSemaphores is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

Valid Usage

- VUID-VkBindSparseInfo-pWaitSemaphores-03246
  If any element of pWaitSemaphores or pSignalSemaphores was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE then the pNext chain **must** include a VkTimelineSemaphoreSubmitInfo structure
- VUID-VkBindSparseInfo-pNext-03247
  If the pNext chain of this structure includes a VkTimelineSemaphoreSubmitInfo structure and any element of pWaitSemaphores was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE then its waitSemaphoreValueCount member **must** equal waitSemaphoreCount
- VUID-VkBindSparseInfo-pNext-03248
  If the pNext chain of this structure includes a VkTimelineSemaphoreSubmitInfo structure and any element of pSignalSemaphores was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE then its signalSemaphoreValueCount member **must** equal signalSemaphoreCount
- VUID-VkBindSparseInfo-pSignalSemaphores-03249
  For each element of pSignalSemaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues **must** have a value greater than the current value of the semaphore when the semaphore signal operation is executed
- VUID-VkBindSparseInfo-pWaitSemaphores-03250
  For each element of pWaitSemaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues **must** have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference
- VUID-VkBindSparseInfo-pSignalSemaphores-03251
  For each element of pSignalSemaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues **must** have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

Valid Usage (Implicit)

- VUID-VkBindSparseInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_BIND_SPARSE_INFO
- VUID-VkBindSparseInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkDeviceGroupBindSparseInfo,

VkFrameBoundaryEXT, or VkTimelineSemaphoreSubmitInfo

- VUID-VkBindSparseInfo-sType-unique
  The sType value of each struct in the pNext chain **must** be unique
- VUID-VkBindSparseInfo-pWaitSemaphores-parameter
  If waitSemaphoreCount is not 0, pWaitSemaphores **must** be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles
- VUID-VkBindSparseInfo-pBufferBinds-parameter
  If bufferBindCount is not 0, pBufferBinds **must** be a valid pointer to an array of bufferBindCount valid VkSparseBufferMemoryBindInfo structures
- VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter
  If imageOpaqueBindCount is not 0, pImageOpaqueBinds **must** be a valid pointer to an array of imageOpaqueBindCount valid VkSparseImageOpaqueMemoryBindInfo structures
- VUID-VkBindSparseInfo-pImageBinds-parameter
  If imageBindCount is not 0, pImageBinds **must** be a valid pointer to an array of imageBindCount valid VkSparseImageMemoryBindInfo structures
- VUID-VkBindSparseInfo-pSignalSemaphores-parameter
  If signalSemaphoreCount is not 0, pSignalSemaphores **must** be a valid pointer to an array of signalSemaphoreCount valid VkSemaphore handles
- VUID-VkBindSparseInfo-commonparent
  Both of the elements of pSignalSemaphores, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

To specify the values to use when waiting for and signaling semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkBindSparseInfo structure.

If the pNext chain of VkBindSparseInfo includes a VkDeviceGroupBindSparseInfo structure, then that structure includes device indices specifying which instance of the resources and memory are bound.

The VkDeviceGroupBindSparseInfo structure is defined as:

```
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           resourceDeviceIndex;
    uint32_t           memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `resourceDeviceIndex` is a device index indicating which instance of the resource is bound.
- `memoryDeviceIndex` is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the `resourceDeviceIndex`.

If this structure is not present, `resourceDeviceIndex` and `memoryDeviceIndex` are assumed to be zero.

Valid Usage

- VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118
  `resourceDeviceIndex` and `memoryDeviceIndex` **must** both be valid device indices
- VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119
  Each memory allocation bound in this batch **must** have allocated an instance for `memoryDeviceIndex`

Valid Usage (Implicit)

- VUID-VkDeviceGroupBindSparseInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO`

Chapter 32. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API **can** be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions **must** be enabled in order to use each of the functions described in this chapter.

32.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API **may** be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it **must** either:

- `#define` the appropriate preprocessor symbol prior to including the `vulkan.h` header file, or
- include `vulkan_core.h` and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application **must** enable instance extensions with `vkCreateInstance` before using them.

32.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by `VkSurfaceKHR` handles:

```
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The `VK_KHR_surface` extension declares the `VkSurfaceKHR` object, and provides a function for destroying `VkSurfaceKHR` objects. Separate platform-specific extensions each provide a function for creating a `VkSurfaceKHR` object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.

NOTE On certain platforms, the Vulkan loader and ICDs **may** have conventions that treat

the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers **may** wrap `VkSurfaceKHR` objects.

32.2.1. Android Platform

To create a `VkSurfaceKHR` object for an Android native window, call:

```
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance                                  instance,
    const VkAndroidSurfaceCreateInfoKHR*        pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkAndroidSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

During the lifetime of a surface created using a particular ANativeWindow handle any attempts to create another surface for the same ANativeWindow and any attempts to connect to the same ANativeWindow through other platform mechanisms will fail.

NOTE In particular, only one `VkSurfaceKHR` **can** exist at a time for a given window. Similarly, a native window **cannot** be used by both a `VkSurfaceKHR` and `EGLSurface` simultaneously.

If successful, `vkCreateAndroidSurfaceKHR` increments the ANativeWindow's reference count, and `vkDestroySurfaceKHR` will decrement it.

On Android, when a swapchain's `imageExtent` does not match the surface's `currentExtent`, the presentable images will be scaled to the surface's dimensions during presentation. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum image size supported by the consumer. For the system compositor, `currentExtent` is the window size (i.e. the consumer's preferred size).

Valid Usage (Implicit)

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkAndroidSurfaceCreateInfoKHR structure

- VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
  `pSurface` **must** be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`

The `VkAndroidSurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkAndroidSurfaceCreateFlagsKHR  flags;
    struct ANativeWindow*           window;
} VkAndroidSurfaceCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `window` is a pointer to the ANativeWindow to associate the surface with.

Valid Usage

- VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
  `window` **must** point to a valid Android ANativeWindow

Valid Usage (Implicit)

- VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR`
- VUID-VkAndroidSurfaceCreateInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`

- VUID-VkAndroidSurfaceCreateInfoKHR-flags-zerobitmask
  `flags` **must** be `0`

To remove an unnecessary compile time dependency, an incomplete type definition of ANativeWindow is provided in the Vulkan headers:

```
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual ANativeWindow type is defined in Android NDK headers.

```
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

32.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance                                  instance,
    const VkWaylandSurfaceCreateInfoKHR*        pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkWaylandSurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkWaylandSurfaceCreateInfoKHR structure
- VUID-vkCreateWaylandSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid

VkAllocationCallbacks structure

- VUID-vkCreateWaylandSurfaceKHR-pSurface-parameter
  `pSurface` **must** be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkWaylandSurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkWaylandSurfaceCreateFlagsKHR  flags;
    struct wl_display*              display;
    struct wl_surface*              surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `display` and `surface` are pointers to the Wayland `wl_display` and `wl_surface` to associate the surface with.

Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304
  `display` **must** point to a valid Wayland `wl_display`
- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305
  `surface` **must** point to a valid Wayland `wl_surface`

Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR`
- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext

pNext **must** be NULL

- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zerobitmask
  flags **must** be 0

On Wayland, currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain's imageExtent to will be the size of the window, after the first image is presented. minImageExtent is (1,1), and maxImageExtent is the maximum supported surface size. Any calls to vkGetPhysicalDeviceSurfacePresentModesKHR on a surface created with vkCreateWaylandSurfaceKHR are **required** to return VK_PRESENT_MODE_MAILBOX_KHR as one of the valid present modes.

Some Vulkan functions **may** send protocol over the specified wl_display connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to a wl_surface. Applications **must** therefore ensure that both the wl_display and the wl_surface remain valid for the lifetime of any VkSwapchainKHR objects created from a particular wl_display and wl_surface. Also, calling vkQueuePresentKHR will result in Vulkan sending wl_surface.commit requests to the underlying wl_surface of each The wl_surface.attach, wl_surface.damage, and wl_surface.commit requests **must** be issued by the implementation during the call to vkQueuePresentKHR and **must** not be issued by the implementation outside of vkQueuePresentKHR. This ensures that any Wayland requests sent by the client after the call to vkQueuePresentKHR returns will be received by the compositor after the wl_surface.commit. Regardless of the mode of swapchain creation, a new wl_event_queue **must** be created for each successful vkCreateWaylandSurfaceKHR call, and every Wayland object created by the implementation **must** be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this **must** be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests **must** be sent to the Wayland display server prior to calling vkQueuePresentKHR.

```
// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;
```

VkWaylandSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

32.2.3. Win32 Platform

To create a VkSurfaceKHR object for a Win32 window, call:

```
// Provided by VK_KHR_win32_surface
VkResult vkCreateWin32SurfaceKHR(
    VkInstance                                  instance,
    const VkWin32SurfaceCreateInfoKHR*          pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWin32SurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkWin32SurfaceCreateInfoKHR structure
- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter
  `pSurface` **must** be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Some Vulkan functions **may** call the `SendMessage` system API when interacting with a `VkSurfaceKHR` through a `VkSwapchainKHR`. In a multithreaded environment, calling `SendMessage` from a thread that is not the thread associated with `pCreateInfo->hwnd` will block until the application has processed the window message. Thus, applications **should** either call these Vulkan functions on the message pump thread, or make sure their message pump is actively running. Failing to do so **may** result in deadlocks.

The functions subject to this requirement are:

- vkCreateSwapchainKHR
- vkDestroySwapchainKHR
- vkAcquireNextImageKHR and vkAcquireNextImage2KHR
- vkQueuePresentKHR
- vkAcquireFullScreenExclusiveModeEXT

- vkReleaseFullScreenExclusiveModeEXT
- vkSetHdrMetadataEXT

The VkWin32SurfaceCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkWin32SurfaceCreateFlagsKHR    flags;
    HINSTANCE                       hinstance;
    HWND                            hwnd;
} VkWin32SurfaceCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- hinstance is the Win32 HINSTANCE for the window to associate the surface with.
- hwnd is the Win32 HWND for the window to associate the surface with.

Valid Usage

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  hinstance **must** be a valid Win32 HINSTANCE
- VUID-VkWin32SurfaceCreateInfoKHR-hwnd-01308
  hwnd **must** be a valid Win32 HWND

Valid Usage (Implicit)

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR
- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
  pNext **must** be NULL
- VUID-VkWin32SurfaceCreateInfoKHR-flags-zerobitmask
  flags **must** be 0

With Win32, minImageExtent, maxImageExtent, and currentExtent **must** always equal the window size.

The currentExtent of a Win32 surface **must** have both width and height greater than 0, or both of them 0.

NOTE Due to above restrictions, it is only possible to create a new swapchain on this platform with imageExtent being equal to the current size of the window, as

reported in VkSurfaceCapabilitiesKHR::currentExtent.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

```
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
```

VkWin32SurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

32.2.4. XCB Platform

To create a VkSurfaceKHR object for an X11 window, using the XCB client-side library, call:

```
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance                                  instance,
    const VkXcbSurfaceCreateInfoKHR*            pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- instance is the instance to associate the surface with.
- pCreateInfo is a pointer to a VkXcbSurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateXcbSurfaceKHR-instance-parameter
  instance **must** be a valid VkInstance handle
- VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkXcbSurfaceCreateInfoKHR structure
- VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateXcbSurfaceKHR-pSurface-parameter
  pSurface **must** be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkXcbSurfaceCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkXcbSurfaceCreateFlagsKHR      flags;
    xcb_connection_t*               connection;
    xcb_window_t                    window;
} VkXcbSurfaceCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- connection is a pointer to an xcb_connection_t to the X server.
- window is the xcb_window_t for the X11 window to associate the surface with.

Valid Usage

- VUID-VkXcbSurfaceCreateInfoKHR-connection-01310
  connection **must** point to a valid X11 xcb_connection_t
- VUID-VkXcbSurfaceCreateInfoKHR-window-01311
  window **must** be a valid X11 xcb_window_t

Valid Usage (Implicit)

- VUID-VkXcbSurfaceCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR
- VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext
  pNext **must** be NULL
- VUID-VkXcbSurfaceCreateInfoKHR-flags-zerobitmask
  flags **must** be 0

With Xcb, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of an Xcb surface **must** have both `width` and `height` greater than 0, or both of them 0.

NOTE

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in VkSurfaceCapabilitiesKHR::`currentExtent`.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

Some Vulkan functions **may** send protocol over the specified xcb connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to an xcb window. Applications **must** therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains **must**

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so **may** result in deadlock.

```
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
```

`VkXcbSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

32.2.5. Xlib Platform

To create a `VkSurfaceKHR` object for an X11 window, using the Xlib client-side library, call:

```
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance                                  instance,
    const VkXlibSurfaceCreateInfoKHR*           pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkXlibSurfaceCreateInfoKHR` structure containing the parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateXlibSurfaceKHR-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkXlibSurfaceCreateInfoKHR structure
- VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateXlibSurfaceKHR-pSurface-parameter
  `pSurface` **must** be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXlibSurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_xlib_surface
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType                sType;
    const void*                    pNext;
    VkXlibSurfaceCreateFlagsKHR    flags;
    Display*                       dpy;
    Window                         window;
} VkXlibSurfaceCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `dpy` is a pointer to an Xlib `Display` connection to the X server.
- `window` is an Xlib `Window` to associate the surface with.

Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
  `dpy` **must** point to a valid Xlib `Display`

- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
  `window` **must** be a valid Xlib `Window`

Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR`
- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkXlibSurfaceCreateInfoKHR-flags-zerobitmask
  `flags` **must** be `0`

With Xlib, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of an Xlib surface **must** have both `width` and `height` greater than 0, or both of them 0.

NOTE

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in VkSurfaceCapabilitiesKHR::`currentExtent`.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

Some Vulkan functions **may** send protocol over the specified Xlib `Display` connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to an Xlib window. Applications **must** therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains **must**

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so **may** result in deadlock.

Some implementations may require threads to implement some presentation modes so applications **must** call `XInitThreads`() before calling any other Xlib functions.

```
// Provided by VK_KHR_xlib_surface
typedef VkFlags VkXlibSurfaceCreateFlagsKHR;
```

`VkXlibSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

32.2.6. Platform-Independent Information

Once created, VkSurfaceKHR objects **can** be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) **should** be destroyed, as there is no way to restore them to a not-lost state. Applications **may** attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and **may** depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

```
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(
    VkInstance                                  instance,
    VkSurfaceKHR                                surface,
    const VkAllocationCallbacks*                pAllocator);
```

- instance is the instance used to create the surface.
- surface is the surface to destroy.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

Destroying a VkSurfaceKHR merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

Valid Usage

- VUID-vkDestroySurfaceKHR-surface-01266
  All VkSwapchainKHR objects created for surface **must** have been destroyed prior to destroying surface
- VUID-vkDestroySurfaceKHR-surface-01267
  If VkAllocationCallbacks were provided when surface was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroySurfaceKHR-surface-01268
  If no VkAllocationCallbacks were provided when surface was created, pAllocator **must** be NULL

Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
  instance **must** be a valid VkInstance handle
- VUID-vkDestroySurfaceKHR-surface-parameter

If `surface` is not VK_NULL_HANDLE, `surface` **must** be a valid VkSurfaceKHR handle

- VUID-vkDestroySurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroySurfaceKHR-surface-parent
  If `surface` is a valid handle, it **must** have been created, allocated, or retrieved from `instance`

Host Synchronization

- Host access to `surface` **must** be externally synchronized

32.3. Presenting Directly to Display Devices

In some environments applications **can** also present Vulkan rendering directly to display devices without using an intermediate windowing system. This **can** be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The `VK_KHR_display` extension provides the functionality necessary to enumerate display devices and create `VkSurfaceKHR` objects that target displays.

32.3.1. Display Enumeration

Displays are represented by `VkDisplayKHR` handles:

```
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkDisplayPropertiesKHR*                     pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of VkDisplayPropertiesKHR structures.

If `pProperties` is `NULL`, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the

number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If the value of pPropertyCount is less than the number of display devices for physicalDevice, at most pPropertyCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter
  physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter
  pPropertyCount **must** be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties **must** be a valid pointer to an array of pPropertyCount VkDisplayPropertiesKHR structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPropertiesKHR structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR                  display;
    const char*                   displayName;
    VkExtent2D                    physicalDimensions;
    VkExtent2D                    physicalResolution;
    VkSurfaceTransformFlagsKHR    supportedTransforms;
    VkBool32                      planeReorderPossible;
    VkBool32                      persistentContent;
} VkDisplayPropertiesKHR;
```

- display is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.
- displayName is NULL or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If NULL, no suitable name is available. If not NULL, the string pointed to **must** remain accessible and unmodified as

long as `display` is valid.

- `physicalDimensions` describes the physical width and height of the visible portion of the display, in millimeters.
- `physicalResolution` describes the physical, native, or preferred resolution of the display.

NOTE	For devices which have no natural value to return here, implementations **should** return the maximum resolution supported.

- `supportedTransforms` is a bitmask of VkSurfaceTransformFlagBitsKHR describing which transforms are supported by this display.
- `planeReorderPossible` tells whether the planes on this display **can** have their z order changed. If this is `VK_TRUE`, the application **can** re-arrange the planes on this display in any order relative to each other.
- `persistentContent` tells whether the display supports self-refresh/internal buffering. If this is true, the application **can** submit persistent present operations on swapchains created against this display.

NOTE	Persistent presents **may** have higher latency, and **may** use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkDisplayProperties2KHR*                    pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayProperties2KHR` behaves similarly to vkGetPhysicalDeviceDisplayPropertiesKHR, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkDisplayProperties2KHR structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType           sType;
    void*                     pNext;
    VkDisplayPropertiesKHR    displayProperties;
} VkDisplayProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayProperties` is a VkDisplayPropertiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR`
- VUID-VkDisplayProperties2KHR-pNext-pNext
  `pNext` **must** be `NULL`

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To release a previously acquired display, call:

```
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice                            physicalDevice,
    VkDisplayKHR                                display);
```

- `physicalDevice` The physical device the display is on.
- `display` The display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkReleaseDisplayEXT-display-parameter
  `display` **must** be a valid VkDisplayKHR handle
- VUID-vkReleaseDisplayEXT-display-parent
  `display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`

Failure

None

Display Planes

Images are presented to individual planes on a display. Devices **must** support at least one plane on each display. Planes **can** be stacked and blended to composite multiple images on one display. Devices **may** support only a fixed stacking order and fixed mapping between planes and displays, or they **may** allow arbitrary application-specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkDisplayPlanePropertiesKHR*                pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlanePropertiesKHR` structures.

If pProperties is NULL, then the number of display planes available for physicalDevice is returned in pPropertyCount. Otherwise, pPropertyCount **must** point to a variable set by the application to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If the value of pPropertyCount is less than the number of display planes for physicalDevice, at most pPropertyCount structures will be written.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter
  physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter
  pPropertyCount **must** be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties **must** be a valid pointer to an array of pPropertyCount VkDisplayPlanePropertiesKHR structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlanePropertiesKHR structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR    currentDisplay;
    uint32_t        currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```

- currentDisplay is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be VK_NULL_HANDLE.
- currentStackIndex is the current z-order of the plane. This will be between 0 and the value returned by vkGetPhysicalDeviceDisplayPlanePropertiesKHR in pPropertyCount.

To query the properties of a device's display planes, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkDisplayPlaneProperties2KHR*               pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to vkGetPhysicalDeviceDisplayPlanePropertiesKHR, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkDisplayPlaneProperties2KHR structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType                 sType;
    void*                           pNext;
    VkDisplayPlanePropertiesKHR     displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPlaneProperties` is a VkDisplayPlanePropertiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneProperties2KHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- VUID-VkDisplayPlaneProperties2KHR-pNext-pNext
  `pNext` **must** be `NULL`

To determine which displays a plane is usable with, call

```
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t                                    planeIndex,
    uint32_t*                                   pDisplayCount,
    VkDisplayKHR*                               pDisplays);
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and **must** be in the range [0, physical device plane count - 1].
- `pDisplayCount` is a pointer to an integer related to the number of displays available or queried, as described below.
- `pDisplays` is either `NULL` or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is `NULL`, then the number of displays usable with the specified `planeIndex` for `physicalDevice` is returned in `pDisplayCount`. Otherwise, `pDisplayCount` **must** point to a variable set by the application to the number of elements in the `pDisplays` array, and on return the variable is overwritten with the number of handles actually written to `pDisplays`. If the value of `pDisplayCount` is less than the number of usable display-plane pairs for `physicalDevice`, at most `pDisplayCount` handles will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available pairs were returned.

Valid Usage

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249
  `planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter
  `pDisplayCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter
  If the value referenced by `pDisplayCount` is not `0`, and `pDisplays` is not `NULL`, `pDisplays` **must** be a valid pointer to an array of `pDisplayCount` VkDisplayKHR handles

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Additional properties of displays are queried using specialized query functions.

Display Modes

Display modes are represented by `VkDisplayModeKHR` handles:

```
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```
// Provided by VK_KHR_display
VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    VkDisplayKHR                                display,
    uint32_t*                                   pPropertyCount,
    VkDisplayModePropertiesKHR*                 pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display modes available on the specified `display` for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display modes for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available display modes were returned.

Valid Usage (Implicit)

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter
  `display` **must** be a valid VkDisplayKHR handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkDisplayModePropertiesKHR structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent
  `display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayModePropertiesKHR structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR              displayMode;
    VkDisplayModeParametersKHR    parameters;
} VkDisplayModePropertiesKHR;
```

- displayMode is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- parameters is a VkDisplayModeParametersKHR structure describing the display parameters associated with displayMode.

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

VkDisplayModeCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device's built-in display modes, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    VkDisplayKHR                                display,
    uint32_t*                                   pPropertyCount,
    VkDisplayModeProperties2KHR*                pProperties);
```

- physicalDevice is the physical device associated with display.
- display is the display to query.
- pPropertyCount is a pointer to an integer related to the number of display modes available or queried, as described below.
- pProperties is either NULL or a pointer to an array of VkDisplayModeProperties2KHR structures.

vkGetDisplayModeProperties2KHR behaves similarly to vkGetDisplayModePropertiesKHR, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetDisplayModeProperties2KHR-display-parameter
  `display` **must** be a valid VkDisplayKHR handle
- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkDisplayModeProperties2KHR structures
- VUID-vkGetDisplayModeProperties2KHR-display-parent
  `display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayModeProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType               sType;
    void*                         pNext;
    VkDisplayModePropertiesKHR    displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayModeProperties` is a VkDisplayModePropertiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR`

- VUID-VkDisplayModeProperties2KHR-pNext-pNext
  `pNext` **must** be `NULL`

The `VkDisplayModeParametersKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D    visibleRegion;
    uint32_t      refreshRate;
} VkDisplayModeParametersKHR;
```

- `visibleRegion` is the 2D extents of the visible region.
- `refreshRate` is a `uint32_t` that is the number of times the display is refreshed each second multiplied by 1000.

NOTE For example, a 60Hz display mode would report a `refreshRate` of 60,000.

Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
  The `width` member of `visibleRegion` **must** be greater than `0`
- VUID-VkDisplayModeParametersKHR-height-01991
  The `height` member of `visibleRegion` **must** be greater than `0`
- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  `refreshRate` **must** be greater than `0`

Additional modes **may** also be created by calling:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice                            physicalDevice,
    VkDisplayKHR                                display,
    const VkDisplayModeCreateInfoKHR*           pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDisplayModeKHR*                           pMode);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to create an additional mode for.
- `pCreateInfo` is a pointer to a VkDisplayModeCreateInfoKHR structure describing the new mode to create.
- `pAllocator` is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).

- `pMode` is a pointer to a VkDisplayModeKHR handle in which the mode created is returned.

Valid Usage (Implicit)

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkCreateDisplayModeKHR-display-parameter
  `display` **must** be a valid VkDisplayKHR handle
- VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkDisplayModeCreateInfoKHR structure
- VUID-vkCreateDisplayModeKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateDisplayModeKHR-pMode-parameter
  `pMode` **must** be a valid pointer to a VkDisplayModeKHR handle
- VUID-vkCreateDisplayModeKHR-display-parent
  `display` **must** have been created, allocated, or retrieved from `physicalDevice`

Host Synchronization

- Host access to `display` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkDisplayModeCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType                sType;
    const void*                    pNext;
    VkDisplayModeCreateFlagsKHR    flags;
    VkDisplayModeParametersKHR     parameters;
} VkDisplayModeCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use, and **must** be zero.
- `parameters` is a VkDisplayModeParametersKHR structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation **must** return `VK_ERROR_INITIALIZATION_FAILED`.

Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR`
- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
  `parameters` **must** be a valid VkDisplayModeParametersKHR structure

Applications that wish to present directly to a display **must** select which layer, or "plane" of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice                            physicalDevice,
    VkDisplayModeKHR                            mode,
    uint32_t                                    planeIndex,
    VkDisplayPlaneCapabilitiesKHR*              pCapabilities);
```

- `physicalDevice` is the physical device associated with the display specified by `mode`
- `mode` is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- `planeIndex` is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
- `pCapabilities` is a pointer to a VkDisplayPlaneCapabilitiesKHR structure in which the capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter

`mode` **must** be a valid VkDisplayModeKHR handle

- VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter
  `pCapabilities` **must** be a valid pointer to a VkDisplayPlaneCapabilitiesKHR structure
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parent
  `mode` **must** have been created, allocated, or retrieved from `physicalDevice`

Host Synchronization

- Host access to `mode` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR    supportedAlpha;
    VkOffset2D                     minSrcPosition;
    VkOffset2D                     maxSrcPosition;
    VkExtent2D                     minSrcExtent;
    VkExtent2D                     maxSrcExtent;
    VkOffset2D                     minDstPosition;
    VkOffset2D                     maxDstPosition;
    VkExtent2D                     minDstExtent;
    VkExtent2D                     maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

- `supportedAlpha` is a bitmask of VkDisplayPlaneAlphaFlagBitsKHR describing the supported alpha blending modes.
- `minSrcPosition` is the minimum source rectangle offset supported by this plane using the specified mode.
- `maxSrcPosition` is the maximum source rectangle offset supported by this plane using the specified mode. The `x` and `y` components of `maxSrcPosition` **must** each be greater than or equal to the `x` and `y` components of `minSrcPosition`, respectively.
- `minSrcExtent` is the minimum source rectangle size supported by this plane using the specified mode.

- `maxSrcExtent` is the maximum source rectangle size supported by this plane using the specified mode.
- `minDstPosition`, `maxDstPosition`, `minDstExtent`, `maxDstExtent` all have similar semantics to their corresponding `*Src*` equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the `*Src*` offsets, `minDstPosition` and `maxDstPosition` **may** contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors **may** support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning `minSrcPosition`, `maxSrcPosition`, `minSrcExtent`, and `maxSrcExtent` values that indicate a range of possible positions and sizes which **may** be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors **may** also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning `minDstPosition`, `maxDstPosition`, `minDstExtent` and `maxDstExtent` values that indicate a range of possible positions and sizes which **may** be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors **may** support only a 1-1 mapping between pixels in the presentable images and the display mode. This **may** be indicated by returning (0,0) for `minSrcPosition`, `maxSrcPosition`, `minDstPosition`, and `maxDstPosition`, and (display mode width, display mode height) for `minSrcExtent`, `maxSrcExtent`, `minDstExtent`, and `maxDstExtent`.

The value `supportedAlpha` **must** contain at least one valid VkDisplayPlaneAlphaFlagBitsKHR bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in `VkDisplayPlaneCapabilitiesKHR` are guaranteed to be supported. Presentation requests specifying unsupported combinations **may** fail.

To query the capabilities of a given mode and plane combination, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice                            physicalDevice,
    const VkDisplayPlaneInfo2KHR*               pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR*             pCapabilities);
```

- `physicalDevice` is the physical device associated with `pDisplayPlaneInfo`.
- `pDisplayPlaneInfo` is a pointer to a VkDisplayPlaneInfo2KHR structure describing the plane and mode.
- `pCapabilities` is a pointer to a VkDisplayPlaneCapabilities2KHR structure in which the capabilities are returned.

`vkGetDisplayPlaneCapabilities2KHR` behaves similarly to vkGetDisplayPlaneCapabilitiesKHR, with the ability to specify extended inputs via chained input structures, and to return extended

information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter
  `pDisplayPlaneInfo` **must** be a valid pointer to a valid VkDisplayPlaneInfo2KHR structure
- VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter
  `pCapabilities` **must** be a valid pointer to a VkDisplayPlaneCapabilities2KHR structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneInfo2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType     sType;
    const void*         pNext;
    VkDisplayModeKHR    mode;
    uint32_t            planeIndex;
} VkDisplayPlaneInfo2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mode` is the display mode the application intends to program when using the specified plane.

> **NOTE** This parameter also implicitly specifies a display.

- `planeIndex` is the plane which the application intends to use with the display.

The members of `VkDisplayPlaneInfo2KHR` correspond to the arguments to vkGetDisplayPlaneCapabilitiesKHR, with `sType` and `pNext` added for extensibility.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneInfo2KHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR`
- VUID-VkDisplayPlaneInfo2KHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDisplayPlaneInfo2KHR-mode-parameter
  `mode` **must** be a valid VkDisplayModeKHR handle

Host Synchronization

- Host access to `mode` **must** be externally synchronized

The `VkDisplayPlaneCapabilities2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType                 sType;
    void*                           pNext;
    VkDisplayPlaneCapabilitiesKHR   capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `capabilities` is a VkDisplayPlaneCapabilitiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneCapabilities2KHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR`
- VUID-VkDisplayPlaneCapabilities2KHR-pNext-pNext
  `pNext` **must** be `NULL`

32.3.2. Display Control

To set the power state of a display, call:

```
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice                                    device,
    VkDisplayKHR                                display,
    const VkDisplayPowerInfoEXT*                pDisplayPowerInfo);
```

- `device` is a logical device associated with `display`.
- `display` is the display whose power state is modified.
- `pDisplayPowerInfo` is a pointer to a VkDisplayPowerInfoEXT structure specifying the new power state of `display`.

Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDisplayPowerControlEXT-display-parameter
  `display` **must** be a valid VkDisplayKHR handle
- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
  `pDisplayPowerInfo` **must** be a valid pointer to a valid VkDisplayPowerInfoEXT structure
- VUID-vkDisplayPowerControlEXT-commonparent
  Both of `device`, and `display` **must** have been created, allocated, or retrieved from the same VkPhysicalDevice

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkDisplayPowerInfoEXT` structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkDisplayPowerStateEXT    powerState;
} VkDisplayPowerInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `powerState` is a VkDisplayPowerStateEXT value specifying the new power state of the display.

Valid Usage (Implicit)

- VUID-VkDisplayPowerInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT`
- VUID-VkDisplayPowerInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDisplayPowerInfoEXT-powerState-parameter
  `powerState` **must** be a valid VkDisplayPowerStateEXT value

Possible values of VkDisplayPowerInfoEXT::`powerState`, specifying the new power state of a display, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- `VK_DISPLAY_POWER_STATE_OFF_EXT` specifies that the display is powered down.
- `VK_DISPLAY_POWER_STATE_SUSPEND_EXT` specifies that the display is put into a low power mode, from which it **may** be able to transition back to `VK_DISPLAY_POWER_STATE_ON_EXT` more quickly than if it were in `VK_DISPLAY_POWER_STATE_OFF_EXT`. This state **may** be the same as `VK_DISPLAY_POWER_STATE_OFF_EXT`.
- `VK_DISPLAY_POWER_STATE_ON_EXT` specifies that the display is powered on.

32.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a `VkSurfaceKHR` object for a display plane, call:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance                                  instance,
    const VkDisplaySurfaceCreateInfoKHR*        pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- `instance` is the instance corresponding to the physical device the targeted display is on.
- `pCreateInfo` is a pointer to a VkDisplaySurfaceCreateInfoKHR structure specifying which mode,

plane, and other parameters to use, as described below.

- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface is returned.

Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkDisplaySurfaceCreateInfoKHR structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
  `pSurface` **must** be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkDisplaySurfaceCreateFlagsKHR  flags;
    VkDisplayModeKHR                displayMode;
    uint32_t                        planeIndex;
    uint32_t                        planeStackIndex;
    VkSurfaceTransformFlagBitsKHR   transform;
    float                           globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR  alphaMode;
    VkExtent2D                      imageExtent;
} VkDisplaySurfaceCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use, and **must** be zero.
- `displayMode` is a VkDisplayModeKHR handle specifying the mode to use when displaying this surface.
- `planeIndex` is the plane on which this surface appears.
- `planeStackIndex` is the z-order of the plane.
- `transform` is a VkSurfaceTransformFlagBitsKHR value specifying the transformation to apply to images as part of the scanout operation.
- `globalAlpha` is the global alpha value. This value is ignored if `alphaMode` is not `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR`.
- `alphaMode` is a VkDisplayPlaneAlphaFlagBitsKHR value specifying the type of alpha blending to use.
- `imageExtent` is the size of the presentable images to use with the surface.

NOTE

Creating a display surface **must** not modify the state of the displays, planes, or other resources it names. For example, it **must** not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

Valid Usage

- VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252
  `planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`
- VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253
  If the `planeReorderPossible` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to `displayMode` is `VK_TRUE` then `planeStackIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`; otherwise `planeStackIndex` **must** equal the `currentStackIndex` member of `VkDisplayPlanePropertiesKHR` returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` for the display plane corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254
  If `alphaMode` is `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` then `globalAlpha` **must** be between `0` and `1`, inclusive
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255
  `alphaMode` **must** be one of the bits present in the `supportedAlpha` member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740
  `transform` **must** be one of the bits present in the `supportedTransforms` member of `VkDisplayPropertiesKHR` for the display corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256

The `width` and `height` members of `imageExtent` **must** be less than or equal to VkPhysicalDeviceLimits::`maxImageDimension2D`

Valid Usage (Implicit)

- VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR`
- VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDisplaySurfaceCreateInfoKHR-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
  `displayMode` **must** be a valid VkDisplayModeKHR handle
- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
  `transform` **must** be a valid VkSurfaceTransformFlagBitsKHR value
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
  `alphaMode` **must** be a valid VkDisplayPlaneAlphaFlagBitsKHR value

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;
```

`VkDisplaySurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which **can** be set in VkDisplaySurfaceCreateInfoKHR::`alphaMode`, specifying the type of alpha blending to use on a display, are:

```
// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;
```

- `VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR` specifies that the source image will be treated as opaque.
- `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` specifies that a global alpha value **must** be specified that will be applied to all pixels in the source image.
- `VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR` specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source

image's other color components.

- VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR is equivalent to VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR, except the source alpha values are assumed to be premultiplied into the source image's other color components.

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;
```

VkDisplayPlaneAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkDisplayPlaneAlphaFlagBitsKHR.

32.3.4. Presenting to Headless Surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

NOTE

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customizable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless VkSurfaceKHR object, call:

```
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance                                  instance,
    const VkHeadlessSurfaceCreateInfoEXT*       pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSurfaceKHR*                               pSurface);
```

- instance is the instance to associate the surface with.
- pCreateInfo is a pointer to a VkHeadlessSurfaceCreateInfoEXT structure containing parameters affecting the creation of the surface object.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateHeadlessSurfaceEXT-instance-parameter

`instance` **must** be a valid VkInstance handle

- VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkHeadlessSurfaceCreateInfoEXT structure
- VUID-vkCreateHeadlessSurfaceEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter
  `pSurface` **must** be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkHeadlessSurfaceCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType                    sType;
    const void*                        pNext;
    VkHeadlessSurfaceCreateFlagsEXT    flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage (Implicit)

- VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`
- VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zerobitmask
  `flags` **must** be `0`

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain's `imageExtent` to will be the size of the surface, after the first image is

presented.

```
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

VkHeadlessSurfaceCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

32.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility **can** be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally **may** be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t                                    queueFamilyIndex,
    VkSurfaceKHR                                surface,
    VkBool32*                                   pSupported);
```

- physicalDevice is the physical device.
- queueFamilyIndex is the queue family.
- surface is the surface.
- pSupported is a pointer to a VkBool32. VK_TRUE indicates support, and VK_FALSE indicates no support.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269 queueFamilyIndex **must** be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter physicalDevice **must** be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter
  `pSupported` **must** be a valid pointer to a VkBool32 value
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent
  Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

32.4.1. Android Platform

On Android, all physical devices and queue families **must** be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

32.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t                                    queueFamilyIndex,
    struct wl_display*                          display);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306

queueFamilyIndex **must** be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter display **must** be a valid pointer to a wl_display value

32.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t                                    queueFamilyIndex);
```

- physicalDevice is the physical device.
- queueFamilyIndex is the queue family index.

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309 queueFamilyIndex **must** be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter physicalDevice **must** be a valid VkPhysicalDevice handle

32.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:

```
// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t                                    queueFamilyIndex,
    xcb_connection_t*                           connection,
    xcb_visualid_t                              visual_id);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an `xcb_connection_t` to the X server.
- `visual_id` is an X11 visual (`xcb_visualid_t`).

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312 `queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter `connection` **must** be a valid pointer to an `xcb_connection_t` value

32.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```
// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t                                    queueFamilyIndex,
    Display*                                    dpy,
    VisualID                                    visualID);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dpy` is a pointer to an Xlib `Display` connection to the server.

- `visualId` is an X11 visual (`VisualID`).

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315 `queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter `dpy` **must** be a valid pointer to a `Display` value

32.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities **can** be obtained with the queries listed below in this section.

NOTE In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by vkGetPhysicalDeviceImageFormatProperties. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

32.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice                            physicalDevice,
    VkSurfaceKHR                                surface,
    VkSurfaceCapabilitiesKHR*                   pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a VkSurfaceCapabilitiesKHR structure in which the

capabilities are returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211
  `surface` **must** be supported by `physicalDevice`, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter
  `pSurfaceCapabilities` **must** be a valid pointer to a VkSurfaceCapabilitiesKHR structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent
  Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t                         minImageCount;
    uint32_t                         maxImageCount;
    VkExtent2D                       currentExtent;
    VkExtent2D                       minImageExtent;
    VkExtent2D                       maxImageExtent;
    uint32_t                         maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR       supportedTransforms;
    VkSurfaceTransformFlagBitsKHR    currentTransform;
    VkCompositeAlphaFlagsKHR         supportedCompositeAlpha;
    VkImageUsageFlags                supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- `minImageCount` is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- `maxImageCount` is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.
- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- `minImageExtent` contains the smallest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be less than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageExtent` contains the largest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `minImageExtent`. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageArrayLayers` is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.
- `supportedTransforms` is a bitmask of VkSurfaceTransformFlagBitsKHR indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- `currentTransform` is VkSurfaceTransformFlagBitsKHR value indicating the surface's current transform relative to the presentation engine's natural orientation.
- `supportedCompositeAlpha` is a bitmask of VkCompositeAlphaFlagBitsKHR, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.
- `supportedUsageFlags` is a bitmask of VkImageUsageFlagBits representing the ways the

application **can** use the presentable images of a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_FIFO_LATEST_READY_EXT, VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR, VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR for the surface on the specified device. VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT **must** be included in the set. Implementations **may** support additional usages.

NOTE	Supported usage flags of a presentable image when using VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR presentation mode are provided by VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags.

NOTE	Formulas such as min(N, maxImageCount) are not correct, since maxImageCount **may** be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR*      pSurfaceInfo,
    VkSurfaceCapabilities2KHR*                  pSurfaceCapabilities);
```

- physicalDevice is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- pSurfaceInfo is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.
- pSurfaceCapabilities is a pointer to a VkSurfaceCapabilities2KHR structure in which the capabilities are returned.

vkGetPhysicalDeviceSurfaceCapabilities2KHR behaves similarly to vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521
  pSurfaceInfo->surface **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522
  pSurfaceInfo->surface **must** be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671
  If a VkSurfaceCapabilitiesFullScreenExclusiveEXT structure is included in the pNext chain of pSurfaceCapabilities, a VkSurfaceFullScreenExclusiveWin32InfoEXT structure **must** be included in the pNext chain of pSurfaceInfo

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter `pSurfaceInfo` **must** be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter `pSurfaceCapabilities` **must** be a valid pointer to a VkSurfaceCapabilities2KHR structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkPhysicalDeviceSurfaceInfo2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSurfaceKHR       surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surface` is the surface that will be associated with the swapchain.

The members of `VkPhysicalDeviceSurfaceInfo2KHR` correspond to the arguments to vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with `sType` and `pNext` added for extensibility.

Additional capabilities of a surface **may** be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities **can** be queried by adding a VkSurfaceFullScreenExclusiveInfoEXT structure to the `pNext` chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a VkSurfaceFullScreenExclusiveWin32InfoEXT structure **may** also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same

parameters included in the pNext chain of VkSwapchainCreateInfoKHR.

Valid Usage

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672
  If the pNext chain includes a VkSurfaceFullScreenExclusiveInfoEXT structure with its fullScreenExclusive member set to VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT, and surface was created using vkCreateWin32SurfaceKHR, a VkSurfaceFullScreenExclusiveWin32InfoEXT structure **must** be included in the pNext chain
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919
  If surface is not VK_NULL_HANDLE, surface **must** be a valid VkSurfaceKHR handle

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkSurfaceFullScreenExclusiveInfoEXT or VkSurfaceFullScreenExclusiveWin32InfoEXT
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique
  The sType value of each struct in the pNext chain **must** be unique

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkSurfaceFullScreenExclusiveInfoEXT structure, then that structure specifies the application's preferred full-screen transition behavior.

The VkSurfaceFullScreenExclusiveInfoEXT structure is defined as:

```
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType             sType;
    void*                       pNext;
    VkFullScreenExclusiveEXT    fullScreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fullScreenExclusive is a VkFullScreenExclusiveEXT value specifying the preferred full-screen transition behavior.

If this structure is not present, fullScreenExclusive is considered to be VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT.

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_INFO_EXT`
- VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter
  `fullScreenExclusive` **must** be a valid VkFullScreenExclusiveEXT value

Possible values of `VkSurfaceFullScreenExclusiveInfoEXT::fullScreenExclusive` are:

```
// Provided by VK_EXT_full_screen_exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT` specifies that the implementation **should** determine the appropriate full-screen method by whatever means it deems appropriate.
- `VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT` specifies that the implementation **may** use full-screen exclusive mechanisms when available. Such mechanisms **may** result in better performance and/or the availability of different presentation capabilities, but **may** require a more disruptive transition during swapchain initialization, first presentation and/or destruction.
- `VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT` specifies that the implementation **should** avoid using full-screen mechanisms which rely on disruptive transitions.
- `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` specifies that the application will manage full-screen exclusive mode by using the vkAcquireFullScreenExclusiveModeEXT and vkReleaseFullScreenExclusiveModeEXT commands.

The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure is defined as:

```
// Provided by VK_KHR_win32_surface with VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    HMONITOR           hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hmonitor` is the Win32 `HMONITOR` handle identifying the display to create the surface with.

NOTE If `hmonitor` is invalidated (e.g. the monitor is unplugged) during the lifetime of a

swapchain created with this structure, operations on that swapchain will return VK_ERROR_OUT_OF_DATE_KHR.

NOTE It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes **may** alter the surface capabilities reported for the created surface.

Valid Usage

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673
  hmonitor **must** be a valid HMONITOR

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_WIN32_INFO_EXT

The VkSurfaceCapabilities2KHR structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType             sType;
    void*                       pNext;
    VkSurfaceCapabilitiesKHR    surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surfaceCapabilities is a VkSurfaceCapabilitiesKHR structure describing the capabilities of the specified surface.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2KHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR
- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkSharedPresentSurfaceCapabilitiesKHR, VkSurfaceCapabilitiesFullScreenExclusiveEXT, or VkSurfaceProtectedCapabilitiesKHR
- VUID-VkSurfaceCapabilities2KHR-sType-unique
  The sType value of each struct in the pNext chain **must** be unique

An application queries if a protected VkSurfaceKHR is displayable on a specific windowing system using VkSurfaceProtectedCapabilitiesKHR, which **can** be passed in pNext parameter of VkSurfaceCapabilities2KHR.

The VkSurfaceProtectedCapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- supportsProtected specifies whether a protected swapchain created from VkPhysicalDeviceSurfaceInfo2KHR::surface for a particular windowing system **can** be displayed on screen or not. If supportsProtected is VK_TRUE, then creation of swapchains with the VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR flag set **must** be supported for surface.

Valid Usage (Implicit)

- VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR

The VkSharedPresentSurfaceCapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType      sType;
    void*                pNext;
    VkImageUsageFlags    sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- sharedPresentSupportedUsageFlags is a bitmask of VkImageUsageFlagBits representing the ways the application **can** use the shared presentable image from a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR for the surface on the specified device. VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT **must** be included in the set but implementations **may** support additional usages.

Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

The `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is defined as:

```
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fullScreenExclusiveControlSupported` is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure **can** be included in the `pNext` chain of VkSurfaceCapabilities2KHR to determine support for exclusive full-screen access. If `fullScreenExclusiveSupported` is `VK_FALSE`, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications **must** not attempt to create swapchains with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` set if `fullScreenExclusiveSupported` is `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT`

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice                            physicalDevice,
    VkSurfaceKHR                                surface,
    VkSurfaceCapabilities2EXT*                  pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- `surface` is the surface that will be associated with the swapchain.

- `pSurfaceCapabilities` is a pointer to a VkSurfaceCapabilities2EXT structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2EXT` behaves similarly to vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pSurfaceCapabilities` parameter.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06523
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06211
  `surface` **must** be supported by `physicalDevice`, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter
  `pSurfaceCapabilities` **must** be a valid pointer to a VkSurfaceCapabilities2EXT structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent
  Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceCapabilities2EXT` structure is defined as:

```
// Provided by VK_EXT_display_surface_counter
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType                  sType;
    void*                            pNext;
    uint32_t                         minImageCount;
    uint32_t                         maxImageCount;
    VkExtent2D                       currentExtent;
    VkExtent2D                       minImageExtent;
    VkExtent2D                       maxImageExtent;
    uint32_t                         maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR       supportedTransforms;
    VkSurfaceTransformFlagBitsKHR    currentTransform;
    VkCompositeAlphaFlagsKHR         supportedCompositeAlpha;
    VkImageUsageFlags                supportedUsageFlags;
    VkSurfaceCounterFlagsEXT         supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minImageCount` is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- `maxImageCount` is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.
- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- `minImageExtent` contains the smallest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be less than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageExtent` contains the largest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `minImageExtent`. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageArrayLayers` is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.
- `supportedTransforms` is a bitmask of VkSurfaceTransformFlagBitsKHR indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- `currentTransform` is VkSurfaceTransformFlagBitsKHR value indicating the surface's current transform relative to the presentation engine's natural orientation.
- `supportedCompositeAlpha` is a bitmask of VkCompositeAlphaFlagBitsKHR, representing the alpha

compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- `supportedUsageFlags` is a bitmask of VkImageUsageFlagBits representing the ways the application **can** use the presentable images of a swapchain created with VkPresentModeKHR set to `VK_PRESENT_MODE_FIFO_LATEST_READY_EXT`, `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` **must** be included in the set. Implementations **may** support additional usages.
- `supportedSurfaceCounters` is a bitmask of VkSurfaceCounterFlagBitsEXT indicating the supported surface counter types.

Valid Usage

- VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246
  `supportedSurfaceCounters` **must** not include `VK_SURFACE_COUNTER_VBLANK_BIT_EXT` unless the surface queried is a display surface

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2EXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT`
- VUID-VkSurfaceCapabilities2EXT-pNext-pNext
  `pNext` **must** be `NULL`

Bits which **can** be set in VkSurfaceCapabilities2EXT::`supportedSurfaceCounters`, indicating supported surface counter types, are:

```
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
  // VK_SURFACE_COUNTER_VBLANK_EXT is a deprecated alias
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- `VK_SURFACE_COUNTER_VBLANK_BIT_EXT` specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

`VkSurfaceCounterFlagsEXT` is a bitmask type for setting a mask of zero or more

VkSurfaceCounterFlagBitsEXT.

Bits which **may** be set in VkSurfaceCapabilitiesKHR::supportedTransforms indicating the presentation transforms supported for the surface on the specified device, and possible values of VkSurfaceCapabilitiesKHR::currentTransform indicating the surface's current transform relative to the presentation engine's natural orientation, are:

```
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR specifies that image content is presented without being transformed.
- VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR specifies that image content is rotated 90 degrees clockwise.
- VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR specifies that image content is rotated 180 degrees clockwise.
- VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR specifies that image content is rotated 270 degrees clockwise.
- VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR specifies that image content is mirrored horizontally.
- VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```
// Provided by VK_KHR_display
typedef VkFlags VkSurfaceTransformFlagsKHR;
```

VkSurfaceTransformFlagsKHR is a bitmask type for setting a mask of zero or more VkSurfaceTransformFlagBitsKHR.

The supportedCompositeAlpha member is of type VkCompositeAlphaFlagBitsKHR, containing the following values:

```
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

- VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.
- VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.
- VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.
- VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

```
// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;
```

VkCompositeAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkCompositeAlphaFlagBitsKHR.

32.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice                            physicalDevice,
    VkSurfaceKHR                                surface,
    uint32_t*                                   pSurfaceFormatCount,
    VkSurfaceFormatKHR*                         pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format pairs available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormatKHR` structures.

If `pSurfaceFormats` is `NULL`, then the number of format pairs supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` **must** point to a variable set by the application to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format pairs supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available format pairs were returned.

The number of format pairs supported **must** be greater than or equal to 1. `pSurfaceFormats` **must** not contain an entry whose value for `format` is `VK_FORMAT_UNDEFINED`.

If `pSurfaceFormats` includes an entry whose value for `colorSpace` is `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` and whose value for `format` is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for `VK_IMAGE_TILING_OPTIMAL`, then `pSurfaceFormats` **must** also contain an entry with the same value for `colorSpace` and `format` equal to the corresponding SRGB (or UNORM) format.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525
  `surface` **must** be supported by `physicalDevice`, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter
  If `surface` is not VK_NULL_HANDLE, `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter
  `pSurfaceFormatCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter
  If the value referenced by `pSurfaceFormatCount` is not `0`, and `pSurfaceFormats` is not `NULL`, `pSurfaceFormats` **must** be a valid pointer to an array of `pSurfaceFormatCount` VkSurfaceFormatKHR structures

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent
  Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceFormatKHR` structure is defined as:

```
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
    VkFormat           format;
    VkColorSpaceKHR    colorSpace;
} VkSurfaceFormatKHR;
```

- `format` is a VkFormat that is compatible with the specified surface.
- `colorSpace` is a presentation VkColorSpaceKHR that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR*      pSurfaceInfo,
    uint32_t*                                   pSurfaceFormatCount,
    VkSurfaceFormat2KHR*                        pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- `pSurfaceInfo` is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format tuples available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of VkSurfaceFormat2KHR structures.

vkGetPhysicalDeviceSurfaceFormats2KHR behaves similarly to vkGetPhysicalDeviceSurfaceFormatsKHR, with the ability to be extended via pNext chains.

If pSurfaceFormats is NULL, then the number of format tuples supported for the given surface is returned in pSurfaceFormatCount. Otherwise, pSurfaceFormatCount **must** point to a variable set by the application to the number of elements in the pSurfaceFormats array, and on return the variable is overwritten with the number of structures actually written to pSurfaceFormats. If the value of pSurfaceFormatCount is less than the number of format tuples supported, at most pSurfaceFormatCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available values were returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521
  pSurfaceInfo->surface **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522
  pSurfaceInfo->surface **must** be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter
  physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter
  pSurfaceInfo **must** be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter
  pSurfaceFormatCount **must** be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter
  If the value referenced by pSurfaceFormatCount is not 0, and pSurfaceFormats is not NULL, pSurfaceFormats **must** be a valid pointer to an array of pSurfaceFormatCount VkSurfaceFormat2KHR structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceFormat2KHR structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType       sType;
    void*                 pNext;
    VkSurfaceFormatKHR    surfaceFormat;
} VkSurfaceFormat2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surfaceFormat is a VkSurfaceFormatKHR structure describing a format-color space pair that is compatible with the specified surface.

Valid Usage (Implicit)

- VUID-VkSurfaceFormat2KHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR
- VUID-VkSurfaceFormat2KHR-pNext-pNext
  pNext **must** be NULL

While the format of a presentable image refers to the encoding of each pixel, the colorSpace determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and transfer functions indicating the mapping between the image data and the colorimetry with respect to the given color space.

Possible values of VkSurfaceFormatKHR::colorSpace, specifying the color spaces that a presentation engine can accept, are:

```
// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
  // Provided by VK_EXT_swapchain_colorspace
  // VK_COLOR_SPACE_DOLBYVISION_EXT is deprecated, but no reason was given in the API
XML
    VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
  // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
  // VK_COLORSPACE_SRGB_NONLINEAR_KHR is a deprecated alias
    VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
  // Provided by VK_EXT_swapchain_colorspace
  // VK_COLOR_SPACE_DCI_P3_LINEAR_EXT is a deprecated alias
    VK_COLOR_SPACE_DCI_P3_LINEAR_EXT = VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT,
} VkColorSpaceKHR;
```

- VK_COLOR_SPACE_SRGB_NONLINEAR_KHR specifies support for the images in sRGB color space, encoded according to the sRGB specification.
- VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT specifies support for the images in Display-P3 color space, encoded using a Display-P3 transfer function.
- VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT specifies support for the images in extended sRGB color space, encoded using a linear transfer function.
- VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT specifies support for the images in extended sRGB color space, encoded according to the scRGB specification.

- VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT specifies support for the images in Display-P3 color space, encoded using a linear transfer function.
- VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT specifies support for the images in DCI-P3 color space, encoded according to the DCI-P3 specification. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.
- VK_COLOR_SPACE_BT709_LINEAR_EXT specifies support for the images in BT709 color space, encoded using a linear transfer function.
- VK_COLOR_SPACE_BT709_NONLINEAR_EXT specifies support for the images in BT709 color space, encoded according to the BT709 specification.
- VK_COLOR_SPACE_BT2020_LINEAR_EXT specifies support for the images in BT2020 color space, encoded using a linear transfer function.
- VK_COLOR_SPACE_HDR10_ST2084_EXT specifies support for the images in HDR10 (BT2020) color space, encoded according to SMPTE ST2084 Perceptual Quantizer (PQ) specification.
- VK_COLOR_SPACE_HDR10_HLG_EXT specifies support for the images in HDR10 (BT2020) color space, encoded according to the Hybrid Log Gamma (HLG) specification.
- VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT specifies support for images in Adobe RGB color space, encoded using a linear transfer function.
- VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT specifies support for the images in Adobe RGB color space, encoded according to the Adobe RGB specification (approximately Gamma 2.2).
- VK_COLOR_SPACE_PASS_THROUGH_EXT specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.

NOTE

In the initial release of the VK_KHR_surface and VK_KHR_swapchain extensions, the token VK_COLORSPACE_SRGB_NONLINEAR_KHR was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, VK_COLOR_SPACE_SRGB_NONLINEAR_KHR is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

NOTE

In older versions of this extension VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT was misnamed VK_COLOR_SPACE_DCI_P3_LINEAR_EXT. This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is deprecated but is maintained for backwards compatibility.

NOTE

In older versions of the VK_EXT_swapchain_colorspace extension, VK_COLOR_SPACE_DOLBYVISION_EXT was exposed. The intent was to indicate the presentation engine shall decode an image using the SMPTE ST 2084 Perceptual Quantizer (PQ) EOTF, and then apply a proprietary OOTF to process the image. However, Dolby Vision profile 8.4 describes an encoding using the Hybrid Log Gamma (HLG) OETF, and there is no swapchain extension for signaling Dolby Vision metadata to be used by a proprietary OOTF. This enum is deprecated but is maintained for backwards compatibility.

NOTE

Note

For a traditional “Linear” or non-gamma transfer function color space use `VK_COLOR_SPACE_PASS_THROUGH_EXT`.

The presentation engine interprets the pixel values of the R, G, and B components as having been encoded using an appropriate transfer function. Applications **should** ensure that the appropriate transfer function has been applied. Textures Output Format Conversion requires that all implementations implicitly apply the sRGB $EOTF^{-1}$ on R, G, and B components when shaders write to an sRGB pixel format image, which is useful for sRGB color spaces. For sRGB color spaces with other pixel formats, or other non-linear color spaces, applications **can** apply the transfer function explicitly in a shader. The A channel is always interpreted as linearly encoded.

This extension defines enums for VkColorSpaceKHR that correspond to the following color spaces:

Table 45. Color Spaces and Attributes

Name	Red Primary	Green Primary	Blue Primary	White-point	Transfer function
DCI-P3	1.000, 0.000	0.000, 1.000	0.000, 0.000	0.3333, 0.3333	DCI P3
Display-P3	0.680, 0.320	0.265, 0.690	0.150, 0.060	0.3127, 0.3290 (D65)	Display-P3
BT709	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	BT709
sRGB	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	sRGB
extended sRGB	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	scRGB
HDR10_ST2084	0.708, 0.292	0.170, 0.797	0.131, 0.046	0.3127, 0.3290 (D65)	ST2084 PQ
HDR10_HLG	0.708, 0.292	0.170, 0.797	0.131, 0.046	0.3127, 0.3290 (D65)	HLG
Adobe RGB	0.640, 0.330	0.210, 0.710	0.150, 0.060	0.3127, 0.3290 (D65)	Adobe RGB

The transfer functions are described in the “Transfer Functions” chapter of the Khronos Data Format Specification.

Except Display-P3 OETF, which is:

$$E = \begin{cases} 1.055 \times L^{\frac{1}{2.4}} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\ 12.92 \times L & \text{for } 0 \leq L < 0.0030186 \end{cases}$$

where L is the linear value of a color component and E is the encoded value (as stored in the image in memory).

NOTE For most uses, the sRGB OETF is equivalent.

32.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice                            physicalDevice,
    VkSurfaceKHR                                surface,
    uint32_t*                                   pPresentModeCount,
    VkPresentModeKHR*                           pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- `surface` is the surface that will be associated with the swapchain.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of VkPresentModeKHR values, indicating the supported presentation modes.

If `pPresentModes` is `NULL`, then the number of presentation modes supported for the given `surface` is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount` **must** point to a variable set by the application to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available modes were returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525
  `surface` **must** be supported by `physicalDevice`, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter
  If `surface` is not VK_NULL_HANDLE, `surface` **must** be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter
  `pPresentModeCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter
  If the value referenced by `pPresentModeCount` is not `0`, and `pPresentModes` is not `NULL`, `pPresentModes` **must** be a valid pointer to an array of `pPresentModeCount` VkPresentModeKHR values
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent
  Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

Alternatively, to query the supported presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```
// Provided by VK_EXT_full_screen_exclusive
VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR*      pSurfaceInfo,
    uint32_t*                                   pPresentModeCount,
    VkPresentModeKHR*                           pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- `pSurfaceInfo` is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of VkPresentModeKHR values, indicating the supported presentation modes.

`vkGetPhysicalDeviceSurfacePresentModes2EXT` behaves similarly to vkGetPhysicalDeviceSurfacePresentModesKHR, with the ability to specify extended inputs via chained input structures.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06521
  `pSurfaceInfo->surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06522
  `pSurfaceInfo->surface` **must** be supported by `physicalDevice`, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter
  `pSurfaceInfo` **must** be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter
  `pPresentModeCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter
  If the value referenced by `pPresentModeCount` is not `0`, and `pPresentModes` is not `NULL`, `pPresentModes` **must** be a valid pointer to an array of `pPresentModeCount` VkPresentModeKHR values

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

Possible values of elements of the vkGetPhysicalDeviceSurfacePresentModesKHR::`pPresentModes` array, indicating the supported presentation modes for a surface, are:

```
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
  // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
  // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
  // Provided by VK_EXT_present_mode_fifo_latest_ready
    VK_PRESENT_MODE_FIFO_LATEST_READY_EXT = 1000361000,
} VkPresentModeKHR;
```

- VK_PRESENT_MODE_IMMEDIATE_KHR specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode **may** result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.
- VK_PRESENT_MODE_MAILBOX_KHR specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.
- VK_PRESENT_MODE_FIFO_KHR specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of presentMode that is **required** to be supported.
- VK_PRESENT_MODE_FIFO_RELAXED_KHR specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode **may** result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.
- VK_PRESENT_MODE_FIFO_LATEST_READY_EXT specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue. At each vertical blanking period, the presentation engine dequeues all successive requests that are ready to be presented from the beginning of the queue. The image of the last

dequeued request will be presented. The other dequeued requests will be dropped.

- VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application **must** make a presentation request whenever an update is required. However, the presentation engine **may** update the current image at any point, meaning this mode **may** result in visible tearing.
- VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine **must** update the current image without any need for further presentation requests. The application **can** indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode **may** result in visible tearing if rendering to the image is not timed correctly.

The supported VkImageUsageFlagBits of the presentable images of a swapchain created for a surface **may** differ depending on the presentation mode, and can be determined as per the table below:

Table 46. Presentable Image Usage Queries

Presentation mode	Image usage flags
VK_PRESENT_MODE_IMMEDIATE_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_MAILBOX_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_FIFO_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_FIFO_RELAXED_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_FIFO_LATEST_READY_EXT	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR	VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags
VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR	VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags

NOTE For reference, the mode indicated by VK_PRESENT_MODE_FIFO_KHR is equivalent to the behavior of {wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode indicated by VK_PRESENT_MODE_FIFO_RELAXED_KHR is equivalent to the behavior of {wgl|glX}SwapBuffers with a swap interval of -1 (from the {WGL|GLX}_EXT_swap_control_tear extensions).

32.6. Full Screen Exclusive Control

Swapchains created with fullScreenExclusive set to VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT **must** acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:

```
// Provided by VK_EXT_full_screen_exclusive
VkResult vkAcquireFullScreenExclusiveModeEXT(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to acquire exclusive full-screen access for.

Valid Usage

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674
  `swapchain` **must** not be in the retired state
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675
  `swapchain` **must** be a swapchain created with a VkSurfaceFullScreenExclusiveInfoEXT structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676
  `swapchain` **must** not currently have exclusive full-screen access

A return value of `VK_SUCCESS` indicates that the `swapchain` successfully acquired exclusive full-screen access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with vkReleaseFullScreenExclusiveModeEXT, destroys the swapchain, or if any of the swapchain commands return `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then `VK_ERROR_INITIALIZATION_FAILED` is returned. An application **can** attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` has been returned by a swapchain command.

Valid Usage (Implicit)

- VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter
  `swapchain` **must** be a valid VkSwapchainKHR handle
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parent
  `swapchain` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_SURFACE_LOST_KHR

To release exclusive full-screen access from a swapchain, call:

```
// Provided by VK_EXT_full_screen_exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain);
```

- device is the device associated with swapchain.
- swapchain is the swapchain to release exclusive full-screen access from.

NOTE Applications will not be able to present to swapchain after this call until exclusive full-screen access is reacquired. This is usually useful to handle when an application is minimized or otherwise intends to stop presenting for a time.

Valid Usage

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677
  swapchain **must** not be in the retired state
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678
  swapchain **must** be a swapchain created with a VkSurfaceFullScreenExclusiveInfoEXT structure, with fullScreenExclusive set to VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT

Valid Usage (Implicit)

- VUID-vkReleaseFullScreenExclusiveModeEXT-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-parameter
  swapchain **must** be a valid VkSwapchainKHR handle
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-parent
  swapchain **must** have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

32.7. Device Group Queries

A logical device that represents multiple physical devices **may** support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice                                    device,
    VkDeviceGroupPresentCapabilitiesKHR*        pDeviceGroupPresentCapabilities);
```

- device is the logical device.
- pDeviceGroupPresentCapabilities is a pointer to a VkDeviceGroupPresentCapabilitiesKHR structure in which the device's capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter
  pDeviceGroupPresentCapabilities **must** be a valid pointer to a VkDeviceGroupPresentCapabilitiesKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY

- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDeviceGroupPresentCapabilitiesKHR structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType                      sType;
    void*                                pNext;
    uint32_t                             presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR     modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- presentMask is an array of VK_MAX_DEVICE_GROUP_SIZE uint32_t masks, where the mask at element i is non-zero if physical device i has a presentation engine, and where bit j is set in element i if physical device i **can** present swapchain images from physical device j. If element i is non-zero, then bit i **must** be set.
- modes is a bitmask of VkDeviceGroupPresentModeFlagBitsKHR indicating which device group presentation modes are supported.

modes always has VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR set.

The present mode flags are also used when presenting an image, in VkDeviceGroupPresentInfoKHR::mode.

If a device group only includes a single physical device, then modes **must** equal VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR.

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR
- VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext
  pNext **must** be NULL

Bits which **may** be set in VkDeviceGroupPresentCapabilitiesKHR::modes, indicating which device group presentation modes are supported, are:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
    VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;
```

- `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` specifies that any physical device with a presentation engine **can** present its own swapchain images.
- `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR` specifies that any physical device with a presentation engine **can** present swapchain images from any physical device in its `presentMask`.
- `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR` specifies that any physical device with a presentation engine **can** present the sum of swapchain images from any physical devices in its `presentMask`.
- `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR` specifies that multiple physical devices with a presentation engine **can** each present their own swapchain images.

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;
```

`VkDeviceGroupPresentModeFlagsKHR` is a bitmask type for setting a mask of zero or more VkDeviceGroupPresentModeFlagBitsKHR.

Some surfaces **may** not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice                                    device,
    VkSurfaceKHR                                surface,
    VkDeviceGroupPresentModeFlagsKHR*           pModes);
```

- `device` is the logical device.
- `surface` is the surface.
- `pModes` is a pointer to a VkDeviceGroupPresentModeFlagsKHR in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded. These modes **must** be a subset of the modes returned by vkGetDeviceGroupPresentCapabilitiesKHR.

Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
  `surface` **must** be supported by all physical devices associated with `device`, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
  `pModes` **must** be a valid pointer to a VkDeviceGroupPresentModeFlagsKHR value
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
  Both of `device`, and `surface` **must** have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

- Host access to `surface` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

Alternatively, to query the supported device group presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```
// Provided by VK_EXT_full_screen_exclusive with VK_KHR_device_group or VK_VERSION_1_1
VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice                                    device,
    const VkPhysicalDeviceSurfaceInfo2KHR*      pSurfaceInfo,
    VkDeviceGroupPresentModeFlagsKHR*           pModes);
```

- `device` is the logical device.
- `pSurfaceInfo` is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.
- `pModes` is a pointer to a VkDeviceGroupPresentModeFlagsKHR in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to vkGetDeviceGroupSurfacePresentModesKHR, with the ability to specify extended inputs via chained input structures.

Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-06213
  `pSurfaceInfo->surface` **must** be supported by all physical devices associated with `device`, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-parameter
  `pSurfaceInfo` **must** be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure
- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter
  `pModes` **must** be a valid pointer to a VkDeviceGroupPresentModeFlagsKHR value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

When using `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, the application **may** need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice                            physicalDevice,
    VkSurfaceKHR                                surface,
    uint32_t*                                   pRectCount,
    VkRect2D*                                   pRects);
```

- `physicalDevice` is the physical device.
- `surface` is the surface.
- `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
- `pRects` is either `NULL` or a pointer to an array of VkRect2D structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` **must** point to a variable set by the application to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command **must** not overlap.

Valid Usage

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06523
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
  `surface` **must** be supported by `physicalDevice`, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter
  `pRectCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter
  If the value referenced by `pRectCount` is not `0`, and `pRects` is not `NULL`, `pRects` **must** be a

valid pointer to an array of pRectCount VkRect2D structures

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent
  Both of physicalDevice, and surface **must** have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

- Host access to surface **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

32.8. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.

Providing a mechanism which allows applications to block, waiting for a specific step of the presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The VK_KHR_present_wait extension allows applications to tell the presentation engine at the vkQueuePresentKHR call that it plans on waiting for presentation by passing a VkPresentIdKHR structure. The presentId passed in that structure may then be passed to a future vkWaitForPresentKHR call to cause the application to block until that presentation is finished.

32.9. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by VkSwapchainKHR handles:

```
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface.

The presentable images are represented by VkImage objects created by the platform. One image (which **can** be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images **can** be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window **cannot** be associated with more than one non-retired swapchain at a time. Further, swapchains **cannot** be created for native windows that have a non-Vulkan graphics API surface associated with them.

NOTE

The presentation engine is an abstraction for the platform's compositor or display engine.

The presentation engine **may** be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations **may** use the device's graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application **can** acquire use of a presentable image from the presentation engine. Use of a presentable image **must** occur only after the image is returned by vkAcquireNextImageKHR, and before it is released by vkQueuePresentKHR. This includes transitioning the image layout and rendering commands.

An application **can** acquire use of a presentable image with vkAcquireNextImageKHR. After acquiring a presentable image and before modifying it, the application **must** use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application **can** then transition the image's layout, queue rendering commands to it, etc. Finally, the application presents the image with vkQueuePresentKHR, which releases the acquisition of the image.

The presentation engine controls the order in which presentable images are acquired for use by the application.

NOTE

This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

How this all works is described below.

If a swapchain is created with presentMode set to either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, a single presentable image **can** be acquired, referred to as a shared presentable image. A shared presentable image **may** be concurrently accessed by the application and the presentation engine, without transitioning the image's layout after it is initially presented.

- With VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application **must** call vkQueuePresentKHR to guarantee an update. However, the presentation engine **may**

update from it at any time.

- With VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to vkQueuePresentKHR, after which the presentation engine will update from it without any need for further present calls. The application **can** indicate the image contents have been updated by calling vkQueuePresentKHR, but this does not guarantee the timing of when updates will occur.

The presentation engine **may** access a shared presentable image at any time after it is first presented. To avoid tearing, an application **should** coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine's refresh cycle they are intended for.

NOTE	The VK_KHR_shared_presentable_image extension does not provide functionality for determining the timing of the presentation engine's refresh cycles.

In order to query a swapchain's status when rendering to a shared presentable image, call:

```
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain);
```

- device is the device associated with swapchain.
- swapchain is the swapchain to query.

Valid Usage (Implicit)

- VUID-vkGetSwapchainStatusKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parameter
  swapchain **must** be a valid VkSwapchainKHR handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parent
  swapchain **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to swapchain **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The possible return values for vkGetSwapchainStatusKHR **should** be interpreted as follows:

- VK_SUCCESS specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's VkPresentModeKHR.
- VK_SUBOPTIMAL_KHR the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's VkPresentModeKHR.
- VK_ERROR_OUT_OF_DATE_KHR the surface has changed in such a way that it is no longer compatible with the swapchain.
- VK_ERROR_SURFACE_LOST_KHR the surface is no longer available.

NOTE The swapchain state **may** be cached by implementations, so applications **should** regularly call vkGetSwapchainStatusKHR when using a swapchain with VkPresentModeKHR equal to VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR.

To create a swapchain, call:

```
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice                                    device,
    const VkSwapchainCreateInfoKHR*             pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSwapchainKHR*                             pSwapchain);
```

- device is the device to create the swapchain for.
- pCreateInfo is a pointer to a VkSwapchainCreateInfoKHR structure specifying the parameters of the created swapchain.
- pAllocator is the allocator used for host memory allocated for the swapchain object when there

is no more specific allocator available (see Memory Allocation).

- pSwapchain is a pointer to a VkSwapchainKHR handle in which the created swapchain object will be returned.

As mentioned above, if vkCreateSwapchainKHR succeeds, it will return a handle to a swapchain containing an array of at least pCreateInfo->minImageCount presentable images.

While acquired by the application, presentable images **can** be used in any way that equivalent non-presentable images **can** be used. A presentable image is equivalent to a non-presentable image created with the following VkImageCreateInfo parameters:

VkImageCreateInfo **Field**	**Value**
flags	VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR are both set if VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR is set all other bits are unset
imageType	VK_IMAGE_TYPE_2D
format	pCreateInfo->imageFormat
extent	{pCreateInfo->imageExtent.width, pCreateInfo->imageExtent.height, 1}
mipLevels	1
arrayLayers	pCreateInfo->imageArrayLayers
samples	VK_SAMPLE_COUNT_1_BIT
tiling	VK_IMAGE_TILING_OPTIMAL
usage	pCreateInfo->imageUsage
sharingMode	pCreateInfo->imageSharingMode
queueFamilyIndexCount	pCreateInfo->queueFamilyIndexCount
pQueueFamilyIndices	pCreateInfo->pQueueFamilyIndices
initialLayout	VK_IMAGE_LAYOUT_UNDEFINED

The pCreateInfo->surface **must** not be destroyed until after the swapchain is destroyed.

If oldSwapchain is VK_NULL_HANDLE, and the native window referred to by pCreateInfo->surface is already associated with a Vulkan swapchain, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR **must** be returned.

If the native window referred to by pCreateInfo->surface is already associated with a non-Vulkan graphics API surface, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR **must** be returned.

The native window referred to by `pCreateInfo->surface` **must** not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

`vkCreateSwapchainKHR` will return `VK_ERROR_DEVICE_LOST` if the logical device was lost. The `VkSwapchainKHR` is a child of the `device`, and **must** be destroyed before the `device`. However, `VkSurfaceKHR` is not a child of any `VkDevice` and is not affected by the lost device. After successfully recreating a `VkDevice`, the same `VkSurfaceKHR` **can** be used to create a new `VkSwapchainKHR`, provided the previous one was destroyed.

If the `oldSwapchain` parameter of `pCreateInfo` is a valid swapchain, which has exclusive full-screen access, that access is released from `pCreateInfo->oldSwapchain`. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from `pCreateInfo->oldSwapchain`.

NOTE This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation **may** fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, `VK_ERROR_INITIALIZATION_FAILED` will be returned.

NOTE In particular, it will fail if the `imageExtent` member of `pCreateInfo` does not match the extents of the monitor. Other reasons for failure may include the application not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

Valid Usage (Implicit)

- VUID-vkCreateSwapchainKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkSwapchainCreateInfoKHR structure
- VUID-vkCreateSwapchainKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
  `pSwapchain` **must** be a valid pointer to a VkSwapchainKHR handle

Host Synchronization

- Host access to `pCreateInfo->surface` **must** be externally synchronized
- Host access to `pCreateInfo->oldSwapchain` **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
- VK_ERROR_INITIALIZATION_FAILED

The VkSwapchainCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_swapchain
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType                  sType;
    const void*                      pNext;
    VkSwapchainCreateFlagsKHR        flags;
    VkSurfaceKHR                     surface;
    uint32_t                         minImageCount;
    VkFormat                         imageFormat;
    VkColorSpaceKHR                  imageColorSpace;
    VkExtent2D                       imageExtent;
    uint32_t                         imageArrayLayers;
    VkImageUsageFlags                imageUsage;
    VkSharingMode                    imageSharingMode;
    uint32_t                         queueFamilyIndexCount;
    const uint32_t*                  pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR    preTransform;
    VkCompositeAlphaFlagBitsKHR      compositeAlpha;
    VkPresentModeKHR                 presentMode;
    VkBool32                         clipped;
    VkSwapchainKHR                   oldSwapchain;
} VkSwapchainCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkSwapchainCreateFlagBitsKHR indicating parameters of the swapchain creation.
- surface is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with surface.
- minImageCount is the minimum number of presentable images that the application needs. The

implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.

- `imageFormat` is a VkFormat value specifying the format the swapchain image(s) will be created with.
- `imageColorSpace` is a VkColorSpaceKHR value specifying the way the swapchain interprets image data.
- `imageExtent` is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface's `currentExtent` as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

> **NOTE** On some platforms, it is normal that `maxImageExtent` **may** become `(0, 0)`, for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements .

- `imageArrayLayers` is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.
- `imageUsage` is a bitmask of VkImageUsageFlagBits describing the intended usage of the (acquired) swapchain images.
- `imageSharingMode` is the sharing mode used for the image(s) of the swapchain.
- `queueFamilyIndexCount` is the number of queue families having access to the image(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.
- `pQueueFamilyIndices` is a pointer to an array of queue family indices having access to the images(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.
- `preTransform` is a VkSurfaceTransformFlagBitsKHR value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the `currentTransform` value returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, the presentation engine will transform the image content as part of the presentation operation.
- `compositeAlpha` is a VkCompositeAlphaFlagBitsKHR value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.
- `presentMode` is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.
- `clipped` specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
  - If `clipped` is `VK_TRUE`, the presentable images associated with the swapchain **may** not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders **may** not execute for these pixels, and thus any side effects they would have had will not occur. Setting `VK_TRUE` does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.
  - If `clipped` is `VK_FALSE`, presentable images associated with the swapchain will own all of the pixels they contain.

NOTE

Applications **should** set this value to VK_TRUE if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- oldSwapchain is VK_NULL_HANDLE, or the existing non-retired swapchain currently associated with surface. Providing a valid oldSwapchain **may** aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling vkCreateSwapchainKHR with an oldSwapchain that is not VK_NULL_HANDLE, oldSwapchain is retired — even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not oldSwapchain is VK_NULL_HANDLE.

Upon calling vkCreateSwapchainKHR with an oldSwapchain that is not VK_NULL_HANDLE, any images from oldSwapchain that are not acquired by the application **may** be freed by the implementation, which **may** occur even if creation of the new swapchain fails. The application **can** destroy oldSwapchain to free all memory associated with oldSwapchain.

NOTE

Multiple retired swapchains **can** be associated with the same VkSurfaceKHR through multiple uses of oldSwapchain that outnumber calls to vkDestroySwapchainKHR.

After oldSwapchain is retired, the application **can** pass to vkQueuePresentKHR any images it had already acquired from oldSwapchain. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, vkQueuePresentKHR **may** fail if oldSwapchain has entered a state that causes VK_ERROR_OUT_OF_DATE_KHR to be returned.

The application **can** continue to use a shared presentable image obtained from oldSwapchain until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return VK_ERROR_OUT_OF_DATE_KHR.

Valid Usage

- VUID-VkSwapchainCreateInfoKHR-surface-01270
  surface **must** be a surface that is supported by the device as determined using vkGetPhysicalDeviceSurfaceSupportKHR
- VUID-VkSwapchainCreateInfoKHR-minImageCount-01272
  minImageCount **must** be less than or equal to the value returned in the maxImageCount member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface if the returned maxImageCount is not zero
- VUID-VkSwapchainCreateInfoKHR-presentMode-02839
  If presentMode is not VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR nor VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, then minImageCount **must** be greater than or equal to the value returned in the minImageCount member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-minImageCount-01383
  `minImageCount` **must** be `1` if `presentMode` is either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`
- VUID-VkSwapchainCreateInfoKHR-imageFormat-01273
  `imageFormat` and `imageColorSpace` **must** match the `format` and `colorSpace` members, respectively, of one of the `VkSurfaceFormatKHR` structures returned by `vkGetPhysicalDeviceSurfaceFormatsKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-pNext-07781
  `imageExtent` **must** be between `minImageExtent` and `maxImageExtent`, inclusive, where `minImageExtent` and `maxImageExtent` are members of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-imageExtent-01689
  `imageExtent` members `width` and `height` **must** both be non-zero
- VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275
  `imageArrayLayers` **must** be greater than `0` and less than or equal to the `maxImageArrayLayers` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-presentMode-01427
  If `presentMode` is `VK_PRESENT_MODE_FIFO_LATEST_READY_EXT`, `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR`, `imageUsage` **must** be a subset of the supported usage flags present in the `supportedUsageFlags` member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for `surface`
- VUID-VkSwapchainCreateInfoKHR-imageUsage-01384
  If `presentMode` is `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, `imageUsage` **must** be a subset of the supported usage flags present in the `sharedPresentSupportedUsageFlags` member of the VkSharedPresentSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for `surface`
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` **must** be a valid pointer to an array of `queueFamilyIndexCount` `uint32_t` values
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` **must** be greater than `1`
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` **must** be unique and **must** be less than `pQueueFamilyPropertyCount` returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2KHR for the `physicalDevice` that was used to create `device`
- VUID-VkSwapchainCreateInfoKHR-preTransform-01279
  `preTransform` **must** be one of the bits present in the `supportedTransforms` member of the

VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280
  compositeAlpha **must** be one of the bits present in the supportedCompositeAlpha member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface
- VUID-VkSwapchainCreateInfoKHR-presentMode-01281
  presentMode **must** be one of the VkPresentModeKHR values returned by vkGetPhysicalDeviceSurfacePresentModesKHR for the surface
- VUID-VkSwapchainCreateInfoKHR-presentModeFifoLatestReady-10161
  If the presentModeFifoLatestReady feature is not enabled, presentMode **must** not be VK_PRESENT_MODE_FIFO_LATEST_READY_EXT
- VUID-VkSwapchainCreateInfoKHR-physicalDeviceCount-01429
  If the logical device was created with VkDeviceGroupDeviceCreateInfo ::physicalDeviceCount equal to 1, flags **must** not contain VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR
- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-01933
  If oldSwapchain is not VK_NULL_HANDLE, oldSwapchain **must** be a non-retired swapchain associated with native window referred to by surface
- VUID-VkSwapchainCreateInfoKHR-imageFormat-01778
  The implied image creation parameters of the swapchain **must** be supported as reported by vkGetPhysicalDeviceImageFormatProperties
- VUID-VkSwapchainCreateInfoKHR-flags-03168
  If flags contains VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR then the pNext chain **must** include a VkImageFormatListCreateInfo structure with a viewFormatCount greater than zero and pViewFormats **must** have an element equal to imageFormat
- VUID-VkSwapchainCreateInfoKHR-pNext-04099
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and VkImageFormatListCreateInfo::viewFormatCount is not zero then all of the formats in VkImageFormatListCreateInfo::pViewFormats **must** be compatible with the format as described in the compatibility table
- VUID-VkSwapchainCreateInfoKHR-flags-04100
  If flags does not contain VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR and the pNext chain include a VkImageFormatListCreateInfo structure then VkImageFormatListCreateInfo ::viewFormatCount **must** be 0 or 1
- VUID-VkSwapchainCreateInfoKHR-flags-03187
  If flags contains VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR, then VkSurfaceProtectedCapabilitiesKHR::supportsProtected **must** be VK_TRUE in the VkSurfaceProtectedCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface
- VUID-VkSwapchainCreateInfoKHR-pNext-02679
  If the pNext chain includes a VkSurfaceFullScreenExclusiveInfoEXT structure with its fullScreenExclusive member set to VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT,

and `surface` was created using vkCreateWin32SurfaceKHR, a VkSurfaceFullScreenExclusiveWin32InfoEXT structure **must** be included in the `pNext` chain

Valid Usage (Implicit)

- VUID-VkSwapchainCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkSwapchainCreateInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkDeviceGroupSwapchainCreateInfoKHR, VkImageFormatListCreateInfo, VkSurfaceFullScreenExclusiveInfoEXT, VkSurfaceFullScreenExclusiveWin32InfoEXT, or VkSwapchainCounterCreateInfoEXT
- VUID-VkSwapchainCreateInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkSwapchainCreateInfoKHR-flags-parameter
  `flags` **must** be a valid combination of VkSwapchainCreateFlagBitsKHR values
- VUID-VkSwapchainCreateInfoKHR-surface-parameter
  `surface` **must** be a valid VkSurfaceKHR handle
- VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter
  `imageFormat` **must** be a valid VkFormat value
- VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter
  `imageColorSpace` **must** be a valid VkColorSpaceKHR value
- VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter
  `imageUsage` **must** be a valid combination of VkImageUsageFlagBits values
- VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask
  `imageUsage` **must** not be `0`
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter
  `imageSharingMode` **must** be a valid VkSharingMode value
- VUID-VkSwapchainCreateInfoKHR-preTransform-parameter
  `preTransform` **must** be a valid VkSurfaceTransformFlagBitsKHR value
- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter
  `compositeAlpha` **must** be a valid VkCompositeAlphaFlagBitsKHR value
- VUID-VkSwapchainCreateInfoKHR-presentMode-parameter
  `presentMode` **must** be a valid VkPresentModeKHR value
- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter
  If `oldSwapchain` is not VK_NULL_HANDLE, `oldSwapchain` **must** be a valid VkSwapchainKHR handle
- VUID-VkSwapchainCreateInfoKHR-commonparent
  Both of `oldSwapchain`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkInstance

Bits which **can** be set in VkSwapchainCreateInfoKHR::flags, specifying parameters of swapchain creation, are:

```
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
  // Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
  // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
  // Provided by VK_KHR_swapchain_mutable_format
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
} VkSwapchainCreateFlagBitsKHR;
```

- VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR specifies that images created from the swapchain (i.e. with the swapchain member of VkImageSwapchainCreateInfoKHR set to this swapchain's handle) **must** use VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT.
- VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR specifies that the images of the swapchain **can** be used to create a VkImageView with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a VkImageFormatListCreateInfo structure to the pNext chain of VkSwapchainCreateInfoKHR. In addition, this flag also specifies that the swapchain **can** be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.

```
// Provided by VK_KHR_swapchain
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

VkSwapchainCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkSwapchainCreateFlagBitsKHR.

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkDeviceGroupSwapchainCreateInfoKHR structure, then that structure includes a set of device group present modes that the swapchain **can** be used with.

The VkDeviceGroupSwapchainCreateInfoKHR structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType                  sType;
    const void*                      pNext;
    VkDeviceGroupPresentModeFlagsKHR    modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.

- `modes` is a bitfield of modes that the swapchain **can** be used with.

If this structure is not present, `modes` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage (Implicit)

- VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter
  `modes` **must** be a valid combination of VkDeviceGroupPresentModeFlagBitsKHR values
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-requiredbitmask
  `modes` **must** not be `0`

If the `pNext` chain of VkSwapchainCreateInfoKHR includes a VkSurfaceFullScreenExclusiveInfoEXT structure, then that structure specifies the application's preferred full-screen presentation behavior. If this structure is not present, `fullScreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

To enable surface counters when creating a swapchain, add a `VkSwapchainCounterCreateInfoEXT` structure to the `pNext` chain of VkSwapchainCreateInfoKHR. `VkSwapchainCounterCreateInfoEXT` is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType              sType;
    const void*                  pNext;
    VkSurfaceCounterFlagsEXT     surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCounters` is a bitmask of VkSurfaceCounterFlagBitsEXT specifying surface counters to enable for the swapchain.

Valid Usage

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
  The bits in `surfaceCounters` **must** be supported by VkSwapchainCreateInfoKHR::`surface`, as reported by vkGetPhysicalDeviceSurfaceCapabilities2EXT

Valid Usage (Implicit)

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT`

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
  `surfaceCounters` **must** be a valid combination of VkSurfaceCounterFlagBitsEXT values

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:

```
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain,
    VkSurfaceCounterFlagBitsEXT                 counter,
    uint64_t*                                   pCounterValue);
```

- `device` is the VkDevice associated with `swapchain`.
- `swapchain` is the swapchain from which to query the counter value.
- `counter` is a VkSurfaceCounterFlagBitsEXT value specifying the counter to query.
- `pCounterValue` will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation **may** return `VK_ERROR_OUT_OF_DATE_KHR`.

Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
  One or more present commands on `swapchain` **must** have been processed by the presentation engine

Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
  `swapchain` **must** be a valid VkSwapchainKHR handle
- VUID-vkGetSwapchainCounterEXT-counter-parameter
  `counter` **must** be a valid VkSurfaceCounterFlagBitsEXT value
- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
  `pCounterValue` **must** be a valid pointer to a `uint64_t` value
- VUID-vkGetSwapchainCounterEXT-swapchain-parent
  `swapchain` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`

To destroy a swapchain object call:

```
// Provided by VK_KHR_swapchain
void vkDestroySwapchainKHR(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the VkDevice associated with `swapchain`.
- `swapchain` is the swapchain to destroy.
- `pAllocator` is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

The application **must** not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. `swapchain` and all associated `VkImage` handles are destroyed, and **must** not be acquired or used any more by the application. The memory of each `VkImage` will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image **may** not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent `VkSurfaceKHR`, and a new swapchain **can** be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently presented to the display surface is from the swapchain being destroyed, then either any display resources modified by presenting images from any swapchain associated with the display surface **must** be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources **must** be left in their current state.

If `swapchain` has exclusive full-screen access, it is released before the swapchain is destroyed.

Valid Usage

- VUID-vkDestroySwapchainKHR-swapchain-01282
  All uses of presentable images acquired from `swapchain` **must** have completed execution
- VUID-vkDestroySwapchainKHR-swapchain-01283

If VkAllocationCallbacks were provided when swapchain was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroySwapchainKHR-swapchain-01284
  If no VkAllocationCallbacks were provided when swapchain was created, pAllocator **must** be NULL

Valid Usage (Implicit)

- VUID-vkDestroySwapchainKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkDestroySwapchainKHR-swapchain-parameter
  If swapchain is not VK_NULL_HANDLE, swapchain **must** be a valid VkSwapchainKHR handle
- VUID-vkDestroySwapchainKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroySwapchainKHR-swapchain-parent
  If swapchain is a valid handle, it **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to swapchain **must** be externally synchronized

When the VK_KHR_display_swapchain extension is enabled, multiple swapchains that share presentable images are created by calling:

```
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice                                    device,
    uint32_t                                    swapchainCount,
    const VkSwapchainCreateInfoKHR*             pCreateInfos,
    const VkAllocationCallbacks*                pAllocator,
    VkSwapchainKHR*                             pSwapchains);
```

- device is the device to create the swapchains for.
- swapchainCount is the number of swapchains to create.
- pCreateInfos is a pointer to an array of VkSwapchainCreateInfoKHR structures specifying the parameters of the created swapchains.
- pAllocator is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).

- `pSwapchains` is a pointer to an array of VkSwapchainKHR handles in which the created swapchain objects will be returned.

`vkCreateSharedSwapchainsKHR` is similar to vkCreateSwapchainKHR, except that it takes an array of VkSwapchainCreateInfoKHR structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images **must** match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`. If any error occurs, no swapchains will be created. Images presented to multiple swapchains **must** be re-acquired from all of them before being modified. After destroying one or more of the swapchains, the remaining swapchains and the presentable images **can** continue to be used.

Valid Usage (Implicit)

- VUID-vkCreateSharedSwapchainsKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter
  `pCreateInfos` **must** be a valid pointer to an array of `swapchainCount` valid VkSwapchainCreateInfoKHR structures
- VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter
  `pSwapchains` **must** be a valid pointer to an array of `swapchainCount` VkSwapchainKHR handles
- VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength
  `swapchainCount` **must** be greater than `0`

Host Synchronization

- Host access to `pCreateInfos`[].surface **must** be externally synchronized
- Host access to `pCreateInfos`[].oldSwapchain **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

- VK_ERROR_INCOMPATIBLE_DISPLAY_KHR
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR

To obtain the array of presentable images associated with a swapchain, call:

```
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain,
    uint32_t*                                   pSwapchainImageCount,
    VkImage*                                    pSwapchainImages);
```

- device is the device associated with swapchain.
- swapchain is the swapchain to query.
- pSwapchainImageCount is a pointer to an integer related to the number of presentable images available or queried, as described below.
- pSwapchainImages is either NULL or a pointer to an array of VkImage handles.

If pSwapchainImages is NULL, then the number of presentable images for swapchain is returned in pSwapchainImageCount. Otherwise, pSwapchainImageCount **must** point to a variable set by the application to the number of elements in the pSwapchainImages array, and on return the variable is overwritten with the number of structures actually written to pSwapchainImages. If the value of pSwapchainImageCount is less than the number of presentable images for swapchain, at most pSwapchainImageCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available presentable images were returned.

Valid Usage (Implicit)

- VUID-vkGetSwapchainImagesKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetSwapchainImagesKHR-swapchain-parameter
  swapchain **must** be a valid VkSwapchainKHR handle
- VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter
  pSwapchainImageCount **must** be a valid pointer to a uint32_t value
- VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter
  If the value referenced by pSwapchainImageCount is not 0, and pSwapchainImages is not NULL, pSwapchainImages **must** be a valid pointer to an array of pSwapchainImageCount VkImage handles
- VUID-vkGetSwapchainImagesKHR-swapchain-parent
  swapchain **must** have been created, allocated, or retrieved from device

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

NOTE	By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop.

Images returned by vkGetSwapchainImagesKHR are fully backed by memory before they are passed to the application, as if they are each bound completely and contiguously to a single `VkDeviceMemory` object . All presentable images are initially in the `VK_IMAGE_LAYOUT_UNDEFINED` layout, thus before using presentable images, the application **must** transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications **must** not destroy a presentable image. See vkDestroySwapchainKHR for further details on the lifetime of presentable images.

Images **can** also be created by using vkCreateImage with VkImageSwapchainCreateInfoKHR and bound to swapchain memory using vkBindImageMemory2KHR with VkBindImageMemorySwapchainInfoKHR. These images **can** be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images **must** be destroyed with vkDestroyImage.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain,
    uint64_t                                    timeout,
    VkSemaphore                                 semaphore,
    VkFence                                     fence,
    uint32_t*                                   pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain from which an image is being acquired.

- `timeout` specifies how long the function waits, in nanoseconds, if no image is available.
- `semaphore` is VK_NULL_HANDLE or a semaphore to signal.
- `fence` is VK_NULL_HANDLE or a fence to signal.
- `pImageIndex` is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.

Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
  `swapchain` **must** not be in the retired state
- VUID-vkAcquireNextImageKHR-semaphore-01286
  If `semaphore` is not VK_NULL_HANDLE, it **must** be unsignaled
- VUID-vkAcquireNextImageKHR-semaphore-01779
  If `semaphore` is not VK_NULL_HANDLE, it **must** not have any uncompleted signal or wait operations pending
- VUID-vkAcquireNextImageKHR-fence-01287
  If `fence` is not VK_NULL_HANDLE, `fence` **must** be unsignaled
- VUID-vkAcquireNextImageKHR-fence-10066
  If `fence` is not VK_NULL_HANDLE, `fence` **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkAcquireNextImageKHR-semaphore-01780
  `semaphore` and `fence` **must** not both be equal to VK_NULL_HANDLE
- VUID-vkAcquireNextImageKHR-surface-07783
  If forward progress cannot be guaranteed for the `surface` used to create the `swapchain` member of `pAcquireInfo`, `timeout` **must** not be `UINT64_MAX`
- VUID-vkAcquireNextImageKHR-semaphore-03265
  `semaphore` **must** have a VkSemaphoreType of `VK_SEMAPHORE_TYPE_BINARY`

Valid Usage (Implicit)

- VUID-vkAcquireNextImageKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkAcquireNextImageKHR-swapchain-parameter
  `swapchain` **must** be a valid VkSwapchainKHR handle
- VUID-vkAcquireNextImageKHR-semaphore-parameter
  If `semaphore` is not VK_NULL_HANDLE, `semaphore` **must** be a valid VkSemaphore handle
- VUID-vkAcquireNextImageKHR-fence-parameter
  If `fence` is not VK_NULL_HANDLE, `fence` **must** be a valid VkFence handle
- VUID-vkAcquireNextImageKHR-pImageIndex-parameter
  `pImageIndex` **must** be a valid pointer to a `uint32_t` value

- VUID-vkAcquireNextImageKHR-swapchain-parent
  `swapchain` **must** have been created, allocated, or retrieved from `device`
- VUID-vkAcquireNextImageKHR-semaphore-parent
  If `semaphore` is a valid handle, it **must** have been created, allocated, or retrieved from `device`
- VUID-vkAcquireNextImageKHR-fence-parent
  If `fence` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized
- Host access to `semaphore` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`
- `VK_TIMEOUT`
- `VK_NOT_READY`
- `VK_SUBOPTIMAL_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

If an image is acquired successfully, `vkAcquireNextImageKHR` **must** either return `VK_SUCCESS` or `VK_SUBOPTIMAL_KHR`. The implementation **may** return `VK_SUBOPTIMAL_KHR` if the swapchain no longer matches the surface properties exactly, but **can** still be used for presentation.

When successful, `vkAcquireNextImageKHR` acquires a presentable image from `swapchain` that an application **can** use, and sets `pImageIndex` to the index of that image within the swapchain. The presentation engine **may** not have finished reading from the image at the time it is acquired, so the application **must** use `semaphore` and/or `fence` to ensure that the image layout and contents are not modified until the presentation engine reads have completed. Once `vkAcquireNextImageKHR` successfully acquires an image, the semaphore signal operation referenced by `semaphore`, if not VK_NULL_HANDLE, and the fence signal operation referenced by `fence`, if not VK_NULL_HANDLE,

are submitted for execution. If vkAcquireNextImageKHR does not successfully acquire an image, semaphore and fence are unaffected. The order in which images are acquired is implementation-dependent, and **may** be different than the order the images were presented.

If timeout is zero, then vkAcquireNextImageKHR does not wait, and will either successfully acquire an image, or fail and return VK_NOT_READY if no image is available.

If the specified timeout period expires before an image is acquired, vkAcquireNextImageKHR returns VK_TIMEOUT. If timeout is UINT64_MAX, the timeout period is treated as infinite, and vkAcquireNextImageKHR will block until an image is acquired or an error occurs.

Let S be the number of images in swapchain. Let M be the value of VkSurfaceCapabilitiesKHR ::minImageCount.

vkAcquireNextImageKHR **should** not be called if the number of images that the application has currently acquired is greater than S-M. If vkAcquireNextImageKHR is called when the number of images that the application has currently acquired is less than or equal to S-M, vkAcquireNextImageKHR **must** return in finite time with an allowed VkResult code.

NOTE

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use UINT64_MAX. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

If the swapchain images no longer match native surface properties, either VK_SUBOPTIMAL_KHR or VK_ERROR_OUT_OF_DATE_KHR **must** be returned. If VK_ERROR_OUT_OF_DATE_KHR is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with VK_ERROR_OUT_OF_DATE_KHR. Applications need to create a new swapchain for the surface to continue presenting if VK_ERROR_OUT_OF_DATE_KHR is returned.

NOTE

VK_SUBOPTIMAL_KHR **may** happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If device loss occurs (see Lost Device) before the timeout has expired, vkAcquireNextImageKHR **must** return in finite time with either one of the allowed success codes, or VK_ERROR_DEVICE_LOST.

If semaphore is not VK_NULL_HANDLE, the semaphore **must** be unsignaled, with no signal or wait operations pending. It will become signaled when the application **can** use the image.

NOTE

Use of semaphore allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If fence is not equal to VK_NULL_HANDLE, the fence **must** be unsignaled, with no signal operations pending. It will become signaled when the application **can** use the image.

NOTE

Applications **should** not rely on vkAcquireNextImageKHR blocking in order to meter their rendering speed. The implementation **may** return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications **can** use fence to meter their frame generation work to match the presentation rate.

An application **must** wait until either the semaphore or fence is signaled before accessing the image's data.

NOTE

When the presentable image will be accessed by some stage S, the recommended idiom for ensuring correct synchronization is:

- The VkSubmitInfo used to submit the image layout transition for execution includes vkAcquireNextImageKHR::semaphore in its pWaitSemaphores member, with the corresponding element of pWaitDstStageMask including S.
- The synchronization command that performs any necessary image layout transition includes S in both the srcStageMask and dstStageMask.

After a successful return, the image indicated by pImageIndex and its data will be unmodified compared to when it was presented.

NOTE

Exclusive ownership of presentable images corresponding to a swapchain created with VK_SHARING_MODE_EXCLUSIVE as defined in Resource Sharing is not altered by a call to vkAcquireNextImageKHR. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for vkAcquireNextImageKHR depend on the timeout provided:

- VK_SUCCESS is returned if an image became available.
- VK_ERROR_SURFACE_LOST_KHR is returned if the surface becomes no longer available.
- VK_NOT_READY is returned if timeout is zero and no image was available.
- VK_TIMEOUT is returned if timeout is greater than zero and less than UINT64_MAX, and no image became available within the time allowed.
- VK_SUBOPTIMAL_KHR is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but **can** still be used to present to the surface successfully.

NOTE

This **may** happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to re-create the swapchain to better match the platform surface properties.

- VK_ERROR_OUT_OF_DATE_KHR is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation **may** fail . If presentation does succeed, the mapping from the presented image to the native surface is implementation-defined. It is the application's responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a VK_ERROR_OUT_OF_DATE_KHR error will be returned.

NOTE

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems **may** squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice                                    device,
    const VkAcquireNextImageInfoKHR*            pAcquireInfo,
    uint32_t*                                   pImageIndex);
```

- device is the device associated with swapchain.
- pAcquireInfo is a pointer to a VkAcquireNextImageInfoKHR structure containing parameters of the acquire.
- pImageIndex is a pointer to a uint32_t value specifying the index of the next image to use.

Valid Usage

- VUID-vkAcquireNextImage2KHR-surface-07784
  If forward progress cannot be guaranteed for the surface used to create swapchain, the timeout member of pAcquireInfo **must** not be UINT64_MAX

Valid Usage (Implicit)

- VUID-vkAcquireNextImage2KHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
  pAcquireInfo **must** be a valid pointer to a valid VkAcquireNextImageInfoKHR structure

- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
  `pImageIndex` **must** be a valid pointer to a `uint32_t` value

Return Codes

Success

- `VK_SUCCESS`
- `VK_TIMEOUT`
- `VK_NOT_READY`
- `VK_SUBOPTIMAL_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

The `VkAcquireNextImageInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
    uint64_t           timeout;
    VkSemaphore        semaphore;
    VkFence            fence;
    uint32_t           deviceMask;
} VkAcquireNextImageInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is a non-retired swapchain from which an image is acquired.
- `timeout` specifies how long the function waits, in nanoseconds, if no image is available.
- `semaphore` is VK_NULL_HANDLE or a semaphore to signal.
- `fence` is VK_NULL_HANDLE or a fence to signal.
- `deviceMask` is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If vkAcquireNextImageKHR is used, the device mask is considered to include all physical devices in the logical device.

NOTE

vkAcquireNextImage2KHR signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the `deviceMask`. However, only a single physical device **can** wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) **can** wait upon.

Valid Usage

- VUID-VkAcquireNextImageInfoKHR-swapchain-01675
  `swapchain` **must** not be in the retired state
- VUID-VkAcquireNextImageInfoKHR-semaphore-01288
  If `semaphore` is not VK_NULL_HANDLE, it **must** be unsignaled
- VUID-VkAcquireNextImageInfoKHR-semaphore-01781
  If `semaphore` is not VK_NULL_HANDLE, it **must** not have any uncompleted signal or wait operations pending
- VUID-VkAcquireNextImageInfoKHR-fence-01289
  If `fence` is not VK_NULL_HANDLE, `fence` **must** be unsignaled
- VUID-VkAcquireNextImageInfoKHR-fence-10067
  If `fence` is not VK_NULL_HANDLE, `fence` **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-VkAcquireNextImageInfoKHR-semaphore-01782
  `semaphore` and `fence` **must** not both be equal to VK_NULL_HANDLE
- VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
  `deviceMask` **must** be a valid device mask
- VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
  `deviceMask` **must** not be zero
- VUID-VkAcquireNextImageInfoKHR-semaphore-03266
  `semaphore` **must** have a VkSemaphoreType of `VK_SEMAPHORE_TYPE_BINARY`

Valid Usage (Implicit)

- VUID-VkAcquireNextImageInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR`
- VUID-VkAcquireNextImageInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkAcquireNextImageInfoKHR-swapchain-parameter

swapchain **must** be a valid VkSwapchainKHR handle

- VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore **must** be a valid VkSemaphore handle
- VUID-VkAcquireNextImageInfoKHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence **must** be a valid VkFence handle
- VUID-VkAcquireNextImageInfoKHR-commonparent
  Each of fence, semaphore, and swapchain that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to swapchain **must** be externally synchronized
- Host access to semaphore **must** be externally synchronized
- Host access to fence **must** be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue                                     queue,
    const VkPresentInfoKHR*                     pPresentInfo);
```

- queue is a queue that is capable of presentation to the target surface's platform on the same device as the image's swapchain.
- pPresentInfo is a pointer to a VkPresentInfoKHR structure specifying parameters of the presentation.

NOTE There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.

NOTE The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented VkImage at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, and the display standing the right way up).

The result codes VK_ERROR_OUT_OF_DATE_KHR and VK_SUBOPTIMAL_KHR have the same meaning when returned by vkQueuePresentKHR as they do when returned by vkAcquireNextImageKHR. If any swapchain member of pPresentInfo was created with VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT, VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT will be returned if that swapchain does not have

exclusive full-screen access, possibly for implementation-specific reasons outside of the application's control. If multiple swapchains are presented, the result code is determined by applying the following rules in order:

- If the device is lost, VK_ERROR_DEVICE_LOST is returned.
- If any of the target surfaces are no longer available the error VK_ERROR_SURFACE_LOST_KHR is returned.
- If any of the presents would have a result of VK_ERROR_OUT_OF_DATE_KHR if issued separately then VK_ERROR_OUT_OF_DATE_KHR is returned.
- If any of the presents would have a result of VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT if issued separately then VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT is returned.
- If any of the presents would have a result of VK_SUBOPTIMAL_KHR if issued separately then VK_SUBOPTIMAL_KHR is returned.
- Otherwise VK_SUCCESS is returned.

Any writes to memory backing the images referenced by the pImageIndices and pSwapchains members of pPresentInfo, that are available before vkQueuePresentKHR is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Calls to vkQueuePresentKHR **may** block, but **must** return in finite time. The processing of the presentation happens in issue order with other queue operations, but semaphores **must** be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue. However, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

Queueing an image for presentation defines a set of *queue operations*, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the presentation engine.

If vkQueuePresentKHR fails to enqueue the corresponding set of queue operations, it **may** return

VK_ERROR_OUT_OF_HOST_MEMORY or VK_ERROR_OUT_OF_DEVICE_MEMORY. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If vkQueuePresentKHR fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return VK_ERROR_DEVICE_LOST.

However, if the presentation request is rejected by the presentation engine with an error VK_ERROR_OUT_OF_DATE_KHR, VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT, or VK_ERROR_SURFACE_LOST_KHR, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in VkPresentInfoKHR will execute when the corresponding queue operation is complete.

vkQueuePresentKHR releases the acquisition of the images referenced by imageIndices. The queue family corresponding to the queue vkQueuePresentKHR is executed on **must** have ownership of the presented images as defined in Resource Sharing. vkQueuePresentKHR does not alter the queue family ownership, but the presented images **must** not be used again before they have been reacquired using vkAcquireNextImageKHR.

NOTE The application **can** continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes vkQueuePresentKHR to return VK_ERROR_OUT_OF_DATE_KHR.

Valid Usage

- VUID-vkQueuePresentKHR-pSwapchains-01292
  Each element of pSwapchains member of pPresentInfo **must** be a swapchain that is created for a surface for which presentation is supported from queue as determined using a call to vkGetPhysicalDeviceSurfaceSupportKHR
- VUID-vkQueuePresentKHR-pSwapchains-01293
  If more than one member of pSwapchains was created from a display surface, all display surfaces referenced that refer to the same display **must** use the same display mode
- VUID-vkQueuePresentKHR-pWaitSemaphores-01294
  When a semaphore wait operation referring to a binary semaphore defined by the elements of the pWaitSemaphores member of pPresentInfo executes on queue, there **must** be no other queues waiting on the same semaphore
- VUID-vkQueuePresentKHR-pWaitSemaphores-03267
  All elements of the pWaitSemaphores member of pPresentInfo **must** be created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY
- VUID-vkQueuePresentKHR-pWaitSemaphores-03268
  All elements of the pWaitSemaphores member of pPresentInfo **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends **must** have also been submitted for execution

Valid Usage (Implicit)

- VUID-vkQueuePresentKHR-queue-parameter
  `queue` **must** be a valid VkQueue handle
- VUID-vkQueuePresentKHR-pPresentInfo-parameter
  `pPresentInfo` **must** be a valid pointer to a valid VkPresentInfoKHR structure

Host Synchronization

- Host access to `queue` **must** be externally synchronized
- Host access to `pPresentInfo->pWaitSemaphores`[] **must** be externally synchronized
- Host access to `pPresentInfo->pSwapchains`[] **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

Return Codes

Success

- `VK_SUCCESS`
- `VK_SUBOPTIMAL_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

The `VkPresentInfoKHR` structure is defined as:

```
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 waitSemaphoreCount;
    const VkSemaphore*       pWaitSemaphores;
    uint32_t                 swapchainCount;
    const VkSwapchainKHR*    pSwapchains;
    const uint32_t*          pImageIndices;
    VkResult*                pResults;
} VkPresentInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number **may** be zero.
- `pWaitSemaphores` is `NULL` or a pointer to an array of VkSemaphore objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pSwapchains` is a pointer to an array of VkSwapchainKHR objects with `swapchainCount` entries.
- `pImageIndices` is a pointer to an array of indices into the array of each swapchain's presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- `pResults` is a pointer to an array of VkResult typed elements with `swapchainCount` entries. Applications that do not need per-swapchain results **can** use `NULL` for `pResults`. If non-`NULL`, each entry in `pResults` will be set to the VkResult for presenting the swapchain corresponding to the same index in `pSwapchains`.

Before an application **can** present an image, the image's layout **must** be transitioned to the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, or for a shared presentable image the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout.

NOTE

When transitioning the image to `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`, there is no need to delay subsequent processing, or perform any visibility operations (as vkQueuePresentKHR performs automatic visibility operations). To achieve this, the `dstAccessMask` member of the VkImageMemoryBarrier **should** be `0`, and the `dstStageMask` parameter **should** be `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`.

Valid Usage

- VUID-VkPresentInfoKHR-pSwapchain-09231
  Elements of `pSwapchain` **must** be unique
- VUID-VkPresentInfoKHR-pImageIndices-01430

Each element of pImageIndices **must** be the index of a presentable image acquired from the swapchain specified by the corresponding element of the pSwapchains array, and the presented image subresource **must** be in the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout at the time the operation is executed on a VkDevice

- VUID-VkPresentInfoKHR-pNext-06235
  If a VkPresentIdKHR structure is included in the pNext chain, and the presentId feature is not enabled, each presentIds entry in that structure **must** be NULL

Valid Usage (Implicit)

- VUID-VkPresentInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PRESENT_INFO_KHR
- VUID-VkPresentInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkDeviceGroupPresentInfoKHR, VkDisplayPresentInfoKHR, VkFrameBoundaryEXT, VkPresentIdKHR, or VkPresentRegionsKHR
- VUID-VkPresentInfoKHR-sType-unique
  The sType value of each struct in the pNext chain **must** be unique
- VUID-VkPresentInfoKHR-pWaitSemaphores-parameter
  If waitSemaphoreCount is not 0, pWaitSemaphores **must** be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles
- VUID-VkPresentInfoKHR-pSwapchains-parameter
  pSwapchains **must** be a valid pointer to an array of swapchainCount valid VkSwapchainKHR handles
- VUID-VkPresentInfoKHR-pImageIndices-parameter
  pImageIndices **must** be a valid pointer to an array of swapchainCount uint32_t values
- VUID-VkPresentInfoKHR-pResults-parameter
  If pResults is not NULL, pResults **must** be a valid pointer to an array of swapchainCount VkResult values
- VUID-VkPresentInfoKHR-swapchainCount-arraylength
  swapchainCount **must** be greater than 0
- VUID-VkPresentInfoKHR-commonparent
  Both of the elements of pSwapchains, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

When the VK_KHR_incremental_present extension is enabled, additional fields **can** be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine **may** use to only update the region of a surface that is actually changing. The application still **must** ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this

hint. An application **can** provide this hint by adding a VkPresentRegionsKHR structure to the pNext chain of the VkPresentInfoKHR structure.

The VkPresentRegionsKHR structure is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionsKHR {
    VkStructureType              sType;
    const void*                  pNext;
    uint32_t                     swapchainCount;
    const VkPresentRegionKHR*    pRegions;
} VkPresentRegionsKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchainCount is the number of swapchains being presented to by this command.
- pRegions is NULL or a pointer to an array of VkPresentRegionKHR elements with swapchainCount entries. If not NULL, each element of pRegions contains the region that has changed since the last present to the swapchain in the corresponding entry in the VkPresentInfoKHR::pSwapchains array.

Valid Usage

- VUID-VkPresentRegionsKHR-swapchainCount-01260
  swapchainCount **must** be the same value as VkPresentInfoKHR::swapchainCount, where VkPresentInfoKHR is included in the pNext chain of this VkPresentRegionsKHR structure

Valid Usage (Implicit)

- VUID-VkPresentRegionsKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR
- VUID-VkPresentRegionsKHR-pRegions-parameter
  If pRegions is not NULL, pRegions **must** be a valid pointer to an array of swapchainCount valid VkPresentRegionKHR structures
- VUID-VkPresentRegionsKHR-swapchainCount-arraylength
  swapchainCount **must** be greater than 0

For a given image and swapchain, the region to present is specified by the VkPresentRegionKHR structure, which is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionKHR {
    uint32_t                rectangleCount;
    const VkRectLayerKHR*   pRectangles;
} VkPresentRegionKHR;
```

- `rectangleCount` is the number of rectangles in `pRectangles`, or zero if the entire image has changed and should be presented.
- `pRectangles` is either `NULL` or a pointer to an array of `VkRectLayerKHR` structures. The `VkRectLayerKHR` structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and **must** be presented. If non-`NULL`, each entry in `pRectangles` is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles **must** be specified relative to VkSurfaceCapabilitiesKHR ::`currentTransform`, regardless of the swapchain's `preTransform`. The presentation engine will apply the `preTransform` transformation to the rectangles, along with any further transformation it applies to the image content.

Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter
  If `rectangleCount` is not `0`, and `pRectangles` is not `NULL`, `pRectangles` **must** be a valid pointer to an array of `rectangleCount` valid VkRectLayerKHR structures

The `VkRectLayerKHR` structure is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
    VkOffset2D    offset;
    VkExtent2D    extent;
    uint32_t      layer;
} VkRectLayerKHR;
```

- `offset` is the origin of the rectangle, in pixels.
- `extent` is the size of the rectangle, in pixels.
- `layer` is the layer of the image. For images with only one layer, the value of `layer` **must** be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. `VkRectLayerKHR` specifies pixels of the swapchain's image(s), which will be constant for the life of the swapchain.

Valid Usage

- VUID-VkRectLayerKHR-offset-04864
  The sum of `offset` and `extent`, after being transformed according to the `preTransform`

member of the VkSwapchainCreateInfoKHR structure, **must** be no greater than the imageExtent member of the VkSwapchainCreateInfoKHR structure passed to vkCreateSwapchainKHR

- VUID-VkRectLayerKHR-layer-01262
  layer **must** be less than the imageArrayLayers member of the VkSwapchainCreateInfoKHR structure passed to vkCreateSwapchainKHR

When the VK_KHR_display_swapchain extension is enabled, additional fields **can** be specified when presenting an image to a swapchain by setting VkPresentInfoKHR::pNext to point to a VkDisplayPresentInfoKHR structure.

The VkDisplayPresentInfoKHR structure is defined as:

```
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkRect2D           srcRect;
    VkRect2D           dstRect;
    VkBool32           persistent;
} VkDisplayPresentInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- srcRect is a rectangular region of pixels to present. It **must** be a subset of the image being presented. If VkDisplayPresentInfoKHR is not specified, this region will be assumed to be the entire presentable image.
- dstRect is a rectangular region within the visible region of the swapchain's display mode. If VkDisplayPresentInfoKHR is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.
- persistent: If this is VK_TRUE, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but **may** increase presentation latency. If VkDisplayPresentInfoKHR is not specified, persistent mode will not be used.

If the extent of the srcRect and dstRect are not equal, the presented pixels will be scaled accordingly.

Valid Usage

- VUID-VkDisplayPresentInfoKHR-srcRect-01257
  `srcRect` **must** specify a rectangular region that is a subset of the image being presented
- VUID-VkDisplayPresentInfoKHR-dstRect-01258
  `dstRect` **must** specify a rectangular region that is a subset of the `visibleRegion` parameter of the display mode the swapchain being presented uses
- VUID-VkDisplayPresentInfoKHR-persistentContent-01259
  If the `persistentContent` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display the present operation targets is `VK_FALSE`, then `persistent` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-VkDisplayPresentInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`

If the `pNext` chain of VkPresentInfoKHR includes a `VkDeviceGroupPresentInfoKHR` structure, then that structure includes an array of device masks and a device group present mode.

The `VkDeviceGroupPresentInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType                         sType;
    const void*                             pNext;
    uint32_t                                swapchainCount;
    const uint32_t*                         pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR     mode;
} VkDeviceGroupPresentInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is zero or the number of elements in `pDeviceMasks`.
- `pDeviceMasks` is a pointer to an array of device masks, one for each element of VkPresentInfoKHR::`pSwapchains`.
- `mode` is a VkDeviceGroupPresentModeFlagBitsKHR value specifying the device group present mode that will be used for this present.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` **must** have exactly one bit set, and the corresponding physical device **must** have a presentation engine as

reported by VkDeviceGroupPresentCapabilitiesKHR.

If mode is VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of pDeviceMasks selects which instance of the swapchain image is presented. Each element of pDeviceMasks **must** have exactly one bit set, and some physical device in the logical device **must** include that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask.

If mode is VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of pDeviceMasks selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of pDeviceMasks **must** have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR::presentMask.

If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then each element of pDeviceMasks selects which instance(s) of the swapchain images are presented. For each bit set in each element of pDeviceMasks, the corresponding physical device **must** have a presentation engine as reported by VkDeviceGroupPresentCapabilitiesKHR.

If VkDeviceGroupPresentInfoKHR is not provided or swapchainCount is zero then the masks are considered to be 1. If VkDeviceGroupPresentInfoKHR is not provided, mode is considered to be VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR.

Valid Usage

- VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
  swapchainCount **must** equal 0 or VkPresentInfoKHR::swapchainCount
- VUID-VkDeviceGroupPresentInfoKHR-mode-01298
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of pDeviceMasks **must** have exactly one bit set, and the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask **must** be non-zero
- VUID-VkDeviceGroupPresentInfoKHR-mode-01299
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of pDeviceMasks **must** have exactly one bit set, and some physical device in the logical device **must** include that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask
- VUID-VkDeviceGroupPresentInfoKHR-mode-01300
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of pDeviceMasks **must** have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR::presentMask
- VUID-VkDeviceGroupPresentInfoKHR-mode-01301
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then for each bit set in each element of pDeviceMasks, the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask **must** be non-zero
- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
  The value of each element of pDeviceMasks **must** be equal to the device mask passed in VkAcquireNextImageInfoKHR::deviceMask when the image index was last acquired
- VUID-VkDeviceGroupPresentInfoKHR-mode-01303

mode **must** have exactly one bit set, and that bit **must** have been included in VkDeviceGroupSwapchainCreateInfoKHR::modes

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR
- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
  If swapchainCount is not 0, pDeviceMasks **must** be a valid pointer to an array of swapchainCount uint32_t values
- VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
  mode **must** be a valid VkDeviceGroupPresentModeFlagBitsKHR value

The VkPresentIdKHR structure is defined as:

```
// Provided by VK_KHR_present_id
typedef struct VkPresentIdKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           swapchainCount;
    const uint64_t*    pPresentIds;
} VkPresentIdKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchainCount is the number of swapchains being presented to the vkQueuePresentKHR command.
- pPresentIds is NULL or a pointer to an array of uint64_t with swapchainCount entries. If not NULL, each non-zero value in pPresentIds specifies the present id to be associated with the presentation of the swapchain with the same index in the vkQueuePresentKHR call.

For applications to be able to reference specific presentation events queued by a call to vkQueuePresentKHR, an identifier needs to be associated with them. When the presentId feature is enabled, applications **can** include the VkPresentIdKHR structure in the pNext chain of the VkPresentInfoKHR structure to supply identifiers.

Each VkSwapchainKHR has a presentId associated with it. This value is initially zero when the VkSwapchainKHR is created.

When a VkPresentIdKHR structure with a non-NULL pPresentIds is included in the pNext chain of a VkPresentInfoKHR structure, each pSwapchains entry has a presentId associated in the pPresentIds array at the same index as the swapchain in the pSwapchains array. If this presentId is non-zero, then the application **can** later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated presentId. A non-zero presentId **must** be greater

than any non-zero presentId passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations **should** make this as close as possible to the presentation of the first pixel in the new image to the user.

Valid Usage

- VUID-VkPresentIdKHR-swapchainCount-04998
  `swapchainCount` **must** be the same value as `VkPresentInfoKHR`::`swapchainCount`, where this `VkPresentIdKHR` is in the `pNext` chain of the `VkPresentInfoKHR` structure
- VUID-VkPresentIdKHR-presentIds-04999
  Each `presentIds` entry **must** be greater than any previous `presentIds` entry passed for the associated `pSwapchains` entry

Valid Usage (Implicit)

- VUID-VkPresentIdKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_ID_KHR`
- VUID-VkPresentIdKHR-pPresentIds-parameter
  If `pPresentIds` is not `NULL`, `pPresentIds` **must** be a valid pointer to an array of `swapchainCount` `uint64_t` values
- VUID-VkPresentIdKHR-swapchainCount-arraylength
  `swapchainCount` **must** be greater than `0`

When the `presentWait` feature is enabled, an application **can** wait for an image to be presented to the user by first specifying a presentId for the target presentation by adding a `VkPresentIdKHR` structure to the `pNext` chain of the VkPresentInfoKHR structure and then waiting for that presentation to complete by calling:

```
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(
    VkDevice                                    device,
    VkSwapchainKHR                              swapchain,
    uint64_t                                    presentId,
    uint64_t                                    timeout);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain on which an image was queued for presentation.
- `presentId` is the presentation presentId to wait for.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

vkWaitForPresentKHR waits for the presentId associated with swapchain to be increased in value so that it is at least equal to presentId.

For VK_PRESENT_MODE_MAILBOX_KHR (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image **must** be signaled no later than a wait associated with the replacing image would be signaled.

When the presentation has completed, the presentId associated with the related pSwapchains entry will be increased in value so that it is at least equal to the value provided in the VkPresentIdKHR structure.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations **should** make this as close as possible to the presentation of the first pixel in the next image being presented to the user.

The call to vkWaitForPresentKHR will block until either the presentId associated with swapchain is greater than or equal to presentId, or timeout nanoseconds passes. When the swapchain becomes OUT_OF_DATE, the call will either return VK_SUCCESS (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status VK_ERROR_OUT_OF_DATE_KHR (if the image was not presented to the user).

As an exception to the normal rules for objects which are externally synchronized, the swapchain passed to vkWaitForPresentKHR **may** be simultaneously used by other threads in calls to functions other than vkDestroySwapchainKHR. Access to the swapchain data associated with this extension **must** be atomic within the implementation.

Valid Usage

- VUID-vkWaitForPresentKHR-swapchain-04997
  swapchain **must** not be in the retired state
- VUID-vkWaitForPresentKHR-presentWait-06234
  The presentWait feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkWaitForPresentKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkWaitForPresentKHR-swapchain-parameter
  swapchain **must** be a valid VkSwapchainKHR handle
- VUID-vkWaitForPresentKHR-swapchain-parent
  swapchain **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to swapchain **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS
- VK_TIMEOUT
- VK_SUBOPTIMAL_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

32.10. HDR Metadata

This section describes how to improve color reproduction of content to better reproduce colors as seen on the display used to originally optimize the content.

To provide HDR metadata to an implementation, call:

```
// Provided by VK_EXT_hdr_metadata
void vkSetHdrMetadataEXT(
    VkDevice                                    device,
    uint32_t                                    swapchainCount,
    const VkSwapchainKHR*                       pSwapchains,
    const VkHdrMetadataEXT*                     pMetadata);
```

- device is the logical device where the swapchain(s) were created.
- swapchainCount is the number of swapchains included in pSwapchains.
- pSwapchains is a pointer to an array of swapchainCount VkSwapchainKHR handles.
- pMetadata is a pointer to an array of swapchainCount VkHdrMetadataEXT structures.

The metadata will be applied to the specified VkSwapchainKHR objects at the next vkQueuePresentKHR call using that VkSwapchainKHR object. The metadata will persist until a subsequent vkSetHdrMetadataEXT changes it.

Valid Usage (Implicit)

- VUID-vkSetHdrMetadataEXT-device-parameter
  device **must** be a valid VkDevice handle

- VUID-vkSetHdrMetadataEXT-pSwapchains-parameter
  `pSwapchains` **must** be a valid pointer to an array of `swapchainCount` valid VkSwapchainKHR handles
- VUID-vkSetHdrMetadataEXT-pMetadata-parameter
  `pMetadata` **must** be a valid pointer to an array of `swapchainCount` valid VkHdrMetadataEXT structures
- VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength
  `swapchainCount` **must** be greater than `0`
- VUID-vkSetHdrMetadataEXT-pSwapchains-parent
  Each element of `pSwapchains` **must** have been created, allocated, or retrieved from `device`

The `VkHdrMetadataEXT` structure is defined as:

```
// Provided by VK_EXT_hdr_metadata
typedef struct VkHdrMetadataEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkXYColorEXT       displayPrimaryRed;
    VkXYColorEXT       displayPrimaryGreen;
    VkXYColorEXT       displayPrimaryBlue;
    VkXYColorEXT       whitePoint;
    float              maxLuminance;
    float              minLuminance;
    float              maxContentLightLevel;
    float              maxFrameAverageLightLevel;
} VkHdrMetadataEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPrimaryRed` is a VkXYColorEXT structure specifying the red primary of the display used to optimize the content
- `displayPrimaryGreen` is a VkXYColorEXT structure specifying the green primary of the display used to optimize the content
- `displayPrimaryBlue` is a VkXYColorEXT structure specifying the blue primary of the display used to optimize the content
- `whitePoint` is a VkXYColorEXT structure specifying the white-point of the display used to optimize the content
- `maxLuminance` is the maximum luminance of the display used to optimize the content in nits
- `minLuminance` is the minimum luminance of the display used to optimize the content in nits
- `maxContentLightLevel` is the value in nits of the desired luminance for the brightest pixels in the displayed image.
- `maxFrameAverageLightLevel` is the value in nits of the average luminance of the frame which has

the brightest average luminance anywhere in the content.

If any of the above values are unknown, they **can** be set to 0.

NOTE	The meta-data provided here is intended to be used as defined in the SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications. The validity and use of this data is outside the scope of Vulkan.

Valid Usage (Implicit)

- VUID-VkHdrMetadataEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`
- VUID-VkHdrMetadataEXT-pNext-pNext
  `pNext` **must** be `NULL`

The `VkXYColorEXT` structure is defined as:

```
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
    float    x;
    float    y;
} VkXYColorEXT;
```

- `x` is the x chromaticity coordinate.
- `y` is the y chromaticity coordinate.

Chromaticity coordinates are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors.

Chapter 33. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of *deferred operations* allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The VK_KHR_deferred_host_operations extension defines the infrastructure and usage patterns for *deferrable commands*, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands **must** not be deferred unless the deferral is specifically allowed by another extension which depends on VK_KHR_deferred_host_operations. This specification will refer to such extensions as *deferral extensions*.

33.1. Requesting Deferral

When an application requests an operation deferral, the implementation **may** defer the operation. When deferral is requested and the implementation defers any operation, the implementation **must** return VK_OPERATION_DEFERRED_KHR as the success code if no errors occurred. When deferral is requested, the implementation **should** defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation **must** return VK_OPERATION_NOT_DEFERRED_KHR as the success code if no errors occurred.

A deferred operation is created *complete* with an initial result value of VK_SUCCESS. The deferred operation becomes *pending* when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes *complete* when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are *joined* by an application thread, using vkDeferredOperationJoinKHR. Applications **can** join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application **can** query the status of a VkDeferredOperationKHR using the vkGetDeferredOperationMaxConcurrencyKHR or vkGetDeferredOperationResultKHR commands.

Parameters to the command requesting a deferred operation **may** be accessed by the implementation at any time until the deferred operation enters the complete state. The application **must** obey the following rules while a deferred operation is pending:

- Externally synchronized parameters **must** not be accessed.
- Pointer parameters **must** not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which **may** be read by the command **must** not be modified.
- The contents of pointer parameters which **may** be written by the command **must** not be read.
- Vulkan object parameters **must** not be passed as externally synchronized parameters to any other command.

When the deferred operation is complete, the application **should** call vkGetDeferredOperationResultKHR to obtain the VkResult indicating success or failure of the operation. The VkResult value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

When a deferral is requested for a command, the implementation **may** perform memory management operations on the allocator supplied to vkCreateDeferredOperationKHR for the deferred operation object, as described in the Memory Allocation chapter. Such allocations **must** occur on the thread which requests deferral.

If an allocator was supplied for the deferred command at the time of the deferral request, then the implementation **may** perform memory management operations on this allocator during the execution of vkDeferredOperationJoinKHR. These operations **may** occur concurrently and **may** be performed by any joined thread. The application **must** ensure that the supplied allocator is able to operate correctly under these conditions.

33.2. Deferred Host Operations API

The VkDeferredOperationKHR handle is defined as:

```
// Provided by VK_KHR_deferred_host_operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```
// Provided by VK_KHR_deferred_host_operations
VkResult vkCreateDeferredOperationKHR(
    VkDevice                                    device,
    const VkAllocationCallbacks*                pAllocator,
    VkDeferredOperationKHR*                     pDeferredOperation);
```

- `device` is the device which owns `operation`.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDeferredOperation` is a pointer to a handle in which the created VkDeferredOperationKHR is returned.

Valid Usage (Implicit)

- VUID-vkCreateDeferredOperationKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateDeferredOperationKHR-pAllocator-parameter

If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter
`pDeferredOperation` **must** be a valid pointer to a VkDeferredOperationKHR handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

To assign a thread to a deferred operation, call:

```
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      operation);
```

- `device` is the device which owns `operation`.
- `operation` is the deferred operation that the calling thread should work on.

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of `VK_SUCCESS` indicates that `operation` is complete. The application **should** use vkGetDeferredOperationResultKHR to retrieve the result of `operation`.
- A return value of `VK_THREAD_DONE_KHR` indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to vkDeferredOperationJoinKHR are not necessary and will simply harm performance. This situation **may** occur when other threads executing vkDeferredOperationJoinKHR are about to complete `operation`, and the implementation is unable to partition the workload any further.
- A return value of `VK_THREAD_IDLE_KHR` indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation **may** occur if the operation encounters a temporary reduction in parallelism. By returning `VK_THREAD_IDLE_KHR`, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to vkDeferredOperationJoinKHR **can** be beneficial. In the meantime, the application **can** perform other work on the calling thread.

Implementations **must** guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked vkDeferredOperationJoinKHR on a given operation, that thread

must execute the operation to completion and return VK_SUCCESS.

2. If multiple threads have concurrently invoked vkDeferredOperationJoinKHR on the same operation, then at least one of them **must** complete the operation and return VK_SUCCESS.

Valid Usage (Implicit)

- VUID-vkDeferredOperationJoinKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkDeferredOperationJoinKHR-operation-parameter
  operation **must** be a valid VkDeferredOperationKHR handle
- VUID-vkDeferredOperationJoinKHR-operation-parent
  operation **must** have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_THREAD_DONE_KHR
- VK_THREAD_IDLE_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

When a deferred operation is completed, the application **can** destroy the tracking object by calling:

```
// Provided by VK_KHR_deferred_host_operations
void vkDestroyDeferredOperationKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      operation,
    const VkAllocationCallbacks*                pAllocator);
```

- device is the device which owns operation.
- operation is the completed operation to be destroyed.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyDeferredOperationKHR-operation-03434
  If VkAllocationCallbacks were provided when operation was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDeferredOperationKHR-operation-03435

If no VkAllocationCallbacks were provided when operation was created, pAllocator **must** be NULL

- VUID-vkDestroyDeferredOperationKHR-operation-03436
  operation **must** be completed

Valid Usage (Implicit)

- VUID-vkDestroyDeferredOperationKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkDestroyDeferredOperationKHR-operation-parameter
  If operation is not VK_NULL_HANDLE, operation **must** be a valid VkDeferredOperationKHR handle
- VUID-vkDestroyDeferredOperationKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyDeferredOperationKHR-operation-parent
  If operation is a valid handle, it **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to operation **must** be externally synchronized

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      operation);
```

- device is the device which owns operation.
- operation is the deferred operation to be queried.

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads. Applications **can** join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins **may** return VK_THREAD_DONE_KHR immediately, performing no useful work.

If operation is complete, vkGetDeferredOperationMaxConcurrencyKHR returns zero.

If operation is currently joined to any threads, the value returned by this command **may**

immediately be out of date.

If `operation` is pending, implementations **must** not return zero unless at least one thread is currently executing vkDeferredOperationJoinKHR on `operation`. If there are such threads, the implementation **should** return an estimate of the number of additional threads which it could profitably use.

Implementations **may** return 2^{32}-1 to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations **may** return values larger than the maximum concurrency available on the host CPU. In these situations, an application **should** clamp the return value rather than oversubscribing the machine.

NOTE The recommended usage pattern for applications is to query this value once, after deferral, and schedule no more than the specified number of threads to join the operation. Each time a joined thread receives `VK_THREAD_IDLE_KHR`, the application should schedule an additional join at some point in the future, but is not required to do so.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter
  `operation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent
  `operation` **must** have been created, allocated, or retrieved from `device`

The `vkGetDeferredOperationResultKHR` function is defined as:

```
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      operation);
```

- `device` is the device which owns `operation`.
- `operation` is the operation whose deferred result is being queried.

If no command has been deferred on `operation`, `vkGetDeferredOperationResultKHR` returns `VK_SUCCESS`.

If the deferred operation is pending, `vkGetDeferredOperationResultKHR` returns `VK_NOT_READY`.

If the deferred operation is complete, it returns the appropriate return value from the original command. This value **must** be one of the VkResult values which could have been returned by the original command if the operation had not been deferred.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationResultKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeferredOperationResultKHR-operation-parameter
  `operation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkGetDeferredOperationResultKHR-operation-parent
  `operation` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_NOT_READY`

Failure

None

Chapter 34. Acceleration Structures

34.1. Acceleration Structures

Acceleration structures are data structures used by the implementation to efficiently manage scene geometry as it is traversed during a ray tracing query. The application is responsible for managing acceleration structure objects (see Acceleration Structures), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, *top level acceleration structures* and *bottom level acceleration structures*.

An acceleration structure is considered to be constructed if an acceleration structure build command or copy command has been executed with the given acceleration structure as the destination.

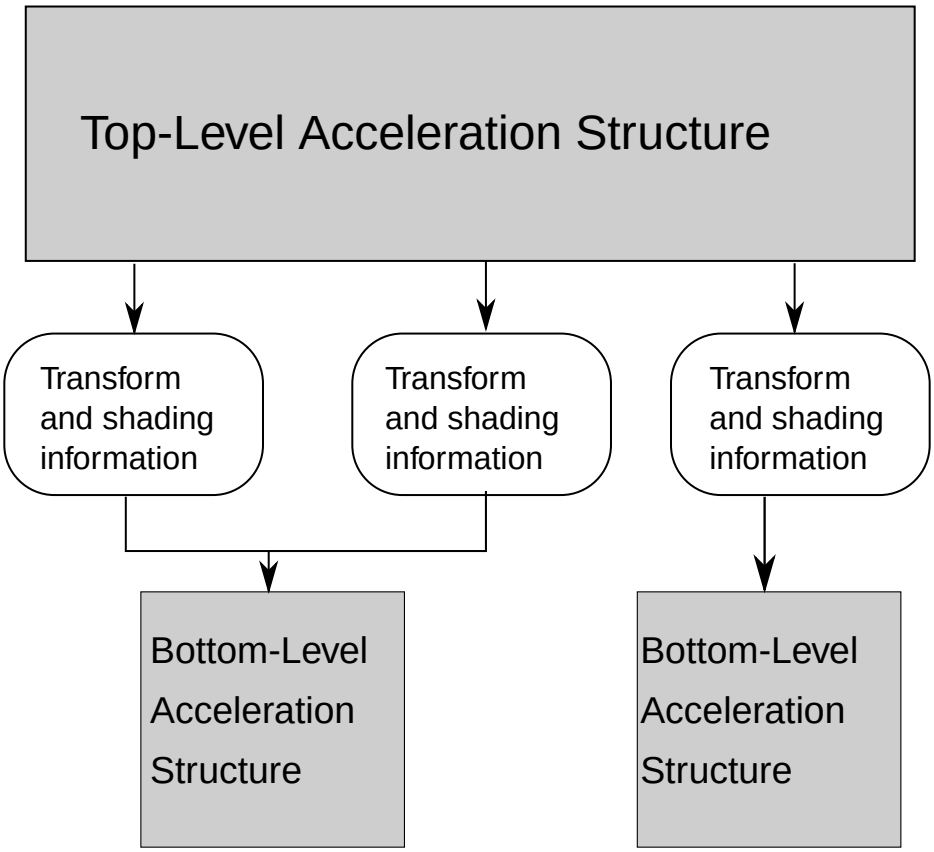

Figure 22. Acceleration Structure

Caption

The diagram shows the relationship between top and bottom level acceleration structures.

34.1.1. Geometry

Geometries refer to a triangle or axis-aligned bounding box.

34.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.

The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects **must** be valid when the top level acceleration structure is accessed.

34.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

34.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A *build* operation is used to construct an acceleration structure.
- An *update* operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description **must** exactly match the one from the original build.

More precisely, the application **must** not use an update operation to do any of the following:

- Change primitives or instances from *active* to *inactive*, or vice versa (as defined in Inactive Primitives and Instances).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

If the original acceleration structure was built using opacity micromaps and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT` was set in `flags`, the application **must** provide the corresponding micromap information to the update operation. The application is prohibited from changing anything other than the specific opacity values assigned to the triangles.

More precisely, the application **must** not use an update operation to do any of the following:

- Remove micromaps or VkOpacityMicromapSpecialIndexEXT values from a geometry which previously had them, or vice versa.
- Change between use of VkOpacityMicromapSpecialIndexEXT values and explicit micro-map

triangles.

- Change the subdivision level or format of the micromap triangle associated with any acceleration-structure triangle.

If the original acceleration structure was built using opacity micromaps and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT` was set in `flags`, the application **must** provide a micromap to the update operation.

If the original acceleration structure was built using opacity micromaps and neither opacity micromap update flag is set the application **must** provide the original micromap to the update operation.

34.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal *inactive* primitives or instances.

An *inactive* triangle is one for which the first (X) component of any vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An *inactive* instance is one whose acceleration structure reference is `0`.

An *inactive* AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, “NaN” refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.

An inactive object is considered invisible to all rays, and **should** not be represented in the acceleration structure. Implementations **should** ensure that the presence of inactive objects does not seriously degrade traversal performance.

Inactive objects are counted in the auto-generated index sequences which are provided to shaders via `InstanceId` and `PrimitiveId` SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications **must** not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.

34.1.6. Degenerate Primitives and Instances

Degenerate primitives and instances behave differently to inactive primitives and instances, and are defined as:

- triangles that have one or more vertices whose respective (X), (Y), (Z) components are identical, or have three vertices that have at least two of the (X), (Y), or (Z) components identical, therefore forming a line or point. Degenerate triangles do not generate any intersections.

- AABBs whose `minX=maxX`, `minY=maxY`, and `minZ=maxZ`. Degenerate AABBs **may** invoke the intersection shader.
- instances that reference bottom level acceleration structures that contain no active primitives. When building an acceleration structure, implementations **should** treat degenerate instances as though they are a point at the instance origin, specified by VkAccelerationStructureInstanceKHR::`transform`.

Unlike *inactive* primitives and instances, *degenerate* primitives and instances **may** transition from the degenerate to the non-degenerate state, or vice versa, when performing an acceleration structure update.

If an acceleration structure is built without `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in VkAccelerationStructureBuildGeometryInfoKHR::`flags` , degenerate primitives **may** be discarded. Primitives that are defined with the same index value for more than one vertex **can** always be discarded.

34.1.7. Building Acceleration Structures

To build acceleration structures call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresKHR(
    VkCommandBuffer                                  commandBuffer,
    uint32_t                                         infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that **must** be provided.
- `pInfos` is a pointer to an array of `infoCount` VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of VkAccelerationStructureBuildRangeInfoKHR structures. Each `ppBuildRangeInfos`[i] is a pointer to an array of `pInfos`[i].`geometryCount` VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos`[i].

The `vkCmdBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

NOTE

This means that an application **cannot** build a top-level acceleration structure in the same vkCmdBuildAccelerationStructuresKHR call as the associated bottom-level or instance acceleration structures are being built. There also **cannot** be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the VkAccelerationStructureBuildGeometryInfoKHR::scratchData buffer device addresses **must** be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of (VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR | VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR). Accesses to each VkAccelerationStructureBuildGeometryInfoKHR::srcAccelerationStructure and VkAccelerationStructureBuildGeometryInfoKHR::dstAccelerationStructure **must** be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR or VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, as appropriate.

Accesses to other input buffers as identified by any used values of VkAccelerationStructureGeometryTrianglesDataKHR::vertexData, VkAccelerationStructureGeometryTrianglesDataKHR::indexData, VkAccelerationStructureGeometryTrianglesDataKHR::transformData, VkAccelerationStructureGeometryAabbsDataKHR::data, and VkAccelerationStructureGeometryInstancesDataKHR::data **must** be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

Valid Usage

- VUID-vkCmdBuildAccelerationStructuresKHR-accelerationStructure-08923
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature **must** be enabled
- VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628
  The mode member of each element of pInfos **must** be a valid VkBuildAccelerationStructureModeKHR value
- VUID-vkCmdBuildAccelerationStructuresKHR-srcAccelerationStructure-04629
  If the srcAccelerationStructure member of any element of pInfos is not VK_NULL_HANDLE, the srcAccelerationStructure member **must** be a valid VkAccelerationStructureKHR handle
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-04630
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member **must** not be VK_NULL_HANDLE
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03403
  The srcAccelerationStructure member of any element of pInfos **must** not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos
- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03698
  The dstAccelerationStructure member of any element of pInfos **must** not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos
- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03800

The dstAccelerationStructure member of any element of pInfos **must** be a valid VkAccelerationStructureKHR handle

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03699
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, its dstAccelerationStructure member **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03700
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR, its dstAccelerationStructure member **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03663
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, inactive primitives in its srcAccelerationStructure member **must** not be made active
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03664
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member **must** not be made inactive
- VUID-vkCmdBuildAccelerationStructuresKHR-None-03407
  The dstAccelerationStructure member of any element of pInfos **must** not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos
- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03701
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03702
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the dstAccelerationStructure member of any other element of pInfos, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03703
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03704
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the scratchData

member of any other element of pInfos, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03705
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03706
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03667
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member **must** have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03668
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members **must** either be the same VkAccelerationStructureKHR, or not have any memory aliasing
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03758
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03759
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03760
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03761
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03762
  For each element of pInfos, if its mode member is

VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member **must** have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03763
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03764
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03765
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.indexType member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03766
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it **must** be NULL
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03767
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was not NULL when srcAccelerationStructure was last built, then it **must** not be NULL
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03768
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index

referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-primitiveCount-03769
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, the `primitiveCount` member of its corresponding `VkAccelerationStructureBuildRangeInfoKHR` structure **must** have the same value which was specified when `srcAccelerationStructure` was last built
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03801
  For each element of `pInfos`[i].`pGeometries` or `pInfos`[i].`ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppBuildRangeInfos`[i][j].`primitiveCount` **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR ::`maxInstanceCount`
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03707
  For each element of `pInfos`, the `buffer` used to create its `dstAccelerationStructure` member **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03708
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the `buffer` used to create its `srcAccelerationStructure` member **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03709
  For each element of `pInfos`, the `buffer` used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03671
  If `pInfos`[i].`mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos`[i].`scratchData.deviceAddress` and `pInfos`[i].`scratchData.deviceAddress` + N - 1 **must** be in the buffer device address range of the same buffer, where N is given by the `buildScratchSize` member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03672
  If `pInfos`[i].`mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos`[i].`scratchData.deviceAddress` and `pInfos`[i].`scratchData.deviceAddress` + N - 1 **must** be in the buffer device address range of the same buffer, where N is given by the `updateScratchSize` member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count
- VUID-vkCmdBuildAccelerationStructuresKHR-geometry-03673
  The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data`

members of all pInfos[i].pGeometries and pInfos[i].ppGeometries are queried **must** have been created with the VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR usage flag

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03674
  The buffer from which the buffer device address pInfos[i].scratchData.deviceAddress is queried **must** have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03802
  For each element of pInfos, its scratchData.deviceAddress member **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03803
  For each element of pInfos, if scratchData.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03710
  For each element of pInfos, its scratchData.deviceAddress member **must** be a multiple of VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03804
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03805
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.vertexData.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03711
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress **must** be aligned to the size in bytes of the smallest component of the format in vertexFormat
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03806
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03807
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, if geometry.triangles.indexData.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03712
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, and with geometry.triangles.indexType not equal to

VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress **must** be aligned to the size in bytes of the type in indexType

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03808
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03809
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, if geometry.aabbs.data.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03714
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress **must** be aligned to 8 bytes
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03715
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_FALSE, geometry.instances.data.deviceAddress **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03716
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, geometry.instances.data.deviceAddress **must** be aligned to 8 bytes
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03717
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, each element of geometry.instances.data.deviceAddress in device memory **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03813
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, geometry.instances.data.deviceAddress **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03814
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.instances.data.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-06707
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each VkAccelerationStructureInstanceKHR ::accelerationStructureReference value in geometry.instances.data.deviceAddress **must** be a valid device address containing a value obtained from vkGetAccelerationStructureDeviceAddressKHR or 0
- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-09547
  commandBuffer **must** not be a protected command buffer
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-10126
  For each pInfos[i], dstAccelerationStructure **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::size greater than or equal to either:
  - the memory size required by the build operation, as returned by vkGetAccelerationStructureBuildSizesKHR with pBuildInfo = pInfos[i] and with each element of the pMaxPrimitiveCounts array greater than or equal to the equivalent ppBuildRangeInfos[i][j].primitiveCount values for j in [0,pInfos[i].geometryCount) or,
  - the result of querying the corresponding VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, if updating a compacted acceleration structure
- VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676
  Each element of ppBuildRangeInfos[i] **must** be a valid pointer to an array of pInfos [i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures

Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-parameter
  pInfos **must** be a valid pointer to an array of infoCount valid VkAccelerationStructureBuildGeometryInfoKHR structures
- VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter
  ppBuildRangeInfos **must** be a valid pointer to an array of infoCount VkAccelerationStructureBuildRangeInfoKHR structures
- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support compute operations

- VUID-vkCmdBuildAccelerationStructuresKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdBuildAccelerationStructuresKHR-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdBuildAccelerationStructuresKHR-infoCount-arraylength
  `infoCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

To build acceleration structures with some parameters sourced on the device call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer                                 commandBuffer,
    uint32_t                                        infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress*                          pIndirectDeviceAddresses,
    const uint32_t*                                 pIndirectStrides,
    const uint32_t* const*                          ppMaxPrimitiveCounts);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build.
- `pInfos` is a pointer to an array of `infoCount` VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
- `pIndirectDeviceAddresses` is a pointer to an array of `infoCount` buffer device addresses which point to `pInfos`[i].`geometryCount` VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos`[i].
- `pIndirectStrides` is a pointer to an array of `infoCount` byte strides between elements of `pIndirectDeviceAddresses`.
- `ppMaxPrimitiveCounts` is a pointer to an array of `infoCount` pointers to arrays of `pInfos`

[i].geometryCount values indicating the maximum number of primitives that will be built by this command for each geometry.

Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers **must** be synchronized as with vkCmdBuildAccelerationStructuresKHR.

Accesses to any element of pIndirectDeviceAddresses **must** be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_INDIRECT_COMMAND_READ_BIT.

Valid Usage

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureIndirectBuild feature **must** be enabled
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-mode-04628
  The mode member of each element of pInfos **must** be a valid VkBuildAccelerationStructureModeKHR value
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-srcAccelerationStructure-04629
  If the srcAccelerationStructure member of any element of pInfos is not VK_NULL_HANDLE, the srcAccelerationStructure member **must** be a valid VkAccelerationStructureKHR handle
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-04630
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member **must** not be VK_NULL_HANDLE
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03403
  The srcAccelerationStructure member of any element of pInfos **must** not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03698
  The dstAccelerationStructure member of any element of pInfos **must** not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03800
  The dstAccelerationStructure member of any element of pInfos **must** be a valid VkAccelerationStructureKHR handle
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03699
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, its dstAccelerationStructure member **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03700
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR, its dstAccelerationStructure member **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03663
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, inactive primitives in its srcAccelerationStructure member **must** not be made active
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03664
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member **must** not be made inactive
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-None-03407
  The dstAccelerationStructure member of any element of pInfos **must** not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03701
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03702
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the dstAccelerationStructure member of any other element of pInfos, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03703
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03704
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03705
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03706

The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03667
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member **must** have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03668
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members **must** either be the same VkAccelerationStructureKHR, or not have any memory aliasing
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03758
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03759
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03760
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03761
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03762
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03763
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its

geometry.triangles.vertexFormat member **must** have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03764
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03765
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.indexType member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03766
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it **must** be NULL
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03767
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was not NULL when srcAccelerationStructure was last built, then it **must** not be NULL
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03768
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index referenced **must** be the same as the corresponding index value when srcAccelerationStructure was last built
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-primitiveCount-03769
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, the primitiveCount member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure **must** have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03801
  For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppMaxPrimitiveCounts[i][j] **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03707
  For each element of pInfos, the buffer used to create its dstAccelerationStructure member **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03708
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its srcAccelerationStructure member **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03709
  For each element of pInfos, the buffer used to create each acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR **must** be bound to device memory
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03671
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR, all addresses between pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 **must** be in the buffer device address range of the same buffer, where N is given by the buildScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03672
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, all addresses between pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 **must** be in the buffer device address range of the same buffer, where N is given by the updateScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-geometry-03673
  The buffers from which the buffer device addresses for all of the geometry.triangles.vertexData, geometry.triangles.indexData, geometry.triangles.transformData, geometry.aabbs.data, and geometry.instances.data members of all pInfos[i].pGeometries and pInfos[i].ppGeometries are queried **must** have been created with the VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR usage flag
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03674
  The buffer from which the buffer device address pInfos[i].scratchData.deviceAddress is queried **must** have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03802
  For each element of pInfos, its scratchData.deviceAddress member **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03803

For each element of pInfos, if scratchData.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03710
  For each element of pInfos, its scratchData.deviceAddress member **must** be a multiple of VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03804
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03805
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.vertexData.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03711
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress **must** be aligned to the size in bytes of the smallest component of the format in vertexFormat
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03806
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03807
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, if geometry.triangles.indexData.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03712
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, and with geometry.triangles.indexType not equal to VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress **must** be aligned to the size in bytes of the type in indexType
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03808
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03809
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a

single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03810
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03811
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03812
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, if geometry.aabbs.data.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03714
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress **must** be aligned to 8 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03715
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_FALSE, geometry.instances.data.deviceAddress **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03716
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, geometry.instances.data.deviceAddress **must** be aligned to 8 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03717
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, each element of geometry.instances.data.deviceAddress in device memory **must** be aligned to 16 bytes
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03813
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, geometry.instances.data.deviceAddress **must** be a valid device address obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03814
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.instances.data.deviceAddress is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-06707
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each VkAccelerationStructureInstanceKHR ::accelerationStructureReference value in geometry.instances.data.deviceAddress **must** be a valid device address containing a value obtained from vkGetAccelerationStructureDeviceAddressKHR or 0

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-09547
  `commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03645
  For any element of `pIndirectDeviceAddresses`, if the buffer from which it was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03646
  For any element of `pIndirectDeviceAddresses`[i], all device addresses between `pIndirectDeviceAddresses`[i] and `pIndirectDeviceAddresses`[i] + (`pInfos`[i].`geometryCount` × `pIndirectStrides`[i]) - 1 **must** be in the buffer device address range of the same buffer
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03647
  For any element of `pIndirectDeviceAddresses`, the buffer from which it was queried **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03648
  Each element of `pIndirectDeviceAddresses` **must** be a multiple of `4`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-03787
  Each element of `pIndirectStrides` **must** be a multiple of `4`
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03651
  Each VkAccelerationStructureBuildRangeInfoKHR structure referenced by any element of `pIndirectDeviceAddresses` **must** be a valid VkAccelerationStructureBuildRangeInfoKHR structure
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03652
  `pInfos`[i].`dstAccelerationStructure` **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::`size` greater than or equal to the memory size required by the build operation, as returned by vkGetAccelerationStructureBuildSizesKHR with `pBuildInfo` = `pInfos`[i] and `pMaxPrimitiveCounts` = `ppMaxPrimitiveCounts`[i]
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-03653
  Each `ppMaxPrimitiveCounts`[i][j] **must** be greater than or equal to the `primitiveCount` value specified by the VkAccelerationStructureBuildRangeInfoKHR structure located at `pIndirectDeviceAddresses`[i] + (`j` × `pIndirectStrides`[i])

Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-parameter
  `pInfos` **must** be a valid pointer to an array of `infoCount` valid VkAccelerationStructureBuildGeometryInfoKHR structures
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
  `pIndirectDeviceAddresses` **must** be a valid pointer to an array of `infoCount` VkDeviceAddress values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
  `pIndirectStrides` **must** be a valid pointer to an array of `infoCount` `uint32_t` values
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
  `ppMaxPrimitiveCounts` **must** be a valid pointer to an array of `infoCount` `uint32_t` values
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-infoCount-arraylength
  `infoCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

The `VkAccelerationStructureBuildGeometryInfoKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType                                    sType;
    const void*                                        pNext;
    VkAccelerationStructureTypeKHR                     type;
    VkBuildAccelerationStructureFlagsKHR               flags;
    VkBuildAccelerationStructureModeKHR                mode;
    VkAccelerationStructureKHR                         srcAccelerationStructure;
    VkAccelerationStructureKHR                         dstAccelerationStructure;
    uint32_t                                           geometryCount;
    const VkAccelerationStructureGeometryKHR*          pGeometries;
    const VkAccelerationStructureGeometryKHR* const*   ppGeometries;
    VkDeviceOrHostAddressKHR                           scratchData;
} VkAccelerationStructureBuildGeometryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is a VkAccelerationStructureTypeKHR value specifying the type of acceleration structure being built.
- `flags` is a bitmask of VkBuildAccelerationStructureFlagBitsKHR specifying additional parameters of the acceleration structure.
- `mode` is a VkBuildAccelerationStructureModeKHR value specifying the type of operation to perform.
- `srcAccelerationStructure` is a pointer to an existing acceleration structure that is to be used to update the `dstAccelerationStructure` acceleration structure when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`.
- `dstAccelerationStructure` is a pointer to the target acceleration structure for the build.
- `geometryCount` specifies the number of geometries that will be built into `dstAccelerationStructure`.
- `pGeometries` is a pointer to an array of VkAccelerationStructureGeometryKHR structures.
- `ppGeometries` is a pointer to an array of pointers to VkAccelerationStructureGeometryKHR structures.
- `scratchData` is the device or host address to memory that will be used as scratch memory for the build.

Only one of `pGeometries` or `ppGeometries` **can** be a valid pointer, the other **must** be `NULL`. Each element of the non-`NULL` array describes the data used to build each acceleration structure geometry.

The index of each element of the `pGeometries` or `ppGeometries` members of VkAccelerationStructureBuildGeometryInfoKHR is used as the *geometry index* during ray traversal. The geometry index is available in ray shaders via the `RayGeometryIndexKHR` built-in, and is used to determine hit and intersection shaders executed during traversal. The geometry index is available to ray queries via the `OpRayQueryGetIntersectionGeometryIndexKHR` instruction.

Members srcAccelerationStructure and dstAccelerationStructure **may** be the same or different for an update operation (when mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR). If they are the same, the update happens in-place. Otherwise, the target acceleration structure is updated and the source is not modified.

Valid Usage

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654
  type **must** not be VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788
  If geometryCount is not 0, exactly one of pGeometries or ppGeometries **must** be a valid pointer, the other **must** be NULL
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789
  If type is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, the geometryType member of elements of either pGeometries or ppGeometries **must** be VK_GEOMETRY_TYPE_INSTANCES_KHR
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790
  If type is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, geometryCount **must** be 1
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR the geometryType member of elements of either pGeometries or ppGeometries **must** not be VK_GEOMETRY_TYPE_INSTANCES_KHR
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR then the geometryType member of each geometry in either pGeometries or ppGeometries **must** be the same
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR then geometryCount **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxGeometryCount
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03794
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR and the geometryType member of either pGeometries or ppGeometries is VK_GEOMETRY_TYPE_AABBS_KHR, the total number of AABBs in all geometries **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03795
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR and the geometryType member of either pGeometries or ppGeometries is VK_GEOMETRY_TYPE_TRIANGLES_KHR, the total number of triangles in all geometries **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-03796
  If flags has the VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR bit set, then it **must** not have the VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR bit set
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-07334
  If flags has the VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT bit

set then it **must** not have the `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT` bit set

Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-parameter
  `type` **must** be a valid VkAccelerationStructureTypeKHR value
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-parameter
  `flags` **must** be a valid combination of VkBuildAccelerationStructureFlagBitsKHR values
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-parameter
  If `geometryCount` is not `0`, and `pGeometries` is not `NULL`, `pGeometries` **must** be a valid pointer to an array of `geometryCount` valid VkAccelerationStructureGeometryKHR structures
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-ppGeometries-parameter
  If `geometryCount` is not `0`, and `ppGeometries` is not `NULL`, `ppGeometries` **must** be a valid pointer to an array of `geometryCount` valid pointers to valid VkAccelerationStructureGeometryKHR structures
- VUID-VkAccelerationStructureBuildGeometryInfoKHR-commonparent
  Both of `dstAccelerationStructure`, and `srcAccelerationStructure` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

The `VkBuildAccelerationStructureModeKHR` enumeration is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```

- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR` specifies that the destination acceleration structure will be built using the specified geometries.
- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The `VkDeviceOrHostAddressKHR` union is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress    deviceAddress;
    void*              hostAddress;
} VkDeviceOrHostAddressKHR;
```

- `deviceAddress` is a buffer device address as returned by the vkGetBufferDeviceAddressKHR command.
- `hostAddress` is a host memory address.

The `VkDeviceOrHostAddressConstKHR` union is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress    deviceAddress;
    const void*        hostAddress;
} VkDeviceOrHostAddressConstKHR;
```

- `deviceAddress` is a buffer device address as returned by the vkGetBufferDeviceAddressKHR command.
- `hostAddress` is a const host memory address.

The `VkAccelerationStructureGeometryKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType                            sType;
    const void*                                pNext;
    VkGeometryTypeKHR                          geometryType;
    VkAccelerationStructureGeometryDataKHR     geometry;
    VkGeometryFlagsKHR                         flags;
} VkAccelerationStructureGeometryKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `geometryType` describes which type of geometry this `VkAccelerationStructureGeometryKHR` refers to.
- `geometry` is a VkAccelerationStructureGeometryDataKHR union describing the geometry data for the relevant geometry type.
- `flags` is a bitmask of VkGeometryFlagBitsKHR values describing additional properties of how the geometry should be built.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR`
- VUID-VkAccelerationStructureGeometryKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter
  `geometryType` **must** be a valid VkGeometryTypeKHR value
- VUID-VkAccelerationStructureGeometryKHR-triangles-parameter
  If `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `triangles` member of `geometry` **must** be a valid VkAccelerationStructureGeometryTrianglesDataKHR structure
- VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter
  If `geometryType` is `VK_GEOMETRY_TYPE_AABBS_KHR`, the `aabbs` member of `geometry` **must** be a valid VkAccelerationStructureGeometryAabbsDataKHR structure
- VUID-VkAccelerationStructureGeometryKHR-instances-parameter
  If `geometryType` is `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the `instances` member of `geometry` **must** be a valid VkAccelerationStructureGeometryInstancesDataKHR structure
- VUID-VkAccelerationStructureGeometryKHR-flags-parameter
  `flags` **must** be a valid combination of VkGeometryFlagBitsKHR values

The `VkAccelerationStructureGeometryDataKHR` union is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef union VkAccelerationStructureGeometryDataKHR {
    VkAccelerationStructureGeometryTrianglesDataKHR    triangles;
    VkAccelerationStructureGeometryAabbsDataKHR        aabbs;
    VkAccelerationStructureGeometryInstancesDataKHR    instances;
} VkAccelerationStructureGeometryDataKHR;
```

- `triangles` is a VkAccelerationStructureGeometryTrianglesDataKHR structure.
- `aabbs` is a VkAccelerationStructureGeometryAabbsDataKHR structure.
- `instances` is a VkAccelerationStructureGeometryInstancesDataKHR structure.

The `VkAccelerationStructureGeometryTrianglesDataKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryTrianglesDataKHR {
    VkStructureType                  sType;
    const void*                      pNext;
    VkFormat                         vertexFormat;
    VkDeviceOrHostAddressConstKHR    vertexData;
    VkDeviceSize                     vertexStride;
    uint32_t                         maxVertex;
    VkIndexType                      indexType;
    VkDeviceOrHostAddressConstKHR    indexData;
    VkDeviceOrHostAddressConstKHR    transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexFormat` is the VkFormat of each vertex element.
- `vertexData` is a device or host address to memory containing vertex data for this geometry.
- `maxVertex` is the number of vertices in `vertexData` minus one.
- `vertexStride` is the stride in bytes between each vertex.
- `indexType` is the VkIndexType of each index element.
- `indexData` is a device or host address to memory containing index data for this geometry.
- `transformData` is a device or host address to memory containing an optional reference to a VkTransformMatrixKHR structure describing a transformation from the space in which the vertices in this geometry are described to the space in which the acceleration structure is defined.

NOTE Unlike the stride for vertex buffers in VkVertexInputBindingDescription for graphics pipelines which must not exceed `maxVertexInputBindingStride`, `vertexStride` for acceleration structure geometry is instead restricted to being a 32-bit value.

Valid Usage

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735
  `vertexStride` **must** be a multiple of the size in bytes of the smallest component of `vertexFormat`
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819
  `vertexStride` **must** be less than or equal to 2^{32}-1
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797
  The format features of `vertexFormat` **must** contain `VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR`
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03798

indexType **must** be VK_INDEX_TYPE_UINT16, VK_INDEX_TYPE_UINT32, or VK_INDEX_TYPE_NONE_KHR

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkAccelerationStructureTrianglesOpacityMicromapEXT
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-unique
  The sType value of each struct in the pNext chain **must** be unique
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter
  vertexFormat **must** be a valid VkFormat value
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter
  indexType **must** be a valid VkIndexType value

The VkAccelerationStructureTrianglesOpacityMicromapEXT structure is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkAccelerationStructureTrianglesOpacityMicromapEXT {
    VkStructureType                    sType;
    void*                              pNext;
    VkIndexType                        indexType;
    VkDeviceOrHostAddressConstKHR      indexBuffer;
    VkDeviceSize                       indexStride;
    uint32_t                           baseTriangle;
    uint32_t                           usageCountsCount;
    const VkMicromapUsageEXT*          pUsageCounts;
    const VkMicromapUsageEXT* const*   ppUsageCounts;
    VkMicromapEXT                      micromap;
} VkAccelerationStructureTrianglesOpacityMicromapEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- indexType is the type of triangle indices used when indexing this micromap
- indexBuffer is the address containing the triangle indices
- indexStride is the byte stride between triangle indices
- baseTriangle is the base value added to the non-negative triangle indices
- usageCountsCount specifies the number of usage counts structures that will be used to determine the size of this micromap.
- pUsageCounts is a pointer to an array of VkMicromapUsageEXT structures.

- `ppUsageCounts` is a pointer to an array of pointers to VkMicromapUsageEXT structures.
- `micromap` is the handle to the micromap object to include in this geometry

If `VkAccelerationStructureTrianglesOpacityMicromapEXT` is included in the `pNext` chain of a VkAccelerationStructureGeometryTrianglesDataKHR structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from `indexBuffer` using `indexType` and `indexStride`. If that value is the unsigned cast of one of the values from VkOpacityMicromapSpecialIndexEXT then that triangle behaves as described for that special value in Ray Opacity Micromap. Otherwise that triangle uses the opacity micromap information from `micromap` at that index plus `baseTriangle`.

Only one of `pUsageCounts` or `ppUsageCounts` **can** be a valid pointer, the other **must** be `NULL`. The elements of the non-`NULL` array describe the total count used to build this geometry. For a given `format` and `subdivisionLevel` the number of triangles in this geometry matching those values after indirection and special index handling **must** be equal to the sum of matching `count` provided.

If `micromap` is VK_NULL_HANDLE, then every value read from `indexBuffer` **must** be one of the values in `VkOpacityMicromapSpecialIndexEXT`.

Valid Usage

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-07335
  Only one of `pUsageCounts` or `ppUsageCounts` **can** be a valid pointer, the other **must** be `NULL`

Valid Usage (Implicit)

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_OPACITY_MICROMAP_EXT`
- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-indexType-parameter
  `indexType` **must** be a valid VkIndexType value
- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-parameter
  If `usageCountsCount` is not `0`, and `pUsageCounts` is not `NULL`, `pUsageCounts` **must** be a valid pointer to an array of `usageCountsCount` VkMicromapUsageEXT structures
- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-ppUsageCounts-parameter
  If `usageCountsCount` is not `0`, and `ppUsageCounts` is not `NULL`, `ppUsageCounts` **must** be a valid pointer to an array of `usageCountsCount` valid pointers to VkMicromapUsageEXT structures
- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-micromap-parameter
  If `micromap` is not VK_NULL_HANDLE, `micromap` **must** be a valid VkMicromapEXT handle

The `VkOpacityMicromapSpecialIndexEXT` enumeration is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapSpecialIndexEXT {
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT = -1,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT = -2,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT = -3,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT = -4,
} VkOpacityMicromapSpecialIndexEXT;
```

- VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT specifies that the entire triangle is fully transparent.
- VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT specifies that the entire triangle is fully opaque.
- VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT specifies that the entire triangle is unknown-transparent.
- VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT specifies that the entire triangle is unknown-opaque.

The VkTransformMatrixKHR structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkTransformMatrixKHR {
    float    matrix[3][4];
} VkTransformMatrixKHR;
```

- matrix is a 3x4 row-major affine transformation matrix.

Valid Usage

- VUID-VkTransformMatrixKHR-matrix-03799
  The first three columns of matrix **must** define an invertible 3x3 matrix

The VkAccelerationStructureGeometryAabbsDataKHR structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryAabbsDataKHR {
    VkStructureType                  sType;
    const void*                      pNext;
    VkDeviceOrHostAddressConstKHR    data;
    VkDeviceSize                     stride;
} VkAccelerationStructureGeometryAabbsDataKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.

- `data` is a device or host address to memory containing VkAabbPositionsKHR structures containing position data for each axis-aligned bounding box in the geometry.
- `stride` is the stride in bytes between each entry in `data`. The stride **must** be a multiple of `8`.

Valid Usage

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545
  `stride` **must** be a multiple of `8`
- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820
  `stride` **must** be less than or equal to 2^{32}-1

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR`
- VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext
  `pNext` **must** be `NULL`

The `VkAabbPositionsKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAabbPositionsKHR {
    float    minX;
    float    minY;
    float    minZ;
    float    maxX;
    float    maxY;
    float    maxZ;
} VkAabbPositionsKHR;
```

- `minX` is the x position of one opposing corner of a bounding box.
- `minY` is the y position of one opposing corner of a bounding box.
- `minZ` is the z position of one opposing corner of a bounding box.
- `maxX` is the x position of the other opposing corner of a bounding box.
- `maxY` is the y position of the other opposing corner of a bounding box.
- `maxZ` is the z position of the other opposing corner of a bounding box.

Valid Usage

- VUID-VkAabbPositionsKHR-minX-03546
  `minX` **must** be less than or equal to `maxX`
- VUID-VkAabbPositionsKHR-minY-03547

`minY` **must** be less than or equal to `maxY`

- VUID-VkAabbPositionsKHR-minZ-03548
  `minZ` **must** be less than or equal to `maxZ`

The `VkAccelerationStructureGeometryInstancesDataKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkBool32                        arrayOfPointers;
    VkDeviceOrHostAddressConstKHR   data;
} VkAccelerationStructureGeometryInstancesDataKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `arrayOfPointers` specifies whether `data` is used as an array of addresses or just an array.
- `data` is either the address of an array of device or host addresses referencing individual VkAccelerationStructureInstanceKHR structures if `arrayOfPointers` is `VK_TRUE`, or the address of an array of VkAccelerationStructureInstanceKHR structures. Addresses and VkAccelerationStructureInstanceKHR structures are tightly packed.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryInstancesDataKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR`
- VUID-VkAccelerationStructureGeometryInstancesDataKHR-pNext-pNext
  `pNext` **must** be `NULL`

Acceleration structure instances **can** be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances **can** point to the same bottom level acceleration structure.

An acceleration structure instance is defined by the structure:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR          transform;
    uint32_t                      instanceCustomIndex:24;
    uint32_t                      mask:8;
    uint32_t                      instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR    flags:8;
    uint64_t                      accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;
```

- `transform` is a VkTransformMatrixKHR structure describing a transformation to be applied to the acceleration structure.
- `instanceCustomIndex` is a 24-bit application-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.
- `mask` is an 8-bit visibility mask for the geometry. The instance **may** only be hit if `Cull Mask & instance.mask != 0`
- `instanceShaderBindingTableRecordOffset` is a 24-bit offset used in calculating the hit shader binding table index.
- `flags` is an 8-bit mask of VkGeometryInstanceFlagBitsKHR values to apply to this instance.
- `accelerationStructureReference` is either :
  - a device address containing the value obtained from vkGetAccelerationStructureDeviceAddressKHR (used by device operations which reference acceleration structures)
  - a VkAccelerationStructureKHR object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceCustomIndex` occupies the 24 least significant bits of that memory
  - `mask` occupies the 8 most significant bits of that memory
- `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceShaderBindingTableRecordOffset` occupies the 24 least significant bits of that memory
  - `flags` occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureInstanceKHR-flags-parameter
  `flags` **must** be a valid combination of VkGeometryInstanceFlagBitsKHR values

Possible values of `flags` in the instance modifying the behavior of that instance are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
  // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT = 0x00000010,
  // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT = 0x00000020,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR =
VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR,
} VkGeometryInstanceFlagBitsKHR;
```

- `VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR` disables face culling for this instance.
- `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` specifies that the facing determination for geometry in this instance is inverted. Because the facing is determined in object space, an instance transform does not change the winding, but a geometry transform does.
- `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` causes this instance to act as though `VK_GEOMETRY_OPAQUE_BIT_KHR` were specified on all geometries referenced by this instance. This behavior **can** be overridden by the SPIR-V `NoOpaqueKHR` ray flag.
- `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` causes this instance to act as though `VK_GEOMETRY_OPAQUE_BIT_KHR` were not specified on all geometries referenced by this instance. This behavior **can** be overridden by the SPIR-V `OpaqueKHR` ray flag.

`VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` and `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` **must** not be used in the same flag.

```
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryInstanceFlagsKHR;
```

`VkGeometryInstanceFlagsKHR` is a bitmask type for setting a mask of zero or more VkGeometryInstanceFlagBitsKHR.

`VkAccelerationStructureBuildRangeInfoKHR` is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
    uint32_t    primitiveCount;
    uint32_t    primitiveOffset;
    uint32_t    firstVertex;
    uint32_t    transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- `primitiveCount` defines the number of primitives for a corresponding acceleration structure geometry.
- `primitiveOffset` defines an offset in bytes into the memory where primitive data is defined.
- `firstVertex` is the index of the first vertex to build from for triangle geometry.
- `transformOffset` defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the VkGeometryTypeKHR used:

- For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `primitiveCount` is the number of triangles to be built, where each triangle is treated as 3 vertices.
  - If the geometry uses indices, `primitiveCount` × 3 indices are consumed from VkAccelerationStructureGeometryTrianglesDataKHR::`indexData`, starting at an offset of `primitiveOffset`. The value of `firstVertex` is added to the index values before fetching vertices.
  - If the geometry does not use indices, `primitiveCount` × 3 vertices are consumed from VkAccelerationStructureGeometryTrianglesDataKHR::`vertexData`, starting at an offset of `primitiveOffset` + VkAccelerationStructureGeometryTrianglesDataKHR::`vertexStride` × `firstVertex`.
  - If VkAccelerationStructureGeometryTrianglesDataKHR::`transformData` is not `NULL`, a single VkTransformMatrixKHR structure is consumed from VkAccelerationStructureGeometryTrianglesDataKHR::`transformData`, at an offset of `transformOffset`. This matrix describes a transformation from the space in which the vertices for all triangles in this geometry are described to the space in which the acceleration structure is defined.
- For geometries of type `VK_GEOMETRY_TYPE_AABBS_KHR`, `primitiveCount` is the number of axis-aligned bounding boxes. `primitiveCount` VkAabbPositionsKHR structures are consumed from VkAccelerationStructureGeometryAabbsDataKHR::`data`, starting at an offset of `primitiveOffset`.
- For geometries of type `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `primitiveCount` is the number of acceleration structures. `primitiveCount` VkAccelerationStructureInstanceKHR structures are consumed from VkAccelerationStructureGeometryInstancesDataKHR::`data`, starting at an offset of `primitiveOffset`.

Valid Usage

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03656

For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the geometry uses indices, the offset primitiveOffset from VkAccelerationStructureGeometryTrianglesDataKHR::indexData **must** be a multiple of the element size of VkAccelerationStructureGeometryTrianglesDataKHR::indexType

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03657
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the geometry does not use indices, the offset primitiveOffset from VkAccelerationStructureGeometryTrianglesDataKHR::vertexData **must** be a multiple of the component size of VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat
- VUID-VkAccelerationStructureBuildRangeInfoKHR-transformOffset-03658
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, the offset transformOffset from VkAccelerationStructureGeometryTrianglesDataKHR::transformData **must** be a multiple of 16
- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659
  For geometries of type VK_GEOMETRY_TYPE_AABBS_KHR, the offset primitiveOffset from VkAccelerationStructureGeometryAabbsDataKHR::data **must** be a multiple of 8
- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03660
  For geometries of type VK_GEOMETRY_TYPE_INSTANCES_KHR, the offset primitiveOffset from VkAccelerationStructureGeometryInstancesDataKHR::data **must** be a multiple of 16

34.1.8. Copying Acceleration Structures

An additional command exists for copying acceleration structures without updating their contents. The acceleration structure object **can** be compacted in order to improve performance. Before copying, an application **must** query the size of the resulting acceleration structure.

To query acceleration structure size parameters call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdWriteAccelerationStructuresPropertiesKHR(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    accelerationStructureCount,
    const VkAccelerationStructureKHR*           pAccelerationStructures,
    VkQueryType                                 queryType,
    VkQueryPool                                 queryPool,
    uint32_t                                    firstQuery);
```

- commandBuffer is the command buffer into which the command will be recorded.
- accelerationStructureCount is the count of acceleration structures for which to query the property.
- pAccelerationStructures is a pointer to an array of existing previously built acceleration structures.
- queryType is a VkQueryType value specifying the type of queries managed by the pool.
- queryPool is the query pool that will manage the results of the query.

- `firstQuery` is the first query index within the query pool that will contain the `accelerationStructureCount` number of results.

Accesses to any of the acceleration structures listed in `pAccelerationStructures` **must** be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

- If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then the value written out is the number of bytes required by a compacted acceleration structure.
- If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then the value written out is the number of bytes required by a serialized acceleration structure.

Valid Usage

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructure-08924
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02493
  `queryPool` **must** have been created with a `queryType` matching `queryType`
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02494
  The queries identified by `queryPool` and `firstQuery` **must** be *unavailable*
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-buffer-03736
  The `buffer` used to create each acceleration structure in `pAccelerationStructures` **must** be bound to device memory
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-query-04880
  The sum of `firstQuery` plus `accelerationStructureCount` **must** be less than or equal to the number of queries in `queryPool`
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964
  All acceleration structures in `pAccelerationStructures` **must** have been built prior to the execution of this command
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431
  All acceleration structures in `pAccelerationStructures` **must** have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-06742
  `queryType` **must** be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

Valid Usage (Implicit)

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter
  `pAccelerationStructures` **must** be a valid pointer to an array of `accelerationStructureCount` valid VkAccelerationStructureKHR handles
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-parameter
  `queryType` **must** be a valid VkQueryType value
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-parameter
  `queryPool` **must** be a valid VkQueryPool handle
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
  `accelerationStructureCount` **must** be greater than `0`
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commonparent
  Each of `commandBuffer`, `queryPool`, and the elements of `pAccelerationStructures` **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

To copy an acceleration structure call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureKHR(
    VkCommandBuffer                             commandBuffer,
    const VkCopyAccelerationStructureInfoKHR*   pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a VkCopyAccelerationStructureInfoKHR structure defining the copy operation.

This command copies the `pInfo->src` acceleration structure to the `pInfo->dst` acceleration structure in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` **must** be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureKHR-accelerationStructure-08925
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled
- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03737
  The `buffer` used to create `pInfo->src` **must** be bound to device memory
- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03738
  The `buffer` used to create `pInfo->dst` **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdCopyAccelerationStructureKHR-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure
- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdCopyAccelerationStructureKHR-renderpass
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdCopyAccelerationStructureKHR-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

The `VkCopyAccelerationStructureInfoKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureInfoKHR {
    VkStructureType                         sType;
    const void*                             pNext;
    VkAccelerationStructureKHR              src;
    VkAccelerationStructureKHR              dst;
    VkCopyAccelerationStructureModeKHR      mode;
} VkCopyAccelerationStructureInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyAccelerationStructureInfoKHR-mode-03410
  `mode` **must** be `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` or `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR`
- VUID-VkCopyAccelerationStructureInfoKHR-src-04963
  The source acceleration structure `src` **must** have been constructed prior to the execution

of this command

- VUID-VkCopyAccelerationStructureInfoKHR-src-03411
  If `mode` is `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR`, `src` **must** have been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` in the build
- VUID-VkCopyAccelerationStructureInfoKHR-buffer-03718
  The `buffer` used to create `src` **must** be bound to device memory
- VUID-VkCopyAccelerationStructureInfoKHR-buffer-03719
  The `buffer` used to create `dst` **must** be bound to device memory
- VUID-VkCopyAccelerationStructureInfoKHR-dst-07791
  The range of memory backing `dst` that is accessed by this command **must** not overlap the memory backing `src` that is accessed by this command

Valid Usage (Implicit)

- VUID-VkCopyAccelerationStructureInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_INFO_KHR`
- VUID-VkCopyAccelerationStructureInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkCopyAccelerationStructureInfoKHR-src-parameter
  `src` **must** be a valid VkAccelerationStructureKHR handle
- VUID-VkCopyAccelerationStructureInfoKHR-dst-parameter
  `dst` **must** be a valid VkAccelerationStructureKHR handle
- VUID-VkCopyAccelerationStructureInfoKHR-mode-parameter
  `mode` **must** be a valid VkCopyAccelerationStructureModeKHR value
- VUID-VkCopyAccelerationStructureInfoKHR-commonparent
  Both of `dst`, and `src` **must** have been created, allocated, or retrieved from the same VkDevice

Possible values of `mode` specifying additional operations to perform during the copy, are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkCopyAccelerationStructureModeKHR {
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR = 0,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR = 1,
  // Provided by VK_KHR_acceleration_structure
    VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR = 2,
  // Provided by VK_KHR_acceleration_structure
    VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR = 3,
} VkCopyAccelerationStructureModeKHR;
```

- `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR` creates a direct copy of the acceleration structure specified in `src` into the one specified by `dst`. The `dst` acceleration structure **must** have

been created with the same parameters as `src`. If `src` contains references to other acceleration structures, `dst` will reference the same acceleration structures.

- `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` creates a more compact version of an acceleration structure `src` into `dst`. The acceleration structure `dst` **must** have been created with a size at least as large as that returned by vkCmdWriteAccelerationStructuresPropertiesKHR, or vkWriteAccelerationStructuresPropertiesKHR after the build of the acceleration structure specified by `src`. If `src` contains references to other acceleration structures, `dst` will reference the same acceleration structures.
- `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR` serializes the acceleration structure to a semi-opaque format which can be reloaded on a compatible implementation.
- `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR` deserializes the semi-opaque serialization format in the buffer to the acceleration structure.

To copy an acceleration structure to device memory call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureToMemoryKHR(
    VkCommandBuffer                             commandBuffer,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is an a pointer to a VkCopyAccelerationStructureToMemoryInfoKHR structure defining the copy operation.

Accesses to `pInfo->src` **must** be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`. Accesses to the buffer indicated by `pInfo->dst.deviceAddress` **must** be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an and an access type of `VK_ACCESS_TRANSFER_WRITE_BIT`.

This command produces the same results as vkCopyAccelerationStructureToMemoryKHR, but writes its result to a device address, and is executed on the device rather than the host. The output **may** not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToAccelerationStructureKHR or vkCopyMemoryToAccelerationStructureKHR.

The defined header structure for the serialized data consists of:

- `VK_UUID_SIZE` bytes of data matching `VkPhysicalDeviceIDProperties::driverUUID`
- `VK_UUID_SIZE` bytes of data identifying the compatibility for comparison using vkGetDeviceAccelerationStructureCompatibilityKHR
- A 64-bit integer of the total size matching the value queried using `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- A 64-bit integer of the deserialized size to be passed in to VkAccelerationStructureCreateInfoKHR::size
- A 64-bit integer of the count of the number of acceleration structure handles following. This value matches the value queried using VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR. This will be zero for a bottom-level acceleration structure. For top-level acceleration structures this number is implementation-dependent; the number of and ordering of the handles may not match the instance descriptions which were used to build the acceleration structure.

The corresponding handles matching the values returned by vkGetAccelerationStructureDeviceAddressKHR are tightly packed in the buffer following the count. The application is expected to store a mapping between those handles and the original application-generated bottom-level acceleration structures to provide when deserializing. The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-accelerationStructure-08926
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature **must** be enabled
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03739
  pInfo->dst.deviceAddress **must** be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03740
  pInfo->dst.deviceAddress **must** be aligned to 256 bytes
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03741
  If the buffer pointed to by pInfo->dst.deviceAddress is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-None-03559
  The buffer used to create pInfo->src **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-parameter
  pInfo **must** be a valid pointer to a valid VkCopyAccelerationStructureToMemoryInfoKHR structure
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support compute operations

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureToMemoryInfoKHR {
    VkStructureType                      sType;
    const void*                          pNext;
    VkAccelerationStructureKHR           src;
    VkDeviceOrHostAddressKHR             dst;
    VkCopyAccelerationStructureModeKHR   mode;
} VkCopyAccelerationStructureToMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy
- `dst` is the device or host address to memory which is the target for the copy
- `mode` is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-04959
  The source acceleration structure `src` **must** have been constructed prior to the execution of this command
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-dst-03561

The memory pointed to by `dst` **must** be at least as large as the serialization size of `src`, as reported by vkWriteAccelerationStructuresPropertiesKHR or vkCmdWriteAccelerationStructuresPropertiesKHR with a query type of `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-03412
  `mode` **must** be `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`

Valid Usage (Implicit)

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR`
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-parameter
  `src` **must** be a valid VkAccelerationStructureKHR handle
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-parameter
  `mode` **must** be a valid VkCopyAccelerationStructureModeKHR value

To copy device memory to an acceleration structure call:

```
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyMemoryToAccelerationStructureKHR(
    VkCommandBuffer                             commandBuffer,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a VkCopyMemoryToAccelerationStructureInfoKHR structure defining the copy operation.

Accesses to `pInfo->dst` **must** be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`. Accesses to the buffer indicated by `pInfo->src.deviceAddress` **must** be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_TRANSFER_READ_BIT`.

This command can accept acceleration structures produced by either vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR.

The structure provided as input to deserialize is as described in vkCmdCopyAccelerationStructureToMemoryKHR, with any acceleration structure handles filled in with the newly-queried handles to bottom level acceleration structures created before

deserialization. These do not need to be built at deserialize time, but **must** be created.

Valid Usage

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-accelerationStructure-08927
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03742
  `pInfo->src.deviceAddress` **must** be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03743
  `pInfo->src.deviceAddress` **must** be aligned to `256` bytes
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03744
  If the buffer pointed to by `pInfo->src.deviceAddress` is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-buffer-03745
  The `buffer` used to create `pInfo->dst` **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

The `VkCopyMemoryToAccelerationStructureInfoKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyMemoryToAccelerationStructureInfoKHR {
    VkStructureType                         sType;
    const void*                             pNext;
    VkDeviceOrHostAddressConstKHR           src;
    VkAccelerationStructureKHR              dst;
    VkCopyAccelerationStructureModeKHR      mode;
} VkCopyMemoryToAccelerationStructureInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the device or host address to memory containing the source data for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-src-04960
  The source memory pointed to by `src` **must** contain data previously serialized using vkCmdCopyAccelerationStructureToMemoryKHR, potentially modified to relocate acceleration structure references as described in that command
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-03413
  `mode` **must** be `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR`
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pInfo-03414
  The data in `src` **must** have a format compatible with the destination physical device as returned by vkGetDeviceAccelerationStructureCompatibilityKHR
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-03746
  `dst` **must** have been created with a `size` greater than or equal to that used to serialize the data in `src`

Valid Usage (Implicit)

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_COPY_MEMORY_TO_ACCELERATION_STRUCTURE_INFO_KHR`
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-parameter
  `dst` **must** be a valid VkAccelerationStructureKHR handle
- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-parameter
  `mode` **must** be a valid VkCopyAccelerationStructureModeKHR value

To check if a serialized acceleration structure is compatible with the current device call:

```
// Provided by VK_KHR_acceleration_structure
void vkGetDeviceAccelerationStructureCompatibilityKHR(
    VkDevice                                    device,
    const VkAccelerationStructureVersionInfoKHR* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR*    pCompatibility);
```

- `device` is the device to check the version against.
- `pVersionInfo` is a pointer to a VkAccelerationStructureVersionInfoKHR structure specifying version information to check against the device.
- `pCompatibility` is a pointer to a VkAccelerationStructureCompatibilityKHR value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-accelerationStructure-08928
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pVersionInfo-parameter
  `pVersionInfo` **must** be a valid pointer to a valid VkAccelerationStructureVersionInfoKHR structure
- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pCompatibility-parameter
  `pCompatibility` **must** be a valid pointer to a VkAccelerationStructureCompatibilityKHR value

The VkAccelerationStructureVersionInfoKHR structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureVersionInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    const uint8_t*     pVersionData;
} VkAccelerationStructureVersionInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pVersionData is a pointer to the version header of an acceleration structure as defined in vkCmdCopyAccelerationStructureToMemoryKHR

NOTE

pVersionData is a *pointer* to an array of 2×VK_UUID_SIZE uint8_t values instead of two VK_UUID_SIZE arrays as the expected use case for this member is to be pointed at the header of a previously serialized acceleration structure (via vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureVersionInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR
- VUID-VkAccelerationStructureVersionInfoKHR-pNext-pNext
  pNext **must** be NULL
- VUID-VkAccelerationStructureVersionInfoKHR-pVersionData-parameter
  pVersionData **must** be a valid pointer to an array of $2 \times VK_UUID_SIZE$ uint8_t values

Possible values of pCompatibility returned by vkGetDeviceAccelerationStructureCompatibilityKHR are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCompatibilityKHR {
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR = 0,
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR = 1,
} VkAccelerationStructureCompatibilityKHR;
```

- VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR if the pVersionData version acceleration structure is compatible with device.
- VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR if the pVersionData version acceleration structure is not compatible with device.

34.2. Host Acceleration Structure Operations

Implementations are also required to provide host implementations of the acceleration structure operations if the `accelerationStructureHostCommands` feature is enabled:

- vkBuildAccelerationStructuresKHR corresponding to vkCmdBuildAccelerationStructuresKHR
- vkCopyAccelerationStructureKHR corresponding to vkCmdCopyAccelerationStructureKHR
- vkCopyAccelerationStructureToMemoryKHR corresponding to vkCmdCopyAccelerationStructureToMemoryKHR
- vkCopyMemoryToAccelerationStructureKHR corresponding to vkCmdCopyMemoryToAccelerationStructureKHR
- vkWriteAccelerationStructuresPropertiesKHR corresponding to vkCmdWriteAccelerationStructuresPropertiesKHR

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All acceleration structures used by the host commands **must** be bound to host-visible memory, and all input data for acceleration structure builds **must** be referenced using host addresses instead of device addresses. Applications are not required to map acceleration structure memory when using the host commands.

NOTE

The vkBuildAccelerationStructuresKHR and vkCmdBuildAccelerationStructuresKHR **may** use different algorithms, and thus are not required to produce identical structures. The structures produced by these two commands **may** exhibit different memory footprints or traversal performance, but should strive to be similar where possible.

Apart from these details, the host and device operations are interchangeable. For example, an application **can** use vkBuildAccelerationStructuresKHR to build a structure, compact it on the device using vkCmdCopyAccelerationStructureKHR, and serialize the result using vkCopyAccelerationStructureToMemoryKHR.

NOTE

For efficient execution, acceleration structures manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build acceleration structures on the host, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkBuildAccelerationStructuresKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    uint32_t                                    infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `device` is the `VkDevice` for which the acceleration structures are being built.
- `deferredOperation` is an optional VkDeferredOperationKHR to request deferral for this command.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that **must** be provided.
- `pInfos` is a pointer to an array of `infoCount` VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of VkAccelerationStructureBuildRangeInfoKHR structures. Each `ppBuildRangeInfos`[i] is a pointer to an array of `pInfos`[i].`geometryCount` VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos`[i].

This command fulfills the same task as vkCmdBuildAccelerationStructuresKHR but is executed by the host.

The `vkBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

NOTE This means that an application **cannot** build a top-level acceleration structure in the same vkBuildAccelerationStructuresKHR call as the associated bottom-level or instance acceleration structures are being built. There also **cannot** be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Valid Usage

- VUID-vkBuildAccelerationStructuresKHR-accelerationStructureHostCommands-03581
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled
- VUID-vkBuildAccelerationStructuresKHR-mode-04628
  The `mode` member of each element of `pInfos` **must** be a valid VkBuildAccelerationStructureModeKHR value
- VUID-vkBuildAccelerationStructuresKHR-srcAccelerationStructure-04629
  If the `srcAccelerationStructure` member of any element of `pInfos` is not VK_NULL_HANDLE, the `srcAccelerationStructure` member **must** be a valid VkAccelerationStructureKHR handle
- VUID-vkBuildAccelerationStructuresKHR-pInfos-04630
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** not be VK_NULL_HANDLE
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03403
  The `srcAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of

pInfos

- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03698
  The dstAccelerationStructure member of any element of pInfos **must** not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03800
  The dstAccelerationStructure member of any element of pInfos **must** be a valid VkAccelerationStructureKHR handle
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03699
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, its dstAccelerationStructure member **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03700
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR, its dstAccelerationStructure member **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03663
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, inactive primitives in its srcAccelerationStructure member **must** not be made active
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03664
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member **must** not be made inactive
- VUID-vkBuildAccelerationStructuresKHR-None-03407
  The dstAccelerationStructure member of any element of pInfos **must** not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03701
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03702
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the dstAccelerationStructure member of any other element of pInfos, which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03703
  The range of memory backing the dstAccelerationStructure member of any element of

pInfos that is accessed by this command **must** not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command

- VUID-vkBuildAccelerationStructuresKHR-scratchData-03704
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-scratchData-03705
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03706
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command **must** not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03667
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member **must** have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03668
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members **must** either be the same VkAccelerationStructureKHR, or not have any memory aliasing
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03758
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03759
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03760
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03761
  For each element of pInfos, if its mode member is

VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member **must** have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03762
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03763
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03764
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03765
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.indexType member **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03766
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it **must** be NULL
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03767
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was not NULL when srcAccelerationStructure was last built, then it **must** not be NULL

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03768
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index referenced **must** be the same as the corresponding index value when srcAccelerationStructure was last built
- VUID-vkBuildAccelerationStructuresKHR-primitiveCount-03769
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, the primitiveCount member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure **must** have the same value which was specified when srcAccelerationStructure was last built
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03801
  For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppBuildRangeInfos[i][j].primitiveCount **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR ::maxInstanceCount
- VUID-vkBuildAccelerationStructuresKHR-pInfos-10126
  For each pInfos[i], dstAccelerationStructure **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::size greater than or equal to either:
  - the memory size required by the build operation, as returned by vkGetAccelerationStructureBuildSizesKHR with pBuildInfo = pInfos[i] and with each element of the pMaxPrimitiveCounts array greater than or equal to the equivalent ppBuildRangeInfos[i][j].primitiveCount values for j in [0,pInfos[i].geometryCount) or,
  - the result of querying the corresponding VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, if updating a compacted acceleration structure
- VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676
  Each element of ppBuildRangeInfos[i] **must** be a valid pointer to an array of pInfos[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures
- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation **must** be complete
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03722
  For each element of pInfos, the buffer used to create its dstAccelerationStructure member **must** be bound to host-visible device memory
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03723
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its srcAccelerationStructure member **must** be bound to host-visible device memory

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03724
  For each element of pInfos, the buffer used to create each acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR **must** be bound to host-visible device memory
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03725
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR, all addresses between pInfos[i].scratchData.hostAddress and pInfos[i].scratchData.hostAddress + N - 1 **must** be valid host memory, where N is given by the buildScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03726
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, all addresses between pInfos[i].scratchData.hostAddress and pInfos[i].scratchData.hostAddress + N - 1 **must** be valid host memory, where N is given by the updateScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03771
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.hostAddress **must** be a valid host address
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03772
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.hostAddress **must** be a valid host address
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03773
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.hostAddress is not 0, it **must** be a valid host address
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03774
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.hostAddress **must** be a valid host address
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03775
  For each element of pInfos, the buffer used to create its dstAccelerationStructure member **must** be bound to memory that was not allocated with multiple instances
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03776
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its srcAccelerationStructure member **must** be bound to memory that was not allocated with multiple instances
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03777

For each element of pInfos, the buffer used to create each acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR **must** be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03778
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, geometry.instances.data.hostAddress **must** be a valid host address
- VUID-vkBuildAccelerationStructuresKHR-pInfos-03779
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each VkAccelerationStructureInstanceKHR ::accelerationStructureReference value in geometry.instances.data.hostAddress **must** be a valid VkAccelerationStructureKHR object

Valid Usage (Implicit)

- VUID-vkBuildAccelerationStructuresKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation **must** be a valid VkDeferredOperationKHR handle
- VUID-vkBuildAccelerationStructuresKHR-pInfos-parameter
  pInfos **must** be a valid pointer to an array of infoCount valid VkAccelerationStructureBuildGeometryInfoKHR structures
- VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter
  ppBuildRangeInfos **must** be a valid pointer to an array of infoCount VkAccelerationStructureBuildRangeInfoKHR structures
- VUID-vkBuildAccelerationStructuresKHR-infoCount-arraylength
  infoCount **must** be greater than 0
- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it **must** have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY

- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact an acceleration structure on the host, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyAccelerationStructureInfoKHR*   pInfo);
```

- device is the device which owns the acceleration structures.
- deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.
- pInfo is a pointer to a VkCopyAccelerationStructureInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyAccelerationStructureKHR but is executed by the host.

Valid Usage

- VUID-vkCopyAccelerationStructureKHR-accelerationStructureHostCommands-03582
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature **must** be enabled
- VUID-vkCopyAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation **must** be complete
- VUID-vkCopyAccelerationStructureKHR-buffer-03727
  The buffer used to create pInfo->src **must** be bound to host-visible device memory
- VUID-vkCopyAccelerationStructureKHR-buffer-03728
  The buffer used to create pInfo->dst **must** be bound to host-visible device memory
- VUID-vkCopyAccelerationStructureKHR-buffer-03780
  The buffer used to create pInfo->src **must** be bound to memory that was not allocated with multiple instances
- VUID-vkCopyAccelerationStructureKHR-buffer-03781
  The buffer used to create pInfo->dst **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyAccelerationStructureKHR-device-parameter
  device **must** be a valid VkDevice handle

- VUID-vkCopyAccelerationStructureKHR-deferredOperation-parameter
  If `deferredOperation` is not VK_NULL_HANDLE, `deferredOperation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkCopyAccelerationStructureKHR-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure
- VUID-vkCopyAccelerationStructureKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy host accessible memory to an acceleration structure, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyMemoryToAccelerationStructureKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- `device` is the device which owns `pInfo->dst`.
- `deferredOperation` is an optional VkDeferredOperationKHR to request deferral for this command.
- `pInfo` is a pointer to a VkCopyMemoryToAccelerationStructureInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMemoryToAccelerationStructureKHR but is executed by the host.

This command can accept acceleration structures produced by either vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR.

Valid Usage

- VUID-vkCopyMemoryToAccelerationStructureKHR-accelerationStructureHostCommands-

03583
The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature **must** be enabled

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03729
  `pInfo->src.hostAddress` **must** be a valid host pointer
- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03750
  `pInfo->src.hostAddress` **must** be aligned to 16 bytes
- VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03730
  The `buffer` used to create `pInfo->dst` **must** be bound to host-visible device memory
- VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03782
  The `buffer` used to create `pInfo->dst` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyMemoryToAccelerationStructureKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parameter
  If `deferredOperation` is not VK_NULL_HANDLE, `deferredOperation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure
- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy an acceleration structure to host accessible memory, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureToMemoryKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- `device` is the device which owns `pInfo->src`.
- `deferredOperation` is an optional VkDeferredOperationKHR to request deferral for this command.
- `pInfo` is a pointer to a VkCopyAccelerationStructureToMemoryInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyAccelerationStructureToMemoryKHR but is executed by the host.

This command produces the same results as vkCmdCopyAccelerationStructureToMemoryKHR, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output **may** not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToAccelerationStructureKHR or vkCopyMemoryToAccelerationStructureKHR.

Valid Usage

- VUID-vkCopyAccelerationStructureToMemoryKHR-accelerationStructureHostCommands-03584
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled
- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03731
  The `buffer` used to create `pInfo->src` **must** be bound to host-visible device memory
- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03732
  `pInfo->dst.hostAddress` **must** be a valid host pointer
- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03751
  `pInfo->dst.hostAddress` **must** be aligned to 16 bytes
- VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03783
  The `buffer` used to create `pInfo->src` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyAccelerationStructureToMemoryKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parameter
  If `deferredOperation` is not VK_NULL_HANDLE, `deferredOperation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyAccelerationStructureToMemoryInfoKHR structure
- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query acceleration structure size parameters on the host, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkWriteAccelerationStructuresPropertiesKHR(
    VkDevice                                    device,
    uint32_t                                    accelerationStructureCount,
    const VkAccelerationStructureKHR*           pAccelerationStructures,
    VkQueryType                                 queryType,
    size_t                                      dataSize,
    void*                                       pData,
    size_t                                      stride);
```

- `device` is the device which owns the acceleration structures in `pAccelerationStructures`.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.

- `queryType` is a VkQueryType value specifying the property to be queried.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to an application-allocated buffer where the results will be written.
- `stride` is the stride in bytes between results for individual queries within `pData`.

This command fulfills the same task as vkCmdWriteAccelerationStructuresPropertiesKHR but is executed by the host.

Valid Usage

- VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureHostCommands-03585
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled
- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964
  All acceleration structures in `pAccelerationStructures` **must** have been built prior to the execution of this command
- VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431
  All acceleration structures in `pAccelerationStructures` **must** have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06742
  `queryType` **must** be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03448
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `stride` **must** be a multiple of the size of VkDeviceSize
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03449
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `pData` **must** point to a VkDeviceSize
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03450
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then `stride` **must** be a multiple of the size of VkDeviceSize
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03451
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then `pData` **must** point to a VkDeviceSize
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06731
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, then `stride` **must** be a multiple of the size of VkDeviceSize
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06732
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, then `pData` **must** point to a

VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06733
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, then `stride` **must** be a multiple of the size of VkDeviceSize
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06734
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, then `pData` **must** point to a VkDeviceSize
- VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-03452
  `dataSize` **must** be greater than or equal to `accelerationStructureCount`*`stride`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03733
  The `buffer` used to create each acceleration structure in `pAccelerationStructures` **must** be bound to host-visible device memory
- VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03784
  The `buffer` used to create each acceleration structure in `pAccelerationStructures` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkWriteAccelerationStructuresPropertiesKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter
  `pAccelerationStructures` **must** be a valid pointer to an array of `accelerationStructureCount` valid VkAccelerationStructureKHR handles
- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-parameter
  `queryType` **must** be a valid VkQueryType value
- VUID-vkWriteAccelerationStructuresPropertiesKHR-pData-parameter
  `pData` **must** be a valid pointer to an array of `dataSize` bytes
- VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
  `accelerationStructureCount` **must** be greater than `0`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-arraylength
  `dataSize` **must** be greater than `0`
- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parent
  Each element of `pAccelerationStructures` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Chapter 35. Micromap

35.1. Micromaps

Acceleration structures store and organize geometry for ray tracing, but in some cases it is beneficial to include some information within the geometry, particularly for triangles. A *micromap* organizes this data around a map of values corresponding to subdivided microtriangles which can be added to a triangle geometry when building a *bottom level acceleration structure*.

An *opacity micromap* is a type of micromap which stores information to control intersection opacity as described in Ray Opacity Micromap.

A micromap is considered to be constructed if a micromap build command or copy command has been executed with the given acceleration structure as the destination.

35.1.1. Building Micromaps

To build micromaps call:

```
// Provided by VK_EXT_opacity_micromap
void vkCmdBuildMicromapsEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    infoCount,
    const VkMicromapBuildInfoEXT*               pInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of micromaps to build. It specifies the number of the `pInfos` structures that **must** be provided.
- `pInfos` is a pointer to an array of `infoCount` VkMicromapBuildInfoEXT structures defining the data used to build each micromap.

The `vkCmdBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

> **NOTE** This means that there **cannot** be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

Accesses to the micromap scratch buffers as identified by the VkMicromapBuildInfoEXT::`scratchData` buffer device addresses **must** be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of (`VK_ACCESS_2_MICROMAP_READ_BIT_EXT` | `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`). Accesses to VkMicromapBuildInfoEXT::`dstMicromap` **must** be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`.

Accesses to other input buffers as identified by any used values of VkMicromapBuildInfoEXT::data or VkMicromapBuildInfoEXT::triangleArray **must** be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

Valid Usage

- VUID-vkCmdBuildMicromapsEXT-pInfos-07461
  For each pInfos[i], dstMicromap **must** have been created with a value of VkMicromapCreateInfoEXT::size greater than or equal to the memory size required by the build operation, as returned by vkGetMicromapBuildSizesEXT with pBuildInfo = pInfos[i]
- VUID-vkCmdBuildMicromapsEXT-mode-07462
  The mode member of each element of pInfos **must** be a valid VkBuildMicromapModeEXT value
- VUID-vkCmdBuildMicromapsEXT-dstMicromap-07463
  The dstMicromap member of any element of pInfos **must** be a valid VkMicromapEXT handle
- VUID-vkCmdBuildMicromapsEXT-pInfos-07464
  For each element of pInfos its type member **must** match the value of VkMicromapCreateInfoEXT::type when its dstMicromap was created
- VUID-vkCmdBuildMicromapsEXT-dstMicromap-07465
  The range of memory backing the dstMicromap member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the dstMicromap member of any other element of pInfos, which is accessed by this command
- VUID-vkCmdBuildMicromapsEXT-dstMicromap-07466
  The range of memory backing the dstMicromap member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command
- VUID-vkCmdBuildMicromapsEXT-scratchData-07467
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command **must** not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command
- VUID-vkCmdBuildMicromapsEXT-pInfos-07508
  For each element of pInfos, the buffer used to create its dstMicromap member **must** be bound to device memory
- VUID-vkCmdBuildMicromapsEXT-pInfos-07509
  If pInfos[i].mode is VK_BUILD_MICROMAP_MODE_BUILD_EXT, all addresses between pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 **must** be in the buffer device address range of the same buffer, where N is given by the buildScratchSize member of the VkMicromapBuildSizesInfoEXT structure returned from a call to vkGetMicromapBuildSizesEXT with an identical VkMicromapBuildInfoEXT structure and primitive count

- VUID-vkCmdBuildMicromapsEXT-data-07510
  The buffers from which the buffer device addresses for all of the `data` and `triangleArray` members of all `pInfos`[i] are queried **must** have been created with the `VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT` usage flag
- VUID-vkCmdBuildMicromapsEXT-pInfos-07511
  For each element of `pInfos`[i] the buffer from which the buffer device address `pInfos`[i].`scratchData.deviceAddress` is queried **must** have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag
- VUID-vkCmdBuildMicromapsEXT-pInfos-07512
  For each element of `pInfos`, its `scratchData.deviceAddress`, `data.deviceAddress`, and `triangleArray.deviceAddress` members **must** be valid device addresses obtained from vkGetBufferDeviceAddressKHR
- VUID-vkCmdBuildMicromapsEXT-pInfos-07513
  For each element of `pInfos`, if `scratchData.deviceAddress`, `data.deviceAddress`, or `triangleArray.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdBuildMicromapsEXT-pInfos-07514
  For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a multiple of VkPhysicalDeviceAccelerationStructurePropertiesKHR::`minAccelerationStructureScratchOffsetAlignment`
- VUID-vkCmdBuildMicromapsEXT-pInfos-07515
  For each element of `pInfos`, its `triangleArray.deviceAddress` and `data.deviceAddress` members **must** be a multiple of `256`

Valid Usage (Implicit)

- VUID-vkCmdBuildMicromapsEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBuildMicromapsEXT-pInfos-parameter
  `pInfos` **must** be a valid pointer to an array of `infoCount` valid VkMicromapBuildInfoEXT structures
- VUID-vkCmdBuildMicromapsEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdBuildMicromapsEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdBuildMicromapsEXT-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdBuildMicromapsEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdBuildMicromapsEXT-infoCount-arraylength
  `infoCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

Formats which **can** be set in VkMicromapUsageEXT::`format` and VkMicromapTriangleEXT::`format` for micromap builds, are:

```
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapFormatEXT {
    VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT = 1,
    VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT = 2,
} VkOpacityMicromapFormatEXT;
```

- `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` specifies that the given micromap format has one bit per subtriangle encoding either fully opaque or fully transparent.
- `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` specifies that the given micromap format has two bits per subtriangle encoding four modes which can be interpreted as described in ray traversal.

NOTE For compactness, these values are stored as 16-bit in some structures.

The `VkMicromapBuildInfoEXT` structure is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildInfoEXT {
    VkStructureType                    sType;
    const void*                        pNext;
    VkMicromapTypeEXT                  type;
    VkBuildMicromapFlagsEXT            flags;
    VkBuildMicromapModeEXT             mode;
    VkMicromapEXT                      dstMicromap;
    uint32_t                           usageCountsCount;
    const VkMicromapUsageEXT*          pUsageCounts;
    const VkMicromapUsageEXT* const*   ppUsageCounts;
    VkDeviceOrHostAddressConstKHR      data;
    VkDeviceOrHostAddressKHR           scratchData;
    VkDeviceOrHostAddressConstKHR      triangleArray;
    VkDeviceSize                       triangleArrayStride;
} VkMicromapBuildInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is a VkMicromapTypeEXT value specifying the type of micromap being built.
- `flags` is a bitmask of VkBuildMicromapFlagBitsEXT specifying additional parameters of the micromap.
- `mode` is a VkBuildMicromapModeEXT value specifying the type of operation to perform.
- `dstMicromap` is a pointer to the target micromap for the build.
- `usageCountsCount` specifies the number of usage counts structures that will be used to determine the size of this micromap.
- `pUsageCounts` is a pointer to an array of VkMicromapUsageEXT structures.
- `ppUsageCounts` is a pointer to an array of pointers to VkMicromapUsageEXT structures.
- `data` is the device or host address to memory which contains the data for the micromap.
- `scratchData` is the device or host address to memory that will be used as scratch memory for the build.
- `triangleArray` is the device or host address to memory containing the VkMicromapTriangleEXT data
- `triangleArrayStride` is the stride in bytes between each element of `triangleArray`

Only one of `pUsageCounts` or `ppUsageCounts` **can** be a valid pointer, the other **must** be `NULL`. The elements of the non-`NULL` array describe the total counts used to build each micromap. Each element contains a `count` which is the number of micromap triangles of that `format` and `subdivisionLevel` contained in the micromap. Multiple elements with the same `format` and `subdivisionLevel` are allowed and the total count for that `format` and `subdivisionLevel` is the sum of the `count` for each element.

Each micromap triangle refers to one element in `triangleArray` which contains the `format` and

`subdivisionLevel` for that particular triangle as well as a `dataOffset` in bytes which is the location relative to `data` where that triangle's micromap data begins. The data at `triangleArray` is laid out as a 4 byte unsigned integer for the `dataOffset` followed by a 2 byte unsigned integer for the subdivision level then a 2 byte unsigned integer for the format. In practice, compilers compile VkMicromapTriangleEXT to match this pattern.

For opacity micromaps, the data at `data` is packed as either one bit per element for `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or two bits per element for `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` and is packed from LSB to MSB in each byte. The data at each index in those bytes is interpreted as discussed in Ray Opacity Micromap.

Valid Usage

- VUID-VkMicromapBuildInfoEXT-pUsageCounts-07516
  Only one of `pUsageCounts` or `ppUsageCounts` **can** be a valid pointer, the other **must** be `NULL`
- VUID-VkMicromapBuildInfoEXT-type-07517
  If `type` is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` the `format` member of VkMicromapUsageEXT **must** be a valid value from `VkOpacityMicromapFormatEXT`
- VUID-VkMicromapBuildInfoEXT-type-07518
  If `type` is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` the `format` member of VkMicromapTriangleEXT **must** be a valid value from `VkOpacityMicromapFormatEXT`

Valid Usage (Implicit)

- VUID-VkMicromapBuildInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_MICROMAP_BUILD_INFO_EXT`
- VUID-VkMicromapBuildInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkMicromapBuildInfoEXT-type-parameter
  `type` **must** be a valid VkMicromapTypeEXT value
- VUID-VkMicromapBuildInfoEXT-flags-parameter
  `flags` **must** be a valid combination of VkBuildMicromapFlagBitsEXT values
- VUID-VkMicromapBuildInfoEXT-pUsageCounts-parameter
  If `usageCountsCount` is not `0`, and `pUsageCounts` is not `NULL`, `pUsageCounts` **must** be a valid pointer to an array of `usageCountsCount` VkMicromapUsageEXT structures
- VUID-VkMicromapBuildInfoEXT-ppUsageCounts-parameter
  If `usageCountsCount` is not `0`, and `ppUsageCounts` is not `NULL`, `ppUsageCounts` **must** be a valid pointer to an array of `usageCountsCount` valid pointers to VkMicromapUsageEXT structures

The `VkBuildMicromapModeEXT` enumeration is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef enum VkBuildMicromapModeEXT {
    VK_BUILD_MICROMAP_MODE_BUILD_EXT = 0,
} VkBuildMicromapModeEXT;
```

- VK_BUILD_MICROMAP_MODE_BUILD_EXT specifies that the destination micromap will be built using the specified data.

The VkMicromapUsageEXT structure is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapUsageEXT {
    uint32_t    count;
    uint32_t    subdivisionLevel;
    uint32_t    format;
} VkMicromapUsageEXT;
```

- count is the number of triangles in the usage format defined by the subdivisionLevel and format below in the micromap
- subdivisionLevel is the subdivision level of this usage format
- format is the format of this usage format

Valid Usage

- VUID-VkMicromapUsageEXT-format-07519
  If the VkMicromapTypeEXT of the micromap is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT then format **must** be VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT or VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT
- VUID-VkMicromapUsageEXT-format-07520
  If the VkMicromapTypeEXT of the micromap is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT and format is VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT then subdivisionLevel **must** be less than or equal to VkPhysicalDeviceOpacityMicromapPropertiesEXT ::maxOpacity2StateSubdivisionLevel
- VUID-VkMicromapUsageEXT-format-07521
  If the VkMicromapTypeEXT of the micromap is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT and format is VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT then subdivisionLevel **must** be less than or equal to VkPhysicalDeviceOpacityMicromapPropertiesEXT ::maxOpacity4StateSubdivisionLevel

The format is interpreted based on the type of the micromap using it.

The VkMicromapTriangleEXT structure is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapTriangleEXT {
    uint32_t    dataOffset;
    uint16_t    subdivisionLevel;
    uint16_t    format;
} VkMicromapTriangleEXT;
```

- `dataOffset` is the offset in bytes of the start of the data for this triangle. This is a byte aligned value.
- `subdivisionLevel` is the subdivision level of this triangle
- `format` is the format of this triangle

Valid Usage

- VUID-VkMicromapTriangleEXT-format-07522
  If the VkMicromapTypeEXT of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` then `format` **must** be `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT`
- VUID-VkMicromapTriangleEXT-format-07523
  If the VkMicromapTypeEXT of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` then `subdivisionLevel` **must** be less than or equal to VkPhysicalDeviceOpacityMicromapPropertiesEXT ::`maxOpacity2StateSubdivisionLevel`
- VUID-VkMicromapTriangleEXT-format-07524
  If the VkMicromapTypeEXT of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` then `subdivisionLevel` **must** be less than or equal to VkPhysicalDeviceOpacityMicromapPropertiesEXT ::`maxOpacity4StateSubdivisionLevel`

The `format` is interpreted based on the `type` of the micromap using it.

35.1.2. Copying Micromaps

An additional command exists for copying micromaps without updating their contents. Before copying, an application **must** query the size of the resulting micromap.

To query micromap size parameters call:

```
// Provided by VK_EXT_opacity_micromap
void vkCmdWriteMicromapsPropertiesEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    micromapCount,
    const VkMicromapEXT*                        pMicromaps,
    VkQueryType                                 queryType,
    VkQueryPool                                 queryPool,
    uint32_t                                    firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `micromapCount` is the count of micromaps for which to query the property.
- `pMicromaps` is a pointer to an array of existing previously built micromaps.
- `queryType` is a VkQueryType value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `micromapCount` number of results.

Accesses to any of the micromaps listed in `pMicromaps` **must** be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`.

- If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then the value written out is the number of bytes required by a serialized micromap.
- If `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`, then the value written out is the number of bytes required by a compacted micromap.

Valid Usage

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07525
  `queryPool` **must** have been created with a `queryType` matching `queryType`
- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07526
  The queries identified by `queryPool` and `firstQuery` **must** be *unavailable*
- VUID-vkCmdWriteMicromapsPropertiesEXT-buffer-07527
  The `buffer` used to create each micromap in `pMicrmaps` **must** be bound to device memory
- VUID-vkCmdWriteMicromapsPropertiesEXT-query-07528
  The sum of `query` plus `micromapCount` **must** be less than or equal to the number of queries in `queryPool`
- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07501
  All micromaps in `pMicromaps` **must** have been constructed prior to the execution of this command
- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in `pMicromaps` **must** have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` if `queryType` is

VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-07503
  queryType **must** be VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT or VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT

Valid Usage (Implicit)

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-parameter
  pMicromaps **must** be a valid pointer to an array of micromapCount valid VkMicromapEXT handles
- VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-parameter
  queryType **must** be a valid VkQueryType value
- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-parameter
  queryPool **must** be a valid VkQueryPool handle
- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support compute operations
- VUID-vkCmdWriteMicromapsPropertiesEXT-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdWriteMicromapsPropertiesEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdWriteMicromapsPropertiesEXT-micromapCount-arraylength
  micromapCount **must** be greater than 0
- VUID-vkCmdWriteMicromapsPropertiesEXT-commonparent
  Each of commandBuffer, queryPool, and the elements of pMicromaps **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

To copy a micromap call:

```
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapEXT(
    VkCommandBuffer                             commandBuffer,
    const VkCopyMicromapInfoEXT*                pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a VkCopyMicromapInfoEXT structure defining the copy operation.

This command copies the `pInfo->src` micromap to the `pInfo->dst` micromap in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` **must** be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT` or `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT` as appropriate.

Valid Usage

- VUID-vkCmdCopyMicromapEXT-buffer-07529
  The `buffer` used to create `pInfo->src` **must** be bound to device memory
- VUID-vkCmdCopyMicromapEXT-buffer-07530
  The `buffer` used to create `pInfo->dst` **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMicromapEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdCopyMicromapEXT-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyMicromapInfoEXT structure
- VUID-vkCmdCopyMicromapEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdCopyMicromapEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- VUID-vkCmdCopyMicromapEXT-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyMicromapEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

The `VkCopyMicromapInfoEXT` structure is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkMicromapEXT            src;
    VkMicromapEXT            dst;
    VkCopyMicromapModeEXT    mode;
} VkCopyMicromapInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source micromap for the copy.
- `dst` is the target micromap for the copy.
- `mode` is a VkCopyMicromapModeEXT value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyMicromapInfoEXT-mode-07531
  `mode` **must** be `VK_COPY_MICROMAP_MODE_COMPACT_EXT` or `VK_COPY_MICROMAP_MODE_CLONE_EXT`
- VUID-VkCopyMicromapInfoEXT-src-07532

The source acceleration structure `src` **must** have been constructed prior to the execution of this command

- VUID-VkCopyMicromapInfoEXT-mode-07533
  If `mode` is `VK_COPY_MICROMAP_MODE_COMPACT_EXT`, `src` **must** have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` in the build
- VUID-VkCopyMicromapInfoEXT-buffer-07534
  The `buffer` used to create `src` **must** be bound to device memory
- VUID-VkCopyMicromapInfoEXT-buffer-07535
  The `buffer` used to create `dst` **must** be bound to device memory

Valid Usage (Implicit)

- VUID-VkCopyMicromapInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_COPY_MICROMAP_INFO_EXT`
- VUID-VkCopyMicromapInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkCopyMicromapInfoEXT-src-parameter
  `src` **must** be a valid VkMicromapEXT handle
- VUID-VkCopyMicromapInfoEXT-dst-parameter
  `dst` **must** be a valid VkMicromapEXT handle
- VUID-VkCopyMicromapInfoEXT-mode-parameter
  `mode` **must** be a valid VkCopyMicromapModeEXT value
- VUID-VkCopyMicromapInfoEXT-commonparent
  Both of `dst`, and `src` **must** have been created, allocated, or retrieved from the same VkDevice

Possible values of `mode` specifying additional operations to perform during the copy, are:

```
// Provided by VK_EXT_opacity_micromap
typedef enum VkCopyMicromapModeEXT {
    VK_COPY_MICROMAP_MODE_CLONE_EXT = 0,
    VK_COPY_MICROMAP_MODE_SERIALIZE_EXT = 1,
    VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT = 2,
    VK_COPY_MICROMAP_MODE_COMPACT_EXT = 3,
} VkCopyMicromapModeEXT;
```

- `VK_COPY_MICROMAP_MODE_CLONE_EXT` creates a direct copy of the micromap specified in `src` into the one specified by `dst`. The `dst` micromap **must** have been created with the same parameters as `src`.
- `VK_COPY_MICROMAP_MODE_SERIALIZE_EXT` serializes the micromap to a semi-opaque format which can be reloaded on a compatible implementation.
- `VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT` deserializes the semi-opaque serialization format in the

buffer to the micromap.

- `VK_COPY_MICROMAP_MODE_COMPACT_EXT` creates a more compact version of a micromap `src` into `dst`. The micromap `dst` **must** have been created with a size at least as large as that returned by vkCmdWriteMicromapsPropertiesEXT after the build of the micromap specified by `src`.

To copy a micromap to device memory call:

```
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapToMemoryEXT(
    VkCommandBuffer                             commandBuffer,
    const VkCopyMicromapToMemoryInfoEXT*        pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is an a pointer to a VkCopyMicromapToMemoryInfoEXT structure defining the copy operation.

Accesses to `pInfo->src` **must** be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`. Accesses to the buffer indicated by `pInfo->dst.deviceAddress` **must** be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_TRANSFER_WRITE_BIT`.

This command produces the same results as vkCopyMicromapToMemoryEXT, but writes its result to a device address, and is executed on the device rather than the host. The output **may** not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToMicromapEXT or vkCopyMemoryToMicromapEXT.

The defined header structure for the serialized data consists of:

- `VK_UUID_SIZE` bytes of data matching `VkPhysicalDeviceIDProperties`::`driverUUID`
- `VK_UUID_SIZE` bytes of data identifying the compatibility for comparison using vkGetDeviceMicromapCompatibilityEXT The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

Valid Usage

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07536
  `pInfo->dst.deviceAddress` **must** be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07537
  `pInfo->dst.deviceAddress` **must** be aligned to `256` bytes
- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07538
  If the buffer pointed to by `pInfo->dst.deviceAddress` is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdCopyMicromapToMemoryEXT-buffer-07539
  The `buffer` used to create `pInfo->src` **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyMicromapToMemoryInfoEXT structure
- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdCopyMicromapToMemoryEXT-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyMicromapToMemoryEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapToMemoryInfoEXT {
    VkStructureType             sType;
    const void*                 pNext;
    VkMicromapEXT               src;
    VkDeviceOrHostAddressKHR    dst;
    VkCopyMicromapModeEXT       mode;
} VkCopyMicromapToMemoryInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `src` is the source micromap for the copy
- `dst` is the device or host address to memory which is the target for the copy
- `mode` is a VkCopyMicromapModeEXT value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyMicromapToMemoryInfoEXT-src-07540
  The source micromap `src` **must** have been constructed prior to the execution of this command
- VUID-VkCopyMicromapToMemoryInfoEXT-dst-07541
  The memory pointed to by `dst` **must** be at least as large as the serialization size of `src`, as reported by vkWriteMicromapsPropertiesEXT or vkCmdWriteMicromapsPropertiesEXT with a query type of `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`
- VUID-VkCopyMicromapToMemoryInfoEXT-mode-07542
  `mode` **must** be `VK_COPY_MICROMAP_MODE_SERIALIZE_EXT`

Valid Usage (Implicit)

- VUID-VkCopyMicromapToMemoryInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_COPY_MICROMAP_TO_MEMORY_INFO_EXT`
- VUID-VkCopyMicromapToMemoryInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkCopyMicromapToMemoryInfoEXT-src-parameter
  `src` **must** be a valid VkMicromapEXT handle
- VUID-VkCopyMicromapToMemoryInfoEXT-mode-parameter
  `mode` **must** be a valid VkCopyMicromapModeEXT value

To copy device memory to a micromap call:

```
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMemoryToMicromapEXT(
    VkCommandBuffer                             commandBuffer,
    const VkCopyMemoryToMicromapInfoEXT*        pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a VkCopyMemoryToMicromapInfoEXT structure defining the copy operation.

Accesses to `pInfo->dst` **must** be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`. Accesses to the buffer indicated by `pInfo->src.deviceAddress` **must** be synchronized with the

VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_TRANSFER_READ_BIT.

This command can accept micromaps produced by either vkCmdCopyMicromapToMemoryEXT or vkCopyMicromapToMemoryEXT.

Valid Usage

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07543
  pInfo->src.deviceAddress **must** be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07544
  pInfo->src.deviceAddress **must** be aligned to 256 bytes
- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07545
  If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdCopyMemoryToMicromapEXT-buffer-07546
  The buffer used to create pInfo->dst **must** be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-parameter
  pInfo **must** be a valid pointer to a valid VkCopyMemoryToMicromapInfoEXT structure
- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support compute operations
- VUID-vkCmdCopyMemoryToMicromapEXT-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyMemoryToMicromapEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

The VkCopyMemoryToMicromapInfoEXT structure is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMemoryToMicromapInfoEXT {
    VkStructureType                  sType;
    const void*                      pNext;
    VkDeviceOrHostAddressConstKHR    src;
    VkMicromapEXT                    dst;
    VkCopyMicromapModeEXT            mode;
} VkCopyMemoryToMicromapInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- src is the device or host address to memory containing the source data for the copy.
- dst is the target micromap for the copy.
- mode is a VkCopyMicromapModeEXT value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyMemoryToMicromapInfoEXT-src-07547
  The source memory pointed to by src **must** contain data previously serialized using vkCmdCopyMicromapToMemoryEXT
- VUID-VkCopyMemoryToMicromapInfoEXT-mode-07548
  mode **must** be VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT
- VUID-VkCopyMemoryToMicromapInfoEXT-src-07549
  The data in src **must** have a format compatible with the destination physical device as returned by vkGetDeviceMicromapCompatibilityEXT
- VUID-VkCopyMemoryToMicromapInfoEXT-dst-07550
  dst **must** have been created with a size greater than or equal to that used to serialize the data in src

Valid Usage (Implicit)

- VUID-VkCopyMemoryToMicromapInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_COPY_MEMORY_TO_MICROMAP_INFO_EXT`
- VUID-VkCopyMemoryToMicromapInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkCopyMemoryToMicromapInfoEXT-dst-parameter
  `dst` **must** be a valid VkMicromapEXT handle
- VUID-VkCopyMemoryToMicromapInfoEXT-mode-parameter
  `mode` **must** be a valid VkCopyMicromapModeEXT value

To check if a serialized micromap is compatible with the current device call:

```
// Provided by VK_EXT_opacity_micromap
void vkGetDeviceMicromapCompatibilityEXT(
    VkDevice                                    device,
    const VkMicromapVersionInfoEXT*             pVersionInfo,
    VkAccelerationStructureCompatibilityKHR*    pCompatibility);
```

- `device` is the device to check the version against.
- `pVersionInfo` is a pointer to a VkMicromapVersionInfoEXT structure specifying version information to check against the device.
- `pCompatibility` is a pointer to a VkAccelerationStructureCompatibilityKHR value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceMicromapCompatibilityEXT-micromap-07551
  The `micromap` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMicromapCompatibilityEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceMicromapCompatibilityEXT-pVersionInfo-parameter
  `pVersionInfo` **must** be a valid pointer to a valid VkMicromapVersionInfoEXT structure
- VUID-vkGetDeviceMicromapCompatibilityEXT-pCompatibility-parameter
  `pCompatibility` **must** be a valid pointer to a VkAccelerationStructureCompatibilityKHR value

The `VkMicromapVersionInfoEXT` structure is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapVersionInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    const uint8_t*     pVersionData;
} VkMicromapVersionInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pVersionData` is a pointer to the version header of a micromap as defined in vkCmdCopyMicromapToMemoryEXT

NOTE

`pVersionData` is a *pointer* to an array of 2×`VK_UUID_SIZE` `uint8_t` values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of a previously serialized micromap (via vkCmdCopyMicromapToMemoryEXT or vkCopyMicromapToMemoryEXT) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

Valid Usage (Implicit)

- VUID-VkMicromapVersionInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_MICROMAP_VERSION_INFO_EXT`
- VUID-VkMicromapVersionInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkMicromapVersionInfoEXT-pVersionData-parameter
  `pVersionData` **must** be a valid pointer to an array of $2 \times VK_UUID_SIZE$ `uint8_t` values

35.2. Host Micromap Operations

Implementations are also required to provide host implementations of the micromap operations if the `micromapHostCommands` feature is enabled:

- vkBuildMicromapsEXT corresponding to vkCmdBuildMicromapsEXT
- vkCopyMicromapEXT corresponding to vkCmdCopyMicromapEXT
- vkCopyMicromapToMemoryEXT corresponding to vkCmdCopyMicromapToMemoryEXT
- vkCopyMemoryToMicromapEXT corresponding to vkCmdCopyMemoryToMicromapEXT
- vkWriteMicromapsPropertiesEXT corresponding to vkCmdWriteMicromapsPropertiesEXT

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All micromaps used by the host commands **must** be bound to host-visible memory, and all input

data for micromap builds **must** be referenced using host addresses instead of device addresses. Applications are not required to map micromap memory when using the host commands.

NOTE

The vkBuildMicromapsEXT and vkCmdBuildMicromapsEXT **may** use different algorithms, and thus are not required to produce identical structures.

Apart from these details, the host and device operations are interchangeable.

NOTE

For efficient execution, micromaps manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build micromaps on the host, call:

```
// Provided by VK_EXT_opacity_micromap
VkResult vkBuildMicromapsEXT(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    uint32_t                                    infoCount,
    const VkMicromapBuildInfoEXT*               pInfos);
```

- `device` is the `VkDevice` for which the micromaps are being built.
- `deferredOperation` is an optional VkDeferredOperationKHR to request deferral for this command.
- `infoCount` is the number of micromaps to build. It specifies the number of the `pInfos` that **must** be provided.
- `pInfos` is a pointer to an array of `infoCount` VkMicromapBuildInfoEXT structures defining the geometry used to build each micromap.

This command fulfills the same task as vkCmdBuildMicromapsEXT but is executed by the host.

The `vkBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

NOTE

This means that there **cannot** be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

Valid Usage

- VUID-vkBuildMicromapsEXT-pInfos-07461
  For each `pInfos`[i], `dstMicromap` **must** have been created with a value of VkMicromapCreateInfoEXT::`size` greater than or equal to the memory size required by the build operation, as returned by vkGetMicromapBuildSizesEXT with `pBuildInfo` = `pInfos`[i]

- VUID-vkBuildMicromapsEXT-mode-07462
  The `mode` member of each element of `pInfos` **must** be a valid VkBuildMicromapModeEXT value
- VUID-vkBuildMicromapsEXT-dstMicromap-07463
  The `dstMicromap` member of any element of `pInfos` **must** be a valid VkMicromapEXT handle
- VUID-vkBuildMicromapsEXT-pInfos-07464
  For each element of `pInfos` its `type` member **must** match the value of VkMicromapCreateInfoEXT::`type` when its `dstMicromap` was created
- VUID-vkBuildMicromapsEXT-dstMicromap-07465
  The range of memory backing the `dstMicromap` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `dstMicromap` member of any other element of `pInfos`, which is accessed by this command
- VUID-vkBuildMicromapsEXT-dstMicromap-07466
  The range of memory backing the `dstMicromap` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command
- VUID-vkBuildMicromapsEXT-scratchData-07467
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command
- VUID-vkBuildMicromapsEXT-pInfos-07552
  For each element of `pInfos`, the `buffer` used to create its `dstMicromap` member **must** be bound to host-visible device memory
- VUID-vkBuildMicromapsEXT-pInfos-07553
  For each element of `pInfos`, all referenced addresses of `pInfos`[i].`data.hostAddress` **must** be valid host memory
- VUID-vkBuildMicromapsEXT-pInfos-07554
  For each element of `pInfos`, all referenced addresses of `pInfos`[i].`triangleArray.hostAddress` **must** be valid host memory
- VUID-vkBuildMicromapsEXT-micromapHostCommands-07555
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature **must** be enabled
- VUID-vkBuildMicromapsEXT-pInfos-07556
  If `pInfos`[i].`mode` is `VK_BUILD_MICROMAP_MODE_BUILD_EXT`, all addresses between `pInfos`[i].`scratchData.hostAddress` and `pInfos`[i].`scratchData.hostAddress` + N - 1 **must** be valid host memory, where N is given by the `buildScratchSize` member of the VkMicromapBuildSizesInfoEXT structure returned from a call to vkGetMicromapBuildSizesEXT with an identical VkMicromapBuildInfoEXT structure and primitive count
- VUID-vkBuildMicromapsEXT-pInfos-07557
  For each element of `pInfos`, the `buffer` used to create its `dstMicromap` member **must** be

bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkBuildMicromapsEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkBuildMicromapsEXT-deferredOperation-parameter
  If `deferredOperation` is not VK_NULL_HANDLE, `deferredOperation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkBuildMicromapsEXT-pInfos-parameter
  `pInfos` **must** be a valid pointer to an array of `infoCount` valid VkMicromapBuildInfoEXT structures
- VUID-vkBuildMicromapsEXT-infoCount-arraylength
  `infoCount` **must** be greater than `0`
- VUID-vkBuildMicromapsEXT-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact a micromap on the host, call:

```
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapEXT(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyMicromapInfoEXT*                pInfo);
```

- `device` is the device which owns the micromaps.
- `deferredOperation` is an optional VkDeferredOperationKHR to request deferral for this command.
- `pInfo` is a pointer to a VkCopyMicromapInfoEXT structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMicromapEXT but is executed by the host.

Valid Usage

- VUID-vkCopyMicromapEXT-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkCopyMicromapEXT-buffer-07558
  The `buffer` used to create `pInfo->src` **must** be bound to host-visible device memory
- VUID-vkCopyMicromapEXT-buffer-07559
  The `buffer` used to create `pInfo->dst` **must** be bound to host-visible device memory
- VUID-vkCopyMicromapEXT-micromapHostCommands-07560
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature **must** be enabled
- VUID-vkCopyMicromapEXT-buffer-07561
  The `buffer` used to create `pInfo->src` **must** be bound to memory that was not allocated with multiple instances
- VUID-vkCopyMicromapEXT-buffer-07562
  The `buffer` used to create `pInfo->dst` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyMicromapEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCopyMicromapEXT-deferredOperation-parameter
  If `deferredOperation` is not VK_NULL_HANDLE, `deferredOperation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkCopyMicromapEXT-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyMicromapInfoEXT structure
- VUID-vkCopyMicromapEXT-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to a micromap, call:

```
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMemoryToMicromapEXT(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyMemoryToMicromapInfoEXT*        pInfo);
```

- device is the device which owns pInfo->dst.
- deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.
- pInfo is a pointer to a VkCopyMemoryToMicromapInfoEXT structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMemoryToMicromapEXT but is executed by the host.

This command can accept micromaps produced by either vkCmdCopyMicromapToMemoryEXT or vkCopyMicromapToMemoryEXT.

Valid Usage

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation **must** be complete
- VUID-vkCopyMemoryToMicromapEXT-pInfo-07563
  pInfo->src.hostAddress **must** be a valid host pointer
- VUID-vkCopyMemoryToMicromapEXT-pInfo-07564
  pInfo->src.hostAddress **must** be aligned to 16 bytes
- VUID-vkCopyMemoryToMicromapEXT-buffer-07565
  The buffer used to create pInfo->dst **must** be bound to host-visible device memory
- VUID-vkCopyMemoryToMicromapEXT-micromapHostCommands-07566
  The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature **must** be enabled
- VUID-vkCopyMemoryToMicromapEXT-buffer-07567
  The buffer used to create pInfo->dst **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyMemoryToMicromapEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parameter
  If `deferredOperation` is not VK_NULL_HANDLE, `deferredOperation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkCopyMemoryToMicromapEXT-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyMemoryToMicromapInfoEXT structure
- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy a micromap to host accessible memory, call:

```
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapToMemoryEXT(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    const VkCopyMicromapToMemoryInfoEXT*        pInfo);
```

- `device` is the device which owns `pInfo->src`.
- `deferredOperation` is an optional VkDeferredOperationKHR to request deferral for this command.
- `pInfo` is a pointer to a VkCopyMicromapToMemoryInfoEXT structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMicromapToMemoryEXT but is executed by the host.

This command produces the same results as vkCmdCopyMicromapToMemoryEXT, but writes its

result directly to a host pointer, and is executed on the host rather than the device. The output **may** not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToMicromapEXT or vkCopyMemoryToMicromapEXT.

Valid Usage

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkCopyMicromapToMemoryEXT-buffer-07568
  The `buffer` used to create `pInfo->src` **must** be bound to host-visible device memory
- VUID-vkCopyMicromapToMemoryEXT-pInfo-07569
  `pInfo->dst.hostAddress` **must** be a valid host pointer
- VUID-vkCopyMicromapToMemoryEXT-pInfo-07570
  `pInfo->dst.hostAddress` **must** be aligned to 16 bytes
- VUID-vkCopyMicromapToMemoryEXT-micromapHostCommands-07571
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature **must** be enabled
- VUID-vkCopyMicromapToMemoryEXT-buffer-07572
  The `buffer` used to create `pInfo->src` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyMicromapToMemoryEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parameter
  If `deferredOperation` is not VK_NULL_HANDLE, `deferredOperation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkCopyMicromapToMemoryEXT-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkCopyMicromapToMemoryInfoEXT structure
- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query micromap size parameters on the host, call:

```
// Provided by VK_EXT_opacity_micromap
VkResult vkWriteMicromapsPropertiesEXT(
    VkDevice                                    device,
    uint32_t                                    micromapCount,
    const VkMicromapEXT*                        pMicromaps,
    VkQueryType                                 queryType,
    size_t                                      dataSize,
    void*                                       pData,
    size_t                                      stride);
```

- device is the device which owns the micromaps in pMicromaps.
- micromapCount is the count of micromaps for which to query the property.
- pMicromaps is a pointer to an array of existing previously built micromaps.
- queryType is a VkQueryType value specifying the property to be queried.
- dataSize is the size in bytes of the buffer pointed to by pData.
- pData is a pointer to an application-allocated buffer where the results will be written.
- stride is the stride in bytes between results for individual queries within pData.

This command fulfills the same task as vkCmdWriteMicromapsPropertiesEXT but is executed by the host.

Valid Usage

- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07501
  All micromaps in pMicromaps **must** have been constructed prior to the execution of this command
- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in pMicromaps **must** have been constructed with VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT if queryType is VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT
- VUID-vkWriteMicromapsPropertiesEXT-queryType-07503
  queryType **must** be VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT or VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT
- VUID-vkWriteMicromapsPropertiesEXT-queryType-10071
  If queryType is VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT or VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT then stride **must** be a multiple of the size of VkDeviceSize

- VUID-vkWriteMicromapsPropertiesEXT-queryType-10072
  If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT` or `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT` then `pData` **must** point to a VkDeviceSize
- VUID-vkWriteMicromapsPropertiesEXT-dataSize-07576
  `dataSize` **must** be greater than or equal to `micromapCount`*`stride`
- VUID-vkWriteMicromapsPropertiesEXT-buffer-07577
  The `buffer` used to create each micromap in `pMicromaps` **must** be bound to host-visible device memory
- VUID-vkWriteMicromapsPropertiesEXT-micromapHostCommands-07578
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature **must** be enabled
- VUID-vkWriteMicromapsPropertiesEXT-buffer-07579
  The `buffer` used to create each micromap in `pMicromaps` **must** be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkWriteMicromapsPropertiesEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parameter
  `pMicromaps` **must** be a valid pointer to an array of `micromapCount` valid VkMicromapEXT handles
- VUID-vkWriteMicromapsPropertiesEXT-queryType-parameter
  `queryType` **must** be a valid VkQueryType value
- VUID-vkWriteMicromapsPropertiesEXT-pData-parameter
  `pData` **must** be a valid pointer to an array of `dataSize` bytes
- VUID-vkWriteMicromapsPropertiesEXT-micromapCount-arraylength
  `micromapCount` **must** be greater than `0`
- VUID-vkWriteMicromapsPropertiesEXT-dataSize-arraylength
  `dataSize` **must** be greater than `0`
- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parent
  Each element of `pMicromaps` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Chapter 36. Ray Traversal

The ray traversal process identifies and handles intersections between a ray and geometries in an acceleration structure.

Ray traversal cannot be started by a Vulkan API command directly - a shader **must** execute `OpRayQueryProceedKHR` or a pipeline trace ray instruction . When the `rayTracingPipeline` feature is enabled, `OpTraceRayKHR` **can** be used for ray tracing in a ray tracing pipeline. When the `rayQuery` feature is enabled, `OpRayQueryProceedKHR` **can** be used in any shader stage.

36.1. Ray Intersection Candidate Determination

Once tracing begins, rays are first tested against instances in a top-level acceleration structure. A ray that intersects an instance will be transformed into the space of the instance to continue traversal within that instance; therefore the transform matrix stored in the instance **must** be invertible.

In case multiple instances are intersected by a ray, the ray transformation into the space of the instance is invariant under the order in which these instances are encountered in the top-level acceleration structure.

NOTE Applying multiple forward and reverse transforms to a ray to transition from one instance to another could result in accumulated errors. Thus an implementation should behave as if the ray is transformed from the origin for each instance independently.

Next, rays are tested against geometries in a bottom-level acceleration structure to determine if a hit occurred between them, initially based only on their geometric properties (i.e. their vertices). The implementation performs similar operations to that of rasterization, but with the effective viewport determined by the parameters of the ray, and the geometry transformed into a space determined by that viewport.

The vertices of each primitive are transformed from acceleration structure space as to ray space r according to the ray origin and direction as follows:

$$\begin{pmatrix} x_r \\ y_r \\ z_r \end{pmatrix} = \begin{pmatrix} a_x^2(1-c)+c & a_x a_y(1-c)-sa_z & a_x a_z(1-c)+sa_y \\ a_x a_y(1-c)+sa_z & a_y^2(1-c)+c & a_y a_z(1-c)-sa_x \\ a_x a_z(1-c)-sa_y & a_y a_z(1-c)+sa_x & a_z^2(1-c)+c \end{pmatrix} \begin{pmatrix} x_{as}-o_x \\ y_{as}-o_y \\ z_{as}-o_z \end{pmatrix}$$

$\mathbf{a}$ is the axis of rotation from the unnormalized ray direction vector $\mathbf{d}$ to the axis vector $\mathbf{k}$:

$$\mathbf{a} = \begin{cases} \dfrac{\mathbf{d}\times\mathbf{k}}{\|\mathbf{d}\times\mathbf{k}\|} & \text{if } \|\mathbf{d}\times\mathbf{k}\| \neq 0 \\ \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} & \text{if } \|\mathbf{d}\times\mathbf{k}\| = 0 \end{cases}$$

s and c are the sine and cosine of the angle of rotation about $\mathbf{a}$ from $\mathbf{d}$ to $\mathbf{k}$:

$$c = \frac{\mathbf{d} \cdot \mathbf{k}}{\|\mathbf{d}\|}$$
$$s = \sqrt{1 - c^2}$$

$\mathbf{k}$ is the unit vector:

$$\mathbf{k} = \begin{pmatrix} 0 \\ 0 \\ -1 \end{pmatrix}$$

$\mathbf{o}$ and $\mathbf{d}$ are the ray origin and unnormalized direction, respectively; the vector described by x_{as}, y_{as}, and z_{as} is any position in acceleration structure space; and the vector described by x_r, y_r, and z_r is the same position in ray space.

An *intersection candidate* is a unique point of intersection between a ray and a geometric primitive. For any primitive that has within its bounds a position $\mathbf{xyz_{as}}$ such that

$$\begin{aligned} x_r &= 0 \\ y_r &= 0 \\ t_{min} < -\frac{z_r}{\|\mathbf{d}\|} < t_{max} &\quad \text{if the primitive is a triangle,} \\ t_{min} \leq -\frac{z_r}{\|\mathbf{d}\|} \leq t_{max} &\quad \text{otherwise} \end{aligned}$$

(where $t = -\frac{z_r}{\|\mathbf{d}\|}$), an intersection candidate exists.

Triangle primitive bounds consist of all points on the plane formed by the three vertices and within the bounds of the edges between the vertices, subject to the watertightness constraints below. AABB primitive bounds consist of all points within an implementation-defined bound which includes the specified box.

NOTE The bounds of the AABB including all points internal to the bound implies that a ray started within the AABB will hit that AABB.

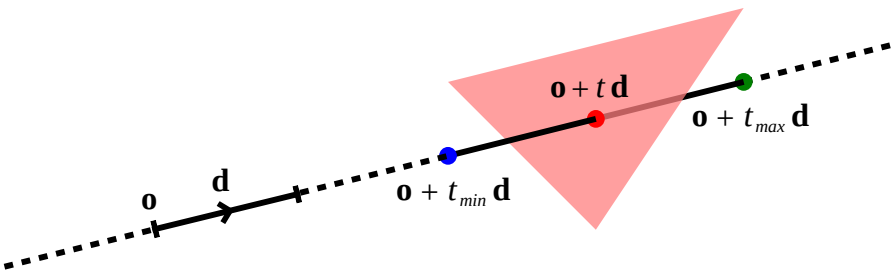

Figure 23. Ray intersection candidate

The determination of this condition is performed in an implementation specific manner, and **may** be performed with floating-point operations. Due to the complexity and number of operations involved, inaccuracies are expected, particularly as the scale of values involved begins to diverge.

Implementations **should** take efforts to maintain as much precision as possible.

NOTE

One very common case is when geometries are close to each other at some distance from the origin in acceleration structure space, where an effect similar to "z-fighting" is likely to be observed. Applications can mitigate this by ensuring their detailed geometries remain close to the origin.

Another likely case is when the origin of a ray is set to a position on a previously intersected surface, and its t_{min} is zero or near zero; an intersection may be detected on the emitting surface. This case can usually be mitigated by offsetting t_{min} slightly.

In the case of AABB geometries, implementations **may** increase their size in an acceleration structure in order to mitigate precision issues. This **may** result in false positive intersections being reported to the application.

For triangle intersection candidates, the b and c barycentric coordinates on the triangle where the above condition is met are made available to future shading. If the ray was traced with a pipeline trace ray instruction, these values are available as a vector of 2 32-bit floating-point values in the `HitAttributeKHR` storage class.

Once an intersection candidate is determined, it proceeds through the following operations, in order:

1. Ray Intersection Culling
2. Ray Intersection Confirmation
3. Ray Closest Hit Determination
4. Ray Result Determination

The sections below describe the exact details of these tests. There is no ordering guarantee between operations performed on different intersection candidates.

36.1.1. Watertightness

For a set of triangles with identical transforms, within a single instance:

- Any set of two or more triangles where all triangles have one vertex with an identical position value, that vertex is a *shared vertex*.
- Any set of two triangles with two shared vertices that were specified in the same winding order in each triangle have a *shared edge* defined by those vertices.

A *closed fan* is a set of three or more triangles where:

- All triangles in the set have the same shared vertex as one of their vertices.
- All edges that include the above vertex are shared edges.
- All above shared edges are shared by exactly two triangles from the set.
- No two triangles in the set intersect, except at shared edges.
- Every triangle in the set is joined to every other triangle in the set by a series of the above

shared edges.

Implementations **should** not double-hit or miss when a ray intersects a shared edge, or a shared vertex of a closed fan.

36.2. Ray Intersection Culling

Candidate intersections go through several phases of culling before confirmation as an actual hit. There is no particular ordering dependency between the different culling operations.

36.2.1. Ray Primitive Culling

If the `rayTraversalPrimitiveCulling` or `rayQuery` features are enabled, the `SkipTrianglesKHR` and `SkipAABBsKHR` ray flags **can** be specified when tracing a ray. `SkipTrianglesKHR` and `SkipAABBsKHR` are mutually exclusive. `SkipTrianglesKHR` is also mutually exclusive with `CullBackFacingTrianglesKHR` and `CullFrontFacingTrianglesKHR`.

If `SkipTrianglesKHR` was included in the `Ray Flags` operand of the ray trace instruction, and the intersection is with a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs. If `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` was included in the pipeline, traversal with pipeline trace ray instructions will all behave as if `SkipTrianglesKHR` was included in their `Ray Flags` operand.

If `SkipAABBsKHR` was included in the `Ray Flags` operand of the ray trace instruction, and the intersection is with an AABB primitive, the intersection is dropped, and no further processing of this intersection occurs. If `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` was included in the pipeline, traversal with pipeline trace ray instructions will all behave as if `SkipAABBsKHR` was included in their `Ray Flags` operand.

36.2.2. Ray Mask Culling

Instances **can** be made invisible to particular rays based on the value of VkAccelerationStructureInstanceKHR::`mask` used to add that instance to a top-level acceleration structure, and the `Cull Mask` parameter used to trace the ray.

For the instance which is intersected, if `mask` & `Cull Mask` == 0, the intersection is dropped, and no further processing occurs.

36.2.3. Ray Face Culling

As in polygon rasterization, one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives **can** be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

Determination

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for rasterization, based on the sign of the polygon's area but using the ray

space coordinates instead of framebuffer coordinates. One way to compute this area is:

$$a = -\frac{1}{2}\sum_{i=0}^{n-1} x_r^i y_r^{i \oplus 1} - x_r^{i \oplus 1} y_r^i$$

where x_r^i and y_r^i are the x and y ray space coordinates of the ith vertex of the n-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and i ⊕ 1 is (i + 1) mod n.

By default, if a is negative then the intersection is with the front face of the triangle, otherwise it is with the back face. If VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR is included in VkAccelerationStructureInstanceKHR::flags for the instance containing the intersected triangle, this determination is reversed. Additionally, if a is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

NOTE In a left-handed coordinate system, an intersection will be with the front face of a triangle if the vertices of the triangle, as defined in index order, appear from the ray's perspective in a clockwise rotation order. VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR was previously annotated as VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR because of this.

If the ray was traced with a pipeline trace ray instruction, the HitKindKHR built-in is set to HitKindFrontFacingTriangleKHR if the intersection is with front-facing geometry, and HitKindBackFacingTriangleKHR if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with OpRayQueryProceedKHR, OpRayQueryGetIntersectionFrontFaceKHR will return true for intersection candidates with front faces, or false for back faces.

Culling

If CullBackFacingTrianglesKHR was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If CullFrontFacingTrianglesKHR was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR was included in VkAccelerationStructureInstanceKHR::flags for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face (a == 0) are unconditionally culled, irrespective of ray flags and geometry instance flags.

The CullBackFacingTrianglesKHR and CullFrontFacingTrianglesKHR Ray Flags are mutually exclusive.

36.2.4. Ray Opacity Culling

Each geometry in the acceleration structure **may** be considered either opaque or not. Opaque geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates **can** also be culled based on their opacity.

Determination

Each individual intersection candidate is initially determined as opaque if `VK_GEOMETRY_OPAQUE_BIT_KHR` was included in the VkAccelerationStructureGeometryKHR::`flags` when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the geometry includes an opacity micromap, the opacity of the intersection at this point is instead derived as described in Ray Opacity Micromap.

If the intersection candidate was generated by an intersection shader, the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` in VkAccelerationStructureInstanceKHR::`flags` will force all geometries in the instance to be considered opaque. Similarly, setting `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including `OpaqueKHR` or `NoOpaqueKHR` in the `Ray Flags` parameter when tracing a ray. `OpaqueKHR` forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, `NoOpaqueKHR` forces all geometries to behave as if they are non-opaque.

If the ray was traced with `OpRayQueryProceedKHR`, to determine the opacity of AABB intersection candidates, `OpRayQueryGetIntersectionCandidateAABBOpaqueKHR` **can** be used. This instruction will return `true` for opaque intersection candidates, and `false` for non-opaque intersection candidates.

Culling

If `CullOpaqueKHR` is included in the `Ray Flags` parameter when tracing a ray, an intersection with a geometry that is considered opaque is dropped, and no further processing occurs.

If `CullNoOpaqueKHR` is included in the `Ray Flags` parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

The `OpaqueKHR`, `NoOpaqueKHR`, `CullOpaqueKHR`, and `CullNoOpaqueKHR` `Ray Flags` are mutually exclusive.

36.2.5. Ray Opacity Micromap

A `VK_GEOMETRY_TYPE_TRIANGLES_KHR` geometry in the acceleration structure **may** have an opacity micromap associated with it to give finer-grained opacity information.

If the intersection candidate is with a geometry with an associated opacity micromap and `VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT` is not set in its instance then the micromap is used to determine geometry opacity instead of the `VK_GEOMETRY_OPAQUE_BIT_KHR` flag in the geometry.

The opacity information in the micromap object is accessed using the candidate intersection u and v coordinates. The integer u and v are computed from ⌊u⌋ + ⌊v⌋, clamping ⌊u⌋ as needed to keep the sum less than or equal to 1 << subdivisionlevel. These values are mapped into a linear index with a space filling curve which is defined recursively by traversing into the sub-triangle nearest vertex 0, then the middle triangle with ordering flipped, then nearest vertex 1 then nearest vertex 2.

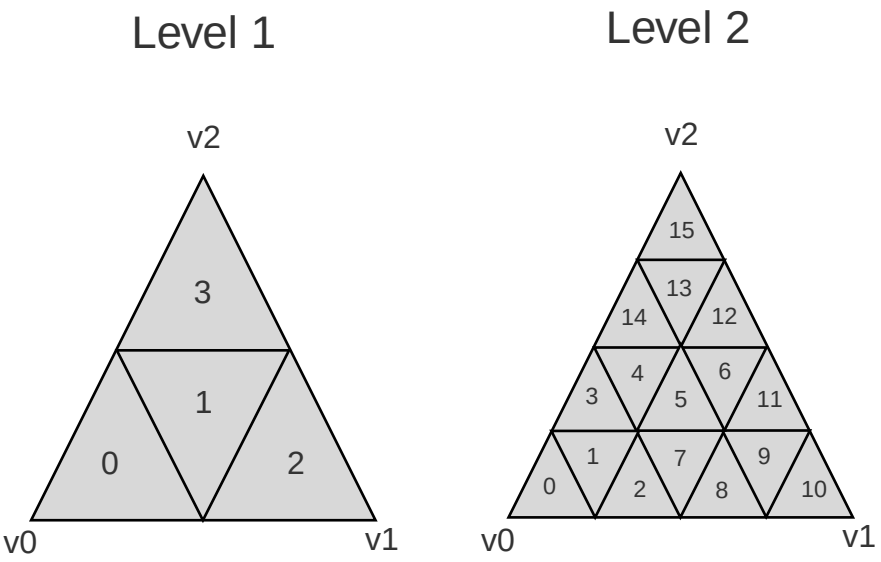

Figure 24. Example ordering for micromap data

NOTE

This encoding is spatially coherent, purely hierarchical, and allows a bit-parallel conversion between barycentric address and index values.

See the appendix for reference code implementing this mapping.

The result of the opacity micromap lookup and operations is to treat the intersection as opaque, non-opaque, or ignored. The interpretation of the values depends on `VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT` in the instance of the candidate intersection or `ForceOpacityMicromap2StateEXT` ray flags on the ray. If either is set, the opacity micromap information is interpreted in 2 state override mode. If the result of the micromap lookup is to treat the intersection candidate as ignored, no further processing of that candidate is done.

If the associated opacity micromap has format `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT`, each element of the micromap is represented by a single bit at the index derived above.

If the associated opacity micromap has format `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT`, each element is represented by a two bit value at the index derived above.

4 State value	2 State value	Special index value	2 State override	Result
0	0	`VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT`	Y	Ignored

4 State value	2 State value	Special index value	2 State override	Result
0	0	VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT	N	Ignored
1	1	VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT	Y	Opaque
1	1	VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT	N	Opaque
2		VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT	Y	Ignored
2		VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT	N	Non-opaque
3		VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT	Y	Opaque
3		VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT	N	Non-opaque

36.3. Ray Intersection Confirmation

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB, candidate intersections are further processed to determine the eventual hit result. Candidates generated from AABB intersections run through the same confirmation process as triangle hits.

36.3.1. AABB Intersection Candidates

For an intersection candidate with an AABB geometry generated by Ray Intersection Candidate Determination, shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs. The occurrence of an AABB intersection candidate does not guarantee the ray intersects the primitive bounds. To avoid propagating false intersections the application **should** verify the intersection candidate before reporting any hits and only report intersections within the bounds of the AABB. Reporting an intersection outside the AABB either through the implementation giving a conservative bound or reporting a t out of range is legal but **may** result in unpredictable closest hit results.

If the ray was traced with a pipeline trace ray instruction, an intersection shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. If this

shader calls OpReportIntersectionKHR, a new intersection candidate is generated as described below. If the intersection shader is VK_SHADER_UNUSED_KHR (which is only allowed for a zero shader group) then no further processing of the intersection candidate occurs.

Each new candidate generated as a result of this processing is a generated intersection candidate from the intersection with AABB geometry, with a t value equal to the Hit parameter of the OpReportIntersectionKHR instruction. The new generated candidate is then independently run through Ray Intersection Confirmation as a generated intersection.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed OpRayQueryProceedKHR, returning true. The resulting ray query has a candidate intersection type of RayQueryCandidateIntersectionAABBKHR. OpRayQueryGenerateIntersectionKHR **can** be called to commit a new intersection candidate with committed intersection type of RayQueryCommittedIntersectionGeneratedKHR. Further ray query processing **can** be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection **can** be terminated with OpRayQueryTerminateKHR. Unlike rays traced with a pipeline trace ray instruction, candidates generated in this way skip generated intersection candidate confirmation; applications **should** make this determination before generating the intersection.

This operation **may** be executed multiple times for the same intersection candidate.

36.3.2. Triangle and Generated Intersection Candidates

For triangle and generated intersection candidates, additional shader code **may** be executed based on the intersection's opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit occurred or not.

If the ray was traced with a pipeline trace ray instruction, an any-hit shader is invoked from the Shader Binding Table according to the specified indexing. If this shader calls OpIgnoreIntersectionKHR, the candidate is dropped and no further processing of the candidate occurs. If the any-hit shader identified is VK_SHADER_UNUSED_KHR, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed OpRayQueryProceedKHR, returning true. As only triangle candidates participate in this operation with ray queries, the resulting candidate intersection type is always RayQueryCandidateIntersectionTriangleKHR. OpRayQueryConfirmIntersectionKHR **can** be called on the ray query to confirm the candidate as a hit with committed intersection type of RayQueryCommittedIntersectionTriangleKHR. Further ray query processing **can** be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection **can** be terminated with OpRayQueryTerminateKHR. If OpRayQueryConfirmIntersectionKHR has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation **may** be executed multiple times for the same intersection candidate unless VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR was specified for the intersected geometry.

36.4. Ray Closest Hit Determination

Unless the ray was traced with the `TerminateOnFirstHitKHR` ray flag, the implementation **must** track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its t value is compared to t_{max} to determine which intersection is closer, where t is the parametric distance along the ray at which the intersection occurred.

- If $t < t_{max}$, t_{max} is set to t and the candidate is set as the current closest hit.
- If $t > t_{max}$, the candidate is dropped and no further processing of that candidate occurs.
- If $t = t_{max}$, the candidate **may** be set as the current closest hit or dropped.

If `TerminateOnFirstHitKHR` was included in the `Ray Flags` used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

36.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by Ray Closest Hit Determination, a closest hit has occurred, otherwise the final result is a miss.

For rays traced with pipeline trace ray instructions which **can** invoke a closest hit shader, if a closest hit result was identified, a closest hit shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if either the ray flags included `SkipClosestHitShaderKHR`, or if the closest hit shader identified is `VK_SHADER_UNUSED_KHR`.

For rays traced with a pipeline trace ray instruction where no hit result was identified, the miss shader identified by the `Miss Index` parameter of the instruction is invoked. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if the miss shader identified is `VK_SHADER_UNUSED_KHR`.

If the ray was traced with `OpRayQueryProceedKHR`, control is returned to the shader which executed `OpRayQueryProceedKHR`, returning `false`. If a closest hit was identified by Ray Closest Hit Determination, the ray query will now have a committed intersection type of `RayQueryCommittedIntersectionGeneratedKHR` or `RayQueryCommittedIntersectionTriangleKHR`. If no closest hit was identified, the committed intersection type will be `RayQueryCommittedIntersectionNoneKHR`.

No further processing of a ray query occurs after this result is determined.

Chapter 37. Ray Tracing

Ray tracing uses a separate rendering pipeline from both the graphics and compute pipelines (see Ray Tracing Pipeline).

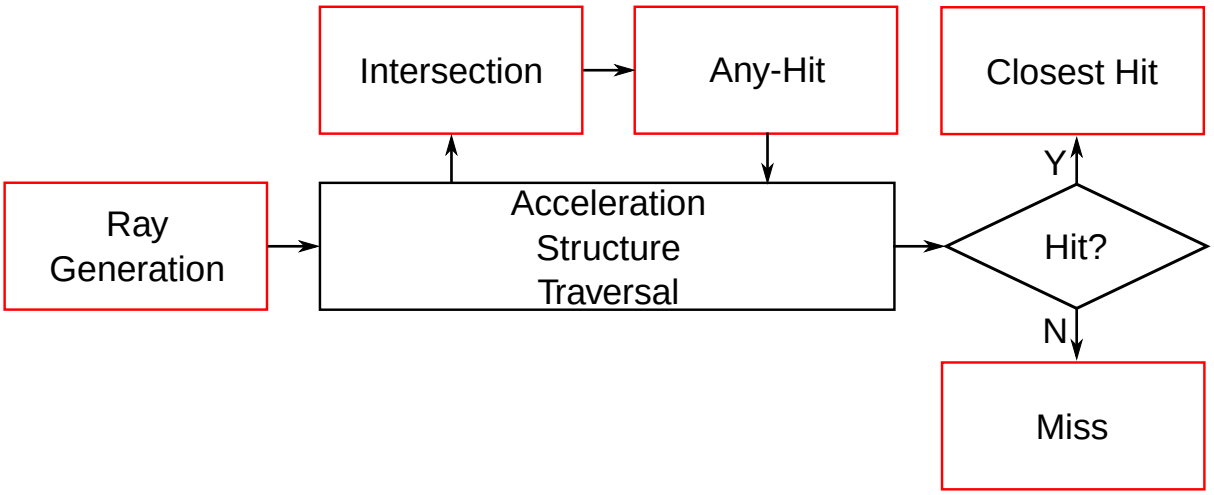

Figure 25. Ray tracing pipeline execution

Caption

Interaction between the different shader stages in the ray tracing pipeline

Within the ray tracing pipeline, a pipeline trace ray instruction **can** be called to perform a ray traversal that invokes the various ray tracing shader stages during its execution. The relationship between the ray tracing pipeline object and the geometries present in the acceleration structure traversed is passed into the ray tracing command in a VkBuffer object known as a *shader binding table*. `OpExecuteCallableKHR` can also be used in ray tracing pipelines to invoke a callable shader.

During execution, control alternates between scheduling and other operations. The scheduling functionality is implementation-specific and is responsible for workload execution. The shader stages are programmable. *Traversal*, which refers to the process of traversing acceleration structures to find potential intersections of rays with geometry, is fixed function.

The programmable portions of the pipeline are exposed in a single-ray programming model, with each invocation handling one ray at a time. Memory operations **can** be synchronized using standard memory barriers. The `Workgroup` scope and variables with a storage class of `Workgroup` **must** not be used in the ray tracing pipeline.

37.1. Shader Call Instructions

A *shader call* is an instruction which **may** cause execution to continue elsewhere by creating one or more invocations that execute a different shader stage.

The following table lists all shader call instructions and which stages each one **can** directly call.

Instruction	Intersection	Any-Hit	Closest Hit	Miss	Callable
OpTraceRayKHR	X	X	X	X	
OpReportIntersectionKHR		X			
OpExecuteCallableKHR					X

Pipeline trace ray instructions **can** be used recursively; invoked shaders **can** themselves execute pipeline trace ray instructions, to a maximum depth defined by the maxRayRecursionDepth limit.

Shaders directly invoked from the API always have a recursion depth of 0; each shader executed by a pipeline trace ray instruction has a recursion depth one higher than the recursion depth of the shader which invoked it. Applications **must** not invoke a shader with a recursion depth greater than the value of maxPipelineRayRecursionDepth specified in the pipeline.

There is no explicit recursion limit for other shader call instructions which may recurse (e.g. OpExecuteCallableKHR) but there is an upper bound determined by the stack size.

An *invocation repack instruction* is a ray tracing instruction where the implementation **may** change the set of invocations that are executing. When a repack instruction is encountered, the invocation is suspended and a new invocation begins and executes the instruction. After executing the repack instruction (which **may** result in other ray tracing shader stages executing) the new invocation ends and the original invocation is resumed, but it **may** be resumed in a different subgroup or at a different SubgroupLocalInvocationId within the same subgroup. When a subset of invocations in a subgroup execute the invocation repack instruction, those that do not execute it remain in the same subgroup at the same SubgroupLocalInvocationId.

The OpTraceRayKHR, OpReportIntersectionKHR, and OpExecuteCallableKHR instructions are invocation repack instructions.

When a ray tracing shader executes a dynamic instance of an invocation repack instruction which results in another ray tracing shader being invoked, their instructions are related by shader-call-order.

For ray tracing invocations that are shader-call-related:

- memory operations on StorageBuffer, Image, and ShaderRecordBufferKHR storage classes **can** be synchronized using the ShaderCallKHR scope.
- the CallableDataKHR, IncomingCallableDataKHR, RayPayloadKHR, HitAttributeKHR, and IncomingRayPayloadKHR storage classes are system-synchronized and no application availability and visibility operations are required.
- memory operations within a single invocation before and after the shader call instruction are ordered by program-order and do not require explicit synchronization.

37.2. Ray Tracing Commands

Ray tracing commands provoke work in the ray tracing pipeline. Ray tracing commands are recorded into a command buffer and when executed by a queue will produce work that executes

according to the bound ray tracing pipeline. A ray tracing pipeline **must** be bound to a command buffer before any ray tracing commands are recorded in that command buffer.

To dispatch ray tracing use:

```
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysKHR(
    VkCommandBuffer                             commandBuffer,
    const VkStridedDeviceAddressRegionKHR*      pRaygenShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR*      pMissShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR*      pHitShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR*      pCallableShaderBindingTable,
    uint32_t                                    width,
    uint32_t                                    height,
    uint32_t                                    depth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRaygenShaderBindingTable` is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the ray generation shader stage.
- `pMissShaderBindingTable` is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the miss shader stage.
- `pHitShaderBindingTable` is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the hit shader stage.
- `pCallableShaderBindingTable` is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the callable shader stage.
- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of `width` × `height` × `depth` rays is assembled.

Valid Usage

- VUID-vkCmdTraceRaysKHR-magFilter-04553
  If a VkSampler created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysKHR-mipmapMode-04770
  If a VkSampler created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysKHR-unnormalizedCoordinates-09635

If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's levelCount and layerCount **must** be 1

- VUID-vkCmdTraceRaysKHR-unnormalizedCoordinates-09636
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's viewType **must** be VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D
- VUID-vkCmdTraceRaysKHR-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features **must** contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT
- VUID-vkCmdTraceRaysKHR-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT
- VUID-vkCmdTraceRaysKHR-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT
- VUID-vkCmdTraceRaysKHR-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT
- VUID-vkCmdTraceRaysKHR-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it **must** not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY
- VUID-vkCmdTraceRaysKHR-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdTraceRaysKHR-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command **must** have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdTraceRaysKHR-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysKHR-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the

OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysKHR-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysKHR-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysKHR-None-08600
  For each set *n* that is statically used by a bound shader, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a VkPipelineLayout that is compatible for set *n*, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdTraceRaysKHR-None-08601
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdTraceRaysKHR-None-10068
  For each array of resources that is used by a bound shader, the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdTraceRaysKHR-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdTraceRaysKHR-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, **must** be valid as described by descriptor validity if they are statically used by a bound shader
- VUID-vkCmdTraceRaysKHR-None-08606
  If the shaderObject feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdTraceRaysKHR-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdTraceRaysKHR-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage
- VUID-vkCmdTraceRaysKHR-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage
- VUID-vkCmdTraceRaysKHR-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage
- VUID-vkCmdTraceRaysKHR-None-08607
  If the shaderObject feature is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command
- VUID-vkCmdTraceRaysKHR-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysKHR-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysKHR-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysKHR-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysKHR-None-06550

If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C$_B$C$_R$ conversion, that object **must** only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdTraceRaysKHR-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C$_B$C$_R$ conversion, that object **must** not use the ConstOffset and Offset operands
- VUID-vkCmdTraceRaysKHR-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's viewType **must** match the Dim operand of the OpTypeImage as described in Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types
- VUID-vkCmdTraceRaysKHR-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage **must** match
- VUID-vkCmdTraceRaysKHR-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdTraceRaysKHR-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have four components
- VUID-vkCmdTraceRaysKHR-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdTraceRaysKHR-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64
- VUID-vkCmdTraceRaysKHR-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 32
- VUID-vkCmdTraceRaysKHR-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64
- VUID-vkCmdTraceRaysKHR-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 32
- VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the

VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag **must** not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag **must** not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command
- VUID-vkCmdTraceRaysKHR-None-07288
  Any shader invocation executed by this command **must** terminate
- VUID-vkCmdTraceRaysKHR-None-09600
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdTraceRaysKHR-None-03429
  Any shader group handle referenced by this call **must** have been queried from the bound ray tracing pipeline
- VUID-vkCmdTraceRaysKHR-None-09458
  If the bound ray tracing pipeline state was created with the VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR dynamic state enabled then vkCmdSetRayTracingPipelineStackSizeKHR **must** have been called in the current command buffer prior to this trace command
- VUID-vkCmdTraceRaysKHR-maxPipelineRayRecursionDepth-03679
  This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of maxPipelineRayRecursionDepth used to create the bound ray tracing pipeline
- VUID-vkCmdTraceRaysKHR-commandBuffer-03635
  commandBuffer **must** not be a protected command buffer
- VUID-vkCmdTraceRaysKHR-size-04023
  The size member of pRayGenShaderBindingTable **must** be equal to its stride member
- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03680
  If the buffer from which pRayGenShaderBindingTable->deviceAddress was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03681
  The buffer from which the pRayGenShaderBindingTable->deviceAddress is queried **must** have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag
- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03682
  pRayGenShaderBindingTable->deviceAddress **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment
- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03683
  If the buffer from which pMissShaderBindingTable->deviceAddress was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory

object

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03684
  The buffer from which the pMissShaderBindingTable->deviceAddress is queried **must** have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag
- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03685
  pMissShaderBindingTable->deviceAddress **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment
- VUID-vkCmdTraceRaysKHR-stride-03686
  pMissShaderBindingTable->stride **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment
- VUID-vkCmdTraceRaysKHR-stride-04029
  pMissShaderBindingTable->stride **must** be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03687
  If the buffer from which pHitShaderBindingTable->deviceAddress was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03688
  The buffer from which the pHitShaderBindingTable->deviceAddress is queried **must** have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03689
  pHitShaderBindingTable->deviceAddress **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment
- VUID-vkCmdTraceRaysKHR-stride-03690
  pHitShaderBindingTable->stride **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment
- VUID-vkCmdTraceRaysKHR-stride-04035
  pHitShaderBindingTable->stride **must** be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride
- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03691
  If the buffer from which pCallableShaderBindingTable->deviceAddress was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03692
  The buffer from which the pCallableShaderBindingTable->deviceAddress is queried **must** have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag
- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03693
  pCallableShaderBindingTable->deviceAddress **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment
- VUID-vkCmdTraceRaysKHR-stride-03694
  pCallableShaderBindingTable->stride **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

- VUID-vkCmdTraceRaysKHR-stride-04041
  pCallableShaderBindingTable->stride **must** be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride
- VUID-vkCmdTraceRaysKHR-flags-03696
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, pHitShaderBindingTable->deviceAddress **must** not be zero
- VUID-vkCmdTraceRaysKHR-flags-03697
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, pHitShaderBindingTable->deviceAddress **must** not be zero
- VUID-vkCmdTraceRaysKHR-flags-03511
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, the shader group handle identified by pMissShaderBindingTable->deviceAddress **must** not be zero
- VUID-vkCmdTraceRaysKHR-flags-03512
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an any-hit shader **must** not be zero
- VUID-vkCmdTraceRaysKHR-flags-03513
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute a closest hit shader **must** not be zero
- VUID-vkCmdTraceRaysKHR-flags-03514
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an intersection shader **must** not be zero
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04735
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR **must** have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04736
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR **must** have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR
- VUID-vkCmdTraceRaysKHR-width-03638
  width **must** be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]

- VUID-vkCmdTraceRaysKHR-height-03639
  `height` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[1] × `VkPhysicalDeviceLimits`::`maxComputeWorkGroupSize`[1]
- VUID-vkCmdTraceRaysKHR-depth-03640
  `depth` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[2] × `VkPhysicalDeviceLimits`::`maxComputeWorkGroupSize`[2]
- VUID-vkCmdTraceRaysKHR-width-03641
  `width` × `height` × `depth` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`maxRayDispatchInvocationCount`

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdTraceRaysKHR-pRaygenShaderBindingTable-parameter
  `pRaygenShaderBindingTable` **must** be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure
- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-parameter
  `pMissShaderBindingTable` **must** be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure
- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-parameter
  `pHitShaderBindingTable` **must** be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure
- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-parameter
  `pCallableShaderBindingTable` **must** be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure
- VUID-vkCmdTraceRaysKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdTraceRaysKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdTraceRaysKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdTraceRaysKHR-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

To dispatch ray tracing, with some parameters sourced on the device, use:

```
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirectKHR(
    VkCommandBuffer                             commandBuffer,
    const VkStridedDeviceAddressRegionKHR*      pRaygenShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR*      pMissShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR*      pHitShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR*      pCallableShaderBindingTable,
    VkDeviceAddress                             indirectDeviceAddress);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRaygenShaderBindingTable` is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the ray generation shader stage.
- `pMissShaderBindingTable` is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the miss shader stage.
- `pHitShaderBindingTable` is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the hit shader stage.
- `pCallableShaderBindingTable` is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the callable shader stage.
- `indirectDeviceAddress` is a buffer device address which is a pointer to a VkTraceRaysIndirectCommandKHR structure containing the trace ray parameters.

`vkCmdTraceRaysIndirectKHR` behaves similarly to vkCmdTraceRaysKHR except that the ray trace query dimensions are read by the device from `indirectDeviceAddress` during execution.

Valid Usage

- VUID-vkCmdTraceRaysIndirectKHR-magFilter-04553
  If a VkSampler created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysIndirectKHR-mipmapMode-04770
  If a VkSampler created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this

command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdTraceRaysIndirectKHR-unnormalizedCoordinates-09635
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's levelCount and layerCount **must** be 1
- VUID-vkCmdTraceRaysIndirectKHR-unnormalizedCoordinates-09636
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's viewType **must** be VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D
- VUID-vkCmdTraceRaysIndirectKHR-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features **must** contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT
- VUID-vkCmdTraceRaysIndirectKHR-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT
- VUID-vkCmdTraceRaysIndirectKHR-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT
- VUID-vkCmdTraceRaysIndirectKHR-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT
- VUID-vkCmdTraceRaysIndirectKHR-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it **must** not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY
- VUID-vkCmdTraceRaysIndirectKHR-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdTraceRaysIndirectKHR-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command **must** have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain

VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysIndirectKHR-None-08600
  For each set *n* that is statically used by a bound shader, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a VkPipelineLayout that is compatible for set *n*, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdTraceRaysIndirectKHR-None-08601
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdTraceRaysIndirectKHR-None-10068
  For each array of resources that is used by a bound shader, the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdTraceRaysIndirectKHR-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdTraceRaysIndirectKHR-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, **must** be valid as described by descriptor validity if they are statically used by a bound shader
- VUID-vkCmdTraceRaysIndirectKHR-None-08606
  If the shaderObject feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdTraceRaysIndirectKHR-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not

have been any calls to dynamic state setting commands for any state specified statically in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdTraceRaysIndirectKHR-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage
- VUID-vkCmdTraceRaysIndirectKHR-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage
- VUID-vkCmdTraceRaysIndirectKHR-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage
- VUID-vkCmdTraceRaysIndirectKHR-None-08607
  If the shaderObject feature is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command
- VUID-vkCmdTraceRaysIndirectKHR-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysIndirectKHR-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysIndirectKHR-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysIndirectKHR-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer,

it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysIndirectKHR-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C$_B$C$_R$ conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions
- VUID-vkCmdTraceRaysIndirectKHR-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C$_B$C$_R$ conversion, that object **must** not use the `ConstOffset` and `Offset` operands
- VUID-vkCmdTraceRaysIndirectKHR-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types
- VUID-vkCmdTraceRaysIndirectKHR-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match
- VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-08795
  If a VkImageView created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-08796
  If a VkImageView created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components
- VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-04469
  If a VkBufferView is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that

instruction **must** have a `Width` of 32

- VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, VkImage objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, VkBuffer objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdTraceRaysIndirectKHR-None-07288
  Any shader invocation executed by this command **must** terminate
- VUID-vkCmdTraceRaysIndirectKHR-None-09600
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdTraceRaysIndirectKHR-None-03429
  Any shader group handle referenced by this call **must** have been queried from the bound ray tracing pipeline
- VUID-vkCmdTraceRaysIndirectKHR-None-09458
  If the bound ray tracing pipeline state was created with the `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state enabled then vkCmdSetRayTracingPipelineStackSizeKHR **must** have been called in the current command buffer prior to this trace command
- VUID-vkCmdTraceRaysIndirectKHR-maxPipelineRayRecursionDepth-03679
  This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline
- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-03635
  `commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdTraceRaysIndirectKHR-size-04023
  The `size` member of `pRayGenShaderBindingTable` **must** be equal to its `stride` member
- VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03680
  If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03681
  The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03682
  `pRayGenShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03683
  If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03684
  The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03685
  `pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupBaseAlignment`
- VUID-vkCmdTraceRaysIndirectKHR-stride-03686
  `pMissShaderBindingTable->stride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupHandleAlignment`
- VUID-vkCmdTraceRaysIndirectKHR-stride-04029
  `pMissShaderBindingTable->stride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`maxShaderGroupStride`
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03687
  If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03688
  The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03689
  `pHitShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupBaseAlignment`
- VUID-vkCmdTraceRaysIndirectKHR-stride-03690
  `pHitShaderBindingTable->stride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupHandleAlignment`
- VUID-vkCmdTraceRaysIndirectKHR-stride-04035
  `pHitShaderBindingTable->stride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`maxShaderGroupStride`
- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03691
  If the buffer from which `pCallableShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03692
  The buffer from which the `pCallableShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03693
  `pCallableShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupBaseAlignment`
- VUID-vkCmdTraceRaysIndirectKHR-stride-03694

pCallableShaderBindingTable->stride **must** be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

- VUID-vkCmdTraceRaysIndirectKHR-stride-04041
  pCallableShaderBindingTable->stride **must** be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride
- VUID-vkCmdTraceRaysIndirectKHR-flags-03696
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, pHitShaderBindingTable->deviceAddress **must** not be zero
- VUID-vkCmdTraceRaysIndirectKHR-flags-03697
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, pHitShaderBindingTable->deviceAddress **must** not be zero
- VUID-vkCmdTraceRaysIndirectKHR-flags-03511
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, the shader group handle identified by pMissShaderBindingTable->deviceAddress **must** not be zero
- VUID-vkCmdTraceRaysIndirectKHR-flags-03512
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an any-hit shader **must** not be zero
- VUID-vkCmdTraceRaysIndirectKHR-flags-03513
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute a closest hit shader **must** not be zero
- VUID-vkCmdTraceRaysIndirectKHR-flags-03514
  If the bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an intersection shader **must** not be zero
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04735
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR **must** have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04736
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR **must** have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR
- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03632

If the buffer from which `indirectDeviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03633
  The buffer from which `indirectDeviceAddress` was queried **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03634
  `indirectDeviceAddress` **must** be a multiple of `4`
- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03636
  All device addresses between `indirectDeviceAddress` and `indirectDeviceAddress` + `sizeof` (`VkTraceRaysIndirectCommandKHR`) - 1 **must** be in the buffer device address range of the same buffer
- VUID-vkCmdTraceRaysIndirectKHR-rayTracingPipelineTraceRaysIndirect-03637
  The `rayTracingPipelineTraceRaysIndirect` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdTraceRaysIndirectKHR-pRaygenShaderBindingTable-parameter
  `pRaygenShaderBindingTable` **must** be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure
- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-parameter
  `pMissShaderBindingTable` **must** be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure
- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-parameter
  `pHitShaderBindingTable` **must** be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure
- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-parameter
  `pCallableShaderBindingTable` **must** be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure
- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdTraceRaysIndirectKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdTraceRaysIndirectKHR-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

The `VkTraceRaysIndirectCommandKHR` structure is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommandKHR {
    uint32_t    width;
    uint32_t    height;
    uint32_t    depth;
} VkTraceRaysIndirectCommandKHR;
```

- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

The members of `VkTraceRaysIndirectCommandKHR` have the same meaning as the similarly named parameters of vkCmdTraceRaysKHR.

Valid Usage

- VUID-VkTraceRaysIndirectCommandKHR-width-03638
  `width` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[0] × `VkPhysicalDeviceLimits`::`maxComputeWorkGroupSize`[0]
- VUID-VkTraceRaysIndirectCommandKHR-height-03639
  `height` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[1] × `VkPhysicalDeviceLimits`::`maxComputeWorkGroupSize`[1]
- VUID-VkTraceRaysIndirectCommandKHR-depth-03640
  `depth` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[2] × `VkPhysicalDeviceLimits`::`maxComputeWorkGroupSize`[2]
- VUID-VkTraceRaysIndirectCommandKHR-width-03641
  `width` × `height` × `depth` **must** be less than or equal to

```
    VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount
```

To dispatch ray tracing, with some parameters sourced on the device, use:

```
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirect2KHR(
    VkCommandBuffer                             commandBuffer,
    VkDeviceAddress                             indirectDeviceAddress);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `indirectDeviceAddress` is a buffer device address which is a pointer to a VkTraceRaysIndirectCommand2KHR structure containing the trace ray parameters.

`vkCmdTraceRaysIndirect2KHR` behaves similarly to vkCmdTraceRaysIndirectKHR except that shader binding table parameters as well as dispatch dimensions are read by the device from `indirectDeviceAddress` during execution.

Valid Usage

- VUID-vkCmdTraceRaysIndirect2KHR-magFilter-04553
  If a VkSampler created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysIndirect2KHR-mipmapMode-04770
  If a VkSampler created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdTraceRaysIndirect2KHR-unnormalizedCoordinates-09635
  If a VkSampler created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a VkImageView as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdTraceRaysIndirect2KHR-unnormalizedCoordinates-09636
  If a VkSampler created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a VkImageView as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`
- VUID-vkCmdTraceRaysIndirect2KHR-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`
- VUID-vkCmdTraceRaysIndirect2KHR-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdTraceRaysIndirect2KHR-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT
- VUID-vkCmdTraceRaysIndirect2KHR-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT
- VUID-vkCmdTraceRaysIndirect2KHR-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it **must** not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY
- VUID-vkCmdTraceRaysIndirect2KHR-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdTraceRaysIndirect2KHR-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command **must** have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2KHR
- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
- VUID-vkCmdTraceRaysIndirect2KHR-None-08600
  For each set *n* that is statically used by a bound shader, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with a VkPipelineLayout that is compatible for set *n*, with the VkPipelineLayout used to create the current VkPipeline or the

VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysIndirect2KHR-None-08601
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdTraceRaysIndirect2KHR-None-10068
  For each array of resources that is used by a bound shader, the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdTraceRaysIndirect2KHR-maintenance4-08602
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility
- VUID-vkCmdTraceRaysIndirect2KHR-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, **must** be valid as described by descriptor validity if they are statically used by a bound shader
- VUID-vkCmdTraceRaysIndirect2KHR-None-08606
  If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdTraceRaysIndirect2KHR-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdTraceRaysIndirect2KHR-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage
- VUID-vkCmdTraceRaysIndirect2KHR-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage
- VUID-vkCmdTraceRaysIndirect2KHR-None-08611

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdTraceRaysIndirect2KHR-None-08607
  If the `shaderObject` feature is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command
- VUID-vkCmdTraceRaysIndirect2KHR-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysIndirect2KHR-None-08612
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysIndirect2KHR-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysIndirect2KHR-None-08613
  If the `robustBufferAccess` feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdTraceRaysIndirect2KHR-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions
- VUID-vkCmdTraceRaysIndirect2KHR-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler $Y'C_BC_R$ conversion, that object **must** not use the `ConstOffset` and `Offset` operands
- VUID-vkCmdTraceRaysIndirect2KHR-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types
- VUID-vkCmdTraceRaysIndirect2KHR-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match

- VUID-vkCmdTraceRaysIndirect2KHR-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdTraceRaysIndirect2KHR-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have four components
- VUID-vkCmdTraceRaysIndirect2KHR-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64
- VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 32
- VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64
- VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 32
- VUID-vkCmdTraceRaysIndirect2KHR-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag **must** not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command
- VUID-vkCmdTraceRaysIndirect2KHR-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag **must** not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command
- VUID-vkCmdTraceRaysIndirect2KHR-None-07288
  Any shader invocation executed by this command **must** terminate
- VUID-vkCmdTraceRaysIndirect2KHR-None-09600
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written

- VUID-vkCmdTraceRaysIndirect2KHR-None-03429
  Any shader group handle referenced by this call **must** have been queried from the bound ray tracing pipeline
- VUID-vkCmdTraceRaysIndirect2KHR-None-09458
  If the bound ray tracing pipeline state was created with the `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state enabled then vkCmdSetRayTracingPipelineStackSizeKHR **must** have been called in the current command buffer prior to this trace command
- VUID-vkCmdTraceRaysIndirect2KHR-maxPipelineRayRecursionDepth-03679
  This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline
- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-03635
  `commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03632
  If the buffer from which `indirectDeviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03633
  The buffer from which `indirectDeviceAddress` was queried **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03634
  `indirectDeviceAddress` **must** be a multiple of `4`
- VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03636
  All device addresses between `indirectDeviceAddress` and `indirectDeviceAddress` + `sizeof` (`VkTraceRaysIndirectCommand2KHR`) - 1 **must** be in the buffer device address range of the same buffer
- VUID-vkCmdTraceRaysIndirect2KHR-rayTracingPipelineTraceRaysIndirect2-03637
  The `rayTracingPipelineTraceRaysIndirect2` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdTraceRaysIndirect2KHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdTraceRaysIndirect2KHR-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Compute	Action

The `VkTraceRaysIndirectCommand2KHR` structure is defined as:

```
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommand2KHR {
    VkDeviceAddress    raygenShaderRecordAddress;
    VkDeviceSize       raygenShaderRecordSize;
    VkDeviceAddress    missShaderBindingTableAddress;
    VkDeviceSize       missShaderBindingTableSize;
    VkDeviceSize       missShaderBindingTableStride;
    VkDeviceAddress    hitShaderBindingTableAddress;
    VkDeviceSize       hitShaderBindingTableSize;
    VkDeviceSize       hitShaderBindingTableStride;
    VkDeviceAddress    callableShaderBindingTableAddress;
    VkDeviceSize       callableShaderBindingTableSize;
    VkDeviceSize       callableShaderBindingTableStride;
    uint32_t           width;
    uint32_t           height;
    uint32_t           depth;
} VkTraceRaysIndirectCommand2KHR;
```

- `raygenShaderRecordAddress` is a VkDeviceAddress of the ray generation shader binding table record used by this command.
- `raygenShaderRecordSize` is a VkDeviceSize number of bytes corresponding to the ray generation shader binding table record at base address `raygenShaderRecordAddress`.
- `missShaderBindingTableAddress` is a VkDeviceAddress of the first record in the miss shader binding table used by this command.
- `missShaderBindingTableSize` is a VkDeviceSize number of bytes corresponding to the total size of the miss shader binding table at `missShaderBindingTableAddress` that may be accessed by this

command.

- `missShaderBindingTableStride` is a VkDeviceSize number of bytes between records of the miss shader binding table.
- `hitShaderBindingTableAddress` is a VkDeviceAddress of the first record in the hit shader binding table used by this command.
- `hitShaderBindingTableSize` is a VkDeviceSize number of bytes corresponding to the total size of the hit shader binding table at `hitShaderBindingTableAddress` that may be accessed by this command.
- `hitShaderBindingTableStride` is a VkDeviceSize number of bytes between records of the hit shader binding table.
- `callableShaderBindingTableAddress` is a VkDeviceAddress of the first record in the callable shader binding table used by this command.
- `callableShaderBindingTableSize` is a VkDeviceSize number of bytes corresponding to the total size of the callable shader binding table at `callableShaderBindingTableAddress` that may be accessed by this command.
- `callableShaderBindingTableStride` is a VkDeviceSize number of bytes between records of the callable shader binding table.
- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

The members of `VkTraceRaysIndirectCommand2KHR` have the same meaning as the similarly named parameters of vkCmdTraceRaysKHR.

Indirect shader binding table buffer parameters **must** satisfy the same memory alignment and binding requirements as their counterparts in vkCmdTraceRaysIndirectKHR and vkCmdTraceRaysKHR.

Valid Usage

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03680
  If the buffer from which `raygenShaderRecordAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03681
  The buffer from which the `raygenShaderRecordAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03682
  `raygenShaderRecordAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`
- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03683
  If the buffer from which `missShaderBindingTableAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03684
  The buffer from which the `missShaderBindingTableAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03685
  `missShaderBindingTableAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupBaseAlignment`
- VUID-VkTraceRaysIndirectCommand2KHR-stride-03686
  `missShaderBindingTableStride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupHandleAlignment`
- VUID-VkTraceRaysIndirectCommand2KHR-stride-04029
  `missShaderBindingTableStride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`maxShaderGroupStride`
- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03687
  If the buffer from which `hitShaderBindingTableAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03688
  The buffer from which the `hitShaderBindingTableAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03689
  `hitShaderBindingTableAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupBaseAlignment`
- VUID-VkTraceRaysIndirectCommand2KHR-stride-03690
  `hitShaderBindingTableStride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupHandleAlignment`
- VUID-VkTraceRaysIndirectCommand2KHR-stride-04035
  `hitShaderBindingTableStride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`maxShaderGroupStride`
- VUID-VkTraceRaysIndirectCommand2KHR-pCallableShaderBindingTable-03691
  If the buffer from which `callableShaderBindingTableAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkTraceRaysIndirectCommand2KHR-pCallableShaderBindingTable-03692
  The buffer from which the `callableShaderBindingTableAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag
- VUID-VkTraceRaysIndirectCommand2KHR-pCallableShaderBindingTable-03693
  `callableShaderBindingTableAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupBaseAlignment`
- VUID-VkTraceRaysIndirectCommand2KHR-stride-03694
  `callableShaderBindingTableStride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`shaderGroupHandleAlignment`
- VUID-VkTraceRaysIndirectCommand2KHR-stride-04041
  `callableShaderBindingTableStride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`maxShaderGroupStride`

- VUID-VkTraceRaysIndirectCommand2KHR-flags-03696
  If the bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, `hitShaderBindingTableAddress` **must** not be zero
- VUID-VkTraceRaysIndirectCommand2KHR-flags-03697
  If the bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, `hitShaderBindingTableAddress` **must** not be zero
- VUID-VkTraceRaysIndirectCommand2KHR-flags-03511
  If the bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by `missShaderBindingTableAddress` **must** not be zero
- VUID-VkTraceRaysIndirectCommand2KHR-flags-03512
  If the bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute an any-hit shader **must** not be zero
- VUID-VkTraceRaysIndirectCommand2KHR-flags-03513
  If the bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute a closest hit shader **must** not be zero
- VUID-VkTraceRaysIndirectCommand2KHR-flags-03514
  If the bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute an intersection shader **must** not be zero
- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-04735
  Any non-zero hit shader group entries in the table identified by `hitShaderBindingTableAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` **must** have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`
- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-04736
  Any non-zero hit shader group entries in the table identified by `hitShaderBindingTableAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` **must** have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`
- VUID-VkTraceRaysIndirectCommand2KHR-width-03638
  `width` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[0] × `VkPhysicalDeviceLimits`::`maxComputeWorkGroupSize`[0]
- VUID-VkTraceRaysIndirectCommand2KHR-height-03639
  `height` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[1] × `VkPhysicalDeviceLimits`::`maxComputeWorkGroupSize`[1]

- VUID-VkTraceRaysIndirectCommand2KHR-depth-03640
  `depth` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxComputeWorkGroupCount`[2] × `VkPhysicalDeviceLimits`::`maxComputeWorkGroupSize`[2]
- VUID-VkTraceRaysIndirectCommand2KHR-width-03641
  `width` × `height` × `depth` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`::`maxRayDispatchInvocationCount`

37.3. Shader Binding Table

A *shader binding table* is a resource which establishes the relationship between the ray tracing pipeline and the acceleration structures that were built for the ray tracing pipeline. It indicates the shaders that operate on each geometry in an acceleration structure. In addition, it contains the resources accessed by each shader, including indices of textures, buffer device addresses, and constants. The application allocates and manages *shader binding tables* as VkBuffer objects.

Each entry in the shader binding table consists of `shaderGroupHandleSize` bytes of data, either as queried by vkGetRayTracingShaderGroupHandlesKHR to refer to those specified shaders, or all zeros to refer to a zero shader group. A zero shader group behaves as though it is a shader group consisting entirely of `VK_SHADER_UNUSED_KHR`. The remainder of the data specified by the stride is application-visible data that can be referenced by a `ShaderRecordBufferKHR` block in the shader.

The shader binding tables to use in a ray tracing pipeline are passed to the vkCmdTraceRaysKHR, or vkCmdTraceRaysIndirectKHR commands. Shader binding tables are read-only in shaders that are executing on the ray tracing pipeline.

Shader variables identified with the `ShaderRecordBufferKHR` storage class are used to access the provided shader binding table. Such variables **must** be:

- typed as `OpTypeStruct`, or an array of this type,
- identified with a `Block` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in Offset and Stride Assignment.

The `Offset` decoration for any member of a `Block`-decorated variable in the `ShaderRecordBufferKHR` storage class **must** not cause the space required for that variable to extend outside the range [0, `maxStorageBufferRange`).

Accesses to the shader binding table from ray tracing pipelines **must** be synchronized with the `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_SHADER_READ_BIT`.

NOTE

Because different shader record buffers can be associated with the same shader, a shader variable with `ShaderRecordBufferKHR` storage class will not be dynamically uniform if different invocations of the same shader can reference different data in the shader record buffer, such as if the same shader occurs twice in the shader binding table with a different shader record buffer. In this case, indexing resources based on values in the `ShaderRecordBufferKHR` storage class, the index should be

decorated as NonUniform.

37.3.1. Indexing Rules

In order to execute the correct shaders and access the correct resources during a ray tracing dispatch, the implementation **must** be able to locate shader binding table entries at various stages of execution. This is accomplished by defining a set of indexing rules that compute shader binding table record positions relative to the buffer's base address in memory. The application **must** organize the contents of the shader binding table's memory in a way that application of the indexing rules will lead to correct records.

Ray Generation Shaders

Only one ray generation shader is executed per ray tracing dispatch.

For vkCmdTraceRaysKHR, the location of the ray generation shader is specified by the pRaygenShaderBindingTable->deviceAddress parameter — there is no indexing. All data accessed **must** be less than pRaygenShaderBindingTable->size bytes from deviceAddress. pRaygenShaderBindingTable->stride is unused, and **must** be equal to pRaygenShaderBindingTable->size.

Hit Shaders

The base for the computation of intersection, any-hit, and closest hit shader locations is the instanceShaderBindingTableRecordOffset value stored with each instance of a top-level acceleration structure (VkAccelerationStructureInstanceKHR). This value determines the beginning of the shader binding table records for a given instance.

In the following rule, geometryIndex refers to the geometry index of the intersected geometry within the instance.

The sbtRecordOffset and sbtRecordStride values are passed in as parameters to traceRayEXT() calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, these correspond to the SBTOffset and SBTStride parameters to the pipeline trace ray instructions.

The result of this computation is then added to pHitShaderBindingTable->deviceAddress, a device address passed to vkCmdTraceRaysKHR .

For vkCmdTraceRaysKHR, the complete rule to compute a hit shader binding table record address in the pHitShaderBindingTable is:

pHitShaderBindingTable->deviceAddress + pHitShaderBindingTable->stride × (instanceShaderBindingTableRecordOffset + geometryIndex × sbtRecordStride + sbtRecordOffset)

All data accessed **must** be less than pHitShaderBindingTable->size bytes from the base address.

Miss Shaders

A miss shader is executed whenever a ray query fails to find an intersection for the given scene geometry. Multiple miss shaders **may** be executed throughout a ray tracing dispatch.

The base for the computation of miss shader locations is `pMissShaderBindingTable->deviceAddress`, a device address passed into vkCmdTraceRaysKHR .

The `missIndex` value is passed in as a parameter to `traceRayEXT`() calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the `MissIndex` parameter to the pipeline trace ray instructions.

For vkCmdTraceRaysKHR, the complete rule to compute a miss shader binding table record address in the `pMissShaderBindingTable` is:

```
pMissShaderBindingTable->deviceAddress + pMissShaderBindingTable->stride × missIndex
```

All data accessed **must** be less than `pMissShaderBindingTable->size` bytes from the base address.

Callable Shaders

A callable shader is executed when requested by a ray tracing shader. Multiple callable shaders **may** be executed throughout a ray tracing dispatch.

The base for the computation of callable shader locations is `pCallableShaderBindingTable->deviceAddress`, a device address passed into vkCmdTraceRaysKHR .

The `sbtRecordIndex` value is passed in as a parameter to `executeCallableEXT`() calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the `SBTIndex` parameter to the `OpExecuteCallableKHR` instruction.

For vkCmdTraceRaysKHR, the complete rule to compute a callable shader binding table record address in the `pCallableShaderBindingTable` is:

```
pCallableShaderBindingTable->deviceAddress + pCallableShaderBindingTable->stride × sbtRecordIndex
```

All data accessed **must** be less than `pCallableShaderBindingTable->size` bytes from the base address.

37.4. Ray Tracing Pipeline Stack

Ray tracing pipelines have a potentially large set of shaders which **may** be invoked in various call chain combinations to perform ray tracing. To store parameters for a given shader execution, an implementation **may** use a stack of data in memory. This stack **must** be sized to the sum of the stack sizes of all shaders in any call chain executed by the application.

If the stack size is not set explicitly, the stack size for a pipeline is:

rayGenStackMax + min(1, `maxPipelineRayRecursionDepth`) × max(closestHitStackMax, missStackMax, intersectionStackMax + anyHitStackMax) + max(0, `maxPipelineRayRecursionDepth` -1) × max(closestHitStackMax, missStackMax) + 2 × callableStackMax

where rayGenStackMax, closestHitStackMax, missStackMax, anyHitStackMax, intersectionStackMax, and callableStackMax are the maximum stack values queried by the respective shader stages for any shaders in any shader groups defined by the pipeline.

This stack size is potentially significant, so an application **may** want to provide a more accurate stack size after pipeline compilation. The value that the application provides is the maximum value of the sum of all shaders in a call chain across all possible call chains, taking into account any application specific knowledge about the properties of the call chains.

NOTE

For example, if an application has two types of closest hit and miss shaders that it can use but the first level of rays will only use the first kind (possibly reflection) and the second level will only use the second kind (occlusion or shadow ray, for example) then the application can compute the stack size by something similar to:

`rayGenStack` + max(`closestHit1Stack`, `miss1Stack`) + max(`closestHit2Stack`, `miss2Stack`)

This is guaranteed to be no larger than the default stack size computation which assumes that both call levels may be the larger of the two.

37.5. Ray Tracing Capture Replay

In a similar way to bufferDeviceAddressCaptureReplay, the `rayTracingPipelineShaderGroupHandleCaptureReplay` feature allows the querying of opaque data which **can** be used in a future replay.

During the capture phase, capture/replay tools are expected to query opaque data for shader group handle replay using vkGetRayTracingCaptureReplayShaderGroupHandlesKHR.

Providing the opaque data during replay, using VkRayTracingShaderGroupCreateInfoKHR ::`pShaderGroupCaptureReplayHandle` at pipeline creation time, causes the implementation to generate identical shader group handles to those in the capture phase, allowing capture/replay tools to reuse previously recorded shader binding table buffer contents or to obtain the same handles by calling vkGetRayTracingCaptureReplayShaderGroupHandlesKHR again.

Chapter 38. Video Coding

Vulkan implementations **may** expose one or more queue families supporting video coding operations. These operations are performed by recording them into a command buffer within a video coding scope, and submitting them to queues with compatible video coding capabilities.

The Vulkan video functionalities are designed to be made available through a set of APIs built on top of each other, consisting of:

- A core API providing common video coding functionalities,
- APIs providing codec-independent video decode and video encode related functionalities, respectively,
- Additional codec-specific APIs built on top of those.

This chapter details the fundamental components and operations of these.

38.1. Video Picture Resources

In the context of video coding, multidimensional arrays of image data that **can** be used as the source or target of video coding operations are referred to as *video picture resources*. They **may** store additional metadata that includes implementation-private information used during the execution of video coding operations, as discussed later.

Video picture resources are backed by VkImage objects. Individual subregions of VkImageView objects created from such resources **can** be used as decode output pictures, encode input pictures, reconstructed pictures, and/or reference pictures.

The parameters of a video picture resource are specified using a `VkVideoPictureResourceInfoKHR` structure.

The `VkVideoPictureResourceInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoPictureResourceInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkOffset2D         codedOffset;
    VkExtent2D         codedExtent;
    uint32_t           baseArrayLayer;
    VkImageView        imageViewBinding;
} VkVideoPictureResourceInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `codedOffset` is the offset in texels of the image subregion to use.
- `codedExtent` is the size in pixels of the coded image data.

- `baseArrayLayer` is the array layer of the image view specified in `imageViewBinding` to use as the video picture resource.
- `imageViewBinding` is an image view representing the video picture resource.

The image subresource referred to by such a structure is defined as the image array layer index specified in `baseArrayLayer` relative to the image subresource range the image view specified in `imageViewBinding` was created with.

The meaning of the `codedOffset` and `codedExtent` depends on the command and context the video picture resource is used in, as well as on the used video profile and corresponding codec-specific semantics, as described later.

A video picture resource is uniquely defined by the image subresource referred to by an instance of this structure, together with the `codedOffset` and `codedExtent` members that identify the image subregion within the image subresource referenced corresponding to the video picture resource according to the particular codec-specific semantics.

Accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::`pictureAccessGranularity`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. As a result, given an effective image subregion corresponding to a video picture resource, the actual image subregion accessed **may** be larger than that as it **may** include additional padding texels due to the picture access granularity. Any writes performed by video coding operations to such padding texels will result in undefined texel values.

Two video picture resources match if they refer to the same image subresource and they specify identical `codedOffset` and `codedExtent` values.

Valid Usage

- VUID-VkVideoPictureResourceInfoKHR-baseArrayLayer-07175
  `baseArrayLayer` **must** be less than the VkImageViewCreateInfo ::`subresourceRange.layerCount` specified when the image view `imageViewBinding` was created

Valid Usage (Implicit)

- VUID-VkVideoPictureResourceInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_PICTURE_RESOURCE_INFO_KHR`
- VUID-VkVideoPictureResourceInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkVideoPictureResourceInfoKHR-imageViewBinding-parameter
  `imageViewBinding` **must** be a valid VkImageView handle

38.2. Decoded Picture Buffer

An integral part of video coding pipelines is the reconstruction of pictures from a compressed video bitstream. A *reconstructed picture* is a video picture resource resulting from this process.

Such reconstructed pictures **can** be used as *reference pictures* in subsequent video coding operations to provide predictions of the values of samples of subsequently decoded or encoded pictures. The correct use of such reconstructed pictures as reference pictures is driven by the video compression standard, the implementation, and the application-specific use cases.

The list of reference pictures used to provide such predictions within a single video coding operation is referred to as the list of *active reference pictures*.

The *decoded picture buffer (DPB)* is an indexed data structure that maintains the set of reference pictures available to be used in video coding operations. Individual indexed entries of the DPB are referred to as the *decoded picture buffer (DPB) slots*. The range of valid DPB slot indices is between zero and `N-1`, where `N` is the capacity of the DPB. Each DPB slot **can** refer to a reference picture containing a *video frame* or **can** refer to up to two reference pictures containing the top and/or bottom *fields* that, when both present, together represent a full *video frame* .

In Vulkan, the state and the backing store of the DPB is separated as follows:

- The state of individual DPB slots is maintained by video session objects.
- The backing store of DPB slots is provided by subregions of VkImage objects used as video picture resources.

In addition, the implementation **may** also maintain opaque metadata associated with DPB slots, including:

- *Reference picture metadata* corresponding to the video picture resource associated with the DPB slot.

Such metadata **may** be stored by the implementation as part of the DPB slot state maintained by the video session, or as part of the video picture resource backing the DPB slot.

Any metadata stored in the video picture resources backing DPB slots are independent of the video session used to store it, hence such video picture resources **can** be shared with other video sessions. Correspondingly, any metadata that is dependent on the video session will always be stored as part of the DPB slot state maintained by that video session.

The responsibility of managing the DPB is split between the application and the implementation as follows:

- The application maintains the association between DPB slot indices and corresponding video picture resources.
- The implementation maintains global and per-slot opaque reference picture metadata.

In addition, the application is also responsible for managing the mapping between the codec-specific picture IDs and DPB slots, and any other codec-specific states unless otherwise specified.

38.2.1. DPB Slot States

At a given time, each DPB slot is either in *active* or *inactive* state. Initially, all DPB slots managed by a video session are in *inactive* state.

A DPB slot **can** be *activated* by using it as the target of picture reconstruction in a video coding operation with the reconstructed picture requested to be set up as a reference picture, according to the codec-specific semantics, changing its state to *active* and associating it with a *picture reference* to the reconstructed pictures.

Some video coding standards allow multiple picture references to be associated with a single DPB slot. In this case the state of the individual picture references **can** be independently updated.

> **NOTE** As an example, H.264 decoding allows associating a separate top field and bottom field picture with the same DPB slot.

As part of reference picture setup, the implementation **may** also generate reference picture metadata. Such reference picture metadata is specific to each picture reference associated with the DPB slot.

If such a video coding operation completes successfully, the activated DPB slot will have a *valid picture reference* and the reconstructed picture is associated with the DPB slot. This is true even if the DPB slot is used as the target of a picture reconstruction that only sets up a top field or bottom field reference picture and thus does not yet refer to a complete frame. However, if any data provided as input to such a video coding operation is not compliant with the video compression standard used, that video coding operation **may** complete unsuccessfully, in which case the activated DPB slot will have an *invalid picture reference*. This is true even if the DPB slot previously had a valid picture reference to a top field or bottom field reference picture, but the reconstruction of the other field corresponding to the DPB slot failed.

The application **can** use queries to get feedback about the outcome of video coding operations and use the resulting VkQueryResultStatusKHR value to determine whether the video coding operation completed successfully (result status is positive) or unsuccessfully (result status is negative).

Using a reference picture associated with a DPB slot that has an *invalid picture reference* as an active reference picture in subsequent video coding operations is legal, however, the contents of the outputs of such operations are undefined, and any DPB slots activated by such video coding operations will also have an *invalid picture reference*. This is true even if such video coding operations **may** otherwise complete successfully.

A DPB slot **can** also be *deactivated* by the application, changing its state to *inactive* and invalidating any picture references and reference picture metadata associated with the DPB slot.

If an already active DPB slot is used as the target of picture reconstruction in a video coding operation, but the decoded picture is not requested to be set up as a reference picture, according to the codec-specific semantics, no reference picture setup happens and the corresponding picture reference and reference picture metadata is invalidated within the DPB slot. If the DPB slot no longer has any associated picture references after such an operation, the DPB slot is implicitly deactivated.

If an already active DPB slot is used as the target of picture reconstruction when decoding a field picture that is not marked as reference, then the behavior is as follows:

- If the DPB slot is currently associated with a frame, then the DPB slot is deactivated.
- If the DPB slot is not currently associated with a top field picture and the decoded picture is a top field picture, or if the DPB slot is not currently associated with a bottom field picture and the decoded picture is a bottom field picture, then the other field picture association of the DPB slot, if any, is not disturbed.
- If the DPB slot is currently associated with a top field picture and the decoded picture is a top field picture, or if the DPB slot is currently associated with a bottom field picture and the decoded picture is a bottom field picture, then that picture association is invalidated, without disturbing the other field picture association, if any. If the DPB slot no longer has any associated picture references after such an operation, the DPB slot is implicitly deactivated.

A DPB slot **can** be activated with a new frame even if it is already active. In this case all previous associations of the DPB slots with reference pictures are replaced with an association with the reconstructed picture used to activate it.

If an already active DPB slot is activated with a reconstructed field picture, then the behavior is as follows:

- If the DPB slot is currently associated with a frame, then that association is replaced with an association with the reconstructed field picture used to activate it.
- If the DPB slot is not currently associated with a top field picture and the DPB slot is activated with a top field picture, or if the DPB slot is not currently associated with a bottom field picture and the DPB slot is activated with a bottom field picture, then the DPB slot is associated with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.
- If the DPB slot is currently associated with a top field picture and the DPB slot is activated with a new top field picture, or if the DPB slot is currently associated with a bottom field picture and the DPB slot is activated with a new bottom field picture, then that association is replaced with an association with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.

38.3. Video Profiles

The `VkVideoProfileInfoKHR` structure is defined as follows:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileInfoKHR {
    VkStructureType                      sType;
    const void*                          pNext;
    VkVideoCodecOperationFlagBitsKHR     videoCodecOperation;
    VkVideoChromaSubsamplingFlagsKHR     chromaSubsampling;
    VkVideoComponentBitDepthFlagsKHR     lumaBitDepth;
    VkVideoComponentBitDepthFlagsKHR     chromaBitDepth;
} VkVideoProfileInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `videoCodecOperation` is a VkVideoCodecOperationFlagBitsKHR value specifying a video codec operation.
- `chromaSubsampling` is a bitmask of VkVideoChromaSubsamplingFlagBitsKHR specifying video chroma subsampling information.
- `lumaBitDepth` is a bitmask of VkVideoComponentBitDepthFlagBitsKHR specifying video luma bit depth information.
- `chromaBitDepth` is a bitmask of VkVideoComponentBitDepthFlagBitsKHR specifying video chroma bit depth information.

Video profiles are provided as input to video capability queries such as vkGetPhysicalDeviceVideoCapabilitiesKHR or vkGetPhysicalDeviceVideoFormatPropertiesKHR, as well as when creating resources to be used by video coding operations such as images, buffers, query pools, and video sessions.

The full description of a video profile is specified by an instance of this structure, and the codec-specific and auxiliary structures provided in its `pNext` chain.

When this structure is specified as an input parameter to vkGetPhysicalDeviceVideoCapabilitiesKHR, or through the `pProfiles` member of a VkVideoProfileListInfoKHR structure in the `pNext` chain of the input parameter of a query command such as vkGetPhysicalDeviceVideoFormatPropertiesKHR or vkGetPhysicalDeviceImageFormatProperties2KHR, the following error codes indicate specific causes of the failure of the query operation:

- `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR` specifies that the requested video picture layout (e.g. through the `pictureLayout` member of a VkVideoDecodeH264ProfileInfoKHR structure included in the `pNext` chain of `VkVideoProfileInfoKHR`) is not supported.
- `VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR` specifies that a video profile operation specified by `videoCodecOperation` is not supported.
- `VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR` specifies that video format parameters specified by `chromaSubsampling`, `lumaBitDepth`, or `chromaBitDepth` are not supported.
- `VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR` specifies that the codec-specific parameters corresponding to the video codec operation are not supported.

Valid Usage

- VUID-VkVideoProfileInfoKHR-chromaSubsampling-07013
  `chromaSubsampling` **must** have a single bit set
- VUID-VkVideoProfileInfoKHR-lumaBitDepth-07014
  `lumaBitDepth` **must** have a single bit set
- VUID-VkVideoProfileInfoKHR-chromaSubsampling-07015
  If `chromaSubsampling` is not `VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR`, then `chromaBitDepth` **must** have a single bit set
- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07179
  If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain **must** include a VkVideoDecodeH264ProfileInfoKHR structure
- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07180
  If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain **must** include a VkVideoDecodeH265ProfileInfoKHR structure
- VUID-VkVideoProfileInfoKHR-videoCodecOperation-09256
  If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the `pNext` chain **must** include a VkVideoDecodeAV1ProfileInfoKHR structure
- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07181
  If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the `pNext` chain **must** include a VkVideoEncodeH264ProfileInfoKHR structure
- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07182
  If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the `pNext` chain **must** include a VkVideoEncodeH265ProfileInfoKHR structure
- VUID-VkVideoProfileInfoKHR-videoCodecOperation-10262
  If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR`, then the `pNext` chain **must** include a VkVideoEncodeAV1ProfileInfoKHR structure

Valid Usage (Implicit)

- VUID-VkVideoProfileInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_PROFILE_INFO_KHR`
- VUID-VkVideoProfileInfoKHR-videoCodecOperation-parameter
  `videoCodecOperation` **must** be a valid VkVideoCodecOperationFlagBitsKHR value
- VUID-VkVideoProfileInfoKHR-chromaSubsampling-parameter
  `chromaSubsampling` **must** be a valid combination of VkVideoChromaSubsamplingFlagBitsKHR values
- VUID-VkVideoProfileInfoKHR-chromaSubsampling-requiredbitmask
  `chromaSubsampling` **must** not be `0`
- VUID-VkVideoProfileInfoKHR-lumaBitDepth-parameter
  `lumaBitDepth` **must** be a valid combination of VkVideoComponentBitDepthFlagBitsKHR

values

- VUID-VkVideoProfileInfoKHR-lumaBitDepth-requiredbitmask
  `lumaBitDepth` **must** not be `0`
- VUID-VkVideoProfileInfoKHR-chromaBitDepth-parameter
  `chromaBitDepth` **must** be a valid combination of VkVideoComponentBitDepthFlagBitsKHR values

Possible values of VkVideoProfileInfoKHR::`videoCodecOperation`, specifying the type of video coding operation and video compression standard used by a video profile, are:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodecOperationFlagBitsKHR {
    VK_VIDEO_CODEC_OPERATION_NONE_KHR = 0,
  // Provided by VK_KHR_video_encode_h264
    VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR = 0x00010000,
  // Provided by VK_KHR_video_encode_h265
    VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR = 0x00020000,
  // Provided by VK_KHR_video_decode_h264
    VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR = 0x00000001,
  // Provided by VK_KHR_video_decode_h265
    VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR = 0x00000002,
  // Provided by VK_KHR_video_decode_av1
    VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR = 0x00000004,
  // Provided by VK_KHR_video_encode_av1
    VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR = 0x00040000,
} VkVideoCodecOperationFlagBitsKHR;
```

- `VK_VIDEO_CODEC_OPERATION_NONE_KHR` specifies that no video codec operations are supported.
- `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` specifies support for H.264 decode operations.
- `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` specifies support for H.265 decode operations.
- `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` specifies support for AV1 decode operations.
- `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` specifies support for H.264 encode operations.
- `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` specifies support for H.265 encode operations.
- `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR` specifies support for AV1 encode operations.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodecOperationFlagsKHR;
```

`VkVideoCodecOperationFlagsKHR` is a bitmask type for setting a mask of zero or more VkVideoCodecOperationFlagBitsKHR.

The video format chroma subsampling is defined with the following enums:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoChromaSubsamplingFlagBitsKHR {
    VK_VIDEO_CHROMA_SUBSAMPLING_INVALID_KHR = 0,
    VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR = 0x00000001,
    VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR = 0x00000002,
    VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR = 0x00000004,
    VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR = 0x00000008,
} VkVideoChromaSubsamplingFlagBitsKHR;
```

- VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR specifies that the format is monochrome.
- VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR specified that the format is 4:2:0 chroma subsampled, i.e. the two chroma components are sampled horizontally and vertically at half the sample rate of the luma component.
- VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR - the format is 4:2:2 chroma subsampled, i.e. the two chroma components are sampled horizontally at half the sample rate of luma component.
- VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR - the format is 4:4:4 chroma sampled, i.e. all three components of the $Y'C_BC_R$ format are sampled at the same rate, thus there is no chroma subsampling.

Chroma subsampling is described in more detail in the Chroma Reconstruction section.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoChromaSubsamplingFlagsKHR;
```

VkVideoChromaSubsamplingFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoChromaSubsamplingFlagBitsKHR.

Possible values for the video format component bit depth are:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoComponentBitDepthFlagBitsKHR {
    VK_VIDEO_COMPONENT_BIT_DEPTH_INVALID_KHR = 0,
    VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR = 0x00000001,
    VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR = 0x00000004,
    VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR = 0x00000010,
} VkVideoComponentBitDepthFlagBitsKHR;
```

- VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR specifies a component bit depth of 8 bits.
- VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR specifies a component bit depth of 10 bits.
- VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR specifies a component bit depth of 12 bits.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoComponentBitDepthFlagsKHR;
```

VkVideoComponentBitDepthFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoComponentBitDepthFlagBitsKHR.

Additional information about the video decode use case **can** be provided by adding a VkVideoDecodeUsageInfoKHR structure to the pNext chain of VkVideoProfileInfoKHR.

The VkVideoDecodeUsageInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeUsageInfoKHR {
    VkStructureType                sType;
    const void*                    pNext;
    VkVideoDecodeUsageFlagsKHR     videoUsageHints;
} VkVideoDecodeUsageInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- videoUsageHints is a bitmask of VkVideoDecodeUsageFlagBitsKHR specifying hints about the intended use of the video decode profile.

Valid Usage (Implicit)

- VUID-VkVideoDecodeUsageInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_DECODE_USAGE_INFO_KHR
- VUID-VkVideoDecodeUsageInfoKHR-videoUsageHints-parameter
  videoUsageHints **must** be a valid combination of VkVideoDecodeUsageFlagBitsKHR values

The following bits **can** be specified in VkVideoDecodeUsageInfoKHR::videoUsageHints as a hint about the video decode use case:

```
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeUsageFlagBitsKHR {
    VK_VIDEO_DECODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR = 0x00000002,
    VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR = 0x00000004,
} VkVideoDecodeUsageFlagBitsKHR;
```

- VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR specifies that video decoding is intended to be used in conjunction with video encoding to transcode a video bitstream with the same and/or different codecs.
- VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR specifies that video decoding is intended to be used to consume a local video bitstream.
- VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR specifies that video decoding is intended to be used to

consume a video bitstream received as a continuous flow over network.

NOTE	There are no restrictions on the combination of bits that **can** be specified by the application. However, applications **should** use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeUsageFlagsKHR;
```

VkVideoDecodeUsageFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoDecodeUsageFlagBitsKHR.

Additional information about the video encode use case **can** be provided by adding a VkVideoEncodeUsageInfoKHR structure to the pNext chain of VkVideoProfileInfoKHR.

The VkVideoEncodeUsageInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeUsageInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkVideoEncodeUsageFlagsKHR      videoUsageHints;
    VkVideoEncodeContentFlagsKHR    videoContentHints;
    VkVideoEncodeTuningModeKHR      tuningMode;
} VkVideoEncodeUsageInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- videoUsageHints is a bitmask of VkVideoEncodeUsageFlagBitsKHR specifying hints about the intended use of the video encode profile.
- videoContentHints is a bitmask of VkVideoEncodeContentFlagBitsKHR specifying hints about the content to be encoded using the video encode profile.
- tuningMode is a VkVideoEncodeTuningModeKHR value specifying the tuning mode to use when encoding with the video profile.

Valid Usage (Implicit)

- VUID-VkVideoEncodeUsageInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_USAGE_INFO_KHR
- VUID-VkVideoEncodeUsageInfoKHR-videoUsageHints-parameter
  videoUsageHints **must** be a valid combination of VkVideoEncodeUsageFlagBitsKHR values
- VUID-VkVideoEncodeUsageInfoKHR-videoContentHints-parameter
  videoContentHints **must** be a valid combination of VkVideoEncodeContentFlagBitsKHR

values

- VUID-VkVideoEncodeUsageInfoKHR-tuningMode-parameter
  If `tuningMode` is not `0`, `tuningMode` **must** be a valid VkVideoEncodeTuningModeKHR value

The following bits **can** be specified in VkVideoEncodeUsageInfoKHR::`videoUsageHints` as a hint about the video encode use case:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeUsageFlagBitsKHR {
    VK_VIDEO_ENCODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR = 0x00000008,
} VkVideoEncodeUsageFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR` specifies that video encoding is intended to be used in conjunction with video decoding to transcode a video bitstream with the same and/or different codecs.
- `VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR` specifies that video encoding is intended to be used to produce a video bitstream that is expected to be sent as a continuous flow over network.
- `VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR` specifies that video encoding is intended to be used for real-time recording for offline consumption.
- `VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR` specifies that video encoding is intended to be used in a video conferencing scenario.

NOTE

There are no restrictions on the combination of bits that **can** be specified by the application. However, applications **should** use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeUsageFlagsKHR;
```

`VkVideoEncodeUsageFlagsKHR` is a bitmask type for setting a mask of zero or more VkVideoEncodeUsageFlagBitsKHR.

The following bits **can** be specified in VkVideoEncodeUsageInfoKHR::`videoContentHints` as a hint about the encoded video content:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeContentFlagBitsKHR {
    VK_VIDEO_ENCODE_CONTENT_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR = 0x00000004,
} VkVideoEncodeContentFlagBitsKHR;
```

- VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR specifies that video encoding is intended to be used to encode camera content.
- VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR specifies that video encoding is intended to be used to encode desktop content.
- VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR specified that video encoding is intended to be used to encode rendered (e.g. game) content.

NOTE

There are no restrictions on the combination of bits that **can** be specified by the application. However, applications **should** use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular content type.

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeContentFlagsKHR;
```

VkVideoEncodeContentFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeContentFlagBitsKHR.

Possible video encode tuning mode values are as follows:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeTuningModeKHR {
    VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR = 1,
    VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR = 2,
    VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR = 3,
    VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR = 4,
} VkVideoEncodeTuningModeKHR;
```

- VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR specifies the default tuning mode.
- VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR specifies that video encoding is tuned for high quality. When using this tuning mode, the implementation **may** compromise the latency of video encoding operations to improve quality.
- VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR specifies that video encoding is tuned for low latency. When using this tuning mode, the implementation **may** compromise quality to increase the performance and lower the latency of video encode operations.

- VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR specifies that video encoding is tuned for ultra-low latency. When using this tuning mode, the implementation **may** compromise quality to maximize the performance and minimize the latency of video encoding operations.
- VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR specifies that video encoding is tuned for lossless encoding. When using this tuning mode, video encode operations produce lossless output.

The VkVideoProfileListInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileListInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    uint32_t                        profileCount;
    const VkVideoProfileInfoKHR*    pProfiles;
} VkVideoProfileListInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- profileCount is the number of elements in the pProfiles array.
- pProfiles is a pointer to an array of VkVideoProfileInfoKHR structures.

NOTE	Video transcoding is an example of a use case that necessitates the specification of multiple profiles in various contexts.

When the application provides a video decode profile and one or more video encode profiles in the profile list, the implementation ensures that any capabilitities returned or resources created are suitable for the video transcoding use cases without the need for manual data transformations.

Valid Usage

- VUID-VkVideoProfileListInfoKHR-pProfiles-06813
  pProfiles **must** not contain more than one element whose videoCodecOperation member specifies a decode operation

Valid Usage (Implicit)

- VUID-VkVideoProfileListInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_PROFILE_LIST_INFO_KHR
- VUID-VkVideoProfileListInfoKHR-pProfiles-parameter
  If profileCount is not 0, pProfiles **must** be a valid pointer to an array of profileCount valid VkVideoProfileInfoKHR structures

38.4. Video Capabilities

38.4.1. Video Coding Capabilities

To query video coding capabilities for a specific video profile, call:

```
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoCapabilitiesKHR(
    VkPhysicalDevice                            physicalDevice,
    const VkVideoProfileInfoKHR*                pVideoProfile,
    VkVideoCapabilitiesKHR*                     pCapabilities);
```

- `physicalDevice` is the physical device from which to query the video decode or encode capabilities.
- `pVideoProfile` is a pointer to a VkVideoProfileInfoKHR structure.
- `pCapabilities` is a pointer to a VkVideoCapabilitiesKHR structure in which the capabilities are returned.

If the video profile described by `pVideoProfile` is supported by the implementation, then this command returns `VK_SUCCESS` and `pCapabilities` is filled with the capabilities supported with the specified video profile. Otherwise, one of the video-profile-specific error codes are returned.

Valid Usage

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07183
  If `pVideoProfile->videoCodecOperation` specifies a decode operation, then the `pNext` chain of `pCapabilities` **must** include a VkVideoDecodeCapabilitiesKHR structure
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07184
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of `pCapabilities` **must** include a VkVideoDecodeH264CapabilitiesKHR structure
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07185
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain of `pCapabilities` **must** include a VkVideoDecodeH265CapabilitiesKHR structure
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-09257
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the `pNext` chain of `pCapabilities` **must** include a VkVideoDecodeAV1CapabilitiesKHR structure
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07186
  If `pVideoProfile->videoCodecOperation` specifies an encode operation, then the `pNext` chain of `pCapabilities` **must** include a VkVideoEncodeCapabilitiesKHR structure
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07187
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`,

then the pNext chain of pCapabilities **must** include a VkVideoEncodeH264CapabilitiesKHR structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07188
  If pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain of pCapabilities **must** include a VkVideoEncodeH265CapabilitiesKHR structure
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-10263
  If pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the pNext chain of pCapabilities **must** include a VkVideoEncodeAV1CapabilitiesKHR structure

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-physicalDevice-parameter
  physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-parameter
  pVideoProfile **must** be a valid pointer to a valid VkVideoProfileInfoKHR structure
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pCapabilities-parameter
  pCapabilities **must** be a valid pointer to a VkVideoCapabilitiesKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR

The VkVideoCapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoCapabilitiesKHR {
    VkStructureType              sType;
    void*                        pNext;
    VkVideoCapabilityFlagsKHR    flags;
    VkDeviceSize                 minBitstreamBufferOffsetAlignment;
    VkDeviceSize                 minBitstreamBufferSizeAlignment;
    VkExtent2D                   pictureAccessGranularity;
    VkExtent2D                   minCodedExtent;
    VkExtent2D                   maxCodedExtent;
    uint32_t                     maxDpbSlots;
    uint32_t                     maxActiveReferencePictures;
    VkExtensionProperties        stdHeaderVersion;
} VkVideoCapabilitiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkVideoCapabilityFlagBitsKHR specifying capability flags.
- `minBitstreamBufferOffsetAlignment` is the minimum alignment for bitstream buffer offsets.
- `minBitstreamBufferSizeAlignment` is the minimum alignment for bitstream buffer range sizes.
- `pictureAccessGranularity` is the granularity at which image access to video picture resources happen.
- `minCodedExtent` is the minimum width and height of the coded frames.
- `maxCodedExtent` is the maximum width and height of the coded frames.
- `maxDpbSlots` is the maximum number of DPB slots supported by a single video session.
- `maxActiveReferencePictures` is the maximum number of active reference pictures a single video coding operation **can** use.
- `stdHeaderVersion` is a VkExtensionProperties structure reporting the Video Std header name and version supported for the video profile.

NOTE It is common for video compression standards to allow using all reference pictures associated with active DPB slots as active reference pictures, hence for video decode profiles the values returned in `maxDpbSlots` and `maxActiveReferencePictures` are often equal. Similarly, in case of video decode profiles supporting field pictures the value of `maxActiveReferencePictures` often equals `maxDpbSlots` × 2.

Valid Usage (Implicit)

- VUID-VkVideoCapabilitiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_CAPABILITIES_KHR`
- VUID-VkVideoCapabilitiesKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkVideoDecodeAV1CapabilitiesKHR,

VkVideoDecodeCapabilitiesKHR, VkVideoDecodeH264CapabilitiesKHR, VkVideoDecodeH265CapabilitiesKHR, VkVideoEncodeAV1CapabilitiesKHR, VkVideoEncodeAV1QuantizationMapCapabilitiesKHR, VkVideoEncodeCapabilitiesKHR, VkVideoEncodeH264CapabilitiesKHR, VkVideoEncodeH264QuantizationMapCapabilitiesKHR, VkVideoEncodeH265CapabilitiesKHR, VkVideoEncodeH265QuantizationMapCapabilitiesKHR, or VkVideoEncodeQuantizationMapCapabilitiesKHR

- VUID-VkVideoCapabilitiesKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique

Bits which **can** be set in VkVideoCapabilitiesKHR::`flags` are:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoCapabilityFlagBitsKHR {
    VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
    VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR = 0x00000002,
} VkVideoCapabilityFlagBitsKHR;
```

- `VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR` specifies that video sessions support producing and consuming protected content.
- `VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR` indicates that the video picture resources associated with the DPB slots of a video session **can** be backed by separate `VkImage` objects. If this capability flag is not present, then all DPB slots of a video session **must** be associated with video picture resources backed by the same `VkImage` object (e.g. using different layers of the same image).

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCapabilityFlagsKHR;
```

`VkVideoCapabilityFlagsKHR` is a bitmask type for setting a mask of zero or more VkVideoCapabilityFlagBitsKHR.

38.4.2. Video Format Capabilities

To enumerate the supported video formats and corresponding capabilities for a specific video profile, call:

```
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoFormatPropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceVideoFormatInfoKHR*   pVideoFormatInfo,
    uint32_t*                                   pVideoFormatPropertyCount,
    VkVideoFormatPropertiesKHR*                 pVideoFormatProperties);
```

- physicalDevice is the physical device from which to query the video format properties.
- pVideoFormatInfo is a pointer to a VkPhysicalDeviceVideoFormatInfoKHR structure specifying the usage and video profiles for which supported image formats and capabilities are returned.
- pVideoFormatPropertyCount is a pointer to an integer related to the number of video format properties available or queried, as described below.
- pVideoFormatProperties is a pointer to an array of VkVideoFormatPropertiesKHR structures in which supported image formats and capabilities are returned.

If pVideoFormatProperties is NULL, then the number of video format properties supported for the given physicalDevice is returned in pVideoFormatPropertyCount. Otherwise, pVideoFormatPropertyCount **must** point to a variable set by the application to the number of elements in the pVideoFormatProperties array, and on return the variable is overwritten with the number of values actually written to pVideoFormatProperties. If the value of pVideoFormatPropertyCount is less than the number of video format properties supported, at most pVideoFormatPropertyCount values will be written to pVideoFormatProperties, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available values were returned.

Video format properties are always queried with respect to a specific set of video profiles. These are specified by chaining the VkVideoProfileListInfoKHR structure to pVideoFormatInfo.

For most use cases, the images are used by a single video session and a single video profile is provided. For a use case such as video transcoding, where a decode session output image **can** be used as encode input in one or more encode sessions, multiple video profiles corresponding to the video sessions that will share the image **must** be provided.

If any of the video profiles specified via VkVideoProfileListInfoKHR::pProfiles are not supported, then this command returns one of the video-profile-specific error codes. Furthermore, if VkPhysicalDeviceVideoFormatInfoKHR::imageUsage includes any image usage flags not supported by the specified video profiles, then this command returns VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR.

This command also returns VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR if VkPhysicalDeviceVideoFormatInfoKHR::imageUsage does not include the appropriate flags as dictated by the decode capability flags returned in VkVideoDecodeCapabilitiesKHR::flags for any of the profiles specified in the VkVideoProfileListInfoKHR structure provided in the pNext chain of pVideoFormatInfo.

If the decode capability flags include VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR but not VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR, then in order to query video format properties for decode DPB and output usage, VkPhysicalDeviceVideoFormatInfoKHR::imageUsage **must** include both VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR and VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR. Otherwise, the call will fail with VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR.

If the decode capability flags include VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR but not VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR, then in order to query video format properties for decode DPB usage, VkPhysicalDeviceVideoFormatInfoKHR::imageUsage **must** include VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, but not VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR. Otherwise, the call will fail with VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR. Similarly, to query video

format properties for decode output usage, VkPhysicalDeviceVideoFormatInfoKHR::imageUsage **must** include VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, but not VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR. Otherwise, the call will fail with VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR.

The imageUsage member of the VkPhysicalDeviceVideoFormatInfoKHR structure specifies the expected video usage flags that the returned video formats **must** support. Correspondingly, the imageUsageFlags member of each VkVideoFormatPropertiesKHR structure returned will contain at least the same set of image usage flags.

If the implementation supports using images of a particular format in operations other than video decode/encode then the imageUsageFlags member of the corresponding VkVideoFormatPropertiesKHR structure returned will include additional image usage flags indicating that.

NOTE

For most use cases, only decode or encode related usage flags are going to be specified. For a use case such as transcode, if the image were to be shared between decode and encode session(s), then both decode and encode related usage flags **can** be set.

Multiple VkVideoFormatPropertiesKHR entries **may** be returned with the same format member with different componentMapping, imageType, or imageTiling values, as described later.

If VkPhysicalDeviceVideoFormatInfoKHR::imageUsageFlags includes VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, multiple VkVideoFormatPropertiesKHR entries **may** be returned with the same format, componentMapping, imageType, and imageTiling member values, but different quantizationMapTexelSize returned in the VkVideoFormatQuantizationMapPropertiesKHR structure, if one is included in the VkVideoFormatPropertiesKHR::pNext chain, when the queried quantization map type supports multiple distinct quantization map texel sizes.

In addition, a different set of VkVideoFormatPropertiesKHR entries **may** be returned depending on the imageUsage member of the VkPhysicalDeviceVideoFormatInfoKHR structure, even for the same set of video profiles, for example, based on whether encode input, encode DPB, decode output, and/or decode DPB usage is requested.

The application **can** select the parameters returned in the VkVideoFormatPropertiesKHR entries and use compatible parameters when creating the input, output, and DPB images. The implementation will report all image creation and usage flags that are valid for images used with the requested video profiles but applications **should** create images only with those that are necessary for the particular use case.

Before creating an image, the application **can** obtain the complete set of supported image format features by calling vkGetPhysicalDeviceImageFormatProperties2KHR using parameters derived from the members of one of the reported VkVideoFormatPropertiesKHR entries and adding the same VkVideoProfileListInfoKHR structure to the pNext chain of VkPhysicalDeviceImageFormatInfo2.

The following applies to all VkVideoFormatPropertiesKHR entries returned by

vkGetPhysicalDeviceVideoFormatPropertiesKHR:

- vkGetPhysicalDeviceFormatProperties2KHR **must** succeed when called with VkVideoFormatPropertiesKHR::format
- If VkVideoFormatPropertiesKHR::imageTiling is VK_IMAGE_TILING_OPTIMAL, then the optimalTilingFeatures returned by vkGetPhysicalDeviceFormatProperties2KHR **must** include all format features required by the image usage flags reported in VkVideoFormatPropertiesKHR::imageUsageFlags for the format, as indicated in the Format Feature Dependent Usage Flags section.
- If VkVideoFormatPropertiesKHR::imageTiling is VK_IMAGE_TILING_LINEAR, then the linearTilingFeatures returned by vkGetPhysicalDeviceFormatProperties2KHR **must** include all format features required by the image usage flags reported in VkVideoFormatPropertiesKHR::imageUsageFlags for the format, as indicated in the Format Feature Dependent Usage Flags section.
- vkGetPhysicalDeviceImageFormatProperties2KHR **must** succeed when called with a VkPhysicalDeviceImageFormatInfo2 structure containing the following information:
  - The pNext chain including the same VkVideoProfileListInfoKHR structure used to call vkGetPhysicalDeviceVideoFormatPropertiesKHR.
  - format set to the value of VkVideoFormatPropertiesKHR::format.
  - type set to the value of VkVideoFormatPropertiesKHR::imageType.
  - tiling set to the value of VkVideoFormatPropertiesKHR::imageTiling.
  - usage set to the value of VkVideoFormatPropertiesKHR::imageUsageFlags.
  - flags set to the value of VkVideoFormatPropertiesKHR::imageCreateFlags.

The componentMapping member of VkVideoFormatPropertiesKHR defines the ordering of the Y'C_BC_R color channels from the perspective of the video codec operations specified in VkVideoProfileListInfoKHR. For example, if the implementation produces video decode output with the format VK_FORMAT_G8_B8R8_2PLANE_420_UNORM where the blue and red chrominance channels are swapped then the componentMapping member of the corresponding VkVideoFormatPropertiesKHR structure will have the following member values:

```
components.r = VK_COMPONENT_SWIZZLE_B;        // Cb component
components.g = VK_COMPONENT_SWIZZLE_IDENTITY; // Y component
components.b = VK_COMPONENT_SWIZZLE_R;        // Cr component
components.a = VK_COMPONENT_SWIZZLE_IDENTITY; // unused, defaults to 1.0
```

Valid Usage

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pNext-06812
  The pNext chain of pVideoFormatInfo **must** include a VkVideoProfileListInfoKHR structure with profileCount greater than 0

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatInfo-parameter
  `pVideoFormatInfo` **must** be a valid pointer to a valid VkPhysicalDeviceVideoFormatInfoKHR structure
- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatPropertyCount-parameter
  `pVideoFormatPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatProperties-parameter
  If the value referenced by `pVideoFormatPropertyCount` is not `0`, and `pVideoFormatProperties` is not `NULL`, `pVideoFormatProperties` **must** be a valid pointer to an array of `pVideoFormatPropertyCount` VkVideoFormatPropertiesKHR structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR`

The `VkPhysicalDeviceVideoFormatInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkPhysicalDeviceVideoFormatInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkImageUsageFlags    imageUsage;
} VkPhysicalDeviceVideoFormatInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageUsage` is a bitmask of VkImageUsageFlagBits specifying the intended usage of the video images.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_FORMAT_INFO_KHR`
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkVideoProfileListInfoKHR
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-parameter
  `imageUsage` **must** be a valid combination of VkImageUsageFlagBits values
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-requiredbitmask
  `imageUsage` **must** not be `0`

The `VkVideoFormatPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoFormatPropertiesKHR {
    VkStructureType       sType;
    void*                 pNext;
    VkFormat              format;
    VkComponentMapping    componentMapping;
    VkImageCreateFlags    imageCreateFlags;
    VkImageType           imageType;
    VkImageTiling         imageTiling;
    VkImageUsageFlags     imageUsageFlags;
} VkVideoFormatPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is a VkFormat that specifies the format that **can** be used with the specified video profiles and image usages.
- `componentMapping` defines the color channel order used for the format. `format` along with `componentMapping` describe how the color channels are ordered when producing video decoder output or are expected to be ordered in video encoder input, when applicable. If the `format` reported does not require component swizzling then all members of `componentMapping` will be set to `VK_COMPONENT_SWIZZLE_IDENTITY`.
- `imageCreateFlags` is a bitmask of VkImageCreateFlagBits specifying the supported image creation flags for the format.
- `imageType` is a VkImageType that specifies the image type the format **can** be used with.

- `imageTiling` is a VkImageTiling that specifies the image tiling the format **can** be used with.
- `imageUsageFlags` is a bitmask of VkImageUsageFlagBits specifying the supported image usage flags for the format.

Valid Usage (Implicit)

- VUID-VkVideoFormatPropertiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_FORMAT_PROPERTIES_KHR`
- VUID-VkVideoFormatPropertiesKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkVideoFormatAV1QuantizationMapPropertiesKHR, VkVideoFormatH265QuantizationMapPropertiesKHR, or VkVideoFormatQuantizationMapPropertiesKHR
- VUID-VkVideoFormatPropertiesKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique

The *list of supported video format properties* for a set of image usage flags with respect to a video profile is defined as the list of VkVideoFormatPropertiesKHR structures and any structures included in its `pNext` chain, obtained by calling vkGetPhysicalDeviceVideoFormatPropertiesKHR with VkPhysicalDeviceVideoFormatInfoKHR::`imageUsage` equal to the VkImageUsageFlags in question and the VkPhysicalDeviceVideoFormatInfoKHR::`pNext` chain including a VkVideoProfileListInfoKHR structure with its `pProfiles` member containing a single array element specifying the VkVideoProfileInfoKHR structure chain describing the video profile in question.

38.5. Video Sessions

Video sessions are objects that represent and maintain the state needed to perform video decode or encode operations using a specific video profile.

In case of video encode profiles this includes the current rate control configuration and the currently set video encode quality level.

Video sessions are represented by `VkVideoSessionKHR` handles:

```
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionKHR)
```

38.5.1. Creating a Video Session

To create a video session object, call:

```
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionKHR(
    VkDevice                                    device,
    const VkVideoSessionCreateInfoKHR*          pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkVideoSessionKHR*                          pVideoSession);
```

- `device` is the logical device that creates the video session.
- `pCreateInfo` is a pointer to a VkVideoSessionCreateInfoKHR structure containing parameters to be used to create the video session.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pVideoSession` is a pointer to a VkVideoSessionKHR handle in which the resulting video session object is returned.

The resulting video session object is said to be created with the video codec operation specified in `pCreateInfo->pVideoProfile->videoCodecOperation`.

The name and version of the codec-specific Video Std header to be used with the video session is specified by the VkExtensionProperties structure pointed to by `pCreateInfo->pStdHeaderVersion`. If a non-existent or unsupported Video Std header version is specified in `pCreateInfo->pStdHeaderVersion->specVersion`, then this command returns `VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR`.

Video session objects are created in *uninitialized* state. In order to transition the video session into *initial* state, the application **must** issue a vkCmdControlVideoCodingKHR command with VkVideoCodingControlInfoKHR::`flags` including `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR`.

Video session objects also maintain the state of the DPB. The number of DPB slots usable with the created video session is specified in `pCreateInfo->maxDpbSlots`, and each slot is initially in the inactive state.

Each DPB slot maintained by the created video session **can** refer to a reference picture representing a video frame.

In addition, if the `videoCodecOperation` member of the VkVideoProfileInfoKHR structure pointed to by `pCreateInfo->pVideoProfile` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pictureLayout` member of the VkVideoDecodeH264ProfileInfoKHR structure provided in the VkVideoProfileInfoKHR::`pNext` chain is not `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR`, then the created video session supports *interlaced* frames and each DPB slot maintained by the created video session **can** instead refer to separate top field and bottom field reference pictures that together **can** represent a full video frame. In this case, it is up to the application, driven by the video content, whether it associates any individual DPB slot with separate top and/or bottom field pictures or a single picture representing a full frame.

The created video session **can** be used to perform video coding operations using video frames up to the maximum size specified in `pCreateInfo->maxCodedExtent`. The minimum frame size allowed is implicitly derived from VkVideoCapabilitiesKHR::`minCodedExtent`, as returned by

vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pCreateInfo->pVideoProfile. Accordingly, the created video session is said to be created with a minCodedExtent equal to that.

In case of video session objects created with a video encode operation, implementations **may** return the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

NOTE Applications **should** not rely on the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

Valid Usage (Implicit)

- VUID-vkCreateVideoSessionKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkCreateVideoSessionKHR-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkVideoSessionCreateInfoKHR structure
- VUID-vkCreateVideoSessionKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateVideoSessionKHR-pVideoSession-parameter
  pVideoSession **must** be a valid pointer to a VkVideoSessionKHR handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR
- VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR

The VkVideoSessionCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionCreateInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    uint32_t                        queueFamilyIndex;
    VkVideoSessionCreateFlagsKHR    flags;
    const VkVideoProfileInfoKHR*    pVideoProfile;
    VkFormat                        pictureFormat;
    VkExtent2D                      maxCodedExtent;
    VkFormat                        referencePictureFormat;
    uint32_t                        maxDpbSlots;
    uint32_t                        maxActiveReferencePictures;
    const VkExtensionProperties*    pStdHeaderVersion;
} VkVideoSessionCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyIndex` is the index of the queue family the created video session will be used with.
- `flags` is a bitmask of VkVideoSessionCreateFlagBitsKHR specifying creation flags.
- `pVideoProfile` is a pointer to a VkVideoProfileInfoKHR structure specifying the video profile the created video session will be used with.
- `pictureFormat` is the image format the created video session will be used with. If `pVideoProfile->videoCodecOperation` specifies a decode operation, then `pictureFormat` is the image format of decode output pictures usable with the created video session. If `pVideoProfile->videoCodecOperation` specifies an encode operation, then `pictureFormat` is the image format of encode input pictures usable with the created video session.
- `maxCodedExtent` is the maximum width and height of the coded frames the created video session will be used with.
- `referencePictureFormat` is the image format of reference pictures stored in the DPB the created video session will be used with.
- `maxDpbSlots` is the maximum number of DPB Slots that **can** be used with the created video session.
- `maxActiveReferencePictures` is the maximum number of active reference pictures that **can** be used in a single video coding operation using the created video session.
- `pStdHeaderVersion` is a pointer to a VkExtensionProperties structure requesting the Video Std header version to use for the `videoCodecOperation` specified in `pVideoProfile`.

Valid Usage

- VUID-VkVideoSessionCreateInfoKHR-protectedMemory-07189
  If the `protectedMemory` feature is not enabled or if VkVideoCapabilitiesKHR::`flags` does not include `VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by

pVideoProfile, then flags **must** not include VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR

- VUID-VkVideoSessionCreateInfoKHR-flags-08371
  If flags includes VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, then videoMaintenance1 **must** be enabled
- VUID-VkVideoSessionCreateInfoKHR-flags-10264
  If flags includes VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR, then the videoEncodeQuantizationMap feature **must** be enabled
- VUID-VkVideoSessionCreateInfoKHR-flags-10265
  If flags includes VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR, then pVideoProfile->videoCodecOperation **must** specify an encode operation
- VUID-VkVideoSessionCreateInfoKHR-flags-10266
  If flags includes VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR, then it **must** not also include VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR
- VUID-VkVideoSessionCreateInfoKHR-flags-10267
  If VkVideoEncodeCapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile, then flags **must** not include VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR
- VUID-VkVideoSessionCreateInfoKHR-flags-10268
  If VkVideoEncodeCapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_CAPABILITY_EMPHASIS_MAP_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile, then flags **must** not include VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR
- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-04845
  pVideoProfile **must** be a supported video profile
- VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04847
  maxDpbSlots **must** be less than or equal to VkVideoCapabilitiesKHR::maxDpbSlots, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile
- VUID-VkVideoSessionCreateInfoKHR-maxActiveReferencePictures-04849
  maxActiveReferencePictures **must** be less than or equal to VkVideoCapabilitiesKHR::maxActiveReferencePictures, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile
- VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04850
  If either maxDpbSlots or maxActiveReferencePictures is 0, then both **must** be 0
- VUID-VkVideoSessionCreateInfoKHR-maxCodedExtent-04851
  maxCodedExtent **must** be between VkVideoCapabilitiesKHR::minCodedExtent and VkVideoCapabilitiesKHR::maxCodedExtent, inclusive, as returned by

vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-04852
  If pVideoProfile->videoCodecOperation specifies a decode operation and maxActiveReferencePictures is greater than 0, then referencePictureFormat **must** be one of the supported decode DPB formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format when called with the imageUsage member of its pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, and with a VkVideoProfileListInfoKHR structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile
- VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-06814
  If pVideoProfile->videoCodecOperation specifies an encode operation and maxActiveReferencePictures is greater than 0, then referencePictureFormat **must** be one of the supported decode DPB formats, as returned by then referencePictureFormat **must** be one of the supported encode DPB formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format when called with the imageUsage member of its pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, and with a VkVideoProfileListInfoKHR structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile
- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04853
  If pVideoProfile->videoCodecOperation specifies a decode operation, then pictureFormat **must** be one of the supported decode output formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format when called with the imageUsage member of its pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, and with a VkVideoProfileListInfoKHR structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile
- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04854
  If pVideoProfile->videoCodecOperation specifies an encode operation, then pictureFormat **must** be one of the supported encode input formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format when called with the imageUsage member of its pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, and with a VkVideoProfileListInfoKHR structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile
- VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-07190
  pStdHeaderVersion->extensionName **must** match VkVideoCapabilitiesKHR::stdHeaderVersion.extensionName, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile
- VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-07191
  pStdHeaderVersion->specVersion **must** be less than or equal to VkVideoCapabilitiesKHR::stdHeaderVersion.specVersion, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile
- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-08251

If pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and the pNext chain of this structure includes a VkVideoEncodeH264SessionCreateInfoKHR structure, then its maxLevelIdc member **must** be less than or equal to VkVideoEncodeH264CapabilitiesKHR::maxLevelIdc, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified in pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-08252
  If pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of this structure includes a VkVideoEncodeH265SessionCreateInfoKHR structure, then its maxLevelIdc member **must** be less than or equal to VkVideoEncodeH265CapabilitiesKHR::maxLevelIdc, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified in pVideoProfile
- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-10269
  If pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the videoEncodeAV1 feature **must** be enabled
- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-10270
  If pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pNext chain of this structure includes a VkVideoEncodeAV1SessionCreateInfoKHR structure, then its maxLevel member **must** be less than or equal to VkVideoEncodeAV1CapabilitiesKHR::maxLevel, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified in pVideoProfile

Valid Usage (Implicit)

- VUID-VkVideoSessionCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_SESSION_CREATE_INFO_KHR
- VUID-VkVideoSessionCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkVideoEncodeAV1SessionCreateInfoKHR, VkVideoEncodeH264SessionCreateInfoKHR, or VkVideoEncodeH265SessionCreateInfoKHR
- VUID-VkVideoSessionCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain **must** be unique
- VUID-VkVideoSessionCreateInfoKHR-flags-parameter
  flags **must** be a valid combination of VkVideoSessionCreateFlagBitsKHR values
- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-parameter
  pVideoProfile **must** be a valid pointer to a valid VkVideoProfileInfoKHR structure
- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-parameter
  pictureFormat **must** be a valid VkFormat value
- VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-parameter
  referencePictureFormat **must** be a valid VkFormat value
- VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-parameter
  pStdHeaderVersion **must** be a valid pointer to a valid VkExtensionProperties structure

Bits which **can** be set in VkVideoSessionCreateInfoKHR::flags are:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoSessionCreateFlagBitsKHR {
    VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
  // Provided by VK_KHR_video_encode_queue
    VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR = 0x00000002,
  // Provided by VK_KHR_video_maintenance1
    VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR = 0x00000004,
  // Provided by VK_KHR_video_encode_quantization_map
    VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR = 0x00000008,
  // Provided by VK_KHR_video_encode_quantization_map
    VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR = 0x00000010,
} VkVideoSessionCreateFlagBitsKHR;
```

- VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR specifies that the video session uses protected video content.
- VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR specifies that the implementation is allowed to override video session parameters and other codec-specific encoding parameters to optimize video encode operations based on the use case information specified in the video profile and the used video encode quality level.

  NOTE Not specifying VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR does not guarantee that the implementation will not do any codec-specific parameter overrides, as certain overrides are necessary for the correct operation of the video encoder implementation due to limitations to the available encoding tools on that implementation. This flag, however, enables the implementation to apply further optimizing overrides.

- VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR specifies that queries within video coding scopes using the created video session are executed inline with video coding operations.
- VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR specifies that the video session **can** be used to encode pictures with quantization delta maps.
- VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR specifies that the video session **can** be used to encode pictures with emphasis maps.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoSessionCreateFlagsKHR;
```

VkVideoSessionCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoSessionCreateFlagBitsKHR.

38.5.2. Destroying a Video Session

To destroy a video session, call:

```
// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionKHR(
    VkDevice                                    device,
    VkVideoSessionKHR                           videoSession,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the video session.
- `videoSession` is the video session to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyVideoSessionKHR-videoSession-07192
  All submitted commands that refer to `videoSession` **must** have completed execution
- VUID-vkDestroyVideoSessionKHR-videoSession-07193
  If `VkAllocationCallbacks` were provided when `videoSession` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyVideoSessionKHR-videoSession-07194
  If no `VkAllocationCallbacks` were provided when `videoSession` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyVideoSessionKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyVideoSessionKHR-videoSession-parameter
  If `videoSession` is not VK_NULL_HANDLE, `videoSession` **must** be a valid VkVideoSessionKHR handle
- VUID-vkDestroyVideoSessionKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyVideoSessionKHR-videoSession-parent
  If `videoSession` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `videoSession` **must** be externally synchronized

38.5.3. Video Session Memory Association

After creating a video session object, and before the object **can** be used to record video coding operations into command buffers using it, the application **must** allocate and bind device memory to the video session. Device memory is allocated separately (see Device Memory) and then associated with the video session.

Video sessions **may** have multiple memory bindings identified by unique unsigned integer values. Appropriate device memory **must** be bound to each such memory binding before using the video session to record command buffer commands with it.

To determine the memory requirements for a video session object, call:

```
// Provided by VK_KHR_video_queue
VkResult vkGetVideoSessionMemoryRequirementsKHR(
    VkDevice                                    device,
    VkVideoSessionKHR                           videoSession,
    uint32_t*                                   pMemoryRequirementsCount,
    VkVideoSessionMemoryRequirementsKHR*        pMemoryRequirements);
```

- `device` is the logical device that owns the video session.
- `videoSession` is the video session to query.
- `pMemoryRequirementsCount` is a pointer to an integer related to the number of memory binding requirements available or queried, as described below.
- `pMemoryRequirements` is `NULL` or a pointer to an array of VkVideoSessionMemoryRequirementsKHR structures in which the memory binding requirements of the video session are returned.

If `pMemoryRequirements` is `NULL`, then the number of memory bindings required for the video session is returned in `pMemoryRequirementsCount`. Otherwise, `pMemoryRequirementsCount` **must** point to a variable set by the application to the number of elements in the `pMemoryRequirements` array, and on return the variable is overwritten with the number of memory binding requirements actually written to `pMemoryRequirements`. If `pMemoryRequirementsCount` is less than the number of memory bindings required for the video session, then at most `pMemoryRequirementsCount` elements will be written to `pMemoryRequirements`, and `VK_INCOMPLETE` will be returned, instead of `VK_SUCCESS`, to indicate that not all required memory binding requirements were returned.

Valid Usage (Implicit)

- VUID-vkGetVideoSessionMemoryRequirementsKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parameter
  `videoSession` **must** be a valid VkVideoSessionKHR handle
- VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirementsCount-parameter
  `pMemoryRequirementsCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirements-parameter
  If the value referenced by `pMemoryRequirementsCount` is not `0`, and `pMemoryRequirements` is not `NULL`, `pMemoryRequirements` **must** be a valid pointer to an array of `pMemoryRequirementsCount` VkVideoSessionMemoryRequirementsKHR structures
- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parent
  `videoSession` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

None

The `VkVideoSessionMemoryRequirementsKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionMemoryRequirementsKHR {
    VkStructureType         sType;
    void*                   pNext;
    uint32_t                memoryBindIndex;
    VkMemoryRequirements    memoryRequirements;
} VkVideoSessionMemoryRequirementsKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryBindIndex` is the index of the memory binding.
- `memoryRequirements` is a VkMemoryRequirements structure in which the requested memory binding requirements for the binding index specified by `memoryBindIndex` are returned.

Valid Usage (Implicit)

- VUID-VkVideoSessionMemoryRequirementsKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_SESSION_MEMORY_REQUIREMENTS_KHR`
- VUID-VkVideoSessionMemoryRequirementsKHR-pNext-pNext
  `pNext` **must** be `NULL`

To attach memory to a video session object, call:

```
// Provided by VK_KHR_video_queue
VkResult vkBindVideoSessionMemoryKHR(
    VkDevice                                    device,
    VkVideoSessionKHR                           videoSession,
    uint32_t                                    bindSessionMemoryInfoCount,
    const VkBindVideoSessionMemoryInfoKHR*      pBindSessionMemoryInfos);
```

- `device` is the logical device that owns the video session.
- `videoSession` is the video session to be bound with device memory.
- `bindSessionMemoryInfoCount` is the number of elements in `pBindSessionMemoryInfos`.
- `pBindSessionMemoryInfos` is a pointer to an array of `bindSessionMemoryInfoCount` VkBindVideoSessionMemoryInfoKHR structures specifying memory regions to be bound to specific memory bindings of the video session.

The valid usage statements below refer to the VkMemoryRequirements structure corresponding to a specific element of `pBindSessionMemoryInfos`, which is defined as follows:

- If the `memoryBindIndex` member of the element of `pBindSessionMemoryInfos` in question matches the `memoryBindIndex` member of one of the elements returned in `pMemoryRequirements` when vkGetVideoSessionMemoryRequirementsKHR is called with the same `videoSession` and with `pMemoryRequirementsCount` equal to `bindSessionMemoryInfoCount`, then the `memoryRequirements` member of that element of `pMemoryRequirements` is the VkMemoryRequirements structure corresponding to the element of `pBindSessionMemoryInfos` in question.
- Otherwise the element of `pBindSessionMemoryInfos` in question is said to not have a corresponding VkMemoryRequirements structure.

Valid Usage

- VUID-vkBindVideoSessionMemoryKHR-videoSession-07195
  The memory binding of `videoSession` identified by the `memoryBindIndex` member of any element of `pBindSessionMemoryInfos` **must** not already be backed by a memory object
- VUID-vkBindVideoSessionMemoryKHR-memoryBindIndex-07196
  The `memoryBindIndex` member of each element of `pBindSessionMemoryInfos` **must** be unique within `pBindSessionMemoryInfos`
- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07197
  Each element of `pBindSessionMemoryInfos` **must** have a corresponding VkMemoryRequirements structure
- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07198
  If an element of `pBindSessionMemoryInfos` has a corresponding VkMemoryRequirements structure, then the `memory` member of that element of `pBindSessionMemoryInfos` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the corresponding VkMemoryRequirements structure
- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07199
  If an element of `pBindSessionMemoryInfos` has a corresponding VkMemoryRequirements

structure, then the `memoryOffset` member of that element of `pBindSessionMemoryInfos` **must** be an integer multiple of the `alignment` member of the corresponding VkMemoryRequirements structure

- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07200
  If an element of `pBindSessionMemoryInfos` has a corresponding VkMemoryRequirements structure, then the `memorySize` member of that element of `pBindSessionMemoryInfos` **must** equal the `size` member of the corresponding VkMemoryRequirements structure

Valid Usage (Implicit)

- VUID-vkBindVideoSessionMemoryKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkBindVideoSessionMemoryKHR-videoSession-parameter
  `videoSession` **must** be a valid VkVideoSessionKHR handle
- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-parameter
  `pBindSessionMemoryInfos` **must** be a valid pointer to an array of `bindSessionMemoryInfoCount` valid VkBindVideoSessionMemoryInfoKHR structures
- VUID-vkBindVideoSessionMemoryKHR-bindSessionMemoryInfoCount-arraylength
  `bindSessionMemoryInfoCount` **must** be greater than `0`
- VUID-vkBindVideoSessionMemoryKHR-videoSession-parent
  `videoSession` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `videoSession` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBindVideoSessionMemoryInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkBindVideoSessionMemoryInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           memoryBindIndex;
    VkDeviceMemory     memory;
    VkDeviceSize       memoryOffset;
    VkDeviceSize       memorySize;
} VkBindVideoSessionMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryBindIndex` is the memory binding index to bind memory to.
- `memory` is the allocated device memory to be bound to the video session's memory binding with index `memoryBindIndex`.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound.
- `memorySize` is the size in bytes of the region of `memory`, starting from `memoryOffset` bytes, to be bound.

Valid Usage

- VUID-VkBindVideoSessionMemoryInfoKHR-memoryOffset-07201
  `memoryOffset` **must** be less than the size of `memory`
- VUID-VkBindVideoSessionMemoryInfoKHR-memorySize-07202
  `memorySize` **must** be less than or equal to the size of `memory` minus `memoryOffset`

Valid Usage (Implicit)

- VUID-VkBindVideoSessionMemoryInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_BIND_VIDEO_SESSION_MEMORY_INFO_KHR`
- VUID-VkBindVideoSessionMemoryInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkBindVideoSessionMemoryInfoKHR-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle

38.6. Video Profile Compatibility

Resources and query pools used with a particular video session **must** be compatible with the video profile the video session was created with.

A VkBuffer is compatible with a video profile if it was created with the VkBufferCreateInfo::`pNext` chain including a VkVideoProfileListInfoKHR structure with its `pProfiles` member containing an

element matching the VkVideoProfileInfoKHR structure chain describing the video profile, and VkBufferCreateInfo::usage including at least one bit specific to video coding usage.

- VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR

A VkBuffer is also compatible with a video profile if it was created with VkBufferCreateInfo::flags including VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR.

A VkImage is compatible with a video profile if it was created with the VkImageCreateInfo::pNext chain including a VkVideoProfileListInfoKHR structure with its pProfiles member containing an element matching the VkVideoProfileInfoKHR structure chain describing the video profile, and VkImageCreateInfo::usage including at least one bit specific to video coding usage.

- VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR

A VkImage is also compatible with a video profile if all of the following conditions are true for the VkImageCreateInfo structure the image was created with:

- VkImageCreateInfo::flags included VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR.
- The list of VkVideoFormatPropertiesKHR structures, obtained by calling vkGetPhysicalDeviceVideoFormatPropertiesKHR with VkPhysicalDeviceVideoFormatInfoKHR::imageUsage equal to the VkImageCreateInfo::usage the image was created with and the VkPhysicalDeviceVideoFormatInfoKHR::pNext chain including a VkVideoProfileListInfoKHR structure with its pProfiles member containing a single array element specifying the VkVideoProfileInfoKHR structure chain describing the video profile in question, contains an element for which all of the following conditions are true with respect to the VkImageCreateInfo structure the image was created with:
  - VkImageCreateInfo::format equals VkVideoFormatPropertiesKHR::format.
  - VkImageCreateInfo::flags only contains VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and/or bits also set in VkVideoFormatPropertiesKHR::imageCreateFlags.

> **NOTE** Specifying VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR when creating decode output pictures or encode input pictures is always supported when the videoMaintenance1 feature is enabled, regardless of the

supported VkImageCreateFlags reported in VkVideoFormatPropertiesKHR::imageCreateFlags. Accordingly, implementations **should** not report VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR in VkVideoFormatPropertiesKHR::imageCreateFlags for any video format.

- VkImageCreateInfo::imageType equals VkVideoFormatPropertiesKHR::imageType.
- VkImageCreateInfo::tiling equals VkVideoFormatPropertiesKHR::imageTiling.
- VkImageCreateInfo::usage only contains bits also set in VkVideoFormatPropertiesKHR::imageUsageFlags, or VkImageCreateInfo::flags includes VK_IMAGE_CREATE_EXTENDED_USAGE_BIT.

NOTE

While some of these rules allow creating buffer or image resources that **may** be compatible with any video profile, applications **should** still prefer to include the specific video profiles the buffer or image resource is expected to be used with (through a VkVideoProfileListInfoKHR structure included in the pNext chain of the corresponding create info structure) whenever the information about the complete set of video profiles is available at resource creation time, to enable the implementation to optimize the created resource for the specific use case. In the absence of that information, the implementation **may** have to make conservative decisions about the memory requirements or representation of the resource.

A VkImageView is compatible with a video profile if the VkImage it was created from is also compatible with that video profile.

A VkQueryPool is compatible with a video profile if it was created with the VkQueryPoolCreateInfo::pNext chain including a VkVideoProfileInfoKHR structure chain describing the same video profile, and VkQueryPoolCreateInfo::queryType having one of the following values:

- VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR
- VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR

38.7. Video Session Parameters

Video session parameters objects **can** store preprocessed codec-specific parameters used with a compatible video session, and enable reducing the number of parameters needed to be provided and processed by the implementation while recording video coding operations into command buffers.

Parameters stored in such objects are *immutable* to facilitate the concurrent use of the stored parameters in multiple threads. At the same time, new parameters **can** be added to existing objects using the vkUpdateVideoSessionParametersKHR command.

In order to support concurrent use of the stored immutable parameters while also allowing the video session parameters object to be extended with new parameters, each video session parameters object maintains an *update sequence counter* that is set to 0 at object creation time and **must** be incremented by each subsequent update operation.

Certain video sequences that adhere to particular video compression standards permit updating

previously supplied parameters. If a parameter update is necessary, the application has the following options:

- Cache the set of parameters on the application side and create a new video session parameters object adding all the parameters with appropriate changes, as necessary; or
- Create a new video session parameters object providing only the updated parameters and the previously used object as the template, which ensures that parameters not specified at creation time will be copied unmodified from the template object.

The actual types of parameters that **can** be stored and the capacity for individual parameter types, and the methods of initializing, updating, and referring to individual parameters are specific to the video codec operation the video session parameters object was created with.

- For `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` these are defined in the H.264 Decode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` these are defined in the H.265 Decode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` these are defined in the AV1 Decode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` these are defined in the H.264 Encode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` these are defined in the H.265 Encode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR` these are defined in the AV1 Encode Parameter Sets section.

Video session parameters objects created with an encode operation are further specialized based on the video encode quality level the video session parameters are used with, as implementations **may** apply different sets of parameter overrides depending on the used quality level. This enables implementations to store the potentially optimized set of parameters in these objects, further limiting the necessary processing required while recording video encode operations into command buffers.

Video session parameters are represented by `VkVideoSessionParametersKHR` handles:

```
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionParametersKHR)
```

38.7.1. Creating Video Session Parameters

To create a video session parameters object, call:

```
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionParametersKHR(
    VkDevice                                    device,
    const VkVideoSessionParametersCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkVideoSessionParametersKHR*                pVideoSessionParameters);
```

- `device` is the logical device that creates the video session parameters object.
- `pCreateInfo` is a pointer to VkVideoSessionParametersCreateInfoKHR structure containing parameters to be used to create the video session parameters object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pVideoSessionParameters` is a pointer to a VkVideoSessionParametersKHR handle in which the resulting video session parameters object is returned.

The resulting video session parameters object is said to be created with the video codec operation `pCreateInfo->videoSession` was created with.

Video session parameters objects created with an encode operation are always created with respect to a video encode quality level. By default, the created video session parameters objects are created with quality level zero, unless otherwise specified by including a VkVideoEncodeQualityLevelInfoKHR structure in the `pCreateInfo->pNext` chain, in which case the video session parameters object is created with the quality level specified in VkVideoEncodeQualityLevelInfoKHR::`qualityLevel`.

If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then it will be used as a template for constructing the new video session parameters object. This happens by first adding any parameters according to the additional creation parameters provided in the `pCreateInfo->pNext` chain, followed by adding any parameters from the template object that have a key that does not match the key of any of the already added parameters.

For video session parameters objects created with an encode operation, the template object specified in `pCreateInfo->videoSessionParametersTemplate` **must** have been created with the same video encode quality level as the newly created object.

NOTE

This means that codec-specific parameters stored in video session parameters objects **can** only be reused across different video encode quality levels by re-specifying them, as previously created video session parameters against other quality levels **cannot** be used as template because the original codec-specific parameters (before the implementation **may** have applied parameter overrides) **may** no longer be available in them for the purposes of constructing the derived object.

Video session parameters objects are only compatible with quantization maps if they are created with `pCreateInfo->flags` including `VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR`.

Video session parameters objects created with

VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR against a video session object that was created with VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR are created with a specific compatible quantization map texel size specified in the quantizationMapTexelSize member of the VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR structure included in the pNext chain of pCreateInfo.

NOTE This means that the quantization map texel size that such a video session parameters object is compatible with is fixed for the lifetime of the object. Applications have to create separate video session parameters objects to use different quantization map texel sizes with a single video session object. This is necessary because the used quantization map texel size may affect the parameter overrides the implementation has to perform and thus the final values of the used codec-specific parameters.

For video session parameters objects created with VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, the template object specified in pCreateInfo->videoSessionParametersTemplate **must** also have been created with VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR and the same compatible quantization map texel size specified in VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR::quantizationMapTexelSize.

NOTE This means that codec-specific parameters stored in video session parameters objects **can** only be reused with different quantization map texel sizes by re-specifying them, as previously created video session parameters against other quantization map texel sizes **cannot** be used as template because the original codec-specific parameters (before the implementation **may** have applied parameter overrides) **may** no longer be available in them for the purposes of constructing the derived object.

For video session parameters objects created without VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, the template object specified in pCreateInfo->videoSessionParametersTemplate **must** also have been created without VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR.

If pCreateInfo->videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the created video session parameters object will initially contain the following sets of parameter entries:

- StdVideoH264SequenceParameterSet structures representing H.264 SPS entries, as follows:
  - If the pParametersAddInfo member of the VkVideoDecodeH264SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH264SequenceParameterSet entries specified in pParametersAddInfo->pStdSPSs are added first;
  - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH264SequenceParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same

seq_parameter_set_id.

- StdVideoH264PictureParameterSet structures representing H.264 PPS entries, as follows:
  - If the pParametersAddInfo member of the VkVideoDecodeH264SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH264PictureParameterSet entries specified in pParametersAddInfo->pStdPPSs are added first;
  - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH264PictureParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same seq_parameter_set_id and pic_parameter_set_id.

If pCreateInfo->videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the created video session parameters object will initially contain the following sets of parameter entries:

- StdVideoH265VideoParameterSet structures representing H.265 VPS entries, as follows:
  - If the pParametersAddInfo member of the VkVideoDecodeH265SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH265VideoParameterSet entries specified in pParametersAddInfo->pStdVPSs are added first;
  - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265VideoParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same vps_video_parameter_set_id.
- StdVideoH265SequenceParameterSet structures representing H.265 SPS entries, as follows:
  - If the pParametersAddInfo member of the VkVideoDecodeH265SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH265SequenceParameterSet entries specified in pParametersAddInfo->pStdSPSs are added first;
  - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265SequenceParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same sps_video_parameter_set_id and sps_seq_parameter_set_id.
- StdVideoH265PictureParameterSet structures representing H.265 PPS entries, as follows:
  - If the pParametersAddInfo member of the VkVideoDecodeH265SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH265PictureParameterSet entries specified in pParametersAddInfo->pStdPPSs are added first;
  - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265PictureParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id.

If pCreateInfo->videoSession was created with the video codec operation

VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the created video session parameters object will contain a single AV1 sequence header represented by a StdVideoAV1SequenceHeader structure specified through the pStdSequenceHeader member of the VkVideoDecodeAV1SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain. As such video session parameters objects **can** only contain a single AV1 sequence header, it is not possible to use a previously created object as a template or subsequently update the created video session parameters object.

If pCreateInfo->videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the created video session parameters object will initially contain the following sets of parameter entries:

- StdVideoH264SequenceParameterSet structures representing H.264 SPS entries, as follows:
  - If the pParametersAddInfo member of the VkVideoEncodeH264SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH264SequenceParameterSet entries specified in pParametersAddInfo->pStdSPSs are added first;
  - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH264SequenceParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same seq_parameter_set_id.
- StdVideoH264PictureParameterSet structures representing H.264 PPS entries, as follows:
  - If the pParametersAddInfo member of the VkVideoEncodeH264SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH264PictureParameterSet entries specified in pParametersAddInfo->pStdPPSs are added first;
  - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH264PictureParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same seq_parameter_set_id and pic_parameter_set_id.

If pCreateInfo->videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the created video session parameters object will initially contain the following sets of parameter entries:

- StdVideoH265VideoParameterSet structures representing H.265 VPS entries, as follows:
  - If the pParametersAddInfo member of the VkVideoEncodeH265SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH265VideoParameterSet entries specified in pParametersAddInfo->pStdVPSs are added first;
  - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265VideoParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same vps_video_parameter_set_id.
- StdVideoH265SequenceParameterSet structures representing H.265 SPS entries, as follows:

    - If the pParametersAddInfo member of the VkVideoEncodeH265SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH265SequenceParameterSet entries specified in pParametersAddInfo->pStdSPSs are added first;
    - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265SequenceParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same sps_video_parameter_set_id and sps_seq_parameter_set_id.
- StdVideoH265PictureParameterSet structures representing H.265 PPS entries, as follows:
    - If the pParametersAddInfo member of the VkVideoEncodeH265SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain is not NULL, then the set of StdVideoH265PictureParameterSet entries specified in pParametersAddInfo->pStdPPSs are added first;
    - If pCreateInfo->videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265PictureParameterSet entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id.

If pCreateInfo->videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the created video session parameters object will contain a single AV1 sequence header specified through the members of the VkVideoEncodeAV1SessionParametersCreateInfoKHR structure provided in the pCreateInfo->pNext chain. As such video session parameters objects **can** only contain a single AV1 sequence header, it is not possible to use a previously created object as a template or subsequently update the created video session parameters object.

In case of video session parameters objects created with a video encode operation, implementations **may** return the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

NOTE	Applications **should** not rely on the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

Valid Usage (Implicit)

- VUID-vkCreateVideoSessionParametersKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkCreateVideoSessionParametersKHR-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkVideoSessionParametersCreateInfoKHR structure
- VUID-vkCreateVideoSessionParametersKHR-pAllocator-parameter

If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateVideoSessionParametersKHR-pVideoSessionParameters-parameter `pVideoSessionParameters` **must** be a valid pointer to a VkVideoSessionParametersKHR handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR`

The `VkVideoSessionParametersCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersCreateInfoKHR {
    VkStructureType                            sType;
    const void*                                pNext;
    VkVideoSessionParametersCreateFlagsKHR     flags;
    VkVideoSessionParametersKHR                videoSessionParametersTemplate;
    VkVideoSessionKHR                          videoSession;
} VkVideoSessionParametersCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkVideoSessionParametersCreateFlagBitsKHR specifying create flags.
- `videoSessionParametersTemplate` is `VK_NULL_HANDLE` or a valid handle to a VkVideoSessionParametersKHR object used as a template for constructing the new video session parameters object.
- `videoSession` is the video session object against which the video session parameters object is going to be created.

Limiting values are defined below that are referenced by the relevant valid usage statements of this structure.

- If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then let `StdVideoH264SequenceParameterSet spsAddList[]` be the list of H.264 SPS entries to add to the created video session parameters

object, defined as follows:

  - If the pParametersAddInfo member of the VkVideoDecodeH264SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH264SequenceParameterSet entries specified in pParametersAddInfo->pStdSPSs are added to spsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH264SequenceParameterSet entry stored in it with seq_parameter_set_id not matching any of the entries already in spsAddList is added to spsAddList.

- If videoSession was created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then let StdVideoH264PictureParameterSet ppsAddList[] be the list of H.264 PPS entries to add to the created video session parameters object, defined as follows:
  - If the pParametersAddInfo member of the VkVideoDecodeH264SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH264PictureParameterSet entries specified in pParametersAddInfo->pStdPPSs are added to ppsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH264PictureParameterSet entry stored in it with seq_parameter_set_id or pic_parameter_set_id not matching any of the entries already in ppsAddList is added to ppsAddList.
- If videoSession was created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then let StdVideoH265VideoParameterSet vpsAddList[] be the list of H.265 VPS entries to add to the created video session parameters object, defined as follows:
  - If the pParametersAddInfo member of the VkVideoDecodeH265SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH265VideoParameterSet entries specified in pParametersAddInfo->pStdVPSs are added to vpsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265VideoParameterSet entry stored in it with vps_video_parameter_set_id not matching any of the entries already in vpsAddList is added to vpsAddList.
- If videoSession was created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then let StdVideoH265SequenceParameterSet spsAddList[] be the list of H.265 SPS entries to add to the created video session parameters object, defined as follows:
  - If the pParametersAddInfo member of the VkVideoDecodeH265SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH265SequenceParameterSet entries specified in pParametersAddInfo->pStdSPSs are added to spsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265SequenceParameterSet entry stored in it with sps_video_parameter_set_id or sps_seq_parameter_set_id not matching any of the entries already in spsAddList is added to spsAddList.

- If videoSession was created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then let StdVideoH265PictureParameterSet ppsAddList[] be the list of H.265 PPS entries to add to the created video session parameters object, defined as follows:
  - If the pParametersAddInfo member of the VkVideoDecodeH265SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH265PictureParameterSet entries specified in pParametersAddInfo->pStdPPSs are added to ppsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265PictureParameterSet entry stored in it with sps_video_parameter_set_id, pps_seq_parameter_set_id, or pps_pic_parameter_set_id not matching any of the entries already in ppsAddList is added to ppsAddList.
- If videoSession was created with an encode operation, then let uint32_t qualityLevel be the video encode quality level of the created video session parameters object, defined as follows:
  - If the pNext chain of this structure includes a VkVideoEncodeQualityLevelInfoKHR structure, then qualityLevel is equal to VkVideoEncodeQualityLevelInfoKHR::qualityLevel.
  - Otherwise qualityLevel is 0
- If videoSession was created with the codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then let StdVideoH264SequenceParameterSet spsAddList[] be the list of H.264 SPS entries to add to the created video session parameters object, defined as follows:
  - If the pParametersAddInfo member of the VkVideoEncodeH264SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH264SequenceParameterSet entries specified in pParametersAddInfo->pStdSPSs are added to spsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH264SequenceParameterSet entry stored in it with seq_parameter_set_id not matching any of the entries already in spsAddList is added to spsAddList.
- If videoSession was created with the codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then let StdVideoH264PictureParameterSet ppsAddList[] be the list of H.264 PPS entries to add to the created video session parameters object, defined as follows:
  - If the pParametersAddInfo member of the VkVideoEncodeH264SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH264PictureParameterSet entries specified in pParametersAddInfo->pStdPPSs are added to ppsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH264PictureParameterSet entry stored in it with seq_parameter_set_id or pic_parameter_set_id not matching any of the entries already in ppsAddList is added to ppsAddList.
- If videoSession was created with the codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then let StdVideoH265VideoParameterSet vpsAddList[] be the list of H.265 VPS entries to add to the created video session parameters

object, defined as follows:

  - If the pParametersAddInfo member of the VkVideoEncodeH265SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH265VideoParameterSet entries specified in pParametersAddInfo->pStdVPSs are added to vpsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265VideoParameterSet entry stored in it with vps_video_parameter_set_id not matching any of the entries already in vpsAddList is added to vpsAddList.

- If videoSession was created with the codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then let StdVideoH265SequenceParameterSet spsAddList[] be the list of H.265 SPS entries to add to the created video session parameters object, defined as follows:
  - If the pParametersAddInfo member of the VkVideoEncodeH265SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH265SequenceParameterSet entries specified in pParametersAddInfo->pStdSPSs are added to spsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265SequenceParameterSet entry stored in it with sps_video_parameter_set_id or sps_seq_parameter_set_id not matching any of the entries already in spsAddList is added to spsAddList.
- If videoSession was created with the codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then let StdVideoH265PictureParameterSet ppsAddList[] be the list of H.265 PPS entries to add to the created video session parameters object, defined as follows:
  - If the pParametersAddInfo member of the VkVideoEncodeH265SessionParametersCreateInfoKHR structure provided in the pNext chain is not NULL, then the set of StdVideoH265PictureParameterSet entries specified in pParametersAddInfo->pStdPPSs are added to ppsAddList;
  - If videoSessionParametersTemplate is not VK_NULL_HANDLE, then each StdVideoH265PictureParameterSet entry stored in it with sps_video_parameter_set_id, pps_seq_parameter_set_id, or pps_pic_parameter_set_id not matching any of the entries already in ppsAddList is added to ppsAddList.

Valid Usage

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-04855
  If videoSessionParametersTemplate is not VK_NULL_HANDLE, it **must** have been created against videoSession
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-08310
  If videoSessionParametersTemplate is not VK_NULL_HANDLE and videoSession was created with an encode operation, then qualityLevel **must** equal the video encode quality level videoSessionParametersTemplate was created with
- VUID-VkVideoSessionParametersCreateInfoKHR-flags-10271

If flags includes VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, then videoSession **must** have been created with VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR

- VUID-VkVideoSessionParametersCreateInfoKHR-flags-10272
  If flags includes VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, then the pNext chain **must** include a VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR structure
- VUID-VkVideoSessionParametersCreateInfoKHR-flags-10273
  If flags includes VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR and videoSession was created with VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR, then the list of video format properties supported for the image usage flag VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR **must** have an element for which VkVideoFormatQuantizationMapPropertiesKHR::quantizationMapTexelSize equals the quantizationMapTexelSize member of the VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-flags-10274
  If flags includes VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR and videoSession was created with VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR, then the list of video format properties supported for the image usage flag VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR **must** have an element for which VkVideoFormatQuantizationMapPropertiesKHR::quantizationMapTexelSize equals the quantizationMapTexelSize member of the VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-10275
  If videoSessionParametersTemplate is not VK_NULL_HANDLE and flags includes VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, then videoSessionParametersTemplate **must** have been created with VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-10276
  If videoSessionParametersTemplate is not VK_NULL_HANDLE and flags includes VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, then videoSessionParametersTemplate **must** have been created with the same quantization map texel size as the one specified in the quantizationMapTexelSize member of the VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-10277

If videoSessionParametersTemplate is not VK_NULL_HANDLE and flags does not include VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, then videoSessionParametersTemplate **must** have been created without VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07203
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the pNext chain **must** include a VkVideoDecodeH264SessionParametersCreateInfoKHR structure
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07204
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the number of elements of spsAddList **must** be less than or equal to the maxStdSPSCount specified in the VkVideoDecodeH264SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07205
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the number of elements of ppsAddList **must** be less than or equal to the maxStdPPSCount specified in the VkVideoDecodeH264SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07206
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the pNext chain **must** include a VkVideoDecodeH265SessionParametersCreateInfoKHR structure
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07207
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the number of elements of vpsAddList **must** be less than or equal to the maxStdVPSCount specified in the VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07208
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the number of elements of spsAddList **must** be less than or equal to the maxStdSPSCount specified in the VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07209
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the number of elements of ppsAddList **must** be less than or equal to the maxStdPPSCount specified in the VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-09258
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then videoSessionParametersTemplate **must**

be VK_NULL_HANDLE

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-09259
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the pNext chain **must** include a VkVideoDecodeAV1SessionParametersCreateInfoKHR structure
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07210
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the pNext chain **must** include a VkVideoEncodeH264SessionParametersCreateInfoKHR structure
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04839
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the number of elements of spsAddList **must** be less than or equal to the maxStdSPSCount specified in the VkVideoEncodeH264SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04840
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the number of elements of ppsAddList **must** be less than or equal to the maxStdPPSCount specified in the VkVideoEncodeH264SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07211
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain **must** include a VkVideoEncodeH265SessionParametersCreateInfoKHR structure
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04841
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of elements of vpsAddList **must** be less than or equal to the maxStdVPSCount specified in the VkVideoEncodeH265SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04842
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of elements of spsAddList **must** be less than or equal to the maxStdSPSCount specified in the VkVideoEncodeH265SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04843
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of elements of ppsAddList **must** be less than or equal to the maxStdPPSCount specified in the VkVideoEncodeH265SessionParametersCreateInfoKHR structure included in the pNext chain
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-08319

If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then num_tile_columns_minus1 **must** be less than VkVideoEncodeH265CapabilitiesKHR::maxTiles.width, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile videoSession was created with, for each element of ppsAddList

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-08320
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then num_tile_rows_minus1 **must** be less than VkVideoEncodeH265CapabilitiesKHR::maxTiles.height, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile videoSession was created with, for each element of ppsAddList
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-10278
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then videoSessionParametersTemplate **must** be VK_NULL_HANDLE
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-10279
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the pNext chain **must** include a VkVideoEncodeAV1SessionParametersCreateInfoKHR structure
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-10280
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the stdOperatingPointCount member of the VkVideoEncodeAV1SessionParametersCreateInfoKHR structure included in the pNext chain **must** be less than or equal to VkVideoEncodeAV1CapabilitiesKHR::maxOperatingPoints, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile videoSession was created with

Valid Usage (Implicit)

- VUID-VkVideoSessionParametersCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_CREATE_INFO_KHR
- VUID-VkVideoSessionParametersCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkVideoDecodeAV1SessionParametersCreateInfoKHR, VkVideoDecodeH264SessionParametersCreateInfoKHR, VkVideoDecodeH265SessionParametersCreateInfoKHR, VkVideoEncodeAV1SessionParametersCreateInfoKHR, VkVideoEncodeH264SessionParametersCreateInfoKHR, VkVideoEncodeH265SessionParametersCreateInfoKHR, VkVideoEncodeQualityLevelInfoKHR, or VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR
- VUID-VkVideoSessionParametersCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain **must** be unique

- VUID-VkVideoSessionParametersCreateInfoKHR-flags-parameter
  `flags` **must** be a valid combination of VkVideoSessionParametersCreateFlagBitsKHR values
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parameter
  If `videoSessionParametersTemplate` is not VK_NULL_HANDLE, `videoSessionParametersTemplate` **must** be a valid VkVideoSessionParametersKHR handle
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-parameter
  `videoSession` **must** be a valid VkVideoSessionKHR handle
- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parent
  If `videoSessionParametersTemplate` is a valid handle, it **must** have been created, allocated, or retrieved from `videoSession`
- VUID-VkVideoSessionParametersCreateInfoKHR-commonparent
  Both of `videoSession`, and `videoSessionParametersTemplate` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Bits which **can** be set in VkVideoSessionParametersCreateInfoKHR::`flags` are:

```
// Provided by VK_KHR_video_encode_quantization_map
typedef enum VkVideoSessionParametersCreateFlagBitsKHR {
  // Provided by VK_KHR_video_encode_quantization_map
    VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR =
0x00000001,
} VkVideoSessionParametersCreateFlagBitsKHR;
```

- `VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR` specifies that the created video session parameters object **can** be used with quantization maps.

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoSessionParametersCreateFlagsKHR;
```

`VkVideoSessionParametersCreateFlagsKHR` is a bitmask type for setting a mask of zero or more VkVideoSessionParametersCreateFlagBitsKHR.

The `VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_quantization_map
typedef struct VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkExtent2D         quantizationMapTexelSize;
} VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `quantizationMapTexelSize` specifies the quantization map texel size a video session parameters object created with `VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR` is compatible with.

Valid Usage (Implicit)

- VUID-VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUANTIZATION_MAP_SESSION_PARAMETERS_CREATE_INFO_KHR`

38.7.2. Destroying Video Session Parameters

To destroy a video session parameters object, call:

```
// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionParametersKHR(
    VkDevice                                    device,
    VkVideoSessionParametersKHR                 videoSessionParameters,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the video session parameters object.
- `videoSessionParameters` is the video session parameters object to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07212
  All submitted commands that refer to `videoSessionParameters` **must** have completed execution
- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07213
  If `VkAllocationCallbacks` were provided when `videoSessionParameters` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07214
  If no `VkAllocationCallbacks` were provided when `videoSessionParameters` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyVideoSessionParametersKHR-device-parameter
  `device` **must** be a valid VkDevice handle

- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-parameter
  If `videoSessionParameters` is not `VK_NULL_HANDLE`, `videoSessionParameters` **must** be a valid VkVideoSessionParametersKHR handle
- VUID-vkDestroyVideoSessionParametersKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-parent
  If `videoSessionParameters` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `videoSessionParameters` **must** be externally synchronized

38.7.3. Updating Video Session Parameters

To update video session parameters object with new parameters, call:

```
// Provided by VK_KHR_video_queue
VkResult vkUpdateVideoSessionParametersKHR(
    VkDevice                                    device,
    VkVideoSessionParametersKHR                 videoSessionParameters,
    const VkVideoSessionParametersUpdateInfoKHR* pUpdateInfo);
```

- `device` is the logical device that updates the video session parameters.
- `videoSessionParameters` is the video session parameters object to update.
- `pUpdateInfo` is a pointer to a VkVideoSessionParametersUpdateInfoKHR structure specifying the parameter update information.

After a successful call to this command, the update sequence counter of `videoSessionParameters` is changed to the value specified in `pUpdateInfo->updateSequenceCount`.

NOTE

As each update issued to a video session parameters object needs to specify the next available update sequence count value, concurrent updates of the same video session parameters object are inherently disallowed. However, recording video coding operations to command buffers referring to parameters previously added to the video session parameters object is allowed, even if there is a concurrent update in progress adding some new entries to the object.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pUpdateInfo->pNext` chain includes a VkVideoDecodeH264SessionParametersAddInfoKHR structure, then this command adds the following parameter entries to `videoSessionParameters`:

- The H.264 SPS entries specified in VkVideoDecodeH264SessionParametersAddInfoKHR::pStdSPSs.
- The H.264 PPS entries specified in VkVideoDecodeH264SessionParametersAddInfoKHR::pStdPPSs.

If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR and the pUpdateInfo->pNext chain includes a VkVideoDecodeH265SessionParametersAddInfoKHR structure, then this command adds the following parameter entries to videoSessionParameters:

- The H.265 VPS entries specified in VkVideoDecodeH265SessionParametersAddInfoKHR::pStdVPSs.
- The H.265 SPS entries specified in VkVideoDecodeH265SessionParametersAddInfoKHR::pStdSPSs.
- The H.265 PPS entries specified in VkVideoDecodeH265SessionParametersAddInfoKHR::pStdPPSs.

If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and the pUpdateInfo->pNext chain includes a VkVideoEncodeH264SessionParametersAddInfoKHR structure, then this command adds the following parameter entries to videoSessionParameters:

- The H.264 SPS entries specified in VkVideoEncodeH264SessionParametersAddInfoKHR::pStdSPSs.
- The H.264 PPS entries specified in VkVideoEncodeH264SessionParametersAddInfoKHR::pStdPPSs.

If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pUpdateInfo->pNext chain includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then this command adds the following parameter entries to videoSessionParameters:

- The H.265 VPS entries specified in VkVideoEncodeH265SessionParametersAddInfoKHR::pStdVPSs.
- The H.265 SPS entries specified in VkVideoEncodeH265SessionParametersAddInfoKHR::pStdSPSs.
- The H.265 PPS entries specified in VkVideoEncodeH265SessionParametersAddInfoKHR::pStdPPSs.

In case of video session parameters objects created with a video encode operation, implementations **may** return the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

NOTE	Applications **should** not rely on the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR

error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

Valid Usage

- VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-07215
  `pUpdateInfo->updateSequenceCount` **must** equal the current update sequence counter of `videoSessionParameters` plus one
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07216
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a VkVideoDecodeH264SessionParametersAddInfoKHR structure, then `videoSessionParameters` **must** not already contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching any of the elements of VkVideoDecodeH264SessionParametersAddInfoKHR::`pStdSPSs`
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07217
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of `StdVideoH264SequenceParameterSet` entries already stored in it plus the value of the `stdSPSCount` member of the VkVideoDecodeH264SessionParametersAddInfoKHR structure included in the `pUpdateInfo->pNext` chain **must** be less than or equal to the VkVideoDecodeH264SessionParametersCreateInfoKHR::`maxStdSPSCount` `videoSessionParameters` was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07218
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a VkVideoDecodeH264SessionParametersAddInfoKHR structure, then `videoSessionParameters` **must** not already contain a `StdVideoH264PictureParameterSet` entry with both `seq_parameter_set_id` and `pic_parameter_set_id` matching any of the elements of VkVideoDecodeH264SessionParametersAddInfoKHR::`pStdPPSs`
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07219
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of `StdVideoH264PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the VkVideoDecodeH264SessionParametersAddInfoKHR structure included in the `pUpdateInfo->pNext` chain **must** be less than or equal to the VkVideoDecodeH264SessionParametersCreateInfoKHR::`maxStdPPSCount` `videoSessionParameters` was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07220
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a VkVideoDecodeH265SessionParametersAddInfoKHR structure, then `videoSessionParameters` **must** not already contain a `StdVideoH265VideoParameterSet` entry with `vps_video_parameter_set_id` matching any of the elements of VkVideoDecodeH265SessionParametersAddInfoKHR::`pStdVPSs`

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07221
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265VideoParameterSet` entries already stored in it plus the value of the `stdVPSCount` member of the VkVideoDecodeH265SessionParametersAddInfoKHR structure included in the `pUpdateInfo->pNext` chain **must** be less than or equal to the VkVideoDecodeH265SessionParametersCreateInfoKHR::`maxStdVPSCount` `videoSessionParameters` was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07222
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a VkVideoDecodeH265SessionParametersAddInfoKHR structure, then `videoSessionParameters` **must** not already contain a `StdVideoH265SequenceParameterSet` entry with both `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` matching any of the elements of VkVideoDecodeH265SessionParametersAddInfoKHR::`pStdSPSs`
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07223
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265SequenceParameterSet` entries already stored in it plus the value of the `stdSPSCount` member of the VkVideoDecodeH265SessionParametersAddInfoKHR structure included in the `pUpdateInfo->pNext` chain **must** be less than or equal to the VkVideoDecodeH265SessionParametersCreateInfoKHR::`maxStdSPSCount` `videoSessionParameters` was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07224
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a VkVideoDecodeH265SessionParametersAddInfoKHR structure, then `videoSessionParameters` **must** not already contain a `StdVideoH265PictureParameterSet` entry with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` all matching any of the elements of VkVideoDecodeH265SessionParametersAddInfoKHR ::`pStdPPSs`
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07225
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the VkVideoDecodeH265SessionParametersAddInfoKHR structure included in the `pUpdateInfo->pNext` chain **must** be less than or equal to the VkVideoDecodeH265SessionParametersCreateInfoKHR::`maxStdPPSCount` `videoSessionParameters` was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-09260
  `videoSessionParameters` **must** not have been created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07226
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes

a VkVideoEncodeH264SessionParametersAddInfoKHR structure, then videoSessionParameters **must** not already contain a StdVideoH264SequenceParameterSet entry with seq_parameter_set_id matching any of the elements of VkVideoEncodeH264SessionParametersAddInfoKHR::pStdSPSs

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06441
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the number of StdVideoH264SequenceParameterSet entries already stored in it plus the value of the stdSPSCount member of the VkVideoEncodeH264SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain **must** be less than or equal to the VkVideoEncodeH264SessionParametersCreateInfoKHR::maxStdSPSCount videoSessionParameters was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07227
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH264SessionParametersAddInfoKHR structure, then videoSessionParameters **must** not already contain a StdVideoH264PictureParameterSet entry with both seq_parameter_set_id and pic_parameter_set_id matching any of the elements of VkVideoEncodeH264SessionParametersAddInfoKHR::pStdPPSs
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06442
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the number of StdVideoH264PictureParameterSet entries already stored in it plus the value of the stdPPSCount member of the VkVideoEncodeH264SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain **must** be less than or equal to the VkVideoEncodeH264SessionParametersCreateInfoKHR::maxStdPPSCount videoSessionParameters was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07228
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then videoSessionParameters **must** not already contain a StdVideoH265VideoParameterSet entry with vps_video_parameter_set_id matching any of the elements of VkVideoEncodeH265SessionParametersAddInfoKHR::pStdVPSs
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06443
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of StdVideoH265VideoParameterSet entries already stored in it plus the value of the stdVPSCount member of the VkVideoEncodeH265SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain **must** be less than or equal to the VkVideoEncodeH265SessionParametersCreateInfoKHR::maxStdVPSCount videoSessionParameters was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07229
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes

a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then videoSessionParameters **must** not already contain a StdVideoH265SequenceParameterSet entry with both sps_video_parameter_set_id and sps_seq_parameter_set_id matching any of the elements of VkVideoEncodeH265SessionParametersAddInfoKHR::pStdSPSs

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06444
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of StdVideoH265SequenceParameterSet entries already stored in it plus the value of the stdSPSCount member of the VkVideoEncodeH265SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain **must** be less than or equal to the VkVideoEncodeH265SessionParametersCreateInfoKHR::maxStdSPSCount videoSessionParameters was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07230
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then videoSessionParameters **must** not already contain a StdVideoH265PictureParameterSet entry with sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id all matching any of the elements of VkVideoEncodeH265SessionParametersAddInfoKHR ::pStdPPSs
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06445
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of StdVideoH265PictureParameterSet entries already stored in it plus the value of the stdPPSCount member of the VkVideoEncodeH265SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain **must** be less than or equal to the VkVideoEncodeH265SessionParametersCreateInfoKHR::maxStdPPSCount videoSessionParameters was created with
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-08321
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then num_tile_columns_minus1 **must** be less than VkVideoEncodeH265CapabilitiesKHR ::maxTiles.width, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile videoSessionParameters was created with, for each element of VkVideoEncodeH265SessionParametersAddInfoKHR::pStdPPSs
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-08322
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then num_tile_rows_minus1 **must** be less than VkVideoEncodeH265CapabilitiesKHR ::maxTiles.height, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile videoSessionParameters was created with, for each element of VkVideoEncodeH265SessionParametersAddInfoKHR::pStdPPSs
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-10281

videoSessionParameters **must** not have been created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR

Valid Usage (Implicit)

- VUID-vkUpdateVideoSessionParametersKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-parameter
  videoSessionParameters **must** be a valid VkVideoSessionParametersKHR handle
- VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-parameter
  pUpdateInfo **must** be a valid pointer to a valid VkVideoSessionParametersUpdateInfoKHR structure
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-parent
  videoSessionParameters **must** have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR

The VkVideoSessionParametersUpdateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersUpdateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           updateSequenceCount;
} VkVideoSessionParametersUpdateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- updateSequenceCount is the new update sequence count to set for the video session parameters object.

Valid Usage (Implicit)

- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-sType

sType **must** be VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_UPDATE_INFO_KHR

- VUID-VkVideoSessionParametersUpdateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkVideoDecodeH264SessionParametersAddInfoKHR, VkVideoDecodeH265SessionParametersAddInfoKHR, VkVideoEncodeH264SessionParametersAddInfoKHR, or VkVideoEncodeH265SessionParametersAddInfoKHR
- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain **must** be unique

38.8. Video Coding Scope

Applications **can** record video coding commands for a video session only within a video coding scope.

To begin a video coding scope, call:

```
// Provided by VK_KHR_video_queue
void vkCmdBeginVideoCodingKHR(
    VkCommandBuffer                             commandBuffer,
    const VkVideoBeginCodingInfoKHR*            pBeginInfo);
```

- commandBuffer is the command buffer in which to record the command.
- pBeginInfo is a pointer to a VkVideoBeginCodingInfoKHR structure specifying the parameters of the video coding scope, including the video session and video session parameters object to use.

After beginning a video coding scope, the video session object specified in pBeginInfo->videoSession is *bound* to the command buffer, and the command buffer is ready to record video coding operations. Similarly, if pBeginInfo->videoSessionParameters is not VK_NULL_HANDLE, it is also *bound* to the command buffer, and video coding operations **can** refer to the codec-specific parameters stored in it.

This command also establishes the set of *bound reference picture resources* that **can** be used as reconstructed pictures or reference pictures within the video coding scope. Each element of this set consists of a video picture resource and the DPB slot index associated with it, if there is one.

The set of bound reference picture resources is immutable within a video coding scope, however, the DPB slot index associated with any of the bound reference picture resources **can** change during the video coding scope in response to video coding operations.

The VkVideoReferenceSlotInfoKHR structures provided as the elements of pBeginInfo->pReferenceSlots are interpreted by this command as follows:

- If slotIndex is non-negative and pPictureResource is not NULL, then the video picture resource defined by the VkVideoPictureResourceInfoKHR structure pointed to by pPictureResource is

added to the set of bound reference picture resources and is associated with the DPB slot index specified in `slotIndex`.

- If `slotIndex` is non-negative and `pPictureResource` is `NULL`, then the DPB slot with index `slotIndex` is deactivated by this command.
- If `slotIndex` is negative and `pPictureResource` is not `NULL`, then the video picture resource defined by the VkVideoPictureResourceInfoKHR structure pointed to by `pPictureResource` is added to the set of bound reference picture resources without an associated DPB slot. Such a picture resource **can** be subsequently used as a reconstructed picture to associate it with a DPB slot.
- If `slotIndex` is negative and `pPictureResource` is `NULL`, then the element is ignored.

NOTE

It is possible for multiple bound reference picture resources to be associated with the same DPB slot index, or for a single bound reference picture to refer to multiple separate reference pictures. For example, in case of an H.264 decode profile with interlaced frame support a single DPB slot can refer to two separate pictures for the top and bottom fields. Depending on the picture layout used by the H.264 decode profile, the following special cases **may** arise:

- If the picture layout is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR`, then the top and bottom field pictures are physically co-located in the same video picture resource with even scanlines corresponding to the top field and odd scanlines corresponding to the bottom field, respectively.
- If the picture layout is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`, then the top and bottom field pictures are stored in separate video picture resources (in separate subregions of the same image layer, in separate layers of the same image, or in entirely separate images), hence two elements of VkVideoBeginCodingInfoKHR::`pReferenceSlots` **can** contain the same `slotIndex` but specify different video picture resources in their `pPictureResource` members.

All non-negative `slotIndex` values specified in the elements of `pBeginInfo->pReferenceSlots` **must** identify DPB slots of the video session that are in the active state at the time this command is executed on the device.

NOTE

The application does not have to specify an entry in `pBeginInfo->pReferenceSlots` corresponding to all active DPB slots of the video session, but only for those which are intended to be used in the video coding scope. This way the application can avoid any potential runtime cost associated with binding the corresponding picture resources to the command buffer.

In case of a video encode session, the application is also responsible for providing information about the current rate control state configured for the video session by including an instance of the VkVideoEncodeRateControlInfoKHR structure in the `pNext` chain of `pBeginInfo`. If no VkVideoEncodeRateControlInfoKHR is included, then the presence of an empty VkVideoEncodeRateControlInfoKHR structure is implied which indicates that the current rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR`. The specified state **must** match the

effective rate control state configured for the video session at the time the recorded command is executed on the device.

NOTE

Including an instance of the VkVideoEncodeRateControlInfoKHR structure in the pNext chain of pBeginInfo does not change the rate control state configured for the video session, but only specifies the expected rate control state configured at the time the recorded command is executed on the device which allows the implementation to have information about the configured rate control state at command buffer recording time. In order to change the current rate control state of a video session, the application has to issue an appropriate vkCmdControlVideoCodingKHR command as described in the Video Coding Control and Rate Control State sections.

Valid Usage

- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07231
  The VkCommandPool that commandBuffer was allocated from **must** support the video codec operation pBeginInfo->videoSession was created with, as returned by vkGetPhysicalDeviceQueueFamilyProperties2KHR in VkQueueFamilyVideoPropertiesKHR::videoCodecOperations
- VUID-vkCmdBeginVideoCodingKHR-None-07232
  There **must** be no active queries
- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07233
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, then pBeginInfo->videoSession **must** not have been created with VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR
- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07234
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, then pBeginInfo->videoSession **must** have been created with VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR
- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07235
  If commandBuffer is an unprotected command buffer, protectedNoFault is not supported, and the pPictureResource member of any element of pBeginInfo->pReferenceSlots is not NULL, then pPictureResource->imageViewBinding for that element **must** not specify an image view created from a protected image
- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07236
  If commandBuffer is a protected command buffer protectedNoFault is not supported, and the pPictureResource member of any element of pBeginInfo->pReferenceSlots is not NULL, then pPictureResource->imageViewBinding for that element **must** specify an image view created from a protected image
- VUID-vkCmdBeginVideoCodingKHR-slotIndex-07239
  If the slotIndex member of any element of pBeginInfo->pReferenceSlots is not negative, then it **must** specify the index of a DPB slot that is in the active state in pBeginInfo->videoSession at the time the command is executed on the device

- VUID-vkCmdBeginVideoCodingKHR-pPictureResource-07265
  Each video picture resource specified by any non-NULL pPictureResource member specified in the elements of pBeginInfo->pReferenceSlots for which slotIndex is not negative **must** match one of the video picture resources currently associated with the DPB slot index of pBeginInfo->videoSession specified by slotIndex at the time the command is executed on the device
- VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-08253
  If pBeginInfo->videoSession was created with a video encode operation and the pNext chain of pBeginInfo does not include an instance of the VkVideoEncodeRateControlInfoKHR structure, then the rate control mode configured for pBeginInfo->videoSession at the time the command is executed on the device **must** be VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR
- VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-08254
  If pBeginInfo->videoSession was created with a video encode operation and the pNext chain of pBeginInfo includes an instance of the VkVideoEncodeRateControlInfoKHR structure, then it **must** match the rate control state configured for pBeginInfo->videoSession at the time the command is executed on the device
- VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-08255
  If pBeginInfo->videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, the current rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, and VkVideoEncodeH264CapabilitiesKHR::requiresGopRemainingFrames is VK_TRUE, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the pBeginInfo->videoSession was created with, then the pNext chain of pBeginInfo **must** include an instance of the VkVideoEncodeH264GopRemainingFrameInfoKHR with its useGopRemainingFrames member set to VK_TRUE
- VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-08256
  If pBeginInfo->videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the current rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, and VkVideoEncodeH265CapabilitiesKHR::requiresGopRemainingFrames is VK_TRUE, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the pBeginInfo->videoSession was created with, then the pNext chain of pBeginInfo **must** include an instance of the VkVideoEncodeH265GopRemainingFrameInfoKHR with its useGopRemainingFrames member set to VK_TRUE
- VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-10282
  If pBeginInfo->videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, the current rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, and VkVideoEncodeAV1CapabilitiesKHR::requiresGopRemainingFrames is VK_TRUE, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the pBeginInfo->videoSession was created with, then the pNext chain of pBeginInfo **must** include an instance of the VkVideoEncodeAV1GopRemainingFrameInfoKHR with its

`useGopRemainingFrames` member set to `VK_TRUE`

Valid Usage (Implicit)

- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-parameter
  `pBeginInfo` **must** be a valid pointer to a valid VkVideoBeginCodingInfoKHR structure
- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support decode, or encode operations
- VUID-vkCmdBeginVideoCodingKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdBeginVideoCodingKHR-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdBeginVideoCodingKHR-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Outside	Decode Encode	Action State

The VkVideoBeginCodingInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoBeginCodingInfoKHR {
    VkStructureType                       sType;
    const void*                           pNext;
    VkVideoBeginCodingFlagsKHR            flags;
    VkVideoSessionKHR                     videoSession;
    VkVideoSessionParametersKHR           videoSessionParameters;
    uint32_t                              referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR*    pReferenceSlots;
} VkVideoBeginCodingInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `videoSession` is the video session object to be bound for the processing of the video commands.
- `videoSessionParameters` is `VK_NULL_HANDLE` or a handle of a VkVideoSessionParametersKHR object to be used for the processing of the video commands. If `VK_NULL_HANDLE`, then no video session parameters object is bound for the duration of the video coding scope.
- `referenceSlotCount` is the number of elements in the `pReferenceSlots` array.
- `pReferenceSlots` is a pointer to an array of VkVideoReferenceSlotInfoKHR structures specifying the information used to determine the set of bound reference picture resources for the video coding scope and their initial association with DPB slot indices.

Limiting values are defined below that are referenced by the relevant valid usage statements of this structure.

- Let `VkOffset2D codedOffsetGranularity` be the minimum alignment requirement for the coded offset of video picture resources. Unless otherwise defined, the value of the `x` and `y` members of `codedOffsetGranularity` are `0`.
  - If `videoSession` was created with an H.264 decode profile with a VkVideoDecodeH264ProfileInfoKHR::`pictureLayout` of `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`, then `codedOffsetGranularity` is equal to VkVideoDecodeH264CapabilitiesKHR::`fieldOffsetGranularity`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for that video profile.

Valid Usage

- VUID-VkVideoBeginCodingInfoKHR-videoSession-07237
  `videoSession` **must** have memory bound to all of its memory bindings returned by vkGetVideoSessionMemoryRequirementsKHR for `videoSession`
- VUID-VkVideoBeginCodingInfoKHR-slotIndex-04856
  Each non-negative VkVideoReferenceSlotInfoKHR::`slotIndex` specified in the elements of `pReferenceSlots` **must** be less than the VkVideoSessionCreateInfoKHR::`maxDpbSlots`

specified when videoSession was created

- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07238
  Each video picture resource corresponding to any non-NULL pPictureResource member specified in the elements of pReferenceSlots **must** be unique within pReferenceSlots
- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07240
  If the pPictureResource member of any element of pReferenceSlots is not NULL, then the image view specified in pPictureResource->imageViewBinding for that element **must** be compatible with the video profile videoSession was created with
- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07241
  If the pPictureResource member of any element of pReferenceSlots is not NULL, then the format of the image view specified in pPictureResource->imageViewBinding for that element **must** match the VkVideoSessionCreateInfoKHR::referencePictureFormat videoSession was created with
- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07242
  If the pPictureResource member of any element of pReferenceSlots is not NULL, then its codedOffset member **must** be an integer multiple of codedOffsetGranularity
- VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07243
  If the pPictureResource member of any element of pReferenceSlots is not NULL, then its codedExtent member **must** be between minCodedExtent and maxCodedExtent, inclusive, videoSession was created with
- VUID-VkVideoBeginCodingInfoKHR-flags-07244
  If VkVideoCapabilitiesKHR::flags does not include VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile videoSession was created with, then pPictureResource->imageViewBinding of all elements of pReferenceSlots with a non-NULL pPictureResource member **must** specify image views created from the same image
- VUID-VkVideoBeginCodingInfoKHR-slotIndex-07245
  If videoSession was created with a decode operation and the slotIndex member of any element of pReferenceSlots is not negative, then the image view specified in pPictureResource->imageViewBinding for that element **must** have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR
- VUID-VkVideoBeginCodingInfoKHR-slotIndex-07246
  If videoSession was created with an encode operation and the slotIndex member of any element of pReferenceSlots is not negative, then the image view specified in pPictureResource->imageViewBinding for that element **must** have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR
- VUID-VkVideoBeginCodingInfoKHR-videoSession-07247
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then videoSessionParameters **must** not be VK_NULL_HANDLE
- VUID-VkVideoBeginCodingInfoKHR-videoSession-07248
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then videoSessionParameters **must** not be

VK_NULL_HANDLE

- VUID-VkVideoBeginCodingInfoKHR-videoSession-09261
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then videoSessionParameters **must** not be VK_NULL_HANDLE
- VUID-VkVideoBeginCodingInfoKHR-videoSession-07249
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then videoSessionParameters **must** not be VK_NULL_HANDLE
- VUID-VkVideoBeginCodingInfoKHR-videoSession-07250
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then videoSessionParameters **must** not be VK_NULL_HANDLE
- VUID-VkVideoBeginCodingInfoKHR-videoSession-10283
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then videoSessionParameters **must** not be VK_NULL_HANDLE
- VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-04857
  If videoSessionParameters is not VK_NULL_HANDLE, it **must** have been created with videoSession specified in VkVideoSessionParametersCreateInfoKHR::videoSession

Valid Usage (Implicit)

- VUID-VkVideoBeginCodingInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_BEGIN_CODING_INFO_KHR
- VUID-VkVideoBeginCodingInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkVideoEncodeAV1GopRemainingFrameInfoKHR, VkVideoEncodeAV1RateControlInfoKHR, VkVideoEncodeH264GopRemainingFrameInfoKHR, VkVideoEncodeH264RateControlInfoKHR, VkVideoEncodeH265GopRemainingFrameInfoKHR, VkVideoEncodeH265RateControlInfoKHR, or VkVideoEncodeRateControlInfoKHR
- VUID-VkVideoBeginCodingInfoKHR-sType-unique
  The sType value of each struct in the pNext chain **must** be unique
- VUID-VkVideoBeginCodingInfoKHR-flags-zerobitmask
  flags **must** be 0
- VUID-VkVideoBeginCodingInfoKHR-videoSession-parameter
  videoSession **must** be a valid VkVideoSessionKHR handle
- VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-parameter
  If videoSessionParameters is not VK_NULL_HANDLE, videoSessionParameters **must** be a valid VkVideoSessionParametersKHR handle

- VUID-VkVideoBeginCodingInfoKHR-pReferenceSlots-parameter
  If `referenceSlotCount` is not `0`, `pReferenceSlots` **must** be a valid pointer to an array of `referenceSlotCount` valid VkVideoReferenceSlotInfoKHR structures
- VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-parent
  If `videoSessionParameters` is a valid handle, it **must** have been created, allocated, or retrieved from `videoSession`
- VUID-VkVideoBeginCodingInfoKHR-commonparent
  Both of `videoSession`, and `videoSessionParameters` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoBeginCodingFlagsKHR;
```

`VkVideoBeginCodingFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkVideoReferenceSlotInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoReferenceSlotInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    int32_t                                  slotIndex;
    const VkVideoPictureResourceInfoKHR*     pPictureResource;
} VkVideoReferenceSlotInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `slotIndex` is the index of the DPB slot or a negative integer value.
- `pPictureResource` is `NULL` or a pointer to a VkVideoPictureResourceInfoKHR structure describing the video picture resource associated with the DPB slot index specified by `slotIndex`.

Valid Usage (Implicit)

- VUID-VkVideoReferenceSlotInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_REFERENCE_SLOT_INFO_KHR`
- VUID-VkVideoReferenceSlotInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkVideoDecodeAV1DpbSlotInfoKHR, VkVideoDecodeH264DpbSlotInfoKHR, VkVideoDecodeH265DpbSlotInfoKHR, VkVideoEncodeAV1DpbSlotInfoKHR, VkVideoEncodeH264DpbSlotInfoKHR, or VkVideoEncodeH265DpbSlotInfoKHR
- VUID-VkVideoReferenceSlotInfoKHR-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkVideoReferenceSlotInfoKHR-pPictureResource-parameter
  If `pPictureResource` is not `NULL`, `pPictureResource` **must** be a valid pointer to a valid VkVideoPictureResourceInfoKHR structure

To end a video coding scope, call:

```
// Provided by VK_KHR_video_queue
void vkCmdEndVideoCodingKHR(
    VkCommandBuffer                             commandBuffer,
    const VkVideoEndCodingInfoKHR*              pEndCodingInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pEndCodingInfo` is a pointer to a VkVideoEndCodingInfoKHR structure specifying the parameters for ending the video coding scope.

After ending a video coding scope, the video session object, the optional video session parameters object, and all reference picture resources previously bound by the corresponding vkCmdBeginVideoCodingKHR command are *unbound*.

Valid Usage

- VUID-vkCmdEndVideoCodingKHR-None-07251
  There **must** be no active queries

Valid Usage (Implicit)

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdEndVideoCodingKHR-pEndCodingInfo-parameter
  `pEndCodingInfo` **must** be a valid pointer to a valid VkVideoEndCodingInfoKHR structure
- VUID-vkCmdEndVideoCodingKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdEndVideoCodingKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support decode, or encode operations
- VUID-vkCmdEndVideoCodingKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdEndVideoCodingKHR-videocoding
  This command **must** only be called inside of a video coding scope
- VUID-vkCmdEndVideoCodingKHR-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Inside	Decode Encode	Action State

The `VkVideoEndCodingInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoEndCodingInfoKHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkVideoEndCodingFlagsKHR    flags;
} VkVideoEndCodingInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage (Implicit)

- VUID-VkVideoEndCodingInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_END_CODING_INFO_KHR`
- VUID-VkVideoEndCodingInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkVideoEndCodingInfoKHR-flags-zerobitmask
  `flags` **must** be `0`

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoEndCodingFlagsKHR;
```

`VkVideoEndCodingFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

38.9. Video Coding Control

To apply dynamic controls to the bound video session object, call:

```
// Provided by VK_KHR_video_queue
void vkCmdControlVideoCodingKHR(
    VkCommandBuffer                             commandBuffer,
    const VkVideoCodingControlInfoKHR*          pCodingControlInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pCodingControlInfo` is a pointer to a VkVideoCodingControlInfoKHR structure specifying the control parameters.

The control parameters provided in this call are applied to the video session at the time the command executes on the device and are in effect until a subsequent call to this command with the same video session bound changes the corresponding control parameters.

A newly created video session **must** be reset before performing video coding operations using it by including `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR` in `pCodingControlInfo->flags`. The reset operation also returns all DPB slots of the video session to the inactive state. Correspondingly, any DPB slot index associated with the bound reference picture resources is removed.

For encode sessions, the reset operation returns rate control configuration to implementation default settings and sets the video encode quality level to zero.

After video coding operations are performed using a video session, the reset operation **can** be used to return the video session to the same *initial* state as after the reset of a newly created video session. This **can** be used, for example, when different video sequences are needed to be processed with the same video session object.

If `pCodingControlInfo->flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, then the command replaces the rate control configuration maintained by the video session with the configuration specified in the VkVideoEncodeRateControlInfoKHR structure included in the `pCodingControlInfo->pNext` chain.

If `pCodingControlInfo->flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR`, then the command changes the current video encode quality level to the value specified in the `qualityLevel` member of the VkVideoEncodeQualityLevelInfoKHR structure included in the `pCodingControlInfo->pNext` chain.

Valid Usage

- VUID-vkCmdControlVideoCodingKHR-flags-07017
  If `pCodingControlInfo->flags` does not include `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR`, then the bound video session **must** not be in uninitialized state at the time the command is executed on the device
- VUID-vkCmdControlVideoCodingKHR-pCodingControlInfo-08243

If the bound video session was not created with an encode operation, then `pCodingControlInfo->flags` **must** not include `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR` or `VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR`

Valid Usage (Implicit)

- VUID-vkCmdControlVideoCodingKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdControlVideoCodingKHR-pCodingControlInfo-parameter
  `pCodingControlInfo` **must** be a valid pointer to a valid VkVideoCodingControlInfoKHR structure
- VUID-vkCmdControlVideoCodingKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdControlVideoCodingKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support decode, or encode operations
- VUID-vkCmdControlVideoCodingKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdControlVideoCodingKHR-videocoding
  This command **must** only be called inside of a video coding scope
- VUID-vkCmdControlVideoCodingKHR-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Inside	Decode Encode	Action

The `VkVideoCodingControlInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoCodingControlInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkVideoCodingControlFlagsKHR    flags;
} VkVideoCodingControlInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkVideoCodingControlFlagsKHR specifying control flags.

Valid Usage

- VUID-VkVideoCodingControlInfoKHR-flags-07018
  If `flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, then the `pNext` chain **must** include a VkVideoEncodeRateControlInfoKHR structure
- VUID-VkVideoCodingControlInfoKHR-flags-08349
  If `flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR`, then the `pNext` chain **must** include a VkVideoEncodeQualityLevelInfoKHR structure

Valid Usage (Implicit)

- VUID-VkVideoCodingControlInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_CODING_CONTROL_INFO_KHR`
- VUID-VkVideoCodingControlInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkVideoEncodeAV1RateControlInfoKHR, VkVideoEncodeH264RateControlInfoKHR, VkVideoEncodeH265RateControlInfoKHR, VkVideoEncodeQualityLevelInfoKHR, or VkVideoEncodeRateControlInfoKHR
- VUID-VkVideoCodingControlInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkVideoCodingControlInfoKHR-flags-parameter
  `flags` **must** be a valid combination of VkVideoCodingControlFlagBitsKHR values
- VUID-VkVideoCodingControlInfoKHR-flags-requiredbitmask
  `flags` **must** not be `0`

Bits which **can** be set in VkVideoCodingControlInfoKHR::`flags`, specifying the video coding control parameters to be modified, are:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodingControlFlagBitsKHR {
    VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR = 0x00000001,
  // Provided by VK_KHR_video_encode_queue
    VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR = 0x00000002,
  // Provided by VK_KHR_video_encode_queue
    VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR = 0x00000004,
} VkVideoCodingControlFlagBitsKHR;
```

- VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR specifies a request for the bound video session to be reset before other coding control parameters are applied.
- VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR specifies that the coding control parameters include video encode rate control parameters (see VkVideoEncodeRateControlInfoKHR).
- VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR specifies that the coding control parameters include video encode quality level parameters (see VkVideoEncodeQualityLevelInfoKHR).

```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodingControlFlagsKHR;
```

VkVideoCodingControlFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoCodingControlFlagBitsKHR.

38.10. Inline Queries

If a video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, beginning queries using commands such as vkCmdBeginQuery within a video coding scope is not allowed. Instead, queries are executed inline by including an instance of the VkVideoInlineQueryInfoKHR structure in the pNext chain of the parameters of one of the video coding commands, with its queryPool member set to a valid VkQueryPool handle.

The VkVideoInlineQueryInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_maintenance1
typedef struct VkVideoInlineQueryInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkQueryPool        queryPool;
    uint32_t           firstQuery;
    uint32_t           queryCount;
} VkVideoInlineQueryInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.

- `queryPool` is `VK_NULL_HANDLE` or a valid handle to a VkQueryPool object that will manage the results of the queries.
- `firstQuery` is the query index within the query pool that will contain the query results for the first video coding operation. The query results of subsequent video coding operations will be contained by subsequent query indices.
- `queryCount` is the number of queries to execute.

NOTE	In practice, if `queryPool` is not `VK_NULL_HANDLE`, then `queryCount` will always have to match the number of video coding operations issued by the video coding command this structure is specified to, meaning that using inline queries in a video coding command will always execute a query for each issued video coding operation.

This structure **can** be included in the `pNext` chain of the input parameter structure of video coding commands.

- In the `pNext` chain of the `pDecodeInfo` parameter of the vkCmdDecodeVideoKHR command to execute a query for each video decode operation issued by the command.
- In the `pNext` chain of the `pEncodeInfo` parameter of the vkCmdEncodeVideoKHR command to execute a query for each video encode operation issued by the command.

Valid Usage

- VUID-VkVideoInlineQueryInfoKHR-queryPool-08372
  If `queryPool` is not `VK_NULL_HANDLE`, then `firstQuery` **must** be less than the number of queries in `queryPool`
- VUID-VkVideoInlineQueryInfoKHR-queryPool-08373
  If `queryPool` is not `VK_NULL_HANDLE`, then the sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`

Valid Usage (Implicit)

- VUID-VkVideoInlineQueryInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_INLINE_QUERY_INFO_KHR`
- VUID-VkVideoInlineQueryInfoKHR-queryPool-parameter
  If `queryPool` is not VK_NULL_HANDLE, `queryPool` **must** be a valid VkQueryPool handle

38.11. Video Decode Operations

Video decode operations consume compressed video data from a video bitstream buffer and zero or more reference pictures, and produce a *decode output picture* and an optional reconstructed picture.

NOTE	Such decode output pictures can be shared with the Decoded Picture Buffer, and can also be used as the input of video encode operations, with graphics or compute operations, or with Window System Integration APIs, depending on the capabilities of the implementation.

Video decode operations **may** access the following resources in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR stage:

- The source video bitstream buffer range and the image subregions corresponding to the list of active reference pictures with access VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR.
- The image subregions corresponding to the target decode output picture and reconstructed picture with access VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR.

The image subresource of each video picture resource accessed by the video decode operation is specified using a corresponding VkVideoPictureResourceInfoKHR structure. Each such image subresource **must** be in the appropriate image layout as follows:

- If the image subresource is used in the video decode operation only as decode output picture, then it **must** be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR layout.
- If the image subresource is used in the video decode operation both as decode output picture and reconstructed picture, then it **must** be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.
- If the image subresource is used in the video decode operation only as reconstructed picture, then it **must** be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.
- If the image subresource is used in the video decode operation as a reference picture, then it **must** be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.

A video decode operation **may** complete unsuccessfully. In this case the decode output picture will have undefined contents. Similarly, if reference picture setup is requested, the reconstructed picture will also have undefined contents, and the activated DPB slot will have an invalid picture reference.

38.11.1. Codec-Specific Semantics

The following aspects of video decode operations are codec-specific:

- The interpretation of the contents of the source video bitstream buffer range.
- The construction and interpretation of the list of active reference pictures and the interpretation of the picture data referred to by the corresponding image subregions.
- The construction and interpretation of information related to the decode output picture and the generation of picture data to the corresponding image subregion.
- The decision on reference picture setup.
- The construction and interpretation of information related to the optional reconstructed picture and the generation of picture data to the corresponding image subregion.

These codec-specific behaviors are defined for each video codec operation separately.

- If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the H.264 Decode Operations section.
- If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the H.265 Decode Operations section.
- If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the AV1 Decode Operations section.

38.11.2. Video Decode Operation Steps

Each video decode operation performs the following steps in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR stage:

1. Reads the encoded video data from the source video bitstream buffer range.
2. Performs picture reconstruction of the encoded video data according to the codec-specific semantics, applying any prediction data read from the active reference pictures in the process;
3. Writes the decoded picture data to the decode output picture, and optionally to the reconstructed picture, if one is specified and is different from the decode output picture, according to the codec-specific semantics;
4. If reference picture setup is requested, the DPB slot index specified in the reconstructed picture information is activated with the reconstructed picture.

When reconstructed picture information is provided, the specified DPB slot index is associated with the corresponding bound reference picture resource, indifferent of whether reference picture setup is requested.

38.11.3. Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR with pVideoProfile->videoCodecOperation specifying a decode operation, the VkVideoDecodeCapabilitiesKHR structure **must** be included in the pNext chain of the VkVideoCapabilitiesKHR structure to retrieve capabilities specific to video decoding.

The VkVideoDecodeCapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeCapabilitiesKHR {
    VkStructureType                    sType;
    void*                              pNext;
    VkVideoDecodeCapabilityFlagsKHR    flags;
} VkVideoDecodeCapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.

- `flags` is a bitmask of VkVideoDecodeCapabilityFlagBitsKHR describing the supported video decoding capabilities.

Valid Usage (Implicit)

- VUID-VkVideoDecodeCapabilitiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_CAPABILITIES_KHR`

Bits which **may** be set in VkVideoDecodeCapabilitiesKHR::`flags`, indicating the decoding capabilities supported, are:

```
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeCapabilityFlagBitsKHR {
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR = 0x00000002,
} VkVideoDecodeCapabilityFlagBitsKHR;
```

- `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` indicates support for using the same video picture resource as the reconstructed picture and decode output picture in a video decode operation.
- `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` indicates support for using distinct video picture resources as the reconstructed picture and decode output picture in a video decode operation.

NOTE Some video profiles allow using distinct video picture resources as the reconstructed picture and decode output picture in specific video decode operations even when the video decode profile does not support `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR`. Even if the implementation only reports coincide, the decode output picture for film grain enabled frames must be a different video picture resource from the reconstructed picture because film grain is applied outside of the coding loop.

Implementations are only **required** to support one of `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` and `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR`. Accordingly, applications **should** handle both cases to maximize portability.

NOTE If both `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` and `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` are supported, an application can choose to create separate images for decode DPB and decode output. E.g. in cases when linear tiling is preferred (and supported) for the decode output picture and the DPB requires optimal tiling, this avoids the need for a separate copy at the expense of additional memory bandwidth requirements during decoding.

```
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeCapabilityFlagsKHR;
```

VkVideoDecodeCapabilityFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoDecodeCapabilityFlagBitsKHR.

38.11.4. Video Decode Commands

To launch video decode operations, call:

```
// Provided by VK_KHR_video_decode_queue
void vkCmdDecodeVideoKHR(
    VkCommandBuffer                             commandBuffer,
    const VkVideoDecodeInfoKHR*                 pDecodeInfo);
```

- commandBuffer is the command buffer in which to record the command.
- pDecodeInfo is a pointer to a VkVideoDecodeInfoKHR structure specifying the parameters of the video decode operations.

Each call issues one or more video decode operations. The implicit parameter opCount corresponds to the number of video decode operations issued by the command. After calling this command, the active query index of each active query is incremented by opCount.

Currently each call to this command results in the issue of a single video decode operation.

If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR and the pNext chain of pDecodeInfo includes a VkVideoInlineQueryInfoKHR structure with its queryPool member specifying a valid VkQueryPool handle, then this command will execute a query for each video decode operation issued by it.

Active Reference Picture Information

The list of active reference pictures used by a video decode operation is a list of image subregions used as the source of reference picture data and related parameters, and is derived from the VkVideoReferenceSlotInfoKHR structures provided as the elements of the pDecodeInfo->pReferenceSlots array. For each element of pDecodeInfo->pReferenceSlots, one or more elements are added to the active reference picture list, as defined by the codec-specific semantics. Each element of this list contains the following information:

- The image subregion within the image subresource referred to by the video picture resource used as the reference picture.
- The DPB slot index the reference picture is associated with.
- The codec-specific reference information related to the reference picture.

Reconstructed Picture Information

Information related to the optional reconstructed picture used by a video decode operation is derived from the VkVideoReferenceSlotInfoKHR structure pointed to by pDecodeInfo-

>pSetupReferenceSlot, if not NULL, as defined by the codec-specific semantics, and consists of the following:

- The image subregion within the image subresource referred to by the video picture resource used as the reconstructed picture.
- The DPB slot index to use for picture reconstruction.
- The codec-specific reference information related to the reconstructed picture.

Specifying a valid VkVideoReferenceSlotInfoKHR structure in pDecodeInfo->pSetupReferenceSlot is always required, unless the video session was created with VkVideoSessionCreateInfoKHR::maxDpbSlot equal to zero. However, the DPB slot identified by pDecodeInfo->pSetupReferenceSlot->slotIndex is only activated with the reconstructed picture specified in pDecodeInfo->pSetupReferenceSlot->pPictureResource if reference picture setup is requested according to the codec-specific semantics.

If reconstructed picture information is specified, and pDecodeInfo->pSetupReferenceSlot->pPictureResource refers to a video picture resource different than that of the decode output picture, but reference picture setup is not requested, the contents of the video picture resource corresponding to the reconstructed picture will be undefined after the video decode operation.

NOTE	Some implementations may always output the reconstructed picture or use it as temporary storage during the video decode operation even when the reconstructed picture is not marked for future reference.

Decode Output Picture Information

Information related to the decode output picture used by a video decode operation is derived from pDecodeInfo->dstPictureResource and any codec-specific parameters provided in the pDecodeInfo->pNext chain, as defined by the codec-specific semantics, and consists of the following:

- The image subregion within the image subresource referred to by the video picture resource used as the decode output picture.
- The codec-specific picture information related to the decode output picture.

Several limiting values are defined below that are referenced by the relevant valid usage statements of this command.

- Let uint32_t activeReferencePictureCount be the size of the list of active reference pictures used by the video decode operation. Unless otherwise defined, activeReferencePictureCount is set to the value of pDecodeInfo->referenceSlotCount.
  - If the bound video session was created with an H.264 decode profile, then let activeReferencePictureCount be the value of pDecodeInfo->referenceSlotCount plus the number of elements of the pDecodeInfo->pReferenceSlots array that have a VkVideoDecodeH264DpbSlotInfoKHR structure included in their pNext chain with both pStdReferenceInfo->flags.top_field_flag and pStdReferenceInfo->flags.bottom_field_flag set.

NOTE	This means that the elements of pDecodeInfo->pReferenceSlots that include both a top and bottom field reference are counted as two separate active reference pictures, as described in the active reference picture list construction rules for H.264 decode operations.

- Let VkOffset2D codedOffsetGranularity be the minimum alignment requirement for the coded offset of video picture resources. Unless otherwise defined, the value of the x and y members of codedOffsetGranularity are 0.
  - If the bound video session was created with an H.264 decode profile with a VkVideoDecodeH264ProfileInfoKHR::pictureLayout of VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR, then codedOffsetGranularity is equal to VkVideoDecodeH264CapabilitiesKHR::fieldOffsetGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for that video profile.
- Let uint32_t dpbFrameUseCount[] be an array of size maxDpbSlots, where maxDpbSlots is the VkVideoSessionCreateInfoKHR::maxDpbSlots the bound video session was created with, with each element indicating the number of times a frame associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of the array be 0.
  - If pDecodeInfo->pSetupReferenceSlot is not NULL, then dpbFrameUseCount[i] is incremented by one, where i equals pDecodeInfo->pSetupReferenceSlot->slotIndex. If the bound video session object was created with an H.264 decode profile, then dpbFrameUseCount[i] is decremented by one if either pStdReferenceInfo->flags.top_field_flag or pStdReferenceInfo->flags.bottom_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pDecodeInfo->pSetupReferenceSlot->pNext chain.
  - For each element of pDecodeInfo->pReferenceSlots, dpbFrameUseCount[i] is incremented by one, where i equals the slotIndex member of the corresponding element. If the bound video session object was created with an H.264 decode profile, then dpbFrameUseCount[i] is decremented by one if either pStdReferenceInfo->flags.top_field_flag or pStdReferenceInfo->flags.bottom_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pNext chain of the corresponding element of pDecodeInfo->pReferenceSlots.
- Let uint32_t dpbTopFieldUseCount[] and uint32_t dpbBottomFieldUseCount[] be arrays of size maxDpbSlots, where maxDpbSlots is the VkVideoSessionCreateInfoKHR::maxDpbSlots the bound video session was created with, with each element indicating the number of times the top field or the bottom field, respectively, associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of the arrays be 0.
  - If the bound video session object was created with an H.264 decode profile and pDecodeInfo->pSetupReferenceSlot is not NULL, then perform the following:
    - If pStdReferenceInfo->flags.top_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pDecodeInfo->pSetupReferenceSlot->pNext chain, then dpbTopFieldUseCount[i] is incremented by one, where i equals pDecodeInfo->pSetupReferenceSlot->slotIndex.

        - If `pStdReferenceInfo->flags.bottom_field_flag` is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the `pDecodeInfo->pSetupReferenceSlot->pNext` chain, then `dpbBottomFieldUseCount[i]` is incremented by one, where `i` equals `pDecodeInfo->pSetupReferenceSlot->slotIndex`.
    - If the bound video session object was created with an H.264 decode profile, then perform the following for each element of `pDecodeInfo->pReferenceSlots`:
        - If `pStdReferenceInfo->flags.top_field_flag` is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the `pNext` chain of the element, then `dpbTopFieldUseCount[i]` is incremented by one, where `i` equals the `slotIndex` member of the element.
        - If `pStdReferenceInfo->flags.bottom_field_flag` is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the `pNext` chain of the element, then `dpbBottomFieldUseCount[i]` is incremented by one, where `i` equals the `slotIndex` member of the element.

Valid Usage

- VUID-vkCmdDecodeVideoKHR-None-08249
  The bound video session **must** have been created with a decode operation
- VUID-vkCmdDecodeVideoKHR-None-07011
  The bound video session **must** not be in uninitialized state at the time the command is executed on the device
- VUID-vkCmdDecodeVideoKHR-opCount-07134
  For each active query, the active query index corresponding to the query type of that query plus `opCount` **must** be less than or equal to the last activatable query index corresponding to the query type of that query plus one
- VUID-vkCmdDecodeVideoKHR-pNext-08365
  If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, and the `pNext` chain of `pDecodeInfo` includes a VkVideoInlineQueryInfoKHR structure with its `queryPool` member specifying a valid `VkQueryPool` handle, then VkVideoInlineQueryInfoKHR::queryCount **must** equal `opCount`
- VUID-vkCmdDecodeVideoKHR-pNext-08366
  If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, and the `pNext` chain of `pDecodeInfo` includes a VkVideoInlineQueryInfoKHR structure with its `queryPool` member specifying a valid `VkQueryPool` handle, then all the queries used by the command, as specified by the VkVideoInlineQueryInfoKHR structure, **must** be *unavailable*
- VUID-vkCmdDecodeVideoKHR-queryType-08367
  If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, then the `queryType` used to create the `queryPool` specified in the VkVideoInlineQueryInfoKHR structure included in the `pNext` chain of `pDecodeInfo` **must** be `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`
- VUID-vkCmdDecodeVideoKHR-queryPool-08368

If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, then the queryPool specified in the VkVideoInlineQueryInfoKHR structure included in the pNext chain of pDecodeInfo **must** have been created with a VkVideoProfileInfoKHR structure included in the pNext chain of VkQueryPoolCreateInfo identical to the one specified in VkVideoSessionCreateInfoKHR ::pVideoProfile the bound video session was created with

- VUID-vkCmdDecodeVideoKHR-queryType-08369
  If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, and the queryType used to create the queryPool specified in the VkVideoInlineQueryInfoKHR structure included in the pNext chain of pDecodeInfo is VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, then the VkCommandPool that commandBuffer was allocated from **must** have been created with a queue family index that supports result status queries, as indicated by VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07135
  pDecodeInfo->srcBuffer **must** be compatible with the video profile the bound video session was created with
- VUID-vkCmdDecodeVideoKHR-commandBuffer-07136
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, then pDecodeInfo->srcBuffer **must** not be a protected buffer
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07138
  pDecodeInfo->srcBufferOffset **must** be an integer multiple of VkVideoCapabilitiesKHR ::minBitstreamBufferOffsetAlignment, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07139
  pDecodeInfo->srcBufferRange **must** be an integer multiple of VkVideoCapabilitiesKHR ::minBitstreamBufferSizeAlignment, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07140
  If pDecodeInfo->pSetupReferenceSlot is not NULL and VkVideoDecodeCapabilitiesKHR::flags does not include VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then the video picture resources specified by pDecodeInfo->dstPictureResource and pDecodeInfo->pSetupReferenceSlot->pPictureResource **must** not match
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07141
  If pDecodeInfo->pSetupReferenceSlot is not NULL and none of the following is true:
  - VkVideoDecodeCapabilitiesKHR::flags includes VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
  - the bound video session was created with the video codec operation

VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR and VkVideoDecodeAV1ProfileInfoKHR::filmGrainSupport set to VK_TRUE, and film grain is enabled for the decoded picture

then the video picture resources specified by pDecodeInfo->dstPictureResource and pDecodeInfo->pSetupReferenceSlot->pPictureResource **must** match

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07142
  pDecodeInfo->dstPictureResource.imageViewBinding **must** be compatible with the video profile the bound video session was created with
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07143
  The format of pDecodeInfo->dstPictureResource.imageViewBinding **must** match the VkVideoSessionCreateInfoKHR::pictureFormat the bound video session was created with
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07144
  pDecodeInfo->dstPictureResource.codedOffset **must** be an integer multiple of codedOffsetGranularity
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07145
  pDecodeInfo->dstPictureResource.codedExtent **must** be between minCodedExtent and maxCodedExtent, inclusive, the bound video session was created with
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07146
  pDecodeInfo->dstPictureResource.imageViewBinding **must** have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR
- VUID-vkCmdDecodeVideoKHR-commandBuffer-07147
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, then pDecodeInfo->dstPictureResource.imageViewBinding **must** not have been created from a protected image
- VUID-vkCmdDecodeVideoKHR-commandBuffer-07148
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, then pDecodeInfo->dstPictureResource.imageViewBinding **must** have been created from a protected image
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-08376
  pDecodeInfo->pSetupReferenceSlot **must** not be NULL unless the bound video session was created with VkVideoSessionCreateInfoKHR::maxDpbSlots equal to zero
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07170
  If pDecodeInfo->pSetupReferenceSlot is not NULL, then pDecodeInfo->pSetupReferenceSlot->slotIndex **must** be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07173
  If pDecodeInfo->pSetupReferenceSlot is not NULL, then pDecodeInfo->pSetupReferenceSlot->pPictureResource->codedOffset **must** be an integer multiple of codedOffsetGranularity
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07149
  If pDecodeInfo->pSetupReferenceSlot is not NULL, then pDecodeInfo->pSetupReferenceSlot->pPictureResource **must** match one of the bound reference picture resource
- VUID-vkCmdDecodeVideoKHR-activeReferencePictureCount-07150
  activeReferencePictureCount **must** be less than or equal to the

VkVideoSessionCreateInfoKHR::maxActiveReferencePictures specified when the bound video session was created

- VUID-vkCmdDecodeVideoKHR-slotIndex-07256
  The slotIndex member of each element of pDecodeInfo->pReferenceSlots **must** be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created
- VUID-vkCmdDecodeVideoKHR-codedOffset-07257
  The codedOffset member of the VkVideoPictureResourceInfoKHR structure pointed to by the pPictureResource member of each element of pDecodeInfo->pReferenceSlots **must** be an integer multiple of codedOffsetGranularity
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07151
  The pPictureResource member of each element of pDecodeInfo->pReferenceSlots **must** match one of the bound reference picture resource associated with the DPB slot index specified in the slotIndex member of that element
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07264
  Each video picture resource corresponding to the pPictureResource member specified in the elements of pDecodeInfo->pReferenceSlots **must** be unique within pDecodeInfo->pReferenceSlots
- VUID-vkCmdDecodeVideoKHR-dpbFrameUseCount-07176
  All elements of dpbFrameUseCount **must** be less than or equal to 1
- VUID-vkCmdDecodeVideoKHR-dpbTopFieldUseCount-07177
  All elements of dpbTopFieldUseCount **must** be less than or equal to 1
- VUID-vkCmdDecodeVideoKHR-dpbBottomFieldUseCount-07178
  All elements of dpbBottomFieldUseCount **must** be less than or equal to 1
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07252
  If pDecodeInfo->pSetupReferenceSlot is NULL or pDecodeInfo->pSetupReferenceSlot->pPictureResource does not refer to the same image subresource as pDecodeInfo->dstPictureResource, then the image subresource referred to by pDecodeInfo->dstPictureResource **must** be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR layout at the time the video decode operation is executed on the device
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07253
  If pDecodeInfo->pSetupReferenceSlot is not NULL and pDecodeInfo->pSetupReferenceSlot->pPictureResource refers to the same image subresource as pDecodeInfo->dstPictureResource, then the image subresource referred to by pDecodeInfo->dstPictureResource **must** be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout at the time the video decode operation is executed on the device
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07254
  If pDecodeInfo->pSetupReferenceSlot is not NULL, then the image subresource referred to by pDecodeInfo->pSetupReferenceSlot->pPictureResource **must** be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout at the time the video decode operation is executed on the device
- VUID-vkCmdDecodeVideoKHR-pPictureResource-07255
  The image subresource referred to by the pPictureResource member of each element of

pDecodeInfo->pReferenceSlots **must** be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout at the time the video decode operation is executed on the device

- VUID-vkCmdDecodeVideoKHR-pNext-07152
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the pNext chain of pDecodeInfo **must** include a VkVideoDecodeH264PictureInfoKHR structure
- VUID-vkCmdDecodeVideoKHR-None-07258
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR but was not created with interlaced frame support, then the decode output picture **must** represent a frame
- VUID-vkCmdDecodeVideoKHR-pSliceOffsets-07153
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then all elements of the pSliceOffsets member of the VkVideoDecodeH264PictureInfoKHR structure included in the pNext chain of pDecodeInfo **must** be less than pDecodeInfo->srcBufferRange
- VUID-vkCmdDecodeVideoKHR-StdVideoH264SequenceParameterSet-07154
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the bound video session parameters object **must** contain a StdVideoH264SequenceParameterSet entry with seq_parameter_set_id matching StdVideoDecodeH264PictureInfo::seq_parameter_set_id that is provided in the pStdPictureInfo member of the VkVideoDecodeH264PictureInfoKHR structure included in the pNext chain of pDecodeInfo
- VUID-vkCmdDecodeVideoKHR-StdVideoH264PictureParameterSet-07155
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the bound video session parameters object **must** contain a StdVideoH264PictureParameterSet entry with seq_parameter_set_id and pic_parameter_set_id matching StdVideoDecodeH264PictureInfo::seq_parameter_set_id and StdVideoDecodeH264PictureInfo::pic_parameter_set_id, respectively, that are provided in the pStdPictureInfo member of the VkVideoDecodeH264PictureInfoKHR structure included in the pNext chain of pDecodeInfo
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07156
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR and pDecodeInfo->pSetupReferenceSlot is not NULL, then the pNext chain of pDecodeInfo->pSetupReferenceSlot **must** include a VkVideoDecodeH264DpbSlotInfoKHR structure
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07259
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR but was not created with interlaced frame support, and pDecodeInfo->pSetupReferenceSlot is not NULL, then the reconstructed picture **must** represent a frame
- VUID-vkCmdDecodeVideoKHR-pNext-07157
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the pNext chain of each element of pDecodeInfo->pReferenceSlots **must** include a VkVideoDecodeH264DpbSlotInfoKHR structure

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07260
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` but was not created with interlaced frame support, then each active reference picture corresponding to the elements of `pDecodeInfo->pReferenceSlots` **must** represent a frame
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07261
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, and the decode output picture represents a frame, then the reconstructed picture **must** also represent a frame
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07262
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, and the decode output picture represents a top field, then the reconstructed picture **must** also represent a top field
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07263
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, and the decode output picture represents a bottom field, then the reconstructed picture **must** also represent a bottom field
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07266
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and an active reference picture corresponding to any element of `pDecodeInfo->pReferenceSlots` represents a frame, then the DPB slot index of the bound video session specified by the `slotIndex` member of that element **must** be currently associated with a frame picture matching the video picture resource specified by the `pPictureResource` member of the same element at the time the command is executed on the device
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07267
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and an active reference picture corresponding to any element of `pDecodeInfo->pReferenceSlots` represents a top field, then the DPB slot index of the bound video session specified by the `slotIndex` member of that element **must** be currently associated with a top field picture matching the video picture resource specified by the `pPictureResource` member of the same element at the time the command is executed on the device
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07268
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and an active reference picture corresponding to any element of `pDecodeInfo->pReferenceSlots` represents a bottom field, then the DPB slot index of the bound video session specified by the `slotIndex` member of that element **must** be currently associated with a bottom field picture matching the video picture resource specified by the `pPictureResource` member of the same element at the time the command is executed on the device
- VUID-vkCmdDecodeVideoKHR-pNext-07158

If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the pNext chain of pDecodeInfo **must** include a VkVideoDecodeH265PictureInfoKHR structure

- VUID-vkCmdDecodeVideoKHR-pSliceSegmentOffsets-07159
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then all elements of the pSliceSegmentOffsets member of the VkVideoDecodeH265PictureInfoKHR structure included in the pNext chain of pDecodeInfo **must** be less than pDecodeInfo->srcBufferRange
- VUID-vkCmdDecodeVideoKHR-StdVideoH265VideoParameterSet-07160
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the bound video session parameters object **must** contain a StdVideoH265VideoParameterSet entry with vps_video_parameter_set_id matching StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id that is provided in the pStdPictureInfo member of the VkVideoDecodeH265PictureInfoKHR structure included in the pNext chain of pDecodeInfo
- VUID-vkCmdDecodeVideoKHR-StdVideoH265SequenceParameterSet-07161
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the bound video session parameters object **must** contain a StdVideoH265SequenceParameterSet entry with sps_video_parameter_set_id and sps_seq_parameter_set_id matching StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id and StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id, respectively, that are provided in the pStdPictureInfo member of the VkVideoDecodeH265PictureInfoKHR structure included in the pNext chain of pDecodeInfo
- VUID-vkCmdDecodeVideoKHR-StdVideoH265PictureParameterSet-07162
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the bound video session parameters object **must** contain a StdVideoH265PictureParameterSet entry with sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id matching StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id, StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id, and StdVideoDecodeH265PictureInfo::pps_pic_parameter_set_id, respectively, that are provided in the pStdPictureInfo member of the VkVideoDecodeH265PictureInfoKHR structure included in the pNext chain of pDecodeInfo
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07163
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR and pDecodeInfo->pSetupReferenceSlot is not NULL, then the pNext chain of pDecodeInfo->pSetupReferenceSlot **must** include a VkVideoDecodeH265DpbSlotInfoKHR structure
- VUID-vkCmdDecodeVideoKHR-pNext-07164
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the pNext chain of each element of pDecodeInfo->pReferenceSlots **must** include a VkVideoDecodeH265DpbSlotInfoKHR structure
- VUID-vkCmdDecodeVideoKHR-filmGrainSupport-09248

If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR and VkVideoDecodeAV1ProfileInfoKHR ::filmGrainSupport set to VK_FALSE, then film grain **must** not be enabled for the decoded picture

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-09249
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, pDecodeInfo->pSetupReferenceSlot is not NULL, and film grain is enabled for the decoded picture, then the video picture resources specified by pDecodeInfo->dstPictureResource and pDecodeInfo->pSetupReferenceSlot->pPictureResource **must** not match
- VUID-vkCmdDecodeVideoKHR-pNext-09250
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the pNext chain of pDecodeInfo **must** include a VkVideoDecodeAV1PictureInfoKHR structure
- VUID-vkCmdDecodeVideoKHR-frameHeaderOffset-09251
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the frameHeaderOffset member of the VkVideoDecodeAV1PictureInfoKHR structure included in the pNext chain of pDecodeInfo **must** be less than the minimum of pDecodeInfo->srcBufferRange
- VUID-vkCmdDecodeVideoKHR-pTileOffsets-09253
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then all elements of the pTileOffsets member of the VkVideoDecodeAV1PictureInfoKHR structure included in the pNext chain of pDecodeInfo **must** be less than pDecodeInfo->srcBufferRange
- VUID-vkCmdDecodeVideoKHR-pTileOffsets-09252
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then for each element i of the pTileOffsets and pTileSizes members of the VkVideoDecodeAV1PictureInfoKHR structure included in the pNext chain of pDecodeInfo the sum of pTileOffsets[i] and pTileSizes[i] **must** be less than or equal to pDecodeInfo->srcBufferRange
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-09254
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR and pDecodeInfo->pSetupReferenceSlot is not NULL, then the pNext chain of pDecodeInfo->pSetupReferenceSlot **must** include a VkVideoDecodeAV1DpbSlotInfoKHR structure
- VUID-vkCmdDecodeVideoKHR-pNext-09255
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the pNext chain of each element of pDecodeInfo->pReferenceSlots **must** include a VkVideoDecodeAV1DpbSlotInfoKHR structure
- VUID-vkCmdDecodeVideoKHR-referenceNameSlotIndices-09262
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then each element of the referenceNameSlotIndices array member of the VkVideoDecodeAV1PictureInfoKHR structure included in the pNext chain of pDecodeInfo **must** either be negative or **must**

equal the slotIndex member of one of the elements of pDecodeInfo->pReferenceSlots

- VUID-vkCmdDecodeVideoKHR-slotIndex-09263
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the slotIndex member of each element of pDecodeInfo->pReferenceSlots **must** equal one of the elements of the referenceNameSlotIndices array member of the VkVideoDecodeAV1PictureInfoKHR structure included in the pNext chain of pDecodeInfo

Valid Usage (Implicit)

- VUID-vkCmdDecodeVideoKHR-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-parameter
  pDecodeInfo **must** be a valid pointer to a valid VkVideoDecodeInfoKHR structure
- VUID-vkCmdDecodeVideoKHR-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdDecodeVideoKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support decode operations
- VUID-vkCmdDecodeVideoKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdDecodeVideoKHR-videocoding
  This command **must** only be called inside of a video coding scope
- VUID-vkCmdDecodeVideoKHR-bufferlevel
  commandBuffer **must** be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Inside	Decode	Action

The VkVideoDecodeInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    VkVideoDecodeFlagsKHR                    flags;
    VkBuffer                                 srcBuffer;
    VkDeviceSize                             srcBufferOffset;
    VkDeviceSize                             srcBufferRange;
    VkVideoPictureResourceInfoKHR            dstPictureResource;
    const VkVideoReferenceSlotInfoKHR*       pSetupReferenceSlot;
    uint32_t                                 referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR*       pReferenceSlots;
} VkVideoDecodeInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `srcBuffer` is the source video bitstream buffer to read the encoded bitstream from.
- `srcBufferOffset` is the starting offset in bytes from the start of `srcBuffer` to read the encoded bitstream from.
- `srcBufferRange` is the size in bytes of the encoded bitstream to decode from `srcBuffer`, starting from `srcBufferOffset`.
- `dstPictureResource` is the video picture resource to use as the decode output picture.
- `pSetupReferenceSlot` is `NULL` or a pointer to a VkVideoReferenceSlotInfoKHR structure specifying the reconstructed picture information.
- `referenceSlotCount` is the number of elements in the `pReferenceSlots` array.
- `pReferenceSlots` is `NULL` or a pointer to an array of VkVideoReferenceSlotInfoKHR structures describing the DPB slots and corresponding reference picture resources to use in this video decode operation (the set of active reference pictures).

Valid Usage

- VUID-VkVideoDecodeInfoKHR-srcBuffer-07165
  `srcBuffer` **must** have been created with `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR` set
- VUID-VkVideoDecodeInfoKHR-srcBufferOffset-07166
  `srcBufferOffset` **must** be less than the size of `srcBuffer`
- VUID-VkVideoDecodeInfoKHR-srcBufferRange-07167
  `srcBufferRange` **must** be less than or equal to the size of `srcBuffer` minus `srcBufferOffset`
- VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-07168
  If `pSetupReferenceSlot` is not `NULL`, then its `slotIndex` member **must** not be negative
- VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-07169
  If `pSetupReferenceSlot` is not `NULL`, then its `pPictureResource` **must** not be `NULL`

- VUID-VkVideoDecodeInfoKHR-slotIndex-07171
  The `slotIndex` member of each element of `pReferenceSlots` **must** not be negative
- VUID-VkVideoDecodeInfoKHR-pPictureResource-07172
  The `pPictureResource` member of each element of `pReferenceSlots` **must** not be `NULL`

Valid Usage (Implicit)

- VUID-VkVideoDecodeInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_INFO_KHR`
- VUID-VkVideoDecodeInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkVideoDecodeAV1PictureInfoKHR, VkVideoDecodeH264PictureInfoKHR, VkVideoDecodeH265PictureInfoKHR, or VkVideoInlineQueryInfoKHR
- VUID-VkVideoDecodeInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkVideoDecodeInfoKHR-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkVideoDecodeInfoKHR-srcBuffer-parameter
  `srcBuffer` **must** be a valid VkBuffer handle
- VUID-VkVideoDecodeInfoKHR-dstPictureResource-parameter
  `dstPictureResource` **must** be a valid VkVideoPictureResourceInfoKHR structure
- VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-parameter
  If `pSetupReferenceSlot` is not `NULL`, `pSetupReferenceSlot` **must** be a valid pointer to a valid VkVideoReferenceSlotInfoKHR structure
- VUID-VkVideoDecodeInfoKHR-pReferenceSlots-parameter
  If `referenceSlotCount` is not `0`, `pReferenceSlots` **must** be a valid pointer to an array of `referenceSlotCount` valid VkVideoReferenceSlotInfoKHR structures

```
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeFlagsKHR;
```

`VkVideoDecodeFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

38.12. H.264 Decode Operations

Video decode operations using an H.264 decode profile **can** be used to decode elementary video stream sequences compliant to the ITU-T H.264 Specification.

NOTE Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by

> Khronos.

This process is performed according to the video decode operation steps with the codec-specific semantics defined in section 8 of the ITU-T H.264 Specification as follows:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The `StdVideoH264SequenceParameterSet` structure corresponding to the active SPS specifying the H.264 sequence parameter set.
  - The `StdVideoH264PictureParameterSet` structure corresponding to the active PPS specifying the H.264 picture parameter set.
  - The `StdVideoDecodeH264PictureInfo` structure specifying the H.264 picture information.
  - The `StdVideoDecodeH264ReferenceInfo` structures specifying the H.264 reference information corresponding to the optional reconstructed picture and any active reference pictures.
- The contents of the provided video bitstream buffer range are interpreted as defined in the H.264 Decode Bitstream Data Access section.
- Picture data in the video picture resources corresponding to the used active reference pictures, decode output picture, and optional reconstructed picture is accessed as defined in the H.264 Decode Picture Data Access section.
- The decision on reference picture setup is made according to the parameters specified in the H.264 picture information.

If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.264 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation **may** complete unsuccessfully.

38.12.1. H.264 Decode Bitstream Data Access

If the target decode output picture is a frame, then the video bitstream buffer range **should** contain a VCL NAL unit comprised of the slice headers and data of a picture representing an entire frame, as defined in sections 7.3.3 and 7.3.4, and this data is interpreted as defined in sections 7.4.3 and 7.4.4 of the ITU-T H.264 Specification, respectively.

If the target decode output picture is a field, then the video bitstream buffer range should contain a VCL NAL unit comprised of the slice headers and data of a picture representing a field, as defined in sections 7.3.3 and 7.3.4, and this data is interpreted as defined in sections 7.4.3 and 7.4.4 of the ITU-T H.264 Specification, respectively.

The offsets provided in VkVideoDecodeH264PictureInfoKHR::`pSliceOffsets` **should** specify the starting offsets corresponding to each slice header within the video bitstream buffer range.

38.12.2. H.264 Decode Picture Data Access

The effective `imageOffset` and `imageExtent` corresponding to a decode output picture, reference

picture, or reconstructed picture used in video decode operations with an H.264 decode profile are defined as follows:

- imageOffset is (codedOffset.x,codedOffset.y) and imageExtent is (codedExtent.width, codedExtent.height), if the picture represents a frame.
- imageOffset is (codedOffset.x,codedOffset.y) and imageExtent is (codedExtent.width, codedExtent.height), if the picture represents a field and the picture layout of the used H.264 decode profile is VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR.
- imageOffset is (codedOffset.x,codedOffset.y) and imageExtent is (codedExtent.width, codedExtent.height / 2), if the picture represents a field and the picture layout of the used H.264 decode profile is VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR.

Where codedOffset and codedExtent are the members of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.

However, accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::pictureAccessGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. This means that the complete image subregion accessed by video coding operations using an H.264 decode profile for the video picture resource is defined as the set of texels within the coordinate range:

([startX,endX), [startY,endY))

Where:

- startX equals imageOffset.x rounded down to the nearest integer multiple of pictureAccessGranularity.width;
- endX equals imageOffset.x + imageExtent.width rounded up to the nearest integer multiple of pictureAccessGranularity.width and clamped to the width of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;
- startY equals imageOffset.y rounded down to the nearest integer multiple of pictureAccessGranularity.height;
- endY equals imageOffset.y + imageExtent.height rounded up to the nearest integer multiple of pictureAccessGranularity.height and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure.

In case of video decode operations using an H.264 decode profile, any access to a picture at the coordinates (x,y), as defined by the ITU-T H.264 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel coordinates specified below:

- (x,y), if the accessed picture represents a frame.
- (x,y × 2), if the accessed picture represents a top field and the picture layout of the used H.264 decode profile is VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR.
- (x,y × 2 + 1), if the accessed picture represents a bottom field and the picture layout of the used H.264 decode profile is

VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR.

- (x,y), if the accessed picture represents a top field and the picture layout of the used H.264 decode profile is VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR.
- (codedOffset.x + x,codedOffset.y + y), if the accessed picture represents a bottom field and the picture layout of the used H.264 decode profile is VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR.

Where codedOffset is the member of the corresponding VkVideoPictureResourceInfoKHR structure.

38.12.3. H.264 Decode Profile

A video profile supporting H.264 video decode operations is specified by setting VkVideoProfileInfoKHR::videoCodecOperation to VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR and adding a VkVideoDecodeH264ProfileInfoKHR structure to the VkVideoProfileInfoKHR::pNext chain.

The VkVideoDecodeH264ProfileInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264ProfileInfoKHR {
    VkStructureType                                 sType;
    const void*                                     pNext;
    StdVideoH264ProfileIdc                          stdProfileIdc;
    VkVideoDecodeH264PictureLayoutFlagBitsKHR       pictureLayout;
} VkVideoDecodeH264ProfileInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stdProfileIdc is a StdVideoH264ProfileIdc value specifying the H.264 codec profile IDC, as defined in section A.2 of the ITU-T H.264 Specification.
- pictureLayout is a VkVideoDecodeH264PictureLayoutFlagBitsKHR value specifying the picture layout used by the H.264 video sequence to be decoded.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264ProfileInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PROFILE_INFO_KHR
- VUID-VkVideoDecodeH264ProfileInfoKHR-pictureLayout-parameter
  If pictureLayout is not 0, pictureLayout **must** be a valid VkVideoDecodeH264PictureLayoutFlagBitsKHR value

The H.264 video decode picture layout flags are defined as follows:

```
// Provided by VK_KHR_video_decode_h264
typedef enum VkVideoDecodeH264PictureLayoutFlagBitsKHR {
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR = 0,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR =
0x00000001,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR =
0x00000002,
} VkVideoDecodeH264PictureLayoutFlagBitsKHR;
```

- VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR specifies support for progressive content. This flag has the value 0.
- VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR specifies support for or use of a picture layout for interlaced content where all lines belonging to the top field are decoded to the even-numbered lines within the picture resource, and all lines belonging to the bottom field are decoded to the odd-numbered lines within the picture resource.
- VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR specifies support for or use of a picture layout for interlaced content where all lines belonging to a field are grouped together in a single image subregion, and the two fields comprising the frame **can** be stored in separate image subregions of the same image subresource or in separate image subresources.

```
// Provided by VK_KHR_video_decode_h264
typedef VkFlags VkVideoDecodeH264PictureLayoutFlagsKHR;
```

VkVideoDecodeH264PictureLayoutFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoDecodeH264PictureLayoutFlagBitsKHR.

38.12.4. H.264 Decode Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities for an H.264 decode profile, the VkVideoCapabilitiesKHR::pNext chain **must** include a VkVideoDecodeH264CapabilitiesKHR structure that will be filled with the profile-specific capabilities.

The VkVideoDecodeH264CapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264CapabilitiesKHR {
    VkStructureType         sType;
    void*                   pNext;
    StdVideoH264LevelIdc    maxLevelIdc;
    VkOffset2D              fieldOffsetGranularity;
} VkVideoDecodeH264CapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxLevelIdc is a StdVideoH264LevelIdc value indicating the maximum H.264 level supported by

the profile, where enum constant STD_VIDEO_H264_LEVEL_IDC_<major>_<minor> identifies H.264 level <major>.<minor> as defined in section A.3 of the ITU-T H.264 Specification.

- fieldOffsetGranularity is the minimum alignment for VkVideoPictureResourceInfoKHR ::codedOffset specified for a video picture resource when using the picture layout VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264CapabilitiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_CAPABILITIES_KHR

38.12.5. H.264 Decode Parameter Sets

Video session parameters objects created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR **can** contain the following types of parameters:

H.264 Sequence Parameter Sets (SPS)

Represented by StdVideoH264SequenceParameterSet structures and interpreted as follows:

- reserved1 and reserved2 are used only for padding purposes and are otherwise ignored;
- seq_parameter_set_id is used as the key of the SPS entry;
- level_idc is one of the enum constants STD_VIDEO_H264_LEVEL_IDC_<major>_<minor> identifying the H.264 level <major>.<minor> as defined in section A.3 of the ITU-T H.264 Specification;
- if flags.seq_scaling_matrix_present_flag is set, then the StdVideoH264ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  - scaling_list_present_mask is a bitmask where bit index i corresponds to seq_scaling_list_present_flag[i] as defined in section 7.4.2.1 of the ITU-T H.264 Specification;
  - use_default_scaling_matrix_mask is a bitmask where bit index i corresponds to UseDefaultScalingMatrix4x4Flag[i], when i < 6, or corresponds to UseDefaultScalingMatrix8x8Flag[i-6], otherwise, as defined in section 7.3.2.1 of the ITU-T H.264 Specification;
  - ScalingList4x4 and ScalingList8x8 correspond to the identically named syntax elements defined in section 7.3.2.1 of the ITU-T H.264 Specification;
- if flags.vui_parameters_present_flag is set, then pSequenceParameterSetVui is a pointer to a StdVideoH264SequenceParameterSetVui structure that is interpreted as follows:
  - reserved1 is used only for padding purposes and is otherwise ignored;
  - flags.color_description_present_flag is interpreted as the value of colour_description_present_flag, as defined in section E.2.1 of the ITU-T H.264 Specification;

NOTE	The name of `colour_description_present_flag` was misspelled in the Video Std header.

  - if `flags.nal_hrd_parameters_present_flag` or `flags.vcl_hrd_parameters_present_flag` is set, then the `StdVideoH264HrdParameters` structure pointed to by `pHrdParameters` is interpreted as follows:
    - `reserved1` is used only for padding purposes and is otherwise ignored;
    - all other members of `StdVideoH264HrdParameters` are interpreted as defined in section E.2.2 of the ITU-T H.264 Specification;
  - all other members of `StdVideoH264SequenceParameterSetVui` are interpreted as defined in section E.2.1 of the ITU-T H.264 Specification;
- all other members of `StdVideoH264SequenceParameterSet` are interpreted as defined in section 7.4.2.1 of the ITU-T H.264 Specification.

H.264 Picture Parameter Sets (PPS)

Represented by `StdVideoH264PictureParameterSet` structures and interpreted as follows:

- the pair constructed from `seq_parameter_set_id` and `pic_parameter_set_id` is used as the key of the PPS entry;
- if `flags.pic_scaling_matrix_present_flag` is set, then the `StdVideoH264ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
  - `scaling_list_present_mask` is a bitmask where bit index i corresponds to `pic_scaling_list_present_flag[i]` as defined in section 7.4.2.2 of the ITU-T H.264 Specification;
  - `use_default_scaling_matrix_mask` is a bitmask where bit index i corresponds to `UseDefaultScalingMatrix4x4Flag[i]`, when i < 6, or corresponds to `UseDefaultScalingMatrix8x8Flag[i-6]`, otherwise, as defined in section 7.3.2.2 of the ITU-T H.264 Specification;
  - `ScalingList4x4` and `ScalingList8x8` correspond to the identically named syntax elements defined in section 7.3.2.2 of the ITU-T H.264 Specification;
- all other members of `StdVideoH264PictureParameterSet` are interpreted as defined in section 7.4.2.2 of the ITU-T H.264 Specification.

When a video session parameters object is created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, the VkVideoSessionParametersCreateInfoKHR::`pNext` chain **must** include a `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure specifying the capacity and initial contents of the object.

The `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersCreateInfoKHR {
    VkStructureType                                    sType;
    const void*                                        pNext;
    uint32_t                                           maxStdSPSCount;
    uint32_t                                           maxStdPPSCount;
    const VkVideoDecodeH264SessionParametersAddInfoKHR*    pParametersAddInfo;
} VkVideoDecodeH264SessionParametersCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxStdSPSCount` is the maximum number of H.264 SPS entries the created `VkVideoSessionParametersKHR` **can** contain.
- `maxStdPPSCount` is the maximum number of H.264 PPS entries the created `VkVideoSessionParametersKHR` **can** contain.
- `pParametersAddInfo` is `NULL` or a pointer to a VkVideoDecodeH264SessionParametersAddInfoKHR structure specifying H.264 parameters to add upon object creation.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264SessionParametersCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR`
- VUID-VkVideoDecodeH264SessionParametersCreateInfoKHR-pParametersAddInfo-parameter
  If `pParametersAddInfo` is not `NULL`, `pParametersAddInfo` **must** be a valid pointer to a valid VkVideoDecodeH264SessionParametersAddInfoKHR structure

The `VkVideoDecodeH264SessionParametersAddInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersAddInfoKHR {
    VkStructureType                              sType;
    const void*                                  pNext;
    uint32_t                                     stdSPSCount;
    const StdVideoH264SequenceParameterSet*      pStdSPSs;
    uint32_t                                     stdPPSCount;
    const StdVideoH264PictureParameterSet*       pStdPPSs;
} VkVideoDecodeH264SessionParametersAddInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdSPSCount` is the number of elements in the `pStdSPSs` array.
- `pStdSPSs` is a pointer to an array of `StdVideoH264SequenceParameterSet` structures describing the

H.264 SPS entries to add.

- `stdPPSCount` is the number of elements in the `pStdPPSs` array.
- `pStdPPSs` is a pointer to an array of `StdVideoH264PictureParameterSet` structures describing the H.264 PPS entries to add.

This structure **can** be specified in the following places:

- In the `pParametersAddInfo` member of the VkVideoDecodeH264SessionParametersCreateInfoKHR structure specified in the `pNext` chain of VkVideoSessionParametersCreateInfoKHR used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).
- In the `pNext` chain of VkVideoSessionParametersUpdateInfoKHR. In this case, if the video codec operation the video session parameters object to be updated was created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then it defines the set of parameters to add to it (see Updating Video Session Parameters).

Valid Usage

- VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-None-04825
  The `seq_parameter_set_id` member of each `StdVideoH264SequenceParameterSet` structure specified in the elements of `pStdSPSs` **must** be unique within `pStdSPSs`
- VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-None-04826
  The pair constructed from the `seq_parameter_set_id` and `pic_parameter_set_id` members of each `StdVideoH264PictureParameterSet` structure specified in the elements of `pStdPPSs` **must** be unique within `pStdPPSs`

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR`
- VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-pStdSPSs-parameter
  If `stdSPSCount` is not `0`, `pStdSPSs` **must** be a valid pointer to an array of `stdSPSCount` `StdVideoH264SequenceParameterSet` values
- VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-pStdPPSs-parameter
  If `stdPPSCount` is not `0`, `pStdPPSs` **must** be a valid pointer to an array of `stdPPSCount` `StdVideoH264PictureParameterSet` values

38.12.6. H.264 Decoding Parameters

The `VkVideoDecodeH264PictureInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264PictureInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    const StdVideoDecodeH264PictureInfo*     pStdPictureInfo;
    uint32_t                                 sliceCount;
    const uint32_t*                          pSliceOffsets;
} VkVideoDecodeH264PictureInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdPictureInfo` is a pointer to a `StdVideoDecodeH264PictureInfo` structure specifying H.264 picture information.
- `sliceCount` is the number of elements in `pSliceOffsets`.
- `pSliceOffsets` is a pointer to an array of `sliceCount` offsets specifying the start offset of the slices of the picture within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.

This structure is specified in the `pNext` chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR to specify the codec-specific picture information for an H.264 decode operation.

Decode Output Picture Information

When this structure is specified in the `pNext` chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR, the information related to the decode output picture is defined as follows:

- If `pStdPictureInfo->flags.field_pic_flag` is not set, then the picture represents a frame.
- If `pStdPictureInfo->flags.field_pic_flag` is set, then the picture represents a field. Specifically:
  - If `pStdPictureInfo->flags.bottom_field_flag` is not set, then the picture represents the top field of the frame.
  - If `pStdPictureInfo->flags.bottom_field_flag` is set, then the picture represents the bottom field of the frame.
- The image subregion used is determined according to the H.264 Decode Picture Data Access section.
- The decode output picture is associated with the H.264 picture information provided in `pStdPictureInfo`.

Std Picture Information

The members of the `StdVideoDecodeH264PictureInfo` structure pointed to by `pStdPictureInfo` are interpreted as follows:

- `reserved1` and `reserved2` are used only for padding purposes and are otherwise ignored;
- `flags.is_intra` as defined in section 3.73 of the ITU-T H.264 Specification;

- `flags.is_reference` as defined in section 3.136 of the ITU-T H.264 Specification;
- `flags.complementary_field_pair` as defined in section 3.35 of the ITU-T H.264 Specification;
- `seq_parameter_set_id` and `pic_parameter_set_id` are used to identify the active parameter sets, as described below;
- all other members are interpreted as defined in section 7.4.3 of the ITU-T H.264 Specification.

Reference picture setup is controlled by the value of `StdVideoDecodeH264PictureInfo::flags.is_reference`. If it is set and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the DPB slot specified in `pDecodeInfo->pSetupReferenceSlot->slotIndex`. If `StdVideoDecodeH264PictureInfo::flags.is_reference` is not set, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

Active Parameter Sets

The members of the `StdVideoDecodeH264PictureInfo` structure pointed to by `pStdPictureInfo` are used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The *active SPS* is the SPS identified by the key specified in `StdVideoDecodeH264PictureInfo::seq_parameter_set_id`.
- The *active PPS* is the PPS identified by the key specified by the pair constructed from `StdVideoDecodeH264PictureInfo::seq_parameter_set_id` and `StdVideoDecodeH264PictureInfo::pic_parameter_set_id`.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264PictureInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PICTURE_INFO_KHR`
- VUID-VkVideoDecodeH264PictureInfoKHR-pStdPictureInfo-parameter
  `pStdPictureInfo` **must** be a valid pointer to a valid `StdVideoDecodeH264PictureInfo` value
- VUID-VkVideoDecodeH264PictureInfoKHR-pSliceOffsets-parameter
  `pSliceOffsets` **must** be a valid pointer to an array of `sliceCount` `uint32_t` values
- VUID-VkVideoDecodeH264PictureInfoKHR-sliceCount-arraylength
  `sliceCount` **must** be greater than `0`

The `VkVideoDecodeH264DpbSlotInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264DpbSlotInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    const StdVideoDecodeH264ReferenceInfo*   pStdReferenceInfo;
} VkVideoDecodeH264DpbSlotInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoDecodeH264ReferenceInfo` structure specifying H.264 reference information.

This structure is specified in the `pNext` chain of VkVideoDecodeInfoKHR::`pSetupReferenceSlot`, if not `NULL`, and the `pNext` chain of the elements of VkVideoDecodeInfoKHR::`pReferenceSlots` to specify the codec-specific reference picture information for an H.264 decode operation.

Active Reference Picture Information

When this structure is specified in the `pNext` chain of the elements of VkVideoDecodeInfoKHR::`pReferenceSlots`, one or two elements are added to the list of active reference pictures used by the video decode operation for each element of VkVideoDecodeInfoKHR::`pReferenceSlots` as follows:

- If neither `pStdReferenceInfo->flags.top_field_flag` nor `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture is added as a frame reference to the list of active reference pictures.
- If `pStdReferenceInfo->flags.top_field_flag` is set, then the picture is added as a top field reference to the list of active reference pictures.
- If `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture is added as a bottom field reference to the list of active reference pictures.
- For each added reference picture, the corresponding image subregion used is determined according to the H.264 Decode Picture Data Access section.
- Each added reference picture is associated with the DPB slot index specified in the `slotIndex` member of the corresponding element of VkVideoDecodeInfoKHR::`pReferenceSlots`.
- Each added reference picture is associated with the H.264 reference information provided in `pStdReferenceInfo`.

NOTE

When both the top and bottom field of an interlaced frame currently associated with a DPB slot is intended to be used as an active reference picture and both fields are stored in the same image subregion (which is the case when using `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR` which stores the two fields at even and odd scanlines of the same image subregion), both references have to be provided through a single VkVideoReferenceSlotInfoKHR structure that has both `flags.top_field_flag` and `flags.bottom_field_flag` set in the `StdVideoDecodeH264ReferenceInfo` structure pointed to by the `pStdReferenceInfo` member of the VkVideoDecodeH264DpbSlotInfoKHR structure included in the corresponding VkVideoReferenceSlotInfoKHR structure's `pNext` chain. However, this approach can only be used when both fields are stored in the same image subregion. If that is not the case (e.g. when using `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR` which requires separate `codedOffset` values for the two fields and also allows storing the two fields of a frame in separate image layers or entirely separate images), then a separate VkVideoReferenceSlotInfoKHR structure needs to be provided for

> referencing the two fields, each only setting one of `flags.top_field_flag` or `flags.bottom_field_flag`, and providing the appropriate video picture resource information in VkVideoReferenceSlotInfoKHR::`pPictureResource`.

Reconstructed Picture Information

When this structure is specified in the `pNext` chain of VkVideoDecodeInfoKHR::`pSetupReferenceSlot`, the information related to the reconstructed picture is defined as follows:

- If neither `pStdReferenceInfo->flags.top_field_flag` nor `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture represents a frame.
- If `pStdReferenceInfo->flags.top_field_flag` is set, then the picture represents a field, specifically, the top field of the frame.
- If `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture represents a field, specifically, the bottom field of the frame.
- The image subregion used is determined according to the H.264 Decode Picture Data Access section.
- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in VkVideoDecodeInfoKHR::`pSetupReferenceSlot->slotIndex`.
- The reconstructed picture is associated with the H.264 reference information provided in `pStdReferenceInfo`.

Std Reference Information

The members of the `StdVideoDecodeH264ReferenceInfo` structure pointed to by `pStdReferenceInfo` are interpreted as follows:

- `flags.top_field_flag` is used to indicate whether the reference is used as top field reference;
- `flags.bottom_field_flag` is used to indicate whether the reference is used as bottom field reference;
- `flags.used_for_long_term_reference` is used to indicate whether the picture is marked as "used for long-term reference" as defined in section 8.2.5.1 of the ITU-T H.264 Specification;
- `flags.is_non_existing` is used to indicate whether the picture is marked as "non-existing" as defined in section 8.2.5.2 of the ITU-T H.264 Specification;
- all other members are interpreted as defined in section 8.2 of the ITU-T H.264 Specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH264DpbSlotInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_DPB_SLOT_INFO_KHR`
- VUID-VkVideoDecodeH264DpbSlotInfoKHR-pStdReferenceInfo-parameter
  `pStdReferenceInfo` **must** be a valid pointer to a valid `StdVideoDecodeH264ReferenceInfo` value

38.12.7. H.264 Decode Requirements

This section describes the **required** H.264 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, as returned by vkGetPhysicalDeviceQueueFamilyProperties2KHR in VkQueueFamilyVideoPropertiesKHR ::videoCodecOperations.

Table 47. Required Video Std Header Versions

Video Std Header Name	Version
vulkan_video_codec_h264std_decode	1.0.0

Table 48. Required Video Capabilities

Video Capability	Requirement	Requirement Type[1]
VkVideoCapabilitiesKHR		
flags	-	min
minBitstreamBufferOffsetAlignment	4096	max
minBitstreamBufferSizeAlignment	4096	max
pictureAccessGranularity	(64,64)	max
minCodedExtent	-	max
maxCodedExtent	-	min
maxDpbSlots	0	min
maxActiveReferencePictures	0	min
VkVideoDecodeCapabilitiesKHR		
flags	VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR or VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR	min
VkVideoDecodeH264CapabilitiesKHR		
maxLevelIdc	STD_VIDEO_H264_LEVEL_IDC_1_0	min
fieldOffsetGranularity	(0,0) except for profiles using VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR	implementation-dependent

1

The **Requirement Type** column specifies the requirement is either the minimum value all

implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

38.13. H.265 Decode Operations

Video decode operations using an H.265 decode profile **can** be used to decode elementary video stream sequences compliant to the ITU-T H.265 Specification.

NOTE	Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video decode operation steps with the codec-specific semantics defined in section 8 of ITU-T H.265 Specification:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The `StdVideoH265VideoParameterSet` structure corresponding to the active VPS specifying the H.265 video parameter set.
  - The `StdVideoH265SequenceParameterSet` structure corresponding to the active SPS specifying the H.265 sequence parameter set.
  - The `StdVideoH265PictureParameterSet` structure corresponding to the active PPS specifying the H.265 picture parameter set.
  - The `StdVideoDecodeH265PictureInfo` structure specifying the H.265 picture information.
  - The `StdVideoDecodeH265ReferenceInfo` structures specifying the H.265 reference information corresponding to the optional reconstructed picture and any active reference pictures.
- The contents of the provided video bitstream buffer range are interpreted as defined in the H.265 Decode Bitstream Data Access section.
- Picture data in the video picture resources corresponding to the used active reference pictures, decode output picture, and optional reconstructed picture is accessed as defined in the H.265 Decode Picture Data Access section.
- The decision on reference picture setup is made according to the parameters specified in the H.265 picture information.

If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.265 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation **may** complete unsuccessfully.

38.13.1. H.265 Decode Bitstream Data Access

The video bitstream buffer range **should** contain a VCL NAL unit comprised of the slice segment headers and data of a picture representing a frame, as defined in sections 7.3.6 and 7.3.8, and this

data is interpreted as defined in sections 7.4.7 and 7.4.9 of the ITU-T H.265 Specification, respectively.

The offsets provided in VkVideoDecodeH265PictureInfoKHR::pSliceSegmentOffsets **should** specify the starting offsets corresponding to each slice segment header within the video bitstream buffer range.

38.13.2. H.265 Decode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::pictureAccessGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. Accordingly, the complete image subregion of a decode output picture, reference picture, or reconstructed picture accessed by video coding operations using an H.265 decode profile is defined as the set of texels within the coordinate range:

([0,endX), [0,endY))

Where:

- endX equals codedExtent.width rounded up to the nearest integer multiple of pictureAccessGranularity.width and clamped to the width of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;
- endY equals codedExtent.height rounded up to the nearest integer multiple of pictureAccessGranularity.height and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;

Where codedExtent is the member of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.

In case of video decode operations using an H.265 decode profile, any access to a picture at the coordinates (x,y), as defined by the ITU-T H.265 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel coordinates (x,y).

38.13.3. H.265 Decode Profile

A video profile supporting H.265 video decode operations is specified by setting VkVideoProfileInfoKHR::videoCodecOperation to VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR and adding a VkVideoDecodeH265ProfileInfoKHR structure to the VkVideoProfileInfoKHR::pNext chain.

The VkVideoDecodeH265ProfileInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265ProfileInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    StdVideoH265ProfileIdc    stdProfileIdc;
} VkVideoDecodeH265ProfileInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH265ProfileIdc` value specifying the H.265 codec profile IDC, as defined in section A.3 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265ProfileInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PROFILE_INFO_KHR`

38.13.4. H.265 Decode Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities for an H.265 decode profile, the VkVideoCapabilitiesKHR::`pNext` chain **must** include a `VkVideoDecodeH265CapabilitiesKHR` structure that will be filled with the profile-specific capabilities.

The `VkVideoDecodeH265CapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265CapabilitiesKHR {
    VkStructureType         sType;
    void*                   pNext;
    StdVideoH265LevelIdc    maxLevelIdc;
} VkVideoDecodeH265CapabilitiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxLevelIdc` is a `StdVideoH265LevelIdc` value indicating the maximum H.265 level supported by the profile, where enum constant `STD_VIDEO_H265_LEVEL_IDC_<major>_<minor>` identifies H.265 level `<major>.<minor>` as defined in section A.4 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265CapabilitiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_CAPABILITIES_KHR`

38.13.5. H.265 Decode Parameter Sets

Video session parameters objects created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` **can** contain the following types of parameters:

H.265 Video Parameter Sets (VPS)

Represented by `StdVideoH265VideoParameterSet` structures and interpreted as follows:

- `reserved1`, `reserved2`, and `reserved3` are used only for padding purposes and are otherwise ignored;
- `vps_video_parameter_set_id` is used as the key of the VPS entry;
- the `max_latency_increase_plus1`, `max_dec_pic_buffering_minus1`, and `max_num_reorder_pics` members of the `StdVideoH265DecPicBufMgr` structure pointed to by `pDecPicBufMgr` correspond to `vps_max_latency_increase_plus1`, `vps_max_dec_pic_buffering_minus1`, and `vps_max_num_reorder_pics`, respectively, as defined in section 7.4.3.1 of the ITU-T H.265 Specification;
- the `StdVideoH265HrdParameters` structure pointed to by `pHrdParameters` is interpreted as follows:
  - `reserved` is used only for padding purposes and is otherwise ignored;
  - `flags.fixed_pic_rate_general_flag` is a bitmask where bit index i corresponds to `fixed_pic_rate_general_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
  - `flags.fixed_pic_rate_within_cvs_flag` is a bitmask where bit index i corresponds to `fixed_pic_rate_within_cvs_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
  - `flags.low_delay_hrd_flag` is a bitmask where bit index i corresponds to `low_delay_hrd_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
  - if `flags.nal_hrd_parameters_present_flag` is set, then `pSubLayerHrdParametersNal` is a pointer to an array of `vps_max_sub_layers_minus1` + 1 number of `StdVideoH265SubLayerHrdParameters` structures where `vps_max_sub_layers_minus1` is the corresponding member of the encompassing `StdVideoH265VideoParameterSet` structure and each element is interpreted as follows:
    - `cbr_flag` is a bitmask where bit index i corresponds to `cbr_flag[i]` as defined in section E.3.3 of the ITU-T H.265 Specification;
    - all other members of the `StdVideoH265SubLayerHrdParameters` structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
  - if `flags.vcl_hrd_parameters_present_flag` is set, then `pSubLayerHrdParametersVcl` is a pointer to an array of `vps_max_sub_layers_minus1` + 1 number of `StdVideoH265SubLayerHrdParameters` structures where `vps_max_sub_layers_minus1` is the corresponding member of the encompassing `StdVideoH265VideoParameterSet` structure and each element is interpreted as follows:
    - `cbr_flag` is a bitmask where bit index i corresponds to `cbr_flag[i]` as defined in

section E.3.3 of the ITU-T H.265 Specification;

        - all other members of the `StdVideoH265SubLayerHrdParameters` structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;

    - all other members of `StdVideoH265HrdParameters` are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;

- the `StdVideoH265ProfileTierLevel` structure pointed to by `pProfileTierLevel` are interpreted as follows:

    - `general_level_idc` is one of the enum constants `STD_VIDEO_H265_LEVEL_IDC_<major>_<minor>` identifying the H.265 level `<major>.<minor>` as defined in section A.4 of the ITU-T H.265 Specification;

    - all other members of `StdVideoH265ProfileTierLevel` are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;

- all other members of `StdVideoH265VideoParameterSet` are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

H.265 Sequence Parameter Sets (SPS)

Represented by `StdVideoH265SequenceParameterSet` structures and interpreted as follows:

- `reserved1` and `reserved2` are used only for padding purposes and are otherwise ignored;
- the pair constructed from `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` is used as the key of the SPS entry;
- the `StdVideoH265ProfileTierLevel` structure pointed to by `pProfileTierLevel` are interpreted as follows:

    - `general_level_idc` is one of the enum constants `STD_VIDEO_H265_LEVEL_IDC_<major>_<minor>` identifying the H.265 level `<major>.<minor>` as defined in section A.4 of the ITU-T H.265 Specification;

    - all other members of `StdVideoH265ProfileTierLevel` are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;

- the `max_latency_increase_plus1`, `max_dec_pic_buffering_minus1`, and `max_num_reorder_pics` members of the `StdVideoH265DecPicBufMgr` structure pointed to by `pDecPicBufMgr` correspond to `sps_max_latency_increase_plus1`, `sps_max_dec_pic_buffering_minus1`, and `sps_max_num_reorder_pics`, respectively, as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
- if `flags.sps_scaling_list_data_present_flag` is set, then the `StdVideoH265ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:

    - `ScalingList4x4`, `ScalingList8x8`, `ScalingList16x16`, and `ScalingList32x32` correspond to `ScalingList[0]`, `ScalingList[1]`, `ScalingList[2]`, and `ScalingList[3]`, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;

    - `ScalingListDCCoef16x16` and `ScalingListDCCoef32x32` correspond to `scaling_list_dc_coef_minus8[0]` and `scaling_list_dc_coef_minus8[1]`, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;

- `pShortTermRefPicSet` is a pointer to an array of `num_short_term_ref_pic_sets` number of `StdVideoH265ShortTermRefPicSet` structures where each element is interpreted as follows:
  - `reserved1`, `reserved2`, and `reserved3` are used only for padding purposes and are otherwise ignored;
  - `used_by_curr_pic_flag` is a bitmask where bit index i corresponds to `used_by_curr_pic_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - `use_delta_flag` is a bitmask where bit index i corresponds to `use_delta_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - `used_by_curr_pic_s0_flag` is a bitmask where bit index i corresponds to `used_by_curr_pic_s0_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - `used_by_curr_pic_s1_flag` is a bitmask where bit index i corresponds to `used_by_curr_pic_s1_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - all other members of `StdVideoH265ShortTermRefPicSet` are interpreted as defined in section 7.4.8 of the ITU-T H.265 Specification;
- if `flags.long_term_ref_pics_present_flag` is set then the `StdVideoH265LongTermRefPicsSps` structure pointed to by `pLongTermRefPicsSps` is interpreted as follows:
  - `used_by_curr_pic_lt_sps_flag` is a bitmask where bit index i corresponds to `used_by_curr_pic_lt_sps_flag[i]` as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
  - all other members of `StdVideoH265LongTermRefPicsSps` are interpreted as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
- if `flags.vui_parameters_present_flag` is set, then the `StdVideoH265SequenceParameterSetVui` structure pointed to by `pSequenceParameterSetVui` is interpreted as follows:
  - `reserved1`, `reserved2`, and `reserved3` are used only for padding purposes and are otherwise ignored;
  - the `StdVideoH265HrdParameters` structure pointed to by `pHrdParameters` is interpreted as follows:
    - `flags.fixed_pic_rate_general_flag` is a bitmask where bit index i corresponds to `fixed_pic_rate_general_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
    - `flags.fixed_pic_rate_within_cvs_flag` is a bitmask where bit index i corresponds to `fixed_pic_rate_within_cvs_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
    - `flags.low_delay_hrd_flag` is a bitmask where bit index i corresponds to `low_delay_hrd_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
    - if `flags.nal_hrd_parameters_present_flag` is set, then `pSubLayerHrdParametersNal` is a pointer to an array of `sps_max_sub_layers_minus1` + 1 number of `StdVideoH265SubLayerHrdParameters` structures where `sps_max_sub_layers_minus1` is the corresponding member of the encompassing `StdVideoH265SequenceParameterSet` structure and each element is interpreted as follows:
      - `cbr_flag` is a bitmask where bit index i corresponds to `cbr_flag[i]` as defined in

section E.3.3 of the ITU-T H.265 Specification;

- all other members of the `StdVideoH265SubLayerHrdParameters` structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;

- if `flags.vcl_hrd_parameters_present_flag` is set, then `pSubLayerHrdParametersVcl` is a pointer to an array of `sps_max_sub_layers_minus1 + 1` number of `StdVideoH265SubLayerHrdParameters` structures where `sps_max_sub_layers_minus1` is the corresponding member of the encompassing `StdVideoH265SequenceParameterSet` structure and each element is interpreted as follows:
  - `cbr_flag` is a bitmask where bit index i corresponds to `cbr_flag[i]` as defined in section E.3.3 of the ITU-T H.265 Specification;
  - all other members of the `StdVideoH265SubLayerHrdParameters` structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
- all other members of `StdVideoH265HrdParameters` are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;

- all other members of `pSequenceParameterSetVui` are interpreted as defined in section E.3.1 of the ITU-T H.265 Specification;

- if `flags.sps_palette_predictor_initializer_present_flag` is set, then the `PredictorPaletteEntries` member of the `StdVideoH265PredictorPaletteEntries` structure pointed to by `pPredictorPaletteEntries` is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;
- all other members of `StdVideoH265SequenceParameterSet` are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

H.265 Picture Parameter Sets (PPS)

Represented by `StdVideoH265PictureParameterSet` structures and interpreted as follows:

- `reserved1`, `reserved2`, and `reserved3` are used only for padding purposes and are otherwise ignored;
- the triplet constructed from `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` is used as the key of the PPS entry;
- if `flags.pps_scaling_list_data_present_flag` is set, then the `StdVideoH265ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
  - `ScalingList4x4`, `ScalingList8x8`, `ScalingList16x16`, and `ScalingList32x32` correspond to `ScalingList[0]`, `ScalingList[1]`, `ScalingList[2]`, and `ScalingList[3]`, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
  - `ScalingListDCCoef16x16` and `ScalingListDCCoef32x32` correspond to `scaling_list_dc_coef_minus8[0]` and `scaling_list_dc_coef_minus8[1]`, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
- if `flags.pps_palette_predictor_initializer_present_flag` is set, then the `PredictorPaletteEntries` member of the `StdVideoH265PredictorPaletteEntries` structure pointed to by `pPredictorPaletteEntries` is interpreted as defined in section 7.4.9.13 of the ITU-

T H.265 Specification;

- all other members of StdVideoH265PictureParameterSet are interpreted as defined in section 7.4.3.3 of the ITU-T H.265 Specification.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain **must** include a VkVideoDecodeH265SessionParametersCreateInfoKHR structure specifying the capacity and initial contents of the object.

The VkVideoDecodeH265SessionParametersCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersCreateInfoKHR {
    VkStructureType                                           sType;
    const void*                                               pNext;
    uint32_t                                                  maxStdVPSCount;
    uint32_t                                                  maxStdSPSCount;
    uint32_t                                                  maxStdPPSCount;
    const VkVideoDecodeH265SessionParametersAddInfoKHR*       pParametersAddInfo;
} VkVideoDecodeH265SessionParametersCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxStdVPSCount is the maximum number of H.265 VPS entries the created VkVideoSessionParametersKHR **can** contain.
- maxStdSPSCount is the maximum number of H.265 SPS entries the created VkVideoSessionParametersKHR **can** contain.
- maxStdPPSCount is the maximum number of H.265 PPS entries the created VkVideoSessionParametersKHR **can** contain.
- pParametersAddInfo is NULL or a pointer to a VkVideoDecodeH265SessionParametersAddInfoKHR structure specifying H.265 parameters to add upon object creation.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265SessionParametersCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_CREATE_INFO_KHR
- VUID-VkVideoDecodeH265SessionParametersCreateInfoKHR-pParametersAddInfo-parameter
  If pParametersAddInfo is not NULL, pParametersAddInfo **must** be a valid pointer to a valid VkVideoDecodeH265SessionParametersAddInfoKHR structure

The VkVideoDecodeH265SessionParametersAddInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersAddInfoKHR {
    VkStructureType                              sType;
    const void*                                  pNext;
    uint32_t                                     stdVPSCount;
    const StdVideoH265VideoParameterSet*         pStdVPSs;
    uint32_t                                     stdSPSCount;
    const StdVideoH265SequenceParameterSet*      pStdSPSs;
    uint32_t                                     stdPPSCount;
    const StdVideoH265PictureParameterSet*       pStdPPSs;
} VkVideoDecodeH265SessionParametersAddInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdVPSCount` is the number of elements in the `pStdVPSs` array.
- `pStdVPSs` is a pointer to an array of `StdVideoH265VideoParameterSet` structures describing the H.265 VPS entries to add.
- `stdSPSCount` is the number of elements in the `pStdSPSs` array.
- `pStdSPSs` is a pointer to an array of `StdVideoH265SequenceParameterSet` structures describing the H.265 SPS entries to add.
- `stdPPSCount` is the number of elements in the `pStdPPSs` array.
- `pStdPPSs` is a pointer to an array of `StdVideoH265PictureParameterSet` structures describing the H.265 PPS entries to add.

This structure **can** be specified in the following places:

- In the `pParametersAddInfo` member of the VkVideoDecodeH265SessionParametersCreateInfoKHR structure specified in the `pNext` chain of VkVideoSessionParametersCreateInfoKHR used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).
- In the `pNext` chain of VkVideoSessionParametersUpdateInfoKHR. In this case, if the video codec operation the video session parameters object to be updated was created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then it defines the set of parameters to add to it (see Updating Video Session Parameters).

Valid Usage

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04833
  The `vps_video_parameter_set_id` member of each `StdVideoH265VideoParameterSet` structure specified in the elements of `pStdVPSs` **must** be unique within `pStdVPSs`
- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04834
  The pair constructed from the `sps_video_parameter_set_id` and `sps_seq_parameter_set_id`

members of each StdVideoH265SequenceParameterSet structure specified in the elements of pStdSPSs **must** be unique within pStdSPSs

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04835
  The triplet constructed from the sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id members of each StdVideoH265PictureParameterSet structure specified in the elements of pStdPPSs **must** be unique within pStdPPSs

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_ADD_INFO_KHR
- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdVPSs-parameter
  If stdVPSCount is not 0, pStdVPSs **must** be a valid pointer to an array of stdVPSCount StdVideoH265VideoParameterSet values
- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdSPSs-parameter
  If stdSPSCount is not 0, pStdSPSs **must** be a valid pointer to an array of stdSPSCount StdVideoH265SequenceParameterSet values
- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdPPSs-parameter
  If stdPPSCount is not 0, pStdPPSs **must** be a valid pointer to an array of stdPPSCount StdVideoH265PictureParameterSet values

38.13.6. H.265 Decoding Parameters

The VkVideoDecodeH265PictureInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265PictureInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    const StdVideoDecodeH265PictureInfo*     pStdPictureInfo;
    uint32_t                                 sliceSegmentCount;
    const uint32_t*                          pSliceSegmentOffsets;
} VkVideoDecodeH265PictureInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pStdPictureInfo is a pointer to a StdVideoDecodeH265PictureInfo structure specifying H.265 picture information.
- sliceSegmentCount is the number of elements in pSliceSegmentOffsets.
- pSliceSegmentOffsets is a pointer to an array of sliceSegmentCount offsets specifying the start offset of the slice segments of the picture within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.

This structure is specified in the pNext chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR to specify the codec-specific picture information for an H.265 decode operation.

Decode Output Picture Information

When this structure is specified in the pNext chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR, the information related to the decode output picture is defined as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The decode output picture is associated with the H.265 picture information provided in pStdPictureInfo.

Std Picture Information

The members of the StdVideoDecodeH265PictureInfo structure pointed to by pStdPictureInfo are interpreted as follows:

- reserved is used only for padding purposes and is otherwise ignored;
- flags.IrapPicFlag as defined in section 3.73 of the ITU-T H.265 Specification;
- flags.IdrPicFlag as defined in section 3.67 of the ITU-T H.265 Specification;
- flags.IsReference as defined in section 3.132 of the ITU-T H.265 Specification;
- sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id are used to identify the active parameter sets, as described below;
- PicOrderCntVal as defined in section 8.3.1 of the ITU-T H.265 Specification;
- NumBitsForSTRefPicSetInSlice is the number of bits used in st_ref_pic_set when short_term_ref_pic_set_sps_flag is 0, or 0 otherwise, as defined in sections 7.4.7 and 7.4.8 of the ITU-T H.265 Specification;
- NumDeltaPocsOfRefRpsIdx is the value of NumDeltaPocs[RefRpsIdx] when short_term_ref_pic_set_sps_flag is 1, or 0 otherwise, as defined in sections 7.4.7 and 7.4.8 of the ITU-T H.265 Specification;
- RefPicSetStCurrBefore, RefPicSetStCurrAfter, and RefPicSetLtCurr are interpreted as defined in section 8.3.2 of the ITU-T H.265 Specification where each element of these arrays either identifies an active reference picture using its DPB slot index or contains the value STD_VIDEO_H265_NO_REFERENCE_PICTURE to indicate “no reference picture”;
- all other members are interpreted as defined in section 8.3.2 of the ITU-T H.265 Specification.

Reference picture setup is controlled by the value of StdVideoDecodeH265PictureInfo ::flags.IsReference. If it is set and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the corresponding DPB slot. If StdVideoDecodeH265PictureInfo::flags.IsReference is not set, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

Active Parameter Sets

The members of the StdVideoDecodeH265PictureInfo structure pointed to by pStdPictureInfo are used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The *active VPS* is the VPS identified by the key specified in StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id.
- The *active SPS* is the SPS identified by the key specified by the pair constructed from StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id and StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id.
- The *active PPS* is the PPS identified by the key specified by the triplet constructed from StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id, StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id, and StdVideoDecodeH265PictureInfo::pps_pic_parameter_set_id.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265PictureInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PICTURE_INFO_KHR
- VUID-VkVideoDecodeH265PictureInfoKHR-pStdPictureInfo-parameter
  pStdPictureInfo **must** be a valid pointer to a valid StdVideoDecodeH265PictureInfo value
- VUID-VkVideoDecodeH265PictureInfoKHR-pSliceSegmentOffsets-parameter
  pSliceSegmentOffsets **must** be a valid pointer to an array of sliceSegmentCount uint32_t values
- VUID-VkVideoDecodeH265PictureInfoKHR-sliceSegmentCount-arraylength
  sliceSegmentCount **must** be greater than 0

The VkVideoDecodeH265DpbSlotInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265DpbSlotInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    const StdVideoDecodeH265ReferenceInfo*   pStdReferenceInfo;
} VkVideoDecodeH265DpbSlotInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pStdReferenceInfo is a pointer to a StdVideoDecodeH265ReferenceInfo structure specifying reference picture information described in section 8.3 of the ITU-T H.265 Specification.

This structure is specified in the pNext chain of VkVideoDecodeInfoKHR::pSetupReferenceSlot, if not NULL, and the pNext chain of the elements of VkVideoDecodeInfoKHR::pReferenceSlots to specify the codec-specific reference picture information for an H.265 decode operation.

Active Reference Picture Information

When this structure is specified in the `pNext` chain of the elements of VkVideoDecodeInfoKHR::`pReferenceSlots`, one element is added to the list of active reference pictures used by the video decode operation for each element of VkVideoDecodeInfoKHR::`pReferenceSlots` as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the `slotIndex` member of the corresponding element of VkVideoDecodeInfoKHR::`pReferenceSlots`.
- The reference picture is associated with the H.265 reference information provided in `pStdReferenceInfo`.

Reconstructed Picture Information

When this structure is specified in the `pNext` chain of VkVideoDecodeInfoKHR::`pSetupReferenceSlot`, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in VkVideoDecodeInfoKHR::`pSetupReferenceSlot->slotIndex`.
- The reconstructed picture is associated with the H.265 reference information provided in `pStdReferenceInfo`.

Std Reference Information

The members of the `StdVideoDecodeH265ReferenceInfo` structure pointed to by `pStdReferenceInfo` are interpreted as follows:

- `flags.used_for_long_term_reference` is used to indicate whether the picture is marked as "used for long-term reference" as defined in section 8.3.2 of the ITU-T H.265 Specification;
- `flags.unused_for_reference` is used to indicate whether the picture is marked as "unused for reference" as defined in section 8.3.2 of the ITU-T H.265 Specification;
- all other members are interpreted as defined in section 8.3 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265DpbSlotInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_DPB_SLOT_INFO_KHR`
- VUID-VkVideoDecodeH265DpbSlotInfoKHR-pStdReferenceInfo-parameter
  `pStdReferenceInfo` **must** be a valid pointer to a valid `StdVideoDecodeH265ReferenceInfo` value

38.13.7. H.265 Decode Requirements

This section describes the **required** H.265 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, as returned by vkGetPhysicalDeviceQueueFamilyProperties2KHR in VkQueueFamilyVideoPropertiesKHR ::videoCodecOperations.

Table 49. Required Video Std Header Versions

Video Std Header Name	Version
vulkan_video_codec_h265std_decode	1.0.0

Table 50. Required Video Capabilities

Video Capability	Requirement	Requirement Type[1]
VkVideoCapabilitiesKHR		
flags	-	min
minBitstreamBufferOffsetAlignment	4096	max
minBitstreamBufferSizeAlignment	4096	max
pictureAccessGranularity	(64,64)	max
minCodedExtent	-	max
maxCodedExtent	-	min
maxDpbSlots	0	min
maxActiveReferencePictures	0	min
VkVideoDecodeCapabilitiesKHR		
flags	VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR or VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR	min
VkVideoDecodeH265CapabilitiesKHR		
maxLevelIdc	STD_VIDEO_H265_LEVEL_IDC_1_0	min

1

The **Requirement Type** column specifies the requirement is either the minimum value all implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

38.14. AV1 Decode Operations

Video decode operations using an AV1 decode profile **can** be used to decode elementary video stream sequences compliant with the AV1 Specification.

> **NOTE** Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video decode operation steps with the codec-specific semantics defined in section 7 of the AV1 Specification:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The `StdVideoAV1SequenceHeader` structure stored in the bound video session parameters object specifying the active sequence header.
  - The `StdVideoDecodeAV1PictureInfo` structure specifying the AV1 picture information.
  - The `StdVideoDecodeAV1ReferenceInfo` structures specifying the AV1 reference information corresponding to the optional reconstructed picture and any active reference pictures.
- The contents of the provided video bitstream buffer range are interpreted as defined in the AV1 Decode Bitstream Data Access section.
- Picture data in the video picture resources corresponding to the used active reference pictures, decode output picture, and optional reconstructed picture is accessed as defined in the AV1 Decode Picture Data Access section.
- The decision on reference picture setup is made according to the parameters specified in the AV1 picture information.

If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the AV1 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation **may** complete unsuccessfully.

38.14.1. AV1 Decode Bitstream Data Access

The video bitstream buffer range **should** contain one or more frame OBUs, comprised of a frame header OBU and tile group OBU, that together represent an entire frame, as defined in sections 5.10, 5.9, and 5.11, and this data is interpreted as defined in sections 6.9, 6.8, and 6.10 of the AV1 Specification, respectively.

The offset specified in VkVideoDecodeAV1PictureInfoKHR::`frameHeaderOffset` **should** specify the starting offset of the frame header OBU of the frame.

> **NOTE** When the tiles of the frame are encoded into multiple tile groups, each frame OBU has a separate frame header OBU but their content is expected to match per the requirements of the AV1 Specification. Accordingly, the offset specified in

> `frameHeaderOffset` **can** be the offset of any of the otherwise identical frame header OBUs when multiple tile groups are present.

The offsets and sizes provided in VkVideoDecodeAV1PictureInfoKHR::`pTileOffsets` and VkVideoDecodeAV1PictureInfoKHR::`pTileSizes`, respectively, **should** specify the starting offsets and sizes corresponding to each tile within the video bitstream buffer range.

38.14.2. AV1 Decode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::`pictureAccessGranularity`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. Accordingly, the complete image subregion of a decode output picture, reference picture, or reconstructed picture accessed by video coding operations using an AV1 decode profile is defined as the set of texels within the coordinate range:

([0,`endX`), [0,`endY`))

Where:

- `endX` equals `codedExtent.width` rounded up to the nearest integer multiple of `pictureAccessGranularity.width` and clamped to the width of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;
- endY equals `codedExtent.height` rounded up to the nearest integer multiple of `pictureAccessGranularity.height` and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;

Where `codedExtent` is the member of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.

In case of video decode operations using an AV1 decode profile, any access to a picture at the coordinates (`x`,`y`), as defined by the AV1 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel coordinates (`x`,`y`).

38.14.3. AV1 Reference Names and Semantics

Individual reference frames used in the decoding process have different semantics, as defined in section 6.10.24 of the AV1 Specification. The AV1 semantics associated with a reference picture are indicated by the corresponding enumeration constant defined in the Video Std enumeration type `StdVideoAV1ReferenceName`:

- `STD_VIDEO_AV1_REFERENCE_NAME_INTRA_FRAME` identifies the reference used for intra coding (`INTRA_FRAME`), as defined in sections 2 and 7.11.2 of the AV1 Specification.
- All other enumeration constants refer to backward or forward references used for inter coding, as defined in sections 2 and 7.11.3 of the AV1 Specification:
  - `STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME` identifies the `LAST_FRAME` reference
  - `STD_VIDEO_AV1_REFERENCE_NAME_LAST2_FRAME` identifies the `LAST2_FRAME` reference

- `STD_VIDEO_AV1_REFERENCE_NAME_LAST3_FRAME` identifies the `LAST3_FRAME` reference
- `STD_VIDEO_AV1_REFERENCE_NAME_GOLDEN_FRAME` identifies the `GOLDEN_FRAME` reference
- `STD_VIDEO_AV1_REFERENCE_NAME_BWDREF_FRAME` identifies the `BWDREF_FRAME` reference
- `STD_VIDEO_AV1_REFERENCE_NAME_ALTREF2_FRAME` identifies the `ALTREF2_FRAME` reference
- `STD_VIDEO_AV1_REFERENCE_NAME_ALTREF_FRAME` identifies the `ALTREF_FRAME` reference

These enumeration constants are not directly used in any APIs but are used to indirectly index into certain Video Std and Vulkan API parameter arrays.

38.14.4. AV1 Decode Profile

A video profile supporting AV1 video decode operations is specified by setting VkVideoProfileInfoKHR::`videoCodecOperation` to `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` and adding a `VkVideoDecodeAV1ProfileInfoKHR` structure to the VkVideoProfileInfoKHR::`pNext` chain.

The `VkVideoDecodeAV1ProfileInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_av1
typedef struct VkVideoDecodeAV1ProfileInfoKHR {
    VkStructureType       sType;
    const void*           pNext;
    StdVideoAV1Profile    stdProfile;
    VkBool32              filmGrainSupport;
} VkVideoDecodeAV1ProfileInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfile` is a `StdVideoAV1Profile` value specifying the AV1 codec profile, as defined in section A.2 of the AV1 Specification.
- `filmGrainSupport` specifies whether AV1 film grain, as defined in section 7.8.3 of the AV1 Specification, **can** be used with the video profile. When this member is `VK_TRUE`, video session objects created against the video profile will be able to decode pictures that have film grain enabled.

NOTE	Enabling `filmGrainSupport` **may** increase the memory requirements of video sessions and/or video picture resources on some implementations.

Valid Usage (Implicit)

- VUID-VkVideoDecodeAV1ProfileInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_PROFILE_INFO_KHR`

38.14.5. AV1 Decode Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities for an AV1 decode profile, the VkVideoCapabilitiesKHR::pNext chain **must** include a VkVideoDecodeAV1CapabilitiesKHR structure that will be filled with the profile-specific capabilities.

The VkVideoDecodeAV1CapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_av1
typedef struct VkVideoDecodeAV1CapabilitiesKHR {
    VkStructureType     sType;
    void*               pNext;
    StdVideoAV1Level    maxLevel;
} VkVideoDecodeAV1CapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxLevel is a StdVideoAV1Level value specifying the maximum AV1 level supported by the profile, as defined in section A.3 of the AV1 Specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeAV1CapabilitiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_CAPABILITIES_KHR

38.14.6. AV1 Decode Parameter Sets

Video session parameters objects created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR contain a single instance of the following parameter set:

AV1 Sequence Header

Represented by StdVideoAV1SequenceHeader structures and interpreted as follows:

- flags.reserved and reserved1 are used only for padding purposes and are otherwise ignored;
- the StdVideoAV1ColorConfig structure pointed to by pColorConfig is interpreted as follows:
  - flags.reserved and reserved1 are used only for padding purposes and are otherwise ignored;
  - all other members of StdVideoAV1ColorConfig are interpreted as defined in section 6.4.2 of the AV1 Specification;
- if flags.timing_info_present_flag is set, then the StdVideoAV1TimingInfo structure pointed to by pTimingInfo is interpreted as follows:

    - `flags.reserved` is used only for padding purposes and is otherwise ignored;
    - all other members of `StdVideoAV1TimingInfo` are interpreted as defined in section 6.4.3 of the AV1 Specification;
- all other members of `StdVideoAV1SequenceHeader` are interpreted as defined in section 6.4 of the AV1 Specification.

When a video session parameters object is created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, the `VkVideoSessionParametersCreateInfoKHR::pNext` chain **must** include a `VkVideoDecodeAV1SessionParametersCreateInfoKHR` structure specifying the contents of the object.

The `VkVideoDecodeAV1SessionParametersCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_av1
typedef struct VkVideoDecodeAV1SessionParametersCreateInfoKHR {
    VkStructureType                    sType;
    const void*                        pNext;
    const StdVideoAV1SequenceHeader*   pStdSequenceHeader;
} VkVideoDecodeAV1SessionParametersCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdSequenceHeader` is a pointer to a `StdVideoAV1SequenceHeader` structure describing the AV1 sequence header entry to store in the created object.

NOTE

As AV1 video session parameters objects will only ever contain a single AV1 sequence header, this has to be specified at object creation time and such video session parameters objects cannot be updated using the `vkUpdateVideoSessionParametersKHR` command. When a new AV1 sequence header is decoded from the input video bitstream the application needs to create a new video session parameters object to store it.

Valid Usage (Implicit)

- VUID-VkVideoDecodeAV1SessionParametersCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_SESSION_PARAMETERS_CREATE_INFO_KHR`
- VUID-VkVideoDecodeAV1SessionParametersCreateInfoKHR-pStdSequenceHeader-parameter
  `pStdSequenceHeader` **must** be a valid pointer to a valid `StdVideoAV1SequenceHeader` value

38.14.7. AV1 Decoding Parameters

The `VkVideoDecodeAV1PictureInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_av1
typedef struct VkVideoDecodeAV1PictureInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    const StdVideoDecodeAV1PictureInfo*      pStdPictureInfo;
    int32_t                                  referenceNameSlotIndices
[VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR];
    uint32_t                                 frameHeaderOffset;
    uint32_t                                 tileCount;
    const uint32_t*                          pTileOffsets;
    const uint32_t*                          pTileSizes;
} VkVideoDecodeAV1PictureInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdPictureInfo` is a pointer to a `StdVideoDecodeAV1PictureInfo` structure specifying AV1 picture information.
- `referenceNameSlotIndices` is an array of seven (`VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR`, which is equal to the Video Std definition `STD_VIDEO_AV1_REFS_PER_FRAME`) signed integer values specifying the index of the DPB slot or a negative integer value for each AV1 reference name used for inter coding. In particular, the DPB slot index for the AV1 reference name `frame` is specified in `referenceNameSlotIndices`[`frame` - `STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME`].
- `frameHeaderOffset` is the byte offset of the AV1 frame header OBU, as defined in section 5.9 of the AV1 Specification, within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.
- `tileCount` is the number of elements in `pTileOffsets` and `pTileSizes`.
- `pTileOffsets` is a pointer to an array of `tileCount` integers specifying the byte offset of the tiles of the picture within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.
- `pTileSizes` is a pointer to an array of `tileCount` integers specifying the byte size of the tiles of the picture within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.

This structure is specified in the `pNext` chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR to specify the codec-specific picture information for an AV1 decode operation.

Decode Output Picture Information

When this structure is specified in the `pNext` chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR, the information related to the decode output picture is defined as follows:

- The image subregion used is determined according to the AV1 Decode Picture Data Access section.
- The decode output picture is associated with the AV1 picture information provided in `pStdPictureInfo`.

Std Picture Information

The members of the `StdVideoDecodeAV1PictureInfo` structure pointed to by `pStdPictureInfo` are interpreted as follows:

- `flags.reserved`, `reserved1`, and `reserved2` are used only for padding purposes and are otherwise ignored;
- `flags.apply_grain` indicates that film grain is enabled for the decoded picture, as defined in section 6.8.20 of the AV1 Specification;
- `OrderHint`, `OrderHints`, and `expectedFrameId` are interpreted as defined in section 6.8.2 of the AV1 Specification;
- the `StdVideoAV1TileInfo` structure pointed to by `pTileInfo` is interpreted as follows:
  - `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
  - `pMiColStarts` is a pointer to an array of `TileCols` number of unsigned integers that corresponds to `MiColStarts` defined in section 6.8.14 of the AV1 Specification;
  - `pMiRowStarts` is a pointer to an array of `TileRows` number of unsigned integers that corresponds to `MiRowStarts` defined in section 6.8.14 of the AV1 Specification;
  - `pWidthInSbsMinus1` is a pointer to an array of `TileCols` number of unsigned integers that corresponds to `width_in_sbs_minus_1` defined in section 6.8.14 of the AV1 Specification;
  - `pHeightInSbsMinus1` is a pointer to an array of `TileRows` number of unsigned integers that corresponds to `height_in_sbs_minus_1` defined in section 6.8.14 of the AV1 Specification;
  - all other members of `StdVideoAV1TileInfo` are interpreted as defined in section 6.8.14 of the AV1 Specification;
- the `StdVideoAV1Quantization` structure pointed to by `pQuantization` is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - all other members of `StdVideoAV1Quantization` are interpreted as defined in section 6.8.11 of the AV1 Specification;
- if `flags.segmentation_enabled` is set, then the `StdVideoAV1Segmentation` structure pointed to by `pSegmentation` is interpreted as follows:
  - the elements of `FeatureEnabled` are bitmasks where bit index j of element i corresponds to `FeatureEnabled[i][j]` as defined in section 6.8.13 of the AV1 Specification;
  - `FeatureData` is interpreted as defined in section 6.8.13 of the AV1 Specification;
- the `StdVideoAV1LoopFilter` structure pointed to by `pLoopFilter` is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - `update_ref_delta` is a bitmask where bit index i is interpreted as the value of `update_ref_delta` corresponding to element i of `loop_filter_ref_deltas` as defined in section 6.8.10 of the AV1 Specification;
  - `update_mode_delta` is a bitmask where bit index i is interpreted as the value of `update_mode_delta` corresponding to element i of `loop_filter_mode_deltas` as defined in section 6.8.10 of the AV1 Specification;

    - all other members of StdVideoAV1LoopFilter are interpreted as defined in section 6.8.10 of the AV1 Specification;
- if flags.enable_cdef is set in the active sequence header, then the members of the StdVideoAV1CDEF structure pointed to by pCDEF are interpreted as follows:
    - cdef_y_sec_strength and cdef_uv_sec_strength are the bitstream values of the corresponding syntax elements defined in section 5.9.19 of the AV1 Specification;
    - all other members of StdVideoAV1CDEF are interpreted as defined in section 6.10.14 of the AV1 Specification;
- the StdVideoAV1LoopRestoration structure pointed to by pLoopRestoration is interpreted as follows:
    - LoopRestorationSize[plane] is interpreted as log2(size) - 5, where size is the value of LoopRestorationSize[plane] as defined in section 6.10.15 of the AV1 Specification.
    - all other members of StdVideoAV1LoopRestoration are defined as in section 6.10.15 of the AV1 Specification;
- the members of the StdVideoAV1GlobalMotion structure provided in global_motion are interpreted as defined in section 7.10 of the AV1 Specification;
- if flags.film_grain_params_present is set in the active sequence header, then the StdVideoAV1FilmGrain structure pointed to by pFilmGrain is interpreted as follows:
    - flags.reserved is used only for padding purposes and is otherwise ignored;
    - all other members of StdVideoAV1FilmGrain are interpreted as defined in section 6.8.20 of the AV1 Specification;
- all other members are interpreted as defined in section 6.8 of the AV1 Specification.

When film grain is enabled for the decoded frame, the flags.update_grain and film_grain_params_ref_idx values specified in StdVideoAV1FilmGrain are ignored by AV1 decode operations and the load_grain_params function, as defined in section 6.8.20 of the AV1 Specification, is not executed. Instead, the application is responsible for specifying the effective film grain parameters for the frame in StdVideoAV1FilmGrain.

When film grain is enabled for the decoded frame, the application is required to specify a different decode output picture resource in VkVideoDecodeInfoKHR::dstPictureResource compared to the reconstructed picture specified in VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource even if the implementation does not report support for VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR in VkVideoDecodeCapabilitiesKHR::flags for the video decode profile.

Reference picture setup is controlled by the value of StdVideoDecodeAV1PictureInfo::refresh_frame_flags. If it is not zero and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the DPB slot specified in pDecodeInfo->pSetupReferenceSlot->slotIndex. If StdVideoDecodeAV1PictureInfo::refresh_frame_flags is zero, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

Active Parameter Sets

The *active sequence header* is the AV1 sequence header stored in the bound video session parameters object.

Valid Usage (Implicit)

- VUID-VkVideoDecodeAV1PictureInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_PICTURE_INFO_KHR`
- VUID-VkVideoDecodeAV1PictureInfoKHR-pStdPictureInfo-parameter
  `pStdPictureInfo` **must** be a valid pointer to a valid `StdVideoDecodeAV1PictureInfo` value
- VUID-VkVideoDecodeAV1PictureInfoKHR-pTileOffsets-parameter
  `pTileOffsets` **must** be a valid pointer to an array of `tileCount` `uint32_t` values
- VUID-VkVideoDecodeAV1PictureInfoKHR-pTileSizes-parameter
  `pTileSizes` **must** be a valid pointer to an array of `tileCount` `uint32_t` values
- VUID-VkVideoDecodeAV1PictureInfoKHR-tileCount-arraylength
  `tileCount` **must** be greater than `0`

The `VkVideoDecodeAV1DpbSlotInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_decode_av1
typedef struct VkVideoDecodeAV1DpbSlotInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    const StdVideoDecodeAV1ReferenceInfo*    pStdReferenceInfo;
} VkVideoDecodeAV1DpbSlotInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoDecodeAV1ReferenceInfo` structure specifying AV1 reference information.

This structure is specified in the `pNext` chain of VkVideoDecodeInfoKHR::`pSetupReferenceSlot`, if not `NULL`, and the `pNext` chain of the elements of VkVideoDecodeInfoKHR::`pReferenceSlots` to specify the codec-specific reference picture information for an AV1 decode operation.

Active Reference Picture Information

When this structure is specified in the `pNext` chain of the elements of VkVideoDecodeInfoKHR ::`pReferenceSlots`, one element is added to the list of active reference pictures used by the video decode operation for each element of VkVideoDecodeInfoKHR::`pReferenceSlots` as follows:

- The image subregion used is determined according to the AV1 Decode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the `slotIndex` member of the corresponding element of VkVideoDecodeInfoKHR::`pReferenceSlots`.

- The reference picture is associated with the AV1 reference information provided in pStdReferenceInfo.

Reconstructed Picture Information

When this structure is specified in the pNext chain of VkVideoDecodeInfoKHR ::pSetupReferenceSlot, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the AV1 Decode Picture Data Access section.
- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex.
- The reconstructed picture is associated with the AV1 reference information provided in pStdReferenceInfo.

Std Reference Information

The members of the StdVideoDecodeAV1ReferenceInfo structure pointed to by pStdReferenceInfo are interpreted as follows:

- flags.reserved and reserved1 are used only for padding purposes and are otherwise ignored;
- flags.disable_frame_end_update_cdf is interpreted as defined in section 6.8.2 of the AV1 Specification;
- flags.segmentation_enabled is interpreted as defined in section 6.8.13 of the AV1 Specification;
- frame_type is interpreted as defined in section 6.8.2 of the AV1 Specification;

> **NOTE** The frame_type member is defined with the type uint8_t, but it takes the same values defined in the StdVideoAV1FrameType enumeration type as StdVideoDecodeAV1PictureInfo::frame_type.

- RefFrameSignBias is a bitmask where bit index i corresponds to RefFrameSignBias[i] as defined in section 6.8.2 of the AV1 Specification;
- OrderHint is interpreted as defined in section 6.8.2 of the AV1 Specification;
- SavedOrderHints is interpreted as defined in section 7.20 of the AV1 Specification.

> **NOTE** When the AV1 reference information is provided for the reconstructed picture, certain parameters (e.g. frame_type) are specified both in the AV1 picture information and in the AV1 reference information. This is necessary because unlike the AV1 picture information, which is only used for the purposes of the video decode operation in question, the AV1 reference information specified for the reconstructed picture **may** be associated with the activated DPB slot, meaning that some implementations **may** maintain it as part of the reference picture metadata corresponding to the video picture resource associated with the DPB slot. When the AV1 reference information is provided for an active reference picture, the specified parameters

correspond to the parameters specified when the DPB slot was activated (set up) with the reference picture, as usual, in order to communicate these parameters for implementations that do not maintain any subset of these parameters as part of the DPB slot's reference picture metadata.

Valid Usage (Implicit)

- VUID-VkVideoDecodeAV1DpbSlotInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_DPB_SLOT_INFO_KHR`
- VUID-VkVideoDecodeAV1DpbSlotInfoKHR-pStdReferenceInfo-parameter
  `pStdReferenceInfo` **must** be a valid pointer to a valid `StdVideoDecodeAV1ReferenceInfo` value

38.14.8. AV1 Decode Requirements

This section describes the **required** AV1 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, as returned by vkGetPhysicalDeviceQueueFamilyProperties2KHR in VkQueueFamilyVideoPropertiesKHR ::`videoCodecOperations`.

Table 51. Required Video Std Header Versions

Video Std Header Name	Version
`vulkan_video_codec_av1std_decode`	1.0.0

Table 52. Required Video Capabilities

Video Capability	Requirement	Requirement Type[1]
VkVideoCapabilitiesKHR		
`flags`	-	min
`minBitstreamBufferOffsetAlignment`	4096	max
`minBitstreamBufferSizeAlignment`	4096	max
`pictureAccessGranularity`	(64,64)	max
`minCodedExtent`	-	max
`maxCodedExtent`	-	min
`maxDpbSlots`	0	min
`maxActiveReferencePictures`	0	min
VkVideoDecodeCapabilitiesKHR		

Video Capability	Requirement	Requirement Type[1]
flags	VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR or VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR	min
VkVideoDecodeAV1CapabilitiesKHR		
maxLevel	STD_VIDEO_AV1_LEVEL_2_0	min

1

The **Requirement Type** column specifies the requirement is either the minimum value all implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

38.15. Video Encode Operations

Video encode operations consume an *encode input picture* and zero or more reference pictures, and produce compressed video data to a video bitstream buffer and an optional reconstructed picture.

NOTE	Such encode input pictures can be used as the output of video decode operations, with graphics or compute operations, or with Window System Integration APIs, depending on the capabilities of the implementation.

Video encode operations **may** access the following resources in the VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR stage:

- The image subregions corresponding to the source encode input picture and active reference pictures with access VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR.
- The destination video bitstream buffer range and the optional reconstructed picture with access VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR.

The image subresource of each video picture resource accessed by the video encode operation is specified using a corresponding VkVideoPictureResourceInfoKHR structure. Each such image subresource **must** be in the appropriate image layout as follows:

- If the image subresource is used in the video encode operation as an encode input picture, then it **must** be in the VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR layout.
- If the image subresource is used in the video encode operation as a reconstructed picture or reference picture, then it **must** be in the VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR layout.
- If the image subresource is used in the video encode operation as a quantization map, then it **must** be in the VK_IMAGE_LAYOUT_VIDEO_ENCODE_QUANTIZATION_MAP_KHR layout.

A video encode operation **may** complete unsuccessfully. In this case the target video bitstream

buffer will have undefined contents. Similarly, if reference picture setup is requested, the reconstructed-picture will also have undefined contents, and the activated DPB slot will have an invalid picture reference.

If a video encode operation completes successfully and the codec-specific parameters provided by the application adhere to the syntactic and semantic requirements defined in the corresponding video compression standard, then the target video bitstream buffer will contain compressed video data after the execution of the video encode operation according to the respective codec-specific semantics.

38.15.1. Codec-Specific Semantics

The following aspects of video encode operations are codec-specific:

- The compressed video data written to the target video bitstream buffer range.
- The construction and interpretation of the list of active reference pictures and the interpretation of the picture data referred to by the corresponding image subregions.
- The construction and interpretation of information related to the encode input picture and the interpretation of the picture data referred to by the corresponding image subregion.
- The decision on reference picture setup.
- The construction and interpretation of information related to the optional reconstructed picture and the generation of picture data to the corresponding image subregion.
- Certain aspects of rate control.

These codec-specific behaviors are defined for each video codec operation separately.

- If the used video codec operation is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the codec-specific aspects of the video encoding process are performed as defined in the H.264 Encode Operations section.
- If the used video codec operation is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the codec-specific aspects of the video encoding process are performed as defined in the H.265 Encode Operations section.
- If the used video codec operation is `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR`, then the codec-specific aspects of the video encoding process are performed as defined in the AV1 Encode Operations section.

Video Encode Parameter Overrides

Implementations supporting video encode operations for any particular video codec operation often support only a subset of the available encoding tools defined by the corresponding video compression standards. Accordingly, certain implementation-dependent limitations **may** apply to codec-specific parameters provided through the structures defined in the Video Std headers corresponding to the used video codec operation.

Exposing all of these restrictions on particular codec-specific parameter values or combinations thereof in the form of application-queryable capabilities is impractical, hence this specification allows implementations to *override* the value of any of the codec-specific parameters, unless

otherwise specified, as long as all of the following conditions are met:

- If the application-provided codec-specific parameters adhere to the syntactic and semantic requirements and rules defined by the used video compression standard, and thus would be usable to produce a video bitstream compliant with that standard, then the codec-specific parameters resulting from the process of implementation overrides **must** also adhere to the same requirements and rules, and any video bitstream produced using the overridden parameters **must** also be compliant.
- The overridden codec-specific parameter values **must** not have an impact on the codec-independent behaviors defined for video encode operations.
- The implementation **must** not override any codec-specific parameters specified to a command that **may** cause application-provided codec-specific parameters specified to subsequent commands to no longer adhere to the semantic requirements and rules defined by the used video compression standard, unless the implementation also overrides those parameters to adhere to any such requirements and rules.
- The overridden codec-specific parameter values **must** not have an impact on the codec-specific picture data access semantics.
- The overridden codec-specific parameter values **may** change the contents of the codec-specific bitstream elements produced by video encode operations or otherwise retrieved by the application (e.g. using the vkGetEncodedVideoSessionParametersKHR command) but **must** still adhere to the codec-specific semantics defined for that video codec operation, including, but not limited to, the number, type, and order of the encoded codec-specific bitstream elements.

Besides codec-specific parameter overrides performed for implementation-dependent reasons, applications **can** enable the implementation to apply additional optimizing overrides that **may** improve the efficiency or performance of video encoding operations. However, implementations **must** meet the conditions listed above even in case of such optimizing overrides.

NOTE	Unless the application opts in for optimizing overrides, implementations are not expected to override any of the codec-specific parameters, except when such overrides are necessary for the correct operation of video encoder implementation due to limitations to the available encoding tools on that implementation.

38.15.2. Video Encode Operation Steps

Each video encode operation performs the following steps in the `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR` stage:

1. Reads the input picture data from the encode input picture;
2. Determine derived encoding quality parameters according to the codec-specific semantics and the current rate control state;
3. Compresses the input picture data according to the codec-specific semantics, applying any prediction data read from the active reference pictures and rate control restrictions in the process;
4. Writes the encoded bitstream data to the destination video bitstream buffer range;

5. Performs picture reconstruction of the encoded video data according to the codec-specific semantics, applying any prediction data read from the active reference pictures in the process, if a reconstructed picture is specified and reference picture setup is requested;
6. If reference picture setup is requested, the DPB slot index specified in the reconstructed picture information is activated with the reconstructed picture;
7. Writes the reconstructed picture data to the reconstructed picture, if one is specified, according to the codec-specific semantics.

When reconstructed picture information is provided, the specified DPB slot index is associated with the corresponding bound reference picture resource, indifferent of whether reference picture setup is requested.

38.15.3. Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR with `pVideoProfile->videoCodecOperation` specifying an encode operation, the VkVideoEncodeCapabilitiesKHR structure **must** be included in the `pNext` chain of the VkVideoCapabilitiesKHR structure to retrieve capabilities specific to video encoding.

The `VkVideoEncodeCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeCapabilitiesKHR {
    VkStructureType                          sType;
    void*                                    pNext;
    VkVideoEncodeCapabilityFlagsKHR          flags;
    VkVideoEncodeRateControlModeFlagsKHR     rateControlModes;
    uint32_t                                 maxRateControlLayers;
    uint64_t                                 maxBitrate;
    uint32_t                                 maxQualityLevels;
    VkExtent2D                               encodeInputPictureGranularity;
    VkVideoEncodeFeedbackFlagsKHR            supportedEncodeFeedbackFlags;
} VkVideoEncodeCapabilitiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkVideoEncodeCapabilityFlagBitsKHR describing supported encoding features.
- `rateControlModes` is a bitmask of VkVideoEncodeRateControlModeFlagBitsKHR indicating supported rate control modes.
- `maxRateControlLayers` indicates the maximum number of rate control layers supported.
- `maxBitrate` indicates the maximum supported bitrate.
- `maxQualityLevels` indicates the number of discrete video encode quality levels supported. Implementations **must** support at least one quality level.
- `encodeInputPictureGranularity` indicates the granularity at which encode input picture data is

encoded and **may** indicate a texel granularity up to the size of the largest supported codec-specific coding block. This capability does not impose any valid usage constraints on the application, however, depending on the contents of the encode input picture, it **may** have effects on the encoded bitstream, as described in more detail below.

- `supportedEncodeFeedbackFlags` is a bitmask of VkVideoEncodeFeedbackFlagBitsKHR values specifying the supported flags for video encode feedback queries.

Implementations **must** include support for at least `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR` and `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR` in `supportedEncodeFeedbackFlags`.

`encodeInputPictureGranularity` provides information about the way encode input picture data is used as input to video encode operations. In particular, some implementations **may** not be able to limit the set of texels used to encode the output video bitstream to the image subregion specified in the VkVideoPictureResourceInfoKHR structure corresponding to the encode input picture (i.e. to the resolution of the image data to encode specified in its `codedExtent` member).

NOTE For example, the application requests the coded extent to be 1920x1080, but the implementation is only able to source the encode input picture data at the granularity of the codec-specific coding block size which is 16x16 pixels (or as otherwise indicated in `encodeInputPictureGranularity`). In this example, the content is horizontally aligned with the coding block size, but not vertically aligned with it. Thus encoding of the last row of coding blocks will be impacted by the contents of the input image at texel rows 1080 to 1087 (the latter being the next row which is vertically aligned with the coding block size, assuming a zero-based texel row index).

If `codedExtent` rounded up to the next integer multiple of `encodeInputPictureGranularity` is greater than the extent of the image subresource specified for the encode input picture, then the texel values corresponding to texel coordinates outside of the bounds of the image subresource **may** be undefined. However, implementations **should** use well-defined default values for such texels in order to maximize the encoding efficiency for the last coding block row/column, and/or to ensure consistent encoding results across repeated encoding of the same input content. Nonetheless, the values used for such texels **must** not have an effect on whether the video encode operation produces a compliant bitstream, and **must** not have any other effects on the encoded picture data beyond what **may** otherwise result from using these texel values as input to any compression algorithm, as defined in the used video compression standard.

NOTE While not required, it is generally a good practice for applications to make sure that the image subresource used for the encode input picture has an extent that is an integer multiple of the codec-specific coding block size (or at least `encodeInputPictureGranularity`) and that this padding area is filled with known values in order to improve encoding efficiency, portability, and reproducibility.

Valid Usage (Implicit)

- VUID-VkVideoEncodeCapabilitiesKHR-sType-sType

- `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_CAPABILITIES_KHR`

Bits which **may** be set in VkVideoEncodeCapabilitiesKHR::`flags`, indicating the encoding tools supported, are:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeCapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR =
0x00000001,
    VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR =
0x00000002,
  // Provided by VK_KHR_video_encode_quantization_map
    VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR = 0x00000004,
  // Provided by VK_KHR_video_encode_quantization_map
    VK_VIDEO_ENCODE_CAPABILITY_EMPHASIS_MAP_BIT_KHR = 0x00000008,
} VkVideoEncodeCapabilityFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR` specifies that the implementation supports the use of VkVideoEncodeInfoKHR::`precedingExternallyEncodedBytes`.
- `VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR` specifies that the implementation is able to detect and report when the destination video bitstream buffer range provided by the application is not sufficiently large to fit the encoded bitstream data produced by a video encode operation by reporting the `VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR` query result status code.

> **NOTE**
>
> Some implementations **may** not be able to reliably detect insufficient bitstream buffer range conditions in all situations. Such implementations will not report support for the `VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR` encode capability flag for the video profile, but **may** still report the `VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR` query result status code in certain cases. Applications **should** always check for the specific query result status code `VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR` even when this encode capability flag is not supported by the implementation for the video profile in question. However, applications **must** not assume that a different negative query result status code indicating an unsuccessful completion of a video encode operation is not the result of an insufficient bitstream buffer condition unless this encode capability flag is supported.

- `VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR` indicates support for using quantization delta maps.
- `VK_VIDEO_ENCODE_CAPABILITY_EMPHASIS_MAP_BIT_KHR` specifies support for using emphasis maps.

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeCapabilityFlagsKHR;
```

VkVideoEncodeCapabilityFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeCapabilityFlagBitsKHR.

38.15.4. Video Encode Quality Levels

Implementations **can** support more than one video encode quality levels for a video encode profile, which control the number and type of implementation-specific encoding tools and algorithms utilized in the encoding process.

NOTE

Generally, using higher video encode quality levels **may** produce higher quality video streams at the cost of additional processing time. However, as the final quality of an encoded picture depends on the contents of the encode input picture, the contents of the active reference pictures, the codec-specific encode parameters, and the particular implementation-specific tools used corresponding to the individual video encode quality levels, there are no guarantees that using a higher video encode quality level will always produce a higher quality encoded picture for any given set of inputs.

To query properties for a specific video encode quality level supported by a video encode profile, call:

```
// Provided by VK_KHR_video_encode_queue
VkResult vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR* pQualityLevelInfo,
    VkVideoEncodeQualityLevelPropertiesKHR*     pQualityLevelProperties);
```

- physicalDevice is the physical device to query the video encode quality level properties for.
- pQualityLevelInfo is a pointer to a VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR structure specifying the video encode profile and quality level to query properties for.
- pQualityLevelProperties is a pointer to a VkVideoEncodeQualityLevelPropertiesKHR structure in which the properties are returned.

Valid Usage

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelInfo-08257
  If pQualityLevelInfo->pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the pNext chain of pQualityLevelProperties **must** include a VkVideoEncodeH264QualityLevelPropertiesKHR structure
- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelInfo-

08258
If pQualityLevelInfo->pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain of pQualityLevelProperties **must** include a VkVideoEncodeH265QualityLevelPropertiesKHR structure

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelInfo-10305
If pQualityLevelInfo->pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the pNext chain of pQualityLevelProperties **must** include a VkVideoEncodeAV1QualityLevelPropertiesKHR structure

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-physicalDevice-parameter
physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelInfo-parameter
pQualityLevelInfo **must** be a valid pointer to a valid VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR structure
- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelProperties-parameter
pQualityLevelProperties **must** be a valid pointer to a VkVideoEncodeQualityLevelPropertiesKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR

The VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    const VkVideoProfileInfoKHR*    pVideoProfile;
    uint32_t                        qualityLevel;
} VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pVideoProfile` is a pointer to a VkVideoProfileInfoKHR structure specifying the video profile to query the video encode quality level properties for.
- `qualityLevel` is the video encode quality level to query properties for.

Valid Usage

- VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pVideoProfile-08259
  `pVideoProfile` **must** be a supported video profile
- VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pVideoProfile-08260
  `pVideoProfile->videoCodecOperation` **must** specify an encode operation
- VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-qualityLevel-08261
  `qualityLevel` **must** be less than VkVideoEncodeCapabilitiesKHR::`maxQualityLevels`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified in `pVideoProfile`

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR`
- VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pVideoProfile-parameter
  `pVideoProfile` **must** be a valid pointer to a valid VkVideoProfileInfoKHR structure

The `VkVideoEncodeQualityLevelPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeQualityLevelPropertiesKHR {
    VkStructureType                           sType;
    void*                                     pNext;
    VkVideoEncodeRateControlModeFlagBitsKHR   preferredRateControlMode;
    uint32_t                                  preferredRateControlLayerCount;
} VkVideoEncodeQualityLevelPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `preferredRateControlMode` is a VkVideoEncodeRateControlModeFlagBitsKHR value indicating the preferred rate control mode to use with the video encode quality level.
- `preferredRateControlLayerCount` indicates the preferred number of rate control layers to use with the video encode quality level.

Valid Usage (Implicit)

- VUID-VkVideoEncodeQualityLevelPropertiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_PROPERTIES_KHR`
- VUID-VkVideoEncodeQualityLevelPropertiesKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkVideoEncodeAV1QualityLevelPropertiesKHR, VkVideoEncodeH264QualityLevelPropertiesKHR, or VkVideoEncodeH265QualityLevelPropertiesKHR
- VUID-VkVideoEncodeQualityLevelPropertiesKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique

The `VkVideoEncodeQualityLevelInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeQualityLevelInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           qualityLevel;
} VkVideoEncodeQualityLevelInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `qualityLevel` is the used video encode quality level.

This structure **can** be specified in the following places:

- In the `pNext` chain of VkVideoSessionParametersCreateInfoKHR to specify the video encode

quality level to use for a video session parameters object created for a video encode session. If no instance of this structure is included in the pNext chain of VkVideoSessionParametersCreateInfoKHR, then the video session parameters object is created with a video encode quality level of zero.

- In the pNext chain of VkVideoCodingControlInfoKHR to change the video encode quality level state of the bound video session.

Valid Usage

- VUID-VkVideoEncodeQualityLevelInfoKHR-qualityLevel-08311
  qualityLevel **must** be less than VkVideoEncodeCapabilitiesKHR::maxQualityLevels, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile

Valid Usage (Implicit)

- VUID-VkVideoEncodeQualityLevelInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR

38.15.5. Retrieving Encoded Session Parameters

Any codec-specific parameters stored in video session parameters objects **may** need to be separately encoded and included in the final video bitstream data, depending on the used video compression standard. In such cases the application **must** call the vkGetEncodedVideoSessionParametersKHR command to retrieve the encoded parameter data from the used video session parameters object in order to be able to produce a compliant video bitstream.

NOTE

This is needed because implementations **may** have changed some of the codec-specific parameters stored in the video session parameters object, as defined in the Video Encode Parameter Overrides section. In addition, the vkGetEncodedVideoSessionParametersKHR command enables the application to retrieve the encoded parameter data without having to encode these codec-specific parameters manually.

Encoded parameter data **can** be retrieved from a video session parameters object created with a video encode operation using the command:

```
// Provided by VK_KHR_video_encode_queue
VkResult vkGetEncodedVideoSessionParametersKHR(
    VkDevice                                    device,
    const VkVideoEncodeSessionParametersGetInfoKHR* pVideoSessionParametersInfo,
    VkVideoEncodeSessionParametersFeedbackInfoKHR* pFeedbackInfo,
    size_t*                                     pDataSize,
    void*                                       pData);
```

- `device` is the logical device that owns the video session parameters object.
- `pVideoSessionParametersInfo` is a pointer to a VkVideoEncodeSessionParametersGetInfoKHR structure specifying the parameters of the encoded parameter data to retrieve.
- `pFeedbackInfo` is either `NULL` or a pointer to a VkVideoEncodeSessionParametersFeedbackInfoKHR structure in which feedback about the requested parameter data is returned.
- `pDataSize` is a pointer to a `size_t` value related to the amount of encode parameter data returned, as described below.
- `pData` is either `NULL` or a pointer to a buffer to write the encoded parameter data to.

If `pData` is `NULL`, then the size of the encoded parameter data, in bytes, that **can** be retrieved is returned in `pDataSize`. Otherwise, `pDataSize` **must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the number of bytes actually written to `pData`. If `pDataSize` is less than the size of the encoded parameter data that **can** be retrieved, then no data will be written to `pData`, zero will be written to `pDataSize`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that no encoded parameter data was returned.

If `pFeedbackInfo` is not `NULL` then the members of the VkVideoEncodeSessionParametersFeedbackInfoKHR structure and any additional structures included in its `pNext` chain that are applicable to the video session parameters object specified in `pVideoSessionParametersInfo->videoSessionParameters` will be filled with feedback about the requested parameter data on all successful calls to this command.

NOTE This includes the cases when `pData` is `NULL` or when `VK_INCOMPLETE` is returned by the command, and enables the application to determine whether the implementation overrode any of the requested video session parameters without actually needing to retrieve the encoded parameter data itself.

Valid Usage

- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08359 `pVideoSessionParametersInfo->videoSessionParameters` **must** have been created with an encode operation
- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08262 If `pVideoSessionParametersInfo->videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the `pNext` chain of `pVideoSessionParametersInfo` **must** include a VkVideoEncodeH264SessionParametersGetInfoKHR structure
- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08263 If `pVideoSessionParametersInfo->videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then for the VkVideoEncodeH264SessionParametersGetInfoKHR structure included in the `pNext` chain of `pVideoSessionParametersInfo`, if its `writeStdSPS` member is `VK_TRUE`, then `pVideoSessionParametersInfo->videoSessionParameters` **must** contain a

StdVideoH264SequenceParameterSet entry with seq_parameter_set_id matching VkVideoEncodeH264SessionParametersGetInfoKHR::stdSPSId

- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08264
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then for the VkVideoEncodeH264SessionParametersGetInfoKHR structure included in the pNext chain of pVideoSessionParametersInfo, if its writeStdPPS member is VK_TRUE, then pVideoSessionParametersInfo->videoSessionParameters **must** contain a StdVideoH264PictureParameterSet entry with seq_parameter_set_id and pic_parameter_set_id matching VkVideoEncodeH264SessionParametersGetInfoKHR::stdSPSId and VkVideoEncodeH264SessionParametersGetInfoKHR::stdPPSId, respectively
- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08265
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain of pVideoSessionParametersInfo **must** include a VkVideoEncodeH265SessionParametersGetInfoKHR structure
- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08266
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then for the VkVideoEncodeH265SessionParametersGetInfoKHR structure included in the pNext chain of pVideoSessionParametersInfo, if its writeStdVPS member is VK_TRUE, then pVideoSessionParametersInfo->videoSessionParameters **must** contain a StdVideoH265VideoParameterSet entry with vps_video_parameter_set_id matching VkVideoEncodeH265SessionParametersGetInfoKHR::stdVPSId
- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08267
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then for the VkVideoEncodeH265SessionParametersGetInfoKHR structure included in the pNext chain of pVideoSessionParametersInfo, if its writeStdSPS member is VK_TRUE, then pVideoSessionParametersInfo->videoSessionParameters **must** contain a StdVideoH265SequenceParameterSet entry with sps_video_parameter_set_id and sps_seq_parameter_set_id matching VkVideoEncodeH265SessionParametersGetInfoKHR::stdVPSId and VkVideoEncodeH265SessionParametersGetInfoKHR::stdSPSId, respectively
- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08268
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then for the VkVideoEncodeH265SessionParametersGetInfoKHR structure included in the pNext chain of pVideoSessionParametersInfo, if its writeStdPPS member is VK_TRUE, then pVideoSessionParametersInfo->videoSessionParameters **must** contain a StdVideoH265PictureParameterSet entry with sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id matching VkVideoEncodeH265SessionParametersGetInfoKHR::stdVPSId, VkVideoEncodeH265SessionParametersGetInfoKHR::stdSPSId, and VkVideoEncodeH265SessionParametersGetInfoKHR::stdPPSId, respectively

Valid Usage (Implicit)

- VUID-vkGetEncodedVideoSessionParametersKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-parameter
  `pVideoSessionParametersInfo` **must** be a valid pointer to a valid VkVideoEncodeSessionParametersGetInfoKHR structure
- VUID-vkGetEncodedVideoSessionParametersKHR-pFeedbackInfo-parameter
  If `pFeedbackInfo` is not `NULL`, `pFeedbackInfo` **must** be a valid pointer to a VkVideoEncodeSessionParametersFeedbackInfoKHR structure
- VUID-vkGetEncodedVideoSessionParametersKHR-pDataSize-parameter
  `pDataSize` **must** be a valid pointer to a `size_t` value
- VUID-vkGetEncodedVideoSessionParametersKHR-pData-parameter
  If the value referenced by `pDataSize` is not `0`, and `pData` is not `NULL`, `pData` **must** be a valid pointer to an array of `pDataSize` bytes

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkVideoEncodeSessionParametersGetInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeSessionParametersGetInfoKHR {
    VkStructureType                sType;
    const void*                    pNext;
    VkVideoSessionParametersKHR    videoSessionParameters;
} VkVideoEncodeSessionParametersGetInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `videoSessionParameters` is the VkVideoSessionParametersKHR object to retrieve encoded parameter data from.

Depending on the used video encode operation, additional codec-specific structures **may** need to be

included in the pNext chain of this structure to identify the specific video session parameters to retrieve encoded parameter data for, as described in the corresponding sections.

Valid Usage (Implicit)

- VUID-VkVideoEncodeSessionParametersGetInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_GET_INFO_KHR
- VUID-VkVideoEncodeSessionParametersGetInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkVideoEncodeH264SessionParametersGetInfoKHR or VkVideoEncodeH265SessionParametersGetInfoKHR
- VUID-VkVideoEncodeSessionParametersGetInfoKHR-sType-unique
  The sType value of each struct in the pNext chain **must** be unique
- VUID-VkVideoEncodeSessionParametersGetInfoKHR-videoSessionParameters-parameter
  videoSessionParameters **must** be a valid VkVideoSessionParametersKHR handle

The VkVideoEncodeSessionParametersFeedbackInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeSessionParametersFeedbackInfoKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           hasOverrides;
} VkVideoEncodeSessionParametersFeedbackInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- hasOverrides indicates whether any of the requested parameter data were overridden by the implementation.

Depending on the used video encode operation, additional codec-specific structures **can** be included in the pNext chain of this structure to capture codec-specific feedback information about the requested parameter data, as described in the corresponding sections.

Valid Usage (Implicit)

- VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_FEEDBACK_INFO_KHR
- VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkVideoEncodeH264SessionParametersFeedbackInfoKHR or VkVideoEncodeH265SessionParametersFeedbackInfoKHR

- VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique

38.15.6. Video Encode Commands

To launch video encode operations, call:

```
// Provided by VK_KHR_video_encode_queue
void vkCmdEncodeVideoKHR(
    VkCommandBuffer                             commandBuffer,
    const VkVideoEncodeInfoKHR*                 pEncodeInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pEncodeInfo` is a pointer to a VkVideoEncodeInfoKHR structure specifying the parameters of the video encode operations.

Each call issues one or more video encode operations. The implicit parameter `opCount` corresponds to the number of video encode operations issued by the command. After calling this command, the active query index of each active query is incremented by `opCount`.

Currently each call to this command results in the issue of a single video encode operation.

If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR` and the `pNext` chain of `pEncodeInfo` includes a VkVideoInlineQueryInfoKHR structure with its `queryPool` member specifying a valid `VkQueryPool` handle, then this command will execute a query for each video encode operation issued by it.

Active Reference Picture Information

The list of active reference pictures used by a video encode operation is a list of image subregions used as the source of reference picture data and related parameters, and is derived from the VkVideoReferenceSlotInfoKHR structures provided as the elements of the `pEncodeInfo->pReferenceSlots` array. For each element of `pEncodeInfo->pReferenceSlots`, one or more elements are added to the active reference picture list, as defined by the codec-specific semantics. Each element of this list contains the following information:

- The image subregion within the image subresource referred to by the video picture resource used as the reference picture.
- The DPB slot index the reference picture is associated with.
- The codec-specific reference information related to the reference picture.

Reconstructed Picture Information

Information related to the optional reconstructed picture used by a video encode operation is derived from the VkVideoReferenceSlotInfoKHR structure pointed to by `pEncodeInfo->pSetupReferenceSlot`, if not `NULL`, as defined by the codec-specific semantics, and consists of the following:

- The image subregion within the image subresource referred to by the video picture resource used as the reconstructed picture.
- The DPB slot index to use for picture reconstruction.
- The codec-specific reference information related to the reconstructed picture.

Specifying a valid VkVideoReferenceSlotInfoKHR structure in `pEncodeInfo->pSetupReferenceSlot` is always required, unless the video session was created with VkVideoSessionCreateInfoKHR::`maxDpbSlot` equal to zero. However, the DPB slot identified by `pEncodeInfo->pSetupReferenceSlot->slotIndex` is only activated with the reconstructed picture specified in `pEncodeInfo->pSetupReferenceSlot->pPictureResource` if reference picture setup is requested according to the codec-specific semantics.

If reconstructed picture information is specified, but reference picture setup is not requested, according to the codec-specific semantics, the contents of the video picture resource corresponding to the reconstructed picture will be undefined after the video encode operation.

NOTE	Some implementations may always output the reconstructed picture or use it as temporary storage during the video encode operation even when the reconstructed picture is not marked for future reference.

Encode Input Picture Information

Information related to the encode input picture used by a video encode operation is derived from `pEncodeInfo->srcPictureResource` and any codec-specific parameters provided in the `pEncodeInfo->pNext` chain, as defined by the codec-specific semantics, and consists of the following:

- The image subregion within the image subresource referred to by the video picture resource used as the encode input picture.
- The codec-specific picture information related to the encoded picture.

Several limiting values are defined below that are referenced by the relevant valid usage statements of this command.

- Let `uint32_t activeReferencePictureCount` be the size of the list of active reference pictures used by the video encode operation. Unless otherwise defined, `activeReferencePictureCount` is set to the value of `pEncodeInfo->referenceSlotCount`.
- Let `VkOffset2D codedOffsetGranularity` be the minimum alignment requirement for the coded offset of video picture resources. Unless otherwise defined, the value of the `x` and `y` members of `codedOffsetGranularity` are `0`.
- Let `uint32_t dpbFrameUseCount[]` be an array of size `maxDpbSlots`, where `maxDpbSlots` is the VkVideoSessionCreateInfoKHR::`maxDpbSlots` the bound video session was created with, with each element indicating the number of times a frame associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of the array be `0`.
  - If `pEncodeInfo->pSetupReferenceSlot` is not `NULL`, then `dpbFrameUseCount[i]` is incremented by one, where `i` equals `pEncodeInfo->pSetupReferenceSlot->slotIndex`.

    - For each element of `pEncodeInfo->pReferenceSlots`, `dpbFrameUseCount[i]` is incremented by one, where `i` equals the `slotIndex` member of the corresponding element.
- If there is a bound video session parameters object created with `VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR`, then let `VkExtent2D quantizationMapTexelSize` be the quantization map texel size the bound video session parameters object was created with.
- Let `VkExtent2D maxCodingBlockSize` be the maximum codec-specific coding block size that **may** be used by the video encode operation.
    - If the bound video session object was created with an H.264 encode profile, then let `maxCodingBlockSize` be equal to the size of an H.264 macroblock, i.e. `{16,16}`.
    - If the bound video session object was created with an H.265 encode profile, then let `maxCodingBlockSize` be equal to the maximum H.265 coding block size that **may** be used by the video encode operation derived as the maximum of the CTB sizes corresponding to the VkVideoEncodeH265CtbSizeFlagBitsKHR bits set in VkVideoEncodeH265CapabilitiesKHR::`ctbSizes`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with.
    - If the bound video session object was created with an AV1 encode profile, then let `maxCodingBlockSize` be equal to the maximum AV1 superblock size that **may** be used by the video encode operation derived as the maximum of the superblock sizes corresponding to the VkVideoEncodeAV1SuperblockSizeFlagBitsKHR bits set in VkVideoEncodeAV1CapabilitiesKHR::`superblockSizes`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with.
    - Otherwise, `maxCodingBlockSize` is undefined.
- If `maxCodingBlockSize` is defined, then let `VkExtent2D minCodingBlockExtent` be the coded extent of the encode input picture expressed in terms of codec-specific coding blocks, assuming the maximum size of such coding blocks, as defined by `maxCodingBlockSize`, calculated from the value of the `codedExtent` member of `pEncodeInfo->srcPictureResource` as follows:
    - `minCodingBlockExtent.width` = (`codedExtent.width` `maxCodingBlockSize.width` - 1) / `maxCodingBlockSize.width`
    - `minCodingBlockExtent.height` = (`codedExtent.height` `maxCodingBlockSize.height` - 1) / `maxCodingBlockSize.height`
- If the bound video session object was created with an H.264 encode profile, then:
    - Let `StdVideoH264PictureType h264PictureType` be the picture type of the encoded picture set to the value of `pStdPictureInfo->primary_pic_type` specified in the VkVideoEncodeH264PictureInfoKHR structure included in the `pEncodeInfo->pNext` chain.
    - Let `StdVideoH264PictureType h264L0PictureTypes[]` and `StdVideoH264PictureType h264L1PictureTypes[]` be the picture types of the reference pictures in the L0 and L1 reference lists, respectively. If `pStdPictureInfo->pRefLists` specified in the VkVideoEncodeH264PictureInfoKHR structure included in the `pEncodeInfo->pNext` chain is not `NULL`, then for each reference index specified in the elements of the `pStdPictureInfo->pRefLists->RefPicList0` and `pStdPictureInfo->pRefLists->RefPicList1` arrays, if the reference index is not `STD_VIDEO_H264_NO_REFERENCE_PICTURE`, `pStdReferenceInfo-`

>primary_pic_type is added to h264L0PictureTypes or h264L1PictureTypes, respectively, where pStdReferenceInfo is the member of the VkVideoEncodeH264DpbSlotInfoKHR structure included in the pNext chain of the element of pEncodeInfo->pReferenceSlots for which slotIndex equals the reference index in question.

- If the bound video session object was created with an H.265 encode profile, then:
  - Let StdVideoH265PictureType h265PictureType be the picture type of the encoded picture set to the value of pStdPictureInfo->pic_type specified in the VkVideoEncodeH265PictureInfoKHR structure included in the pEncodeInfo->pNext chain.
  - Let StdVideoH265PictureType h265L0PictureTypes[] and StdVideoH265PictureType h265L1PictureTypes[] be the picture types of the reference pictures in the L0 and L1 reference lists, respectively. If pStdPictureInfo->pRefLists specified in the VkVideoEncodeH265PictureInfoKHR structure included in the pEncodeInfo->pNext chain is not NULL, then for each reference index specified in the elements of the pStdPictureInfo->pRefLists->RefPicList0 and pStdPictureInfo->pRefLists->RefPicList1 arrays, if the reference index is not STD_VIDEO_H265_NO_REFERENCE_PICTURE, pStdReferenceInfo->pic_type is added to h265L0PictureTypes or h265L1PictureTypes, respectively, where pStdReferenceInfo is the member of the VkVideoEncodeH265DpbSlotInfoKHR structure included in the pNext chain of the element of pEncodeInfo->pReferenceSlots for which slotIndex equals the reference index in question.
- If the bound video session object was created with an AV1 encode profile, then:
  - If the primaryReferenceCdfOnly member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pEncodeInfo->pNext chain is set to VK_TRUE, then let int32_t cdfOnlyReferenceIndex be the value of VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo->primary_ref_frame.
  - Otherwise let int32_t cdfOnlyReferenceIndex be -1.

Valid Usage

- VUID-vkCmdEncodeVideoKHR-None-08250
  The bound video session **must** have been created with an encode operation
- VUID-vkCmdEncodeVideoKHR-None-07012
  The bound video session **must** not be in uninitialized state at the time the command is executed on the device
- VUID-vkCmdEncodeVideoKHR-None-08318
  The bound video session parameters object **must** have been created with the currently set video encode quality level for the bound video session at the time the command is executed on the device
- VUID-vkCmdEncodeVideoKHR-opCount-07174
  For each active query, the active query index corresponding to the query type of that query plus opCount **must** be less than or equal to the last activatable query index corresponding to the query type of that query plus one
- VUID-vkCmdEncodeVideoKHR-pNext-08360
  If the bound video session was created with

VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, and the pNext chain of pEncodeInfo includes a VkVideoInlineQueryInfoKHR structure with its queryPool member specifying a valid VkQueryPool handle, then VkVideoInlineQueryInfoKHR::queryCount **must** equal opCount

- VUID-vkCmdEncodeVideoKHR-pNext-08361
  If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, and the pNext chain of pEncodeInfo includes a VkVideoInlineQueryInfoKHR structure with its queryPool member specifying a valid VkQueryPool handle, then all the queries used by the command, as specified by the VkVideoInlineQueryInfoKHR structure, **must** be *unavailable*
- VUID-vkCmdEncodeVideoKHR-queryType-08362
  If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, then the queryType used to create the queryPool specified in the VkVideoInlineQueryInfoKHR structure included in the pNext chain of pEncodeInfo **must** be VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR or VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR
- VUID-vkCmdEncodeVideoKHR-queryPool-08363
  If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, then the queryPool specified in the VkVideoInlineQueryInfoKHR structure included in the pNext chain of pEncodeInfo **must** have been created with a VkVideoProfileInfoKHR structure included in the pNext chain of VkQueryPoolCreateInfo identical to the one specified in VkVideoSessionCreateInfoKHR ::pVideoProfile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-queryType-08364
  If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, and the queryType used to create the queryPool specified in the VkVideoInlineQueryInfoKHR structure included in the pNext chain of pEncodeInfo is VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, then the VkCommandPool that commandBuffer was allocated from **must** have been created with a queue family index that supports result status queries, as indicated by VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08201
  pEncodeInfo->dstBuffer **must** be compatible with the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-commandBuffer-08202
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, then pEncodeInfo->dstBuffer **must** not be a protected buffer
- VUID-vkCmdEncodeVideoKHR-commandBuffer-08203
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, then pEncodeInfo->dstBuffer **must** be a protected buffer
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08204
  pEncodeInfo->dstBufferOffset **must** be an integer multiple of VkVideoCapabilitiesKHR ::minBitstreamBufferOffsetAlignment, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with

- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08205
  pEncodeInfo->dstBufferRange **must** be an integer multiple of VkVideoCapabilitiesKHR::minBitstreamBufferSizeAlignment, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08206
  pEncodeInfo->srcPictureResource.imageViewBinding **must** be compatible with the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08207
  The format of pEncodeInfo->srcPictureResource.imageViewBinding **must** match the VkVideoSessionCreateInfoKHR::pictureFormat the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08208
  pEncodeInfo->srcPictureResource.codedOffset **must** be an integer multiple of codedOffsetGranularity
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08209
  pEncodeInfo->srcPictureResource.codedExtent **must** be between minCodedExtent and maxCodedExtent, inclusive, the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08210
  pEncodeInfo->srcPictureResource.imageViewBinding **must** have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- VUID-vkCmdEncodeVideoKHR-commandBuffer-08211
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, then pEncodeInfo->srcPictureResource.imageViewBinding **must** not have been created from a protected image
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08377
  pEncodeInfo->pSetupReferenceSlot **must** not be NULL unless the bound video session was created with VkVideoSessionCreateInfoKHR::maxDpbSlots equal to zero
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08213
  If pEncodeInfo->pSetupReferenceSlot is not NULL, then pEncodeInfo->pSetupReferenceSlot->slotIndex **must** be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08214
  If pEncodeInfo->pSetupReferenceSlot is not NULL, then pEncodeInfo->pSetupReferenceSlot->pPictureResource->codedOffset **must** be an integer multiple of codedOffsetGranularity
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08215
  If pEncodeInfo->pSetupReferenceSlot is not NULL, then pEncodeInfo->pSetupReferenceSlot->pPictureResource **must** match one of the bound reference picture resource
- VUID-vkCmdEncodeVideoKHR-activeReferencePictureCount-08216
  activeReferencePictureCount **must** be less than or equal to the VkVideoSessionCreateInfoKHR::maxActiveReferencePictures specified when the bound video session was created
- VUID-vkCmdEncodeVideoKHR-slotIndex-08217
  The slotIndex member of each element of pEncodeInfo->pReferenceSlots **must** be less than

the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created

- VUID-vkCmdEncodeVideoKHR-codedOffset-08218
  The codedOffset member of the VkVideoPictureResourceInfoKHR structure pointed to by the pPictureResource member of each element of pEncodeInfo->pReferenceSlots **must** be an integer multiple of codedOffsetGranularity
- VUID-vkCmdEncodeVideoKHR-pPictureResource-08219
  The pPictureResource member of each element of pEncodeInfo->pReferenceSlots **must** match one of the bound reference picture resource associated with the DPB slot index specified in the slotIndex member of that element
- VUID-vkCmdEncodeVideoKHR-pPictureResource-08220
  Each video picture resource corresponding to the pPictureResource member specified in the elements of pEncodeInfo->pReferenceSlots **must** be unique within pEncodeInfo->pReferenceSlots
- VUID-vkCmdEncodeVideoKHR-dpbFrameUseCount-08221
  All elements of dpbFrameUseCount **must** be less than or equal to 1
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08222
  The image subresource referred to by pEncodeInfo->srcPictureResource **must** be in the VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR layout at the time the video encode operation is executed on the device
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08223
  If pEncodeInfo->pSetupReferenceSlot is not NULL, then the image subresource referred to by pEncodeInfo->pSetupReferenceSlot->pPictureResource **must** be in the VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR layout at the time the video encode operation is executed on the device
- VUID-vkCmdEncodeVideoKHR-pPictureResource-08224
  The image subresource referred to by the pPictureResource member of each element of pEncodeInfo->pReferenceSlots **must** be in the VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR layout at the time the video encode operation is executed on the device
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10306
  If pEncodeInfo->flags includes VK_VIDEO_ENCODE_WITH_QUANTIZATION_DELTA_MAP_BIT_KHR, then the bound video session **must** have been created with VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10307
  If pEncodeInfo->flags includes VK_VIDEO_ENCODE_WITH_EMPHASIS_MAP_BIT_KHR, then the bound video session **must** have been created with VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10308
  If the current rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then pEncodeInfo->flags **must** not include VK_VIDEO_ENCODE_WITH_EMPHASIS_MAP_BIT_KHR
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10309
  If pEncodeInfo->flags includes VK_VIDEO_ENCODE_WITH_QUANTIZATION_DELTA_MAP_BIT_KHR or

VK_VIDEO_ENCODE_WITH_EMPHASIS_MAP_BIT_KHR, then the pNext chain of pEncodeInfo **must** include a VkVideoEncodeQuantizationMapInfoKHR structure with its quantizationMap member specifying a valid VkImageView handle

- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10310
  If pEncodeInfo->flags includes VK_VIDEO_ENCODE_WITH_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_VIDEO_ENCODE_WITH_EMPHASIS_MAP_BIT_KHR, then the VkImageView specified by the quantizationMap member of the VkVideoEncodeQuantizationMapInfoKHR structure included in the pNext chain **must** be compatible with the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10311
  If pEncodeInfo->flags includes VK_VIDEO_ENCODE_WITH_QUANTIZATION_DELTA_MAP_BIT_KHR, then the VkImageView specified by the quantizationMap member of the VkVideoEncodeQuantizationMapInfoKHR structure included in the pNext chain of pEncodeInfo **must** have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10312
  If pEncodeInfo->flags includes VK_VIDEO_ENCODE_WITH_EMPHASIS_MAP_BIT_KHR, then the VkImageView specified by the quantizationMap member of the VkVideoEncodeQuantizationMapInfoKHR structure included in the pNext chain of pEncodeInfo **must** have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR
- VUID-vkCmdEncodeVideoKHR-pNext-10313
  If an instance of the VkVideoEncodeQuantizationMapInfoKHR structure is included in the pNext chain of pEncodeInfo, its quantizationMap member is not VK_NULL_HANDLE, commandBuffer is an unprotected command buffer, and protectedNoFault is not supported, then VkVideoEncodeQuantizationMapInfoKHR::quantizationMap **must** not have been created from a protected image
- VUID-vkCmdEncodeVideoKHR-pNext-10314
  If an instance of the VkVideoEncodeQuantizationMapInfoKHR structure is included in the pNext chain of pEncodeInfo and its quantizationMap member is not VK_NULL_HANDLE, then the image subresource range referenced by quantizationMap **must** be in the VK_IMAGE_LAYOUT_VIDEO_ENCODE_QUANTIZATION_MAP_KHR layout at the time the video encode operation is executed on the device
- VUID-vkCmdEncodeVideoKHR-pNext-10315
  If an instance of the VkVideoEncodeQuantizationMapInfoKHR structure is included in the pNext chain of pEncodeInfo and its quantizationMap member is not VK_NULL_HANDLE, and there is a bound video session parameters object, then the bound video session parameters object **must** have been created with VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR
- VUID-vkCmdEncodeVideoKHR-pNext-10316
  If an instance of the VkVideoEncodeQuantizationMapInfoKHR structure is included in the pNext chain of pEncodeInfo, its quantizationMap member is not VK_NULL_HANDLE, and there is a bound video session parameters object created with VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, then quantizationMapExtent **must** equal ⌈pEncodeInfo->srcPictureResource.codedExtent /

quantizationMapTexelSize

- VUID-vkCmdEncodeVideoKHR-pNext-08225
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the pNext chain of pEncodeInfo **must** include a VkVideoEncodeH264PictureInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-StdVideoH264SequenceParameterSet-08226
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the bound video session parameters object **must** contain a StdVideoH264SequenceParameterSet entry with seq_parameter_set_id matching StdVideoEncodeH264PictureInfo::seq_parameter_set_id that is provided in the pStdPictureInfo member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-StdVideoH264PictureParameterSet-08227
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the bound video session parameters object **must** contain a StdVideoH264PictureParameterSet entry with seq_parameter_set_id and pic_parameter_set_id matching StdVideoEncodeH264PictureInfo::seq_parameter_set_id and StdVideoEncodeH264PictureInfo::pic_parameter_set_id, respectively, that are provided in the pStdPictureInfo member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08228
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and pEncodeInfo->pSetupReferenceSlot is not NULL, then the pNext chain of pEncodeInfo->pSetupReferenceSlot **must** include a VkVideoEncodeH264DpbSlotInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-pNext-08229
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the pNext chain of each element of pEncodeInfo->pReferenceSlots **must** include a VkVideoEncodeH264DpbSlotInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-constantQp-08269
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and the current rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then VkVideoEncodeH264NaluSliceInfoKHR::constantQp **must** be zero for each element of the pNaluSliceEntries member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-constantQp-08270
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and the current rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then VkVideoEncodeH264NaluSliceInfoKHR::constantQp **must** be between VkVideoEncodeH264CapabilitiesKHR::minQp and VkVideoEncodeH264CapabilitiesKHR::maxQp, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, for each element of the pNaluSliceEntries member

of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo

- VUID-vkCmdEncodeVideoKHR-constantQp-08271
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and VkVideoEncodeH264CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then VkVideoEncodeH264NaluSliceInfoKHR::constantQp **must** have the same value for each element of the pNaluSliceEntries member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-naluSliceEntryCount-08302
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the naluSliceEntryCount member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** be less than or equal to minCodingBlockExtent.width multiplied by minCodingBlockExtent.height
- VUID-vkCmdEncodeVideoKHR-naluSliceEntryCount-08312
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and VkVideoEncodeH264CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then the naluSliceEntryCount member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** be less than or equal to minCodingBlockExtent.height
- VUID-vkCmdEncodeVideoKHR-pNext-08352
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, the pNext chain of pEncodeInfo includes a VkVideoEncodeH264PictureInfoKHR structure, and pEncodeInfo->referenceSlotCount is greater than zero, then VkVideoEncodeH264PictureInfoKHR::pStdPictureInfo->pRefLists **must** not be NULL
- VUID-vkCmdEncodeVideoKHR-pNext-08339
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, the pNext chain of pEncodeInfo includes a VkVideoEncodeH264PictureInfoKHR structure, and VkVideoEncodeH264PictureInfoKHR::pStdPictureInfo->pRefLists is not NULL, then each element of the RefPicList0 and RefPicList1 array members of the StdVideoEncodeH264ReferenceListsInfo structure pointed to by VkVideoEncodeH264PictureInfoKHR::pStdPictureInfo->pRefLists **must** either be STD_VIDEO_H264_NO_REFERENCE_PICTURE or **must** equal the slotIndex member of one of the elements of pEncodeInfo->pReferenceSlots
- VUID-vkCmdEncodeVideoKHR-pNext-08353
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, the pNext chain of pEncodeInfo includes a VkVideoEncodeH264PictureInfoKHR structure, and pEncodeInfo->referenceSlotCount is greater than zero, then the slotIndex member of each element of pEncodeInfo->pReferenceSlots **must** equal one of the elements of the RefPicList0 or RefPicList1 array

members of the StdVideoEncodeH264ReferenceListsInfo structure pointed to by VkVideoEncodeH264PictureInfoKHR::pStdPictureInfo->pRefLists

- VUID-vkCmdEncodeVideoKHR-maxPPictureL0ReferenceCount-08340
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and VkVideoEncodeH264CapabilitiesKHR::maxPPictureL0ReferenceCount is zero, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then h264PictureType and each element of h264L0PictureTypes and h264L1PictureTypes **must** not be STD_VIDEO_H264_PICTURE_TYPE_P
- VUID-vkCmdEncodeVideoKHR-maxBPictureL0ReferenceCount-08341
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and VkVideoEncodeH264CapabilitiesKHR::maxBPictureL0ReferenceCount and VkVideoEncodeH264CapabilitiesKHR::maxL1ReferenceCount are both zero, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then h264PictureType and each element of h264L0PictureTypes and h264L1PictureTypes **must** not be STD_VIDEO_H264_PICTURE_TYPE_B
- VUID-vkCmdEncodeVideoKHR-flags-08342
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and VkVideoEncodeH264CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then each element of h264L0PictureTypes **must** not be STD_VIDEO_H264_PICTURE_TYPE_B
- VUID-vkCmdEncodeVideoKHR-flags-08343
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and VkVideoEncodeH264CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then each element of h264L1PictureTypes **must** not be STD_VIDEO_H264_PICTURE_TYPE_B
- VUID-vkCmdEncodeVideoKHR-pNext-08230
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain of pEncodeInfo **must** include a VkVideoEncodeH265PictureInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-StdVideoH265VideoParameterSet-08231
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the bound video session parameters object **must** contain a StdVideoH265VideoParameterSet entry with vps_video_parameter_set_id matching StdVideoEncodeH265PictureInfo::sps_video_parameter_set_id that is provided in the pStdPictureInfo member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-StdVideoH265SequenceParameterSet-08232
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the bound video session parameters

object **must** contain a StdVideoH265SequenceParameterSet entry with sps_video_parameter_set_id and sps_seq_parameter_set_id matching StdVideoEncodeH265PictureInfo::sps_video_parameter_set_id and StdVideoEncodeH265PictureInfo::pps_seq_parameter_set_id, respectively, that are provided in the pStdPictureInfo member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo

- VUID-vkCmdEncodeVideoKHR-StdVideoH265PictureParameterSet-08233
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the bound video session parameters object **must** contain a StdVideoH265PictureParameterSet entry with sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id matching StdVideoEncodeH265PictureInfo::sps_video_parameter_set_id, StdVideoEncodeH265PictureInfo::pps_seq_parameter_set_id, and StdVideoEncodeH265PictureInfo::pps_pic_parameter_set_id, respectively, that are provided in the pStdPictureInfo member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08234
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and pEncodeInfo->pSetupReferenceSlot is not NULL, then the pNext chain of pEncodeInfo->pSetupReferenceSlot **must** include a VkVideoEncodeH265DpbSlotInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-pNext-08235
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain of each element of pEncodeInfo->pReferenceSlots **must** include a VkVideoEncodeH265DpbSlotInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-constantQp-08272
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the current rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then VkVideoEncodeH265NaluSliceSegmentInfoKHR::constantQp **must** be zero for each element of the pNaluSliceSegmentEntries member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-constantQp-08273
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the current rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then VkVideoEncodeH265NaluSliceSegmentInfoKHR::constantQp **must** be between VkVideoEncodeH265CapabilitiesKHR::minQp and VkVideoEncodeH265CapabilitiesKHR::maxQp, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, for each element of the pNaluSliceSegmentEntries member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-constantQp-08274
  If the bound video session was created with the video codec operation

VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and VkVideoEncodeH265CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then VkVideoEncodeH265NaluSliceSegmentInfoKHR::constantQp **must** have the same value for each element of the pNaluSliceSegmentEntries member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo

- VUID-vkCmdEncodeVideoKHR-naluSliceSegmentEntryCount-08307
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the naluSliceSegmentEntryCount member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** be less than or equal to minCodingBlockExtent.width multiplied by minCodingBlockExtent.height
- VUID-vkCmdEncodeVideoKHR-naluSliceSegmentEntryCount-08313
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and VkVideoEncodeH265CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then the naluSliceSegmentEntryCount member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** be less than or equal to minCodingBlockExtent.height
- VUID-vkCmdEncodeVideoKHR-pNext-08354
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the pNext chain of pEncodeInfo includes a VkVideoEncodeH265PictureInfoKHR structure, and pEncodeInfo->referenceSlotCount is greater than zero, then VkVideoEncodeH265PictureInfoKHR::pStdPictureInfo->pRefLists **must** not be NULL
- VUID-vkCmdEncodeVideoKHR-pNext-08344
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the pNext chain of pEncodeInfo includes a VkVideoEncodeH265PictureInfoKHR structure, and VkVideoEncodeH265PictureInfoKHR::pStdPictureInfo->pRefLists is not NULL, then each element of the RefPicList0 and RefPicList1 array members of the StdVideoEncodeH265ReferenceListsInfo structure pointed to by VkVideoEncodeH265PictureInfoKHR::pStdPictureInfo->pRefLists **must** either be STD_VIDEO_H265_NO_REFERENCE_PICTURE or **must** equal the slotIndex member of one of the elements of pEncodeInfo->pReferenceSlots
- VUID-vkCmdEncodeVideoKHR-pNext-08355
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the pNext chain of pEncodeInfo includes a VkVideoEncodeH265PictureInfoKHR structure, and pEncodeInfo->referenceSlotCount is greater than zero, then the slotIndex member of each element of pEncodeInfo->pReferenceSlots **must** equal one of the elements of the RefPicList0 or RefPicList1 array members of the StdVideoEncodeH265ReferenceListsInfo structure pointed to by VkVideoEncodeH265PictureInfoKHR::pStdPictureInfo->pRefLists

- VUID-vkCmdEncodeVideoKHR-maxPPictureL0ReferenceCount-08345
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and VkVideoEncodeH265CapabilitiesKHR::maxPPictureL0ReferenceCount is zero, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then h265PictureType and each element of h265L0PictureTypes and h265L1PictureTypes **must** not be STD_VIDEO_H265_PICTURE_TYPE_P
- VUID-vkCmdEncodeVideoKHR-maxBPictureL0ReferenceCount-08346
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and VkVideoEncodeH265CapabilitiesKHR::maxBPictureL0ReferenceCount and VkVideoEncodeH265CapabilitiesKHR::maxL1ReferenceCount are both zero, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then h265PictureType and each element of h265L0PictureTypes and h265L1PictureTypes **must** not be STD_VIDEO_H265_PICTURE_TYPE_B
- VUID-vkCmdEncodeVideoKHR-flags-08347
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and VkVideoEncodeH265CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then each element of h265L0PictureTypes **must** not be STD_VIDEO_H264_PICTURE_TYPE_B
- VUID-vkCmdEncodeVideoKHR-flags-08348
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and VkVideoEncodeH265CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then each element of h265L1PictureTypes **must** not be STD_VIDEO_H265_PICTURE_TYPE_B
- VUID-vkCmdEncodeVideoKHR-pNext-10317
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the pNext chain of pEncodeInfo **must** include a VkVideoEncodeAV1PictureInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10318
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and pEncodeInfo->pSetupReferenceSlot is not NULL, then the pNext chain of pEncodeInfo->pSetupReferenceSlot **must** include a VkVideoEncodeAV1DpbSlotInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-pNext-10319
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the pNext chain of each element of pEncodeInfo->pReferenceSlots **must** include a VkVideoEncodeAV1DpbSlotInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-constantQIndex-10320
  If the bound video session was created with the video codec operation

VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the current rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then the constantQIndex member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** be zero

- VUID-vkCmdEncodeVideoKHR-constantQIndex-10321
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the current rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then the constantQIndex member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** be between VkVideoEncodeAV1CapabilitiesKHR::minQIndex and VkVideoEncodeAV1CapabilitiesKHR::maxQIndex, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-flags-10322
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and VkVideoEncodeAV1CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_AV1_CAPABILITY_FRAME_SIZE_OVERRIDE_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo->flags.frame_size_override_flag **must** be zero for the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-flags-10323
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and VkVideoEncodeAV1CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_AV1_CAPABILITY_FRAME_SIZE_OVERRIDE_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then pEncodeInfo->srcPictureResource.codedExtent.width **must** equal StdVideoAV1SequenceHeader::max_frame_width_minus_1 + 1 of the active AV1 sequence header
- VUID-vkCmdEncodeVideoKHR-flags-10324
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and VkVideoEncodeAV1CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_AV1_CAPABILITY_FRAME_SIZE_OVERRIDE_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then pEncodeInfo->srcPictureResource.codedExtent.height **must** equal StdVideoAV1SequenceHeader::max_frame_height_minus_1 + 1 of the active AV1 sequence header
- VUID-vkCmdEncodeVideoKHR-flags-10325
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and VkVideoEncodeAV1CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_AV1_CAPABILITY_MOTION_VECTOR_SCALING_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then for each element i of pEncodeInfo->pReferenceSlots pEncodeInfo->pReferenceSlots[i].pPictureResource->codedExtent **must** match pEncodeInfo->srcPictureResource.codedExtent

- VUID-vkCmdEncodeVideoKHR-predictionMode-10326
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the predictionMode member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_INTRA_ONLY_KHR, then VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo->frame_type **must** be STD_VIDEO_AV1_FRAME_TYPE_KEY or STD_VIDEO_AV1_FRAME_TYPE_INTRA_ONLY
- VUID-vkCmdEncodeVideoKHR-pStdPictureInfo-10327
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and pStdPictureInfo->frame_type for the pStdPictureInfo member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is STD_VIDEO_AV1_FRAME_TYPE_KEY or STD_VIDEO_AV1_FRAME_TYPE_INTRA_ONLY, then VkVideoEncodeAV1PictureInfoKHR::predictionMode **must** be VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_INTRA_ONLY_KHR
- VUID-vkCmdEncodeVideoKHR-maxSingleReferenceCount-10328
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and VkVideoEncodeAV1CapabilitiesKHR::maxSingleReferenceCount is zero, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then the predictionMode member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** not be VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_SINGLE_REFERENCE_KHR
- VUID-vkCmdEncodeVideoKHR-predictionMode-10329
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the predictionMode member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_SINGLE_REFERENCE_KHR, then there **must** be at least one non-negative element of VkVideoEncodeAV1PictureInfoKHR::referenceNameSlotIndices with element index i that does not equal cdfOnlyReferenceIndex and for which bit index i is set in VkVideoEncodeAV1CapabilitiesKHR::singleReferenceNameMask, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-maxUnidirectionalCompoundReferenceCount-10330
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and VkVideoEncodeAV1CapabilitiesKHR::maxUnidirectionalCompoundReferenceCount is zero, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then the predictionMode member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** not be VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_UNIDIRECTIONAL_COMPOUND_KHR
- VUID-vkCmdEncodeVideoKHR-predictionMode-10331
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the predictionMode member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_UNIDIRECTIONAL_COMPOUND_KHR, then there **must** be at least two non-negative elements of VkVideoEncodeAV1PictureInfoKHR

::referenceNameSlotIndices with element indices i and j where (i,j) ∈ {(0,1),(0,2),(0,3),(4,6)}, such that neither element equals cdfOnlyReferenceIndex and for which bit indices i and j are set in VkVideoEncodeAV1CapabilitiesKHR::unidirectionalCompoundReferenceNameMask, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with

- VUID-vkCmdEncodeVideoKHR-maxBidirectionalCompoundReferenceCount-10332
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and VkVideoEncodeAV1CapabilitiesKHR::maxBidirectionalCompoundReferenceCount is zero, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then the predictionMode member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** not be VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_BIDIRECTIONAL_COMPOUND_KHR
- VUID-vkCmdEncodeVideoKHR-predictionMode-10333
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the predictionMode member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_BIDIRECTIONAL_COMPOUND_KHR, then there **must** be at least two non-negative elements of VkVideoEncodeAV1PictureInfoKHR::referenceNameSlotIndices with element indices i ∈ {0,1,2,3} and j ∈ {4,5,6}, respectively, such that neither element equals cdfOnlyReferenceIndex, and for which bit indices i and j are set in VkVideoEncodeAV1CapabilitiesKHR::bidirectionalCompoundReferenceNameMask, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-referenceNameSlotIndices-10334
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then each element of the referenceNameSlotIndices array member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** either be negative or **must** equal the slotIndex member of one of the elements of pEncodeInfo->pReferenceSlots
- VUID-vkCmdEncodeVideoKHR-slotIndex-10335
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the slotIndex member of each element of pEncodeInfo->pReferenceSlots **must** equal one of the elements of the referenceNameSlotIndices array member of the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-pExtensionHeader-10336
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pExtensionHeader member of VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo for the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is not NULL, then pExtensionHeader->temporal_id **must** be less than VkVideoEncodeAV1CapabilitiesKHR::maxTemporalLayerCount, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with

- VUID-vkCmdEncodeVideoKHR-pExtensionHeader-10337
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pExtensionHeader member of VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo for the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is not NULL, then pExtensionHeader->spatial_id **must** be less than VkVideoEncodeAV1CapabilitiesKHR::maxSpatialLayerCount, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10338
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and pEncodeInfo->pSetupReferenceSlot is not NULL, then the pExtensionHeader member of VkVideoEncodeAV1DpbSlotInfoKHR::pStdReferenceInfo for the VkVideoEncodeAV1DpbSlotInfoKHR structure included in the pNext chain of pEncodeInfo->pSetupReferenceSlot and the pExtensionHeader member of VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo for the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo **must** both be NULL or not NULL
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10339
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, pEncodeInfo->pSetupReferenceSlot is not NULL, and the pExtensionHeader member of VkVideoEncodeAV1DpbSlotInfoKHR::pStdReferenceInfo for the VkVideoEncodeAV1DpbSlotInfoKHR structure included in the pNext chain of pEncodeInfo->pSetupReferenceSlot is not NULL, then pExtensionHeader->temporal_id **must** equal pStdPictureInfo->pExtensionHeader->temporal_id in the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-10340
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, pEncodeInfo->pSetupReferenceSlot is not NULL, and the pExtensionHeader member of VkVideoEncodeAV1DpbSlotInfoKHR::pStdReferenceInfo for the VkVideoEncodeAV1DpbSlotInfoKHR structure included in the pNext chain of pEncodeInfo->pSetupReferenceSlot is not NULL, then pExtensionHeader->spatial_id **must** equal pStdPictureInfo->pExtensionHeader->spatial_id in the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo
- VUID-vkCmdEncodeVideoKHR-pExtensionHeader-10341
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pExtensionHeader member of VkVideoEncodeAV1DpbSlotInfoKHR::pStdReferenceInfo for any of the VkVideoEncodeAV1DpbSlotInfoKHR structures included in the pNext chain of any element of pEncodeInfo->pReferenceSlots is not NULL, then pExtensionHeader->temporal_id **must** be less than VkVideoEncodeAV1CapabilitiesKHR::maxTemporalLayerCount, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pExtensionHeader-10342
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pExtensionHeader member of

VkVideoEncodeAV1DpbSlotInfoKHR::pStdReferenceInfo for any of the VkVideoEncodeAV1DpbSlotInfoKHR structures included in the pNext chain of any element of pEncodeInfo->pReferenceSlots is not NULL, then pExtensionHeader->spatial_id **must** be less than VkVideoEncodeAV1CapabilitiesKHR::maxSpatialLayerCount, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with

- VUID-vkCmdEncodeVideoKHR-pTileInfo-10343
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pTileInfo member of VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo for the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is not NULL, then pTileInfo->TileCols **must** be greater than 0
- VUID-vkCmdEncodeVideoKHR-pTileInfo-10344
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pTileInfo member of VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo for the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is not NULL, then pTileInfo->TileRows **must** be greater than 0
- VUID-vkCmdEncodeVideoKHR-pTileInfo-10345
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pTileInfo member of VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo for the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is not NULL, then pTileInfo->TileCols **must** be less than or equal to VkVideoEncodeAV1CapabilitiesKHR::maxTiles.width, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pTileInfo-10346
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pTileInfo member of VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo for the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is not NULL, then pTileInfo->TileRows **must** be less than or equal to VkVideoEncodeAV1CapabilitiesKHR::maxTiles.height, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pTileInfo-10347
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and the pTileInfo member of VkVideoEncodeAV1PictureInfoKHR::pStdPictureInfo for the VkVideoEncodeAV1PictureInfoKHR structure included in the pNext chain of pEncodeInfo is not NULL, then ⌊pEncodeInfo->srcPictureResource.codedExtent.width / pTileInfo->TileCols⌋ **must** be between VkVideoEncodeAV1CapabilitiesKHR::minTileSize.width and VkVideoEncodeAV1CapabilitiesKHR::maxTileSize.width, inclusive, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with

- VUID-vkCmdEncodeVideoKHR-pTileInfo-10348
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR` and the `pTileInfo` member of VkVideoEncodeAV1PictureInfoKHR::`pStdPictureInfo` for the VkVideoEncodeAV1PictureInfoKHR structure included in the `pNext` chain of `pEncodeInfo` is not `NULL`, then □`pEncodeInfo->srcPictureResource.codedExtent.height` / `pTileInfo->TileRows`□ **must** be between VkVideoEncodeAV1CapabilitiesKHR::`minTileSize.height` and VkVideoEncodeAV1CapabilitiesKHR::`maxTileSize.height`, inclusive, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with
- VUID-vkCmdEncodeVideoKHR-pStdPictureInfo-10349
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR`, then VkVideoEncodeAV1PictureInfoKHR::`pStdPictureInfo->flags.segmentation_enabled` for the VkVideoEncodeAV1PictureInfoKHR structure included in the `pNext` chain of `pEncodeInfo` **must** be zero
- VUID-vkCmdEncodeVideoKHR-pStdPictureInfo-10350
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR`, then VkVideoEncodeAV1PictureInfoKHR::`pStdPictureInfo->pSegmentation` for the VkVideoEncodeAV1PictureInfoKHR structure included in the `pNext` chain of `pEncodeInfo` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkCmdEncodeVideoKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-parameter
  `pEncodeInfo` **must** be a valid pointer to a valid VkVideoEncodeInfoKHR structure
- VUID-vkCmdEncodeVideoKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdEncodeVideoKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support encode operations
- VUID-vkCmdEncodeVideoKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdEncodeVideoKHR-videocoding
  This command **must** only be called inside of a video coding scope
- VUID-vkCmdEncodeVideoKHR-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally

synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Inside	Encode	Action

The VkVideoEncodeInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeInfoKHR {
    VkStructureType                       sType;
    const void*                           pNext;
    VkVideoEncodeFlagsKHR                 flags;
    VkBuffer                              dstBuffer;
    VkDeviceSize                          dstBufferOffset;
    VkDeviceSize                          dstBufferRange;
    VkVideoPictureResourceInfoKHR         srcPictureResource;
    const VkVideoReferenceSlotInfoKHR*    pSetupReferenceSlot;
    uint32_t                              referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR*    pReferenceSlots;
    uint32_t                              precedingExternallyEncodedBytes;
} VkVideoEncodeInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is a pointer to a structure extending this structure.
- flags is a bitmask of VkVideoEncodeFlagBitsKHR indicating video encode command flags.
- dstBuffer is the destination video bitstream buffer to write the encoded bitstream to.
- dstBufferOffset is the starting offset in bytes from the start of dstBuffer to write the encoded bitstream to.
- dstBufferRange is the maximum bitstream size in bytes that **can** be written to dstBuffer, starting from dstBufferOffset.
- srcPictureResource is the video picture resource to use as the encode input picture.
- pSetupReferenceSlot is NULL or a pointer to a VkVideoReferenceSlotInfoKHR structure specifying the reconstructed picture information.
- referenceSlotCount is the number of elements in the pReferenceSlots array.
- pReferenceSlots is NULL or a pointer to an array of VkVideoReferenceSlotInfoKHR structures describing the DPB slots and corresponding reference picture resources to use in this video encode operation (the set of active reference pictures).
- precedingExternallyEncodedBytes is the number of bytes externally encoded by the application to

the video bitstream and is used to update the internal state of the implementation's rate control algorithm to account for the bitrate budget consumed by these externally encoded bytes.

Valid Usage

- VUID-VkVideoEncodeInfoKHR-dstBuffer-08236
  `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR` set
- VUID-VkVideoEncodeInfoKHR-dstBufferOffset-08237
  `dstBufferOffset` **must** be less than the size of `dstBuffer`
- VUID-VkVideoEncodeInfoKHR-dstBufferRange-08238
  `dstBufferRange` **must** be less than or equal to the size of `dstBuffer` minus `dstBufferOffset`
- VUID-VkVideoEncodeInfoKHR-pSetupReferenceSlot-08239
  If `pSetupReferenceSlot` is not `NULL`, then its `slotIndex` member **must** not be negative
- VUID-VkVideoEncodeInfoKHR-pSetupReferenceSlot-08240
  If `pSetupReferenceSlot` is not `NULL`, then its `pPictureResource` **must** not be `NULL`
- VUID-VkVideoEncodeInfoKHR-slotIndex-08241
  The `slotIndex` member of each element of `pReferenceSlots` **must** not be negative
- VUID-VkVideoEncodeInfoKHR-pPictureResource-08242
  The `pPictureResource` member of each element of `pReferenceSlots` **must** not be `NULL`

Valid Usage (Implicit)

- VUID-VkVideoEncodeInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_INFO_KHR`
- VUID-VkVideoEncodeInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkVideoEncodeAV1PictureInfoKHR, VkVideoEncodeH264PictureInfoKHR, VkVideoEncodeH265PictureInfoKHR, VkVideoEncodeQuantizationMapInfoKHR, or VkVideoInlineQueryInfoKHR
- VUID-VkVideoEncodeInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkVideoEncodeInfoKHR-flags-parameter
  `flags` **must** be a valid combination of VkVideoEncodeFlagBitsKHR values
- VUID-VkVideoEncodeInfoKHR-dstBuffer-parameter
  `dstBuffer` **must** be a valid VkBuffer handle
- VUID-VkVideoEncodeInfoKHR-srcPictureResource-parameter
  `srcPictureResource` **must** be a valid VkVideoPictureResourceInfoKHR structure
- VUID-VkVideoEncodeInfoKHR-pSetupReferenceSlot-parameter
  If `pSetupReferenceSlot` is not `NULL`, `pSetupReferenceSlot` **must** be a valid pointer to a valid VkVideoReferenceSlotInfoKHR structure
- VUID-VkVideoEncodeInfoKHR-pReferenceSlots-parameter

If `referenceSlotCount` is not `0`, `pReferenceSlots` **must** be a valid pointer to an array of `referenceSlotCount` valid VkVideoReferenceSlotInfoKHR structures

Bits which **can** be set in VkVideoEncodeInfoKHR::`flags`, specifying video encode flags, are:

```
// Provided by VK_KHR_video_encode_quantization_map
typedef enum VkVideoEncodeFlagBitsKHR {
  // Provided by VK_KHR_video_encode_quantization_map
    VK_VIDEO_ENCODE_WITH_QUANTIZATION_DELTA_MAP_BIT_KHR = 0x00000001,
  // Provided by VK_KHR_video_encode_quantization_map
    VK_VIDEO_ENCODE_WITH_EMPHASIS_MAP_BIT_KHR = 0x00000002,
} VkVideoEncodeFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_WITH_QUANTIZATION_DELTA_MAP_BIT_KHR` specifies the use of a quantization delta map in the issued video encode operations.
- `VK_VIDEO_ENCODE_WITH_EMPHASIS_MAP_BIT_KHR` specifies the use of an emphasis map in the issued video encode operations.

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeFlagsKHR;
```

VkVideoEncodeFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeFlagBitsKHR.

38.16. Video Encode Rate Control

The size of the encoded bitstream data produced by video encode operations is a function of the following set of constraints:

- The capabilities of the compression algorithms defined and employed by the used video compression standard;
- Restrictions imposed by the selected video profile according to the rules defined by the used video compression standard;
- Further restrictions imposed by the capabilities supported by the implementation for the selected video profile;
- The image data in the encode input picture and the set of active reference pictures (as these affect the effectiveness of the compression algorithms employed by the video encode operations);
- The set of codec-specific and codec-independent encoding parameters provided by the application.

These also inherently define the set of decoder capabilities required for reconstructing and processing the picture data in the encoded bitstream.

Video coding uses *bitrate* as the quantitative metric associated with encoded bitstream data size which expresses the rate at which video bitstream data **can** be transferred or processed, measured in number of bits per second. This bitrate is both a function of the encoded bitstream data size of the encoded pictures as well as the *frame rate* used by the video sequence.

Rate control algorithms are used by video encode operations to enable adjusting encoding parameters to achieve a target bitrate, or otherwise directly or indirectly control the bitrate of the generated video bitstream data. These algorithms are usually not defined by the used video compression standard, although some video compression standards do provide non-normative guidelines for implementations.

Accordingly, this specification does not mandate implementations to produce identical encoded bitstream data outputs in response to video encode operations, however, it does define a set of codec-independent and codec-specific parameters that enable the application to control the behavior of the rate control algorithms supported by the implementation. Some of these parameters guarantee certain implementation behavior while others provide guidance for implementations to apply various rate control heuristics.

NOTE

Applications need to make sure that they configure rate control parameters appropriately and that they follow the promises made to the implementation through parameters providing guidance for the implementation's rate control algorithms and heuristics in order to be able to get the desired rate control behavior and to be able to hit the set bitrate targets. In addition, the behavior of rate control may also differ across implementations even if the capabilities of the used video profile match between those implementations. This may happen due to implementations applying different rate control algorithms or heuristics internally, and thus even the same set of guidance parameter values may have different effects on the rate control behavior across implementations.

38.16.1. Rate Control Modes

After a video session is reset to the initial state, the default behavior and parameters of video encode rate control are entirely implementation-dependent and the application **cannot** affect the bitrate or quality parameters of the encoded bitstream data produced by video encode operations unless the application changes the rate control configuration of the video session, as described in the Video Coding Control section.

For each supported video profile, the implementation **may** expose a set of *rate control modes* that are available for use by the application when encoding bitstreams targeting that video profile. These modes allow using different rate control algorithms that fall into one of the following two categories:

1. Per-operation rate control
2. Stream-level rate control

In case of *per-operation rate control*, the bitrate of the generated video bitstream data is indirectly controlled by quality, size, or other encoding parameters specified by the application for each individual video encode operation.

In case of *stream-level rate control*, the application **can** directly specify target bitrates besides other encoding parameters to control the behavior of the rate control algorithm used by the implementation across multiple video encode operations.

The rate control modes are defined with the following enums:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeRateControlModeFlagBitsKHR {
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR = 0x00000004,
} VkVideoEncodeRateControlModeFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR` specifies the use of implementation-specific rate control.
- `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR` specifies that rate control is disabled and the application will specify per-operation rate control parameters controlling the encoding quality. In this mode implementations will encode pictures independently of the output bitrate of prior video encode operations.
  - When using an H.264 encode profile, implementations will use the QP value specified in VkVideoEncodeH264NaluSliceInfoKHR::`constantQp` to control the quality of the encoded picture.
  - When using an H.265 encode profile, implementations will use the QP value specified in VkVideoEncodeH265NaluSliceSegmentInfoKHR::`constantQp` to control the quality of the encoded picture.
  - When using an AV1 encode profile, implementations will use the quantizer index value specified in VkVideoEncodeAV1PictureInfoKHR::`constantQIndex` to control the quality of the encoded picture.
- `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR` specifies the use of constant bitrate (CBR) rate control mode. In this mode the implementation will attempt to produce the encoded bitstream at a constant bitrate while conforming to the constraints of other rate control parameters.
- `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR` specifies the use of variable bitrate (VBR) rate control mode. In this mode the implementation will produce the encoded bitstream at a variable bitrate according to the constraints of other rate control parameters.

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeRateControlModeFlagsKHR;
```

`VkVideoEncodeRateControlModeFlagsKHR` is a bitmask type for setting a mask of zero or more VkVideoEncodeRateControlModeFlagBitsKHR.

38.16.2. Leaky Bucket Model

Video encoding implementations use the *leaky bucket model* for stream-level rate control. The leaky bucket is a concept referring to the interface between the video encoder and the consumer (for example, a network connection), where the video encoder produces encoded bitstream data corresponding to the encoded pictures and adds them in the leaky bucket while its content are drained by the consumer.

Analogously, a similar leaky bucket is considered to exist at the input interface of a video decoder, into which encoded bitstream data is continuously added and is subsequently consumed by the video decoder. It is desirable to avoid overflowing or underflowing this leaky bucked because:

- In case of an underflow, the video decoder will be unable to consume encoded bitstream data in order to decode pictures (and optionally display them).
- In case of an overflow, the leaky bucket will be unable to accommodate more encoded bitstream data and such data **may** need to be thrown away, leading to the loss of the corresponding encoded pictures.

These requirements **can** be satisfied by imposing various constraints on the encoder-side leaky bucket to avoid its overflow or underflow, depending on the used rate control algorithm and codec parameters. However, enumerating these constraints is outside the scope of this specification.

The term *virtual buffer* is often used as an alternative to refer to the leaky bucket.

This virtual buffer model is defined by the following parameters:

- The bitrate (`R`) at which the encoded bitstream is expected to be processed.
- The size (`B`) of the virtual buffer.
- The initial occupancy (`F`) of the virtual buffer.

In this model the virtual buffer is used to smooth out fluctuations in the bitrate of the encoded bitstream over time without experiencing buffer overflow or underflow, as long as the bitrate of the encoded stream does not diverge from the target bitrate for extended periods of time.

This buffering **may** inherently impose a processing delay, as the goal of the model is to enable decoders maintain a consistent processing rate of an encoded bitstream with varying data rate.

The initial or start-up delay (`D`) is computed as:

```
D = F / R
```

NOTE	Applications need to configure the virtual buffer with sufficient size to avoid or minimize buffer overflows and underflows while also keeping it small enough to meet their latency goals.

38.16.3. Rate Control Layers

Some video compression standards and video profiles allow associating encoded pictures with specific *video coding layers*. The name, identification, and semantics associated with such video coding layers are defined by the corresponding video compression standards.

Analogously, stream-level rate control **can** be configured to use one or more *rate control layers*:

- When a single rate control layer is configured, it is applied to all encoded pictures, regardless of the picture's video coding layer. In this case the distribution of the available bitrate budget across video coding layers is implementation-dependent.
- When multiple rate control layers are configured, each rate control layer is applied to the corresponding video coding layer, i.e. only across encoded pictures pertaining to the corresponding video coding layer.

Individual rate control layers are identified using *layer indices* between zero and `N-1`, where `N` is the number of active rate control layers.

Rate control layers are only applicable when using stream-level rate control modes.

38.16.4. Rate Control State

Rate control state is maintained by the implementation in the video session objects and its parameters are specified using an instance of the `VkVideoEncodeRateControlInfoKHR` structure. The complete rate control state of a video session is defined by the following set of parameters:

- The values of the members of the VkVideoEncodeRateControlInfoKHR structure used to configure the rate control state.
- The values of the members of any VkVideoEncodeRateControlLayerInfoKHR structures specified in VkVideoEncodeRateControlInfoKHR::`pLayers` used to configure the state of individual rate control layers.
- If the video session was created with an H.264 encode profile:
  - The values of the members of the VkVideoEncodeH264RateControlInfoKHR structure, if one is specified in the `pNext` chain of the VkVideoEncodeRateControlInfoKHR used to configure the rate control state.
  - The values of the members of any VkVideoEncodeH264RateControlLayerInfoKHR structures included in the `pNext` chain of a VkVideoEncodeRateControlLayerInfoKHR structure used to configure the state of a rate control layer.
- If the video session was created with an H.265 encode profile:
  - The values of the members of the VkVideoEncodeH265RateControlInfoKHR structure, if one is specified in the `pNext` chain of the VkVideoEncodeRateControlInfoKHR used to configure the rate control state.
  - The values of the members of any VkVideoEncodeH265RateControlLayerInfoKHR structures included in the `pNext` chain of a VkVideoEncodeRateControlLayerInfoKHR structure used to configure the state of a rate control layer.
- If the video session was created with an AV1 encode profile:

- The values of the members of the VkVideoEncodeAV1RateControlInfoKHR structure, if one is specified in the pNext chain of the VkVideoEncodeRateControlInfoKHR used to configure the rate control state.
- The values of the members of any VkVideoEncodeAV1RateControlLayerInfoKHR structures included in the pNext chain of a VkVideoEncodeRateControlLayerInfoKHR structure used to configure the state of a rate control layer.

Two rate control states match if all the parameters listed above match between them.

The VkVideoEncodeRateControlInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeRateControlInfoKHR {
    VkStructureType                                 sType;
    const void*                                     pNext;
    VkVideoEncodeRateControlFlagsKHR                flags;
    VkVideoEncodeRateControlModeFlagBitsKHR         rateControlMode;
    uint32_t                                        layerCount;
    const VkVideoEncodeRateControlLayerInfoKHR*     pLayers;
    uint32_t                                        virtualBufferSizeInMs;
    uint32_t                                        initialVirtualBufferSizeInMs;
} VkVideoEncodeRateControlInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- rateControlMode is a VkVideoEncodeRateControlModeFlagBitsKHR value specifying the rate control mode.
- layerCount specifies the number of rate control layers to use.
- pLayers is a pointer to an array of layerCount VkVideoEncodeRateControlLayerInfoKHR structures, each specifying the rate control configuration of the corresponding rate control layer.
- virtualBufferSizeInMs is the size in milliseconds of the virtual buffer used by the implementation's rate control algorithm for the leaky bucket model, with respect to the average bitrate of the stream calculated by summing the values of the averageBitrate members of the elements of the pLayers array.
- initialVirtualBufferSizeInMs is the initial occupancy in milliseconds of the virtual buffer used by the implementation's rate control algorithm for the leaky bucket model.

If layerCount is zero then the values of virtualBufferSizeInMs and initialVirtualBufferSizeInMs are ignored.

This structure **can** be specified in the following places:

- In the pNext chain of VkVideoBeginCodingInfoKHR to specify the current rate control state expected to be configured when beginning a video coding scope.

- In the pNext chain of VkVideoCodingControlInfoKHR to change the rate control configuration of the bound video session.

Including this structure in the pNext chain of VkVideoCodingControlInfoKHR and including VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR in VkVideoCodingControlInfoKHR::flags enables updating the rate control configuration of the bound video session. This replaces the entire rate control configuration of the bound video session and **may** reset the state of all enabled rate control layers to an initial state according to the codec-specific rate control semantics defined in the corresponding sections listed below.

When layerCount is greater than one, multiple rate control layers are configured, and each rate control layer is applied to the corresponding video coding layer identified by the index of the corresponding element of pLayer.

- If the video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then this index specifies the H.264 temporal layer ID of the video coding layer the rate control layer is applied to.
- If the video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then this index specifies the H.265 temporal ID of the video coding layer the rate control layer is applied to.
- If the video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then this index specifies the AV1 temporal ID of the temporal layer the rate control layer is applied to.

Additional structures providing codec-specific rate control parameters **can** be included in the pNext chain of VkVideoCodingControlInfoKHR depending on the video profile the bound video session was created. For further details see:

- Video Coding Control
- H.264 Encode Rate Control
- H.265 Encode Rate Control
- AV1 Encode Rate Control

The new rate control configuration takes effect when the corresponding vkCmdControlVideoCodingKHR is executed on the device, and only impacts video encode operations that follow in execution order.

Valid Usage

- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-08248
  If rateControlMode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then layerCount **must** be 0
- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-08275
  If rateControlMode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR, then layerCount **must** be greater than 0
- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-08244

If rateControlMode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR, then it **must** specify one of the bits included in VkVideoEncodeCapabilitiesKHR::rateControlModes, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile

- VUID-VkVideoEncodeRateControlInfoKHR-layerCount-08245
  layerCount member **must** be less than or equal to VkVideoEncodeCapabilitiesKHR ::maxRateControlLayers, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeRateControlInfoKHR-pLayers-08276
  For each element of pLayers, its averageBitrate member **must** be between 1 and VkVideoEncodeCapabilitiesKHR::maxBitrate, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeRateControlInfoKHR-pLayers-08277
  For each element of pLayers, its maxBitrate member **must** be between 1 and VkVideoEncodeCapabilitiesKHR::maxBitrate, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-08356
  If rateControlMode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR, then for each element of pLayers, its averageBitrate member **must** equal its maxBitrate member
- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-08278
  If rateControlMode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR, then for each element of pLayers, its averageBitrate member **must** be less than or equal to its maxBitrate member
- VUID-VkVideoEncodeRateControlInfoKHR-layerCount-08357
  If layerCount is not zero, then virtualBufferSizeInMs **must** be greater than zero
- VUID-VkVideoEncodeRateControlInfoKHR-layerCount-08358
  If layerCount is not zero, then initialVirtualBufferSizeInMs **must** be less than or equal to virtualBufferSizeInMs
- VUID-VkVideoEncodeRateControlInfoKHR-videoCodecOperation-07022
  If the videoCodecOperation of the used video profile is VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, the pNext chain this structure is included in also includes an instance of the VkVideoEncodeH264RateControlInfoKHR structure, and layerCount is greater than 1, then layerCount **must** equal VkVideoEncodeH264RateControlInfoKHR::temporalLayerCount
- VUID-VkVideoEncodeRateControlInfoKHR-videoCodecOperation-07025
  If the videoCodecOperation of the used video profile is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the pNext chain this structure is included in also includes an instance of the VkVideoEncodeH265RateControlInfoKHR structure, and layerCount is greater than 1, then layerCount **must** equal VkVideoEncodeH265RateControlInfoKHR::subLayerCount
- VUID-VkVideoEncodeRateControlInfoKHR-videoCodecOperation-10351
  If the videoCodecOperation of the used video profile is VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, the pNext chain this structure is included in also includes an instance of the VkVideoEncodeAV1RateControlInfoKHR structure, and layerCount is greater than 1, then layerCount **must** equal

VkVideoEncodeAV1RateControlInfoKHR::temporalLayerCount

Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_INFO_KHR
- VUID-VkVideoEncodeRateControlInfoKHR-flags-zerobitmask
  flags **must** be 0
- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-parameter
  If rateControlMode is not 0, rateControlMode **must** be a valid VkVideoEncodeRateControlModeFlagBitsKHR value
- VUID-VkVideoEncodeRateControlInfoKHR-pLayers-parameter
  If layerCount is not 0, pLayers **must** be a valid pointer to an array of layerCount valid VkVideoEncodeRateControlLayerInfoKHR structures

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeRateControlFlagsKHR;
```

VkVideoEncodeRateControlFlagsKHR is a bitmask type for setting a mask, but currently reserved for future use.

Rate Control Layer State

The configuration of individual rate control layers is specified using an instance of the VkVideoEncodeRateControlLayerInfoKHR structure.

The VkVideoEncodeRateControlLayerInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeRateControlLayerInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           averageBitrate;
    uint64_t           maxBitrate;
    uint32_t           frameRateNumerator;
    uint32_t           frameRateDenominator;
} VkVideoEncodeRateControlLayerInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is a pointer to a structure extending this structure.
- averageBitrate is the average bitrate to be targeted by the implementation's rate control algorithm.
- maxBitrate is the peak bitrate to be targeted by the implementation's rate control algorithm.

- `frameRateNumerator` is the numerator of the frame rate assumed by the implementation's rate control algorithm.
- `frameRateDenominator` is the denominator of the frame rate assumed by the implementation's rate control algorithm.

NOTE	The ability of the implementation's rate control algorithm to be able to match the requested average and/or peak bitrates **may** be limited by the set of other codec-independent and codec-specific rate control parameters specified by the application, the input content, as well as the application conforming to the rate control guidance provided to the implementation, as described earlier.

Additional structures providing codec-specific rate control parameters **can** be included in the `pNext` chain of `VkVideoEncodeRateControlLayerInfoKHR` depending on the video profile the bound video session was created with. For further details see:

- Video Coding Control
- H.264 Encode Rate Control
- H.265 Encode Rate Control
- AV1 Encode Rate Control

Valid Usage

- VUID-VkVideoEncodeRateControlLayerInfoKHR-frameRateNumerator-08350
  `frameRateNumerator` **must** be greater than zero
- VUID-VkVideoEncodeRateControlLayerInfoKHR-frameRateDenominator-08351
  `frameRateDenominator` **must** be greater than zero

Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_LAYER_INFO_KHR`
- VUID-VkVideoEncodeRateControlLayerInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkVideoEncodeAV1RateControlLayerInfoKHR, VkVideoEncodeH264RateControlLayerInfoKHR, or VkVideoEncodeH265RateControlLayerInfoKHR
- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique

38.17. Video Encode Quantization Maps

Quantization maps are VkImage objects that are used in video encode operations to control the relative quantization parameter values across the encoded picture. Each texel in the quantization

map controls the relative quantization parameter values used to encode the corresponding rectangular block of texels in the encode input picture.

The size of the rectangular block of texels each quantization map texel covers is referred to as the *quantization map texel size*.

The extent of the image subresource used as a quantization map when encoding a picture with a coded extent of (`width`,`height`) thus has to be at least (⌈`width` / `texelSize.width`⌉, ⌈`height` / `texelSize.height`⌉), where `texelSize` is the used quantization map texel size.

In particular, the quantization map texel at location (`x`,`y`) contains relative quantization parameter values used when encoding the `texelSize` sized rectangular block of the encode input picture starting at the texel location (`x` × `texelSize.width`, `y` × `texelSize.height`).

The quantization map texel size does not always match the size of the codec-specific coding blocks used during encoding. Furthermore, some video compression standards allow the size of the codec-specific coding blocks to vary across the encoded picture. In order to accommodate for such mismatches between the granularity at which quantization parameters are stored in quantization maps and the granularity at which they are applied to codec-specific coding blocks during encoding, the following mapping rules are applied to define the quantization map texel value corresponding to a given codec-specific coding block with a size (`width`,`height`) at the texel location (`x`,`y`) in the encode input picture:

- If the size of the codec-specific coding block matches the used quantization map texel size, then the fetched quantization map value corresponding to the codec-specific coding block is the texel value at the texel location (`x` / `texelSize.width`, `y` / `texelSize.height`).
- If the size of the codec-specific coding block is smaller than the used quantization map texel size, then the fetched quantization map value corresponding to the codec-specific coding block is the texel value at the texel location (⌊`x` / `texelSize.width`⌋, ⌊`y` / `texelSize.height`⌋).
- If the size of the codec-specific coding block is larger than the used quantization map texel size, then the fetched quantization map value corresponding to the codec-specific coding block **may** be any value determined as the linear interpolation of the quantization map texel values in the subregion starting at texel location (`x` / `texelSize.width`,`y` / `texelSize.height`) with a size (⌈`width` / `texelSize.width`⌉, ⌈`height` / `texelSize.height`⌉).

The actual control parameters stored in the quantization map depend on its type. This specification supports the following types of quantization maps:

- Quantization delta maps
- Emphasis maps

38.17.1. Quantization Delta Maps

Quantization delta maps contain values that directly affect the codec-specific quantization parameter values used to encode the corresponding block of the encode input picture.

Quantization delta maps **can** be used in conjunction with any rate control mode, including `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.

Due to their codec-specific nature, they are described in more detail in the corresponding codec-specific section for video encode operations that support them. In particular:

- The behavior of quantization delta maps used with an H.264 encode profile is described in the H.264 Encode Quantization and H.264 QP Delta Maps sections.
- The behavior of quantization delta maps used with an H.265 encode profile is described in the H.265 Encode Quantization and H.265 QP Delta Maps sections.
- The behavior of quantization delta maps used with an AV1 encode profile is described in the AV1 Encode Quantization and AV1 Quantizer Index Delta Maps sections.

This specification does not support quantization delta maps for any other video encode operation.

38.17.2. Emphasis Maps

Emphasis maps contain values that indirectly affect the codec-specific quantization parameter values used to encode the corresponding block of the encode input picture.

The texels of emphasis maps contain values that provide input to the encoder implementation about the relative importance (emphasis) of regions of the encoded pictures in order to enable the implementation's rate control algorithm to allocate more bitrate budget for regions of the encoded picture with higher emphasis values than to those with lower emphasis values.

Emphasis maps **can** only be used when the current rate control mode configured for the video session is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.

As these emphasis values only control the otherwise implementation-specific behavior of the used rate control algorithm, this specification does not impose additional restrictions on implementations beyond the ones outlined in the corresponding codec-specific sections describing quantization behavior:

- The behavior of emphasis maps used with an H.264 encode profile is described in the H.264 Encode Quantization section.
- The behavior of emphasis maps used with an H.265 encode profile is described in the H.265 Encode Quantization section.
- The behavior of emphasis maps used with an AV1 encode profile is described in the AV1 Encode Quantization section.

This specification does not support emphasis maps for any other video encode operation.

Emphasis maps always have single channel unsigned normalized integer formats and implementations are **required** to support the `VK_FORMAT_R8_UNORM` format for emphasis maps, as reported in VkVideoFormatPropertiesKHR::`format`, when the video encode profile supports `VK_VIDEO_ENCODE_CAPABILITY_EMPHASIS_MAP_BIT_KHR`.

38.17.3. Quantization Map Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR with `pVideoProfile->videoCodecOperation`

specifying an encode operation, the VkVideoEncodeQuantizationMapCapabilitiesKHR structure **can** be included in the pNext chain of the VkVideoCapabilitiesKHR structure to retrieve capabilities specific to video encode quantization maps.

The VkVideoEncodeQuantizationMapCapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_quantization_map
typedef struct VkVideoEncodeQuantizationMapCapabilitiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkExtent2D         maxQuantizationMapExtent;
} VkVideoEncodeQuantizationMapCapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxQuantizationMapExtent indicates the maximum supported width and height of quantization maps.

Valid Usage (Implicit)

- VUID-VkVideoEncodeQuantizationMapCapabilitiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUANTIZATION_MAP_CAPABILITIES_KHR

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities of an H.264 encode profile, the VkVideoEncodeH264QuantizationMapCapabilitiesKHR structure **can** be included in the pNext chain of the VkVideoCapabilitiesKHR structure to retrieve additional video encode quantization map capabilities specific to H.264 encode profiles.

The VkVideoEncodeH264QuantizationMapCapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264 with VK_KHR_video_encode_quantization_map
typedef struct VkVideoEncodeH264QuantizationMapCapabilitiesKHR {
    VkStructureType    sType;
    void*              pNext;
    int32_t            minQpDelta;
    int32_t            maxQpDelta;
} VkVideoEncodeH264QuantizationMapCapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- minQpDelta indicates the minimum QP delta value supported for H.264 QP delta maps.
- maxQpDelta indicates the maximum QP delta value supported for H.264 QP delta maps.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264QuantizationMapCapabilitiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_QUANTIZATION_MAP_CAPABILITIES_KHR`

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities of an H.265 encode profile, the `VkVideoEncodeH265QuantizationMapCapabilitiesKHR` structure **can** be included in the `pNext` chain of the VkVideoCapabilitiesKHR structure to retrieve additional video encode quantization map capabilities specific to H.265 encode profiles.

The `VkVideoEncodeH265QuantizationMapCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h265 with VK_KHR_video_encode_quantization_map
typedef struct VkVideoEncodeH265QuantizationMapCapabilitiesKHR {
    VkStructureType    sType;
    void*              pNext;
    int32_t            minQpDelta;
    int32_t            maxQpDelta;
} VkVideoEncodeH265QuantizationMapCapabilitiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minQpDelta` indicates the minimum QP delta value supported for H.265 QP delta maps.
- `maxQpDelta` indicates the maximum QP delta value supported for H.265 QP delta maps.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265QuantizationMapCapabilitiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_QUANTIZATION_MAP_CAPABILITIES_KHR`

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities of an AV1 encode profile, the `VkVideoEncodeAV1QuantizationMapCapabilitiesKHR` structure **can** be included in the `pNext` chain of the VkVideoCapabilitiesKHR structure to retrieve additional video encode quantization map capabilities specific to AV1 encode profiles.

The `VkVideoEncodeAV1QuantizationMapCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_av1 with VK_KHR_video_encode_quantization_map
typedef struct VkVideoEncodeAV1QuantizationMapCapabilitiesKHR {
    VkStructureType    sType;
    void*              pNext;
    int32_t            minQIndexDelta;
    int32_t            maxQIndexDelta;
} VkVideoEncodeAV1QuantizationMapCapabilitiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minQIndexDelta` indicates the minimum quantizer index delta value supported for AV1 quantizer index delta maps.
- `maxQIndexDelta` indicates the maximum quantizer index delta value supported for AV1 quantizer index delta maps.

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1QuantizationMapCapabilitiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_QUANTIZATION_MAP_CAPABILITIES_KHR`

38.17.4. Quantization Map Format Properties

When calling vkGetPhysicalDeviceVideoFormatPropertiesKHR, the VkVideoFormatQuantizationMapPropertiesKHR structure **can** be included in the `pNext` chain of the VkVideoFormatPropertiesKHR structure to retrieve video format properties specific to video encode quantization maps.

The `VkVideoFormatQuantizationMapPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_quantization_map
typedef struct VkVideoFormatQuantizationMapPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkExtent2D         quantizationMapTexelSize;
} VkVideoFormatQuantizationMapPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `quantizationMapTexelSize` indicates the quantization map texel size of the video format, i.e. the number of pixels corresponding to each quantization map texel.

The values returned in this structure are only defined if the allowed image usage flags returned in VkVideoFormatPropertiesKHR::`imageUsageFlags` for this video format include `VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR` or `VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR`.

Implementations **may** support multiple quantization map texel sizes for a particular video format which is indicated by vkGetPhysicalDeviceVideoFormatPropertiesKHR returning multiple entries with different `quantizationMapTexelSize` values.

Valid Usage (Implicit)

- VUID-VkVideoFormatQuantizationMapPropertiesKHR-sType-sType

sType **must** be VK_STRUCTURE_TYPE_VIDEO_FORMAT_QUANTIZATION_MAP_PROPERTIES_KHR

When calling vkGetPhysicalDeviceVideoFormatPropertiesKHR, the VkVideoFormatH265QuantizationMapPropertiesKHR structure **can** be included in the pNext chain of the VkVideoFormatPropertiesKHR structure to retrieve video format properties specific to video encode quantization maps used with an H.265 encode profile.

The VkVideoFormatH265QuantizationMapPropertiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265 with VK_KHR_video_encode_quantization_map
typedef struct VkVideoFormatH265QuantizationMapPropertiesKHR {
    VkStructureType                    sType;
    void*                              pNext;
    VkVideoEncodeH265CtbSizeFlagsKHR   compatibleCtbSizes;
} VkVideoFormatH265QuantizationMapPropertiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- compatibleCtbSizes is a bitmask of VkVideoEncodeH265CtbSizeFlagBitsKHR indicating the CTB sizes that quantization maps using this video format are compatible with.

NOTE

The value of compatibleCtbSizes does not limit the use of the specific quantization map format, but does limit the implementation in being able to encode pictures with CTB sizes not included in compatibleCtbSizes but otherwise supported by the used video profile, as indicated by VkVideoEncodeH265CapabilitiesKHR::ctbSizes. In particular, using smaller quantization map texel sizes may prevent implementations from encoding with larger CTB sizes which may have a negative impact on the efficiency of the encoder.

The values returned in this structure are only defined if the allowed image usage flags returned in VkVideoFormatPropertiesKHR::imageUsageFlags for this video format include VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR.

Valid Usage (Implicit)

- VUID-VkVideoFormatH265QuantizationMapPropertiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_FORMAT_H265_QUANTIZATION_MAP_PROPERTIES_KHR

When calling vkGetPhysicalDeviceVideoFormatPropertiesKHR, the VkVideoFormatAV1QuantizationMapPropertiesKHR structure **can** be included in the pNext chain of the VkVideoFormatPropertiesKHR structure to retrieve video format properties specific to video encode quantization maps used with an AV1 encode profile.

The VkVideoFormatAV1QuantizationMapPropertiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1 with VK_KHR_video_encode_quantization_map
typedef struct VkVideoFormatAV1QuantizationMapPropertiesKHR {
    VkStructureType                          sType;
    void*                                    pNext;
    VkVideoEncodeAV1SuperblockSizeFlagsKHR   compatibleSuperblockSizes;
} VkVideoFormatAV1QuantizationMapPropertiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- compatibleSuperblockSizes is a bitmask of VkVideoEncodeAV1SuperblockSizeFlagBitsKHR indicating the AV1 superblock sizes that quantization maps using this video format are compatible with.

NOTE

The value of compatibleSuperblockSizes does not limit the use of the specific quantization map format, but does limit the implementation in being able to encode pictures with superblock sizes not included in compatibleSuperblockSizes but otherwise supported by the used video profile, as indicated by VkVideoEncodeAV1CapabilitiesKHR::superblockSizes. In particular, using smaller quantization map texel sizes may prevent implementations from encoding with larger superblock sizes which may have a negative impact on the efficiency of the encoder.

The values returned in this structure are only defined if the allowed image usage flags returned in VkVideoFormatPropertiesKHR::imageUsageFlags for this video format include VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR.

Valid Usage (Implicit)

- VUID-VkVideoFormatAV1QuantizationMapPropertiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_FORMAT_AV1_QUANTIZATION_MAP_PROPERTIES_KHR

38.17.5. Encoding with Quantization Maps

The VkVideoEncodeQuantizationMapInfoKHR structure **can** be included in the pNext chain of the VkVideoEncodeInfoKHR structure passed to the vkCmdEncodeVideoKHR command to specify the quantization map used by the issued video encode operations.

The VkVideoEncodeQuantizationMapInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_quantization_map
typedef struct VkVideoEncodeQuantizationMapInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkImageView        quantizationMap;
    VkExtent2D         quantizationMapExtent;
} VkVideoEncodeQuantizationMapInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `quantizationMap` specifies the image view to use as the quantization map.
- `quantizationMapExtent` specifies the extent of the image subregion of `quantizationMap` to use as the quantization map starting at offset (0,0).

Valid Usage

- VUID-VkVideoEncodeQuantizationMapInfoKHR-quantizationMapExtent-10352
  `quantizationMapExtent.width` **must** be less than or equal to the width of `quantizationMap`
- VUID-VkVideoEncodeQuantizationMapInfoKHR-quantizationMapExtent-10353
  `quantizationMapExtent.height` **must** be less than or equal to the height of `quantizationMap`

Valid Usage (Implicit)

- VUID-VkVideoEncodeQuantizationMapInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUANTIZATION_MAP_INFO_KHR`
- VUID-VkVideoEncodeQuantizationMapInfoKHR-quantizationMap-parameter
  If `quantizationMap` is not VK_NULL_HANDLE, `quantizationMap` **must** be a valid VkImageView handle

38.18. H.264 Encode Operations

Video encode operations using an H.264 encode profile **can** be used to encode elementary video stream sequences compliant to the ITU-T H.264 Specification.

NOTE Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video encode operation steps with the codec-specific semantics defined in section 8 of the ITU-T H.264 Specification as follows:

- Syntax elements, derived values, and other parameters are applied from the following structures:

    - The StdVideoH264SequenceParameterSet structure corresponding to the active SPS specifying the H.264 sequence parameter set.
    - The StdVideoH264PictureParameterSet structure corresponding to the active PPS specifying the H.264 picture parameter set.
    - The StdVideoEncodeH264PictureInfo structure specifying the H.264 picture information.
    - The StdVideoEncodeH264SliceHeader structures specifying the H.264 slice header parameters for each encoded H.264 slice.
    - The StdVideoEncodeH264ReferenceInfo structures specifying the H.264 reference information corresponding to the optional reconstructed picture and any active reference pictures.
- The encoded bitstream data is written to the destination video bitstream buffer range as defined in the H.264 Encode Bitstream Data Access section.
- Picture data in the video picture resources corresponding to the used encode input picture, active reference pictures, and optional reconstructed picture is accessed as defined in the H.264 Encode Picture Data Access section.
- The decision on reference picture setup is made according to the parameters specified in the H.264 picture information.

If the parameters adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.264 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video encode operation will complete successfully. Otherwise, the video encode operation **may** complete unsuccessfully.

38.18.1. H.264 Encode Parameter Overrides

Implementations **may** override, unless otherwise specified, any of the H.264 encode parameters specified in the following Video Std structures:

- StdVideoH264SequenceParameterSet
- StdVideoH264PictureParameterSet
- StdVideoEncodeH264PictureInfo
- StdVideoEncodeH264SliceHeader
- StdVideoEncodeH264ReferenceInfo

All such H.264 encode parameter overrides **must** fulfill the conditions defined in the Video Encode Parameter Overrides section.

In addition, implementations **must** not override any of the following H.264 encode parameters:

- StdVideoEncodeH264PictureInfo::primary_pic_type
- StdVideoEncodeH264SliceHeader::slice_type

In case of H.264 encode parameters stored in video session parameters objects, applications need to use the vkGetEncodedVideoSessionParametersKHR command to determine whether any implementation overrides happened. If the query indicates that implementation overrides were applied, then the application needs to retrieve and use the encoded H.264 parameter sets in the

bitstream in order to be able to produce a compliant H.264 video bitstream using the H.264 encode parameters stored in the video session parameters object.

In case of any H.264 encode parameters stored in the encoded bitstream produced by video encode operations, if the implementation supports the VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR video encode feedback query flag, the application **can** use such queries to retrieve feedback about whether any implementation overrides have been applied to those H.264 encode parameters.

38.18.2. H.264 Encode Bitstream Data Access

Each video encode operation writes one or more VCL NAL units comprising of slice headers and data of the encoded picture, in the format defined in sections 7.3.3 and 7.3.4, according to the semantics defined in sections 7.4.3 and 7.4.4 of the ITU-T H.264 Specification, respectively. The number of VCL NAL units written is specified by VkVideoEncodeH264PictureInfoKHR ::naluSliceEntryCount.

In addition, if VkVideoEncodeH264PictureInfoKHR::generatePrefixNalu is VK_TRUE for the video encode operation, then an additional prefix NAL unit is written before each VCL NAL unit corresponding to individual slices in the format defined in section 7.3.2.12, according to the semantics defined in section 7.4.2.12 of the ITU-T H.264 Specification, respectively.

38.18.3. H.264 Encode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::pictureAccessGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. Accordingly, the complete image subregion of a encode input picture, reference picture, or reconstructed picture accessed by video coding operations using an H.264 encode profile is defined as the set of texels within the coordinate range:

([0,endX), [0,endY))

Where:

- endX equals codedExtent.width rounded up to the nearest integer multiple of pictureAccessGranularity.width and clamped to the width of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;
- endY equals codedExtent.height rounded up to the nearest integer multiple of pictureAccessGranularity.height and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;

Where codedExtent is the member of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.

In case of video encode operations using an H.264 encode profile, any access to a picture at the coordinates (x,y), as defined by the ITU-T H.264 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel

coordinates (x,y).

Implementations **may** choose not to access some or all texels within particular reference pictures available to a video encode operation (e.g. due to video encode parameter overrides restricting the effective set of used reference pictures, or if the encoding algorithm chooses not to use certain subregions of the reference picture data for sample prediction).

38.18.4. H.264 Frame, Picture, and Slice

H.264 pictures are partitioned into slices, as defined in section 6.3 of the ITU-T H.264 Specification.

For the purposes of this specification, the H.264 slices comprising a picture are referred to as the *picture partitions* of the picture.

Video encode operations using an H.264 encode profile **can** encode slices of different types, as defined in section 7.4.3 of the ITU-T H.264 Specification, by specifying the corresponding enumeration constant value in `StdVideoEncodeH264SliceHeader`::`slice_type` in the H.264 slice header parameters from the Video Std enumeration type `StdVideoH264SliceType`:

- `STD_VIDEO_H264_SLICE_TYPE_P` indicates that the slice is a *P slice* as defined in section 3.109 of the ITU-T H.264 Specification.
- `STD_VIDEO_H264_SLICE_TYPE_B` indicates that the slice is a *B slice* as defined in section 3.9 of the ITU-T H.264 Specification.
- `STD_VIDEO_H264_SLICE_TYPE_I` indicates that the slice is an *I slice* as defined in section 3.66 of the ITU-T H.264 Specification.

Pictures constructed from such slices **can** be of different types, as defined in section 7.4.2.4 of the ITU-T H.264 Specification. Video encode operations using an H.264 encode profile **can** encode pictures of a specific type by specifying the corresponding enumeration constant value in `StdVideoEncodeH264PictureInfo`::`primary_pic_type` in the H.264 picture information from the Video Std enumeration type `StdVideoH264PictureType`:

- `STD_VIDEO_H264_PICTURE_TYPE_P` indicates that the picture is a *P picture*. A frame consisting of a P picture is also referred to as a *P frame*.
- `STD_VIDEO_H264_PICTURE_TYPE_B` indicates that the picture is a *B picture*. A frame consisting of a B picture is also referred to as a *B frame*.
- `STD_VIDEO_H264_PICTURE_TYPE_I` indicates that the picture is an *I picture*. A frame consisting of an I picture is also referred to as an *I frame*.
- `STD_VIDEO_H264_PICTURE_TYPE_IDR` indicates that the picture is a special type of I picture called an *IDR picture* as defined in section 3.69 of the ITU-T H.264 Specification. A frame consisting of an IDR picture is also referred to as an *IDR frame*.

38.18.5. H.264 Coding Blocks

H.264 encode supports a single type of coding block called a *macroblock*, as defined in section 3.84 of the ITU-T H.264 Specification.

38.18.6. H.264 Encode Profile

A video profile supporting H.264 video encode operations is specified by setting VkVideoProfileInfoKHR::videoCodecOperation to VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and adding a VkVideoEncodeH264ProfileInfoKHR structure to the VkVideoProfileInfoKHR::pNext chain.

The VkVideoEncodeH264ProfileInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264ProfileInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    StdVideoH264ProfileIdc    stdProfileIdc;
} VkVideoEncodeH264ProfileInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stdProfileIdc is a StdVideoH264ProfileIdc value specifying the H.264 codec profile IDC, as defined in section A.2 of the ITU-T H.264 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264ProfileInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PROFILE_INFO_KHR

38.18.7. H.264 Encode Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities for an H.264 encode profile, the VkVideoCapabilitiesKHR::pNext chain **must** include a VkVideoEncodeH264CapabilitiesKHR structure that will be filled with the profile-specific capabilities.

The VkVideoEncodeH264CapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264CapabilitiesKHR {
    VkStructureType                          sType;
    void*                                    pNext;
    VkVideoEncodeH264CapabilityFlagsKHR      flags;
    StdVideoH264LevelIdc                     maxLevelIdc;
    uint32_t                                 maxSliceCount;
    uint32_t                                 maxPPictureL0ReferenceCount;
    uint32_t                                 maxBPictureL0ReferenceCount;
    uint32_t                                 maxL1ReferenceCount;
    uint32_t                                 maxTemporalLayerCount;
    VkBool32                                 expectDyadicTemporalLayerPattern;
    int32_t                                  minQp;
    int32_t                                  maxQp;
    VkBool32                                 prefersGopRemainingFrames;
    VkBool32                                 requiresGopRemainingFrames;
    VkVideoEncodeH264StdFlagsKHR             stdSyntaxFlags;
} VkVideoEncodeH264CapabilitiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkVideoEncodeH264CapabilityFlagBitsKHR indicating supported H.264 encoding capabilities.
- `maxLevelIdc` is a `StdVideoH264LevelIdc` value indicating the maximum H.264 level supported by the profile, where enum constant `STD_VIDEO_H264_LEVEL_IDC_<major>_<minor>` identifies H.264 level `<major>.<minor>` as defined in section A.3 of the ITU-T H.264 Specification.
- `maxSliceCount` indicates the maximum number of slices that **can** be encoded for a single picture. Further restrictions **may** apply to the number of slices that **can** be encoded for a single picture depending on other capabilities and codec-specific rules.
- `maxPPictureL0ReferenceCount` indicates the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.

> **NOTE** As implementations **may** override the reference lists, `maxPPictureL0ReferenceCount` does not limit the number of elements that the application **can** specify in the L0 reference list for P pictures. However, if `maxPPictureL0ReferenceCount` is zero, then the use of P pictures is not allowed.

- `maxBPictureL0ReferenceCount` indicates the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures.
- `maxL1ReferenceCount` indicates the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported.

> **NOTE** As implementations **may** override the reference lists, `maxBPictureL0ReferenceCount` and `maxL1ReferenceCount` does not limit the number of elements that the application **can** specify in the L0 and L1 reference lists for B

> pictures. However, if maxBPictureL0ReferenceCount and maxL1ReferenceCount are both zero, then the use of B pictures is not allowed.

- maxTemporalLayerCount indicates the maximum number of H.264 temporal layers supported by the implementation.
- expectDyadicTemporalLayerPattern indicates that the implementation's rate control algorithms expect the application to use a dyadic temporal layer pattern when encoding multiple temporal layers.
- minQp indicates the minimum QP value supported.
- maxQp indicates the maximum QP value supported.
- prefersGopRemainingFrames indicates that the implementation's rate control algorithm prefers the application to specify the number of frames of each type remaining in the current group of pictures when beginning a video coding scope.
- requiresGopRemainingFrames indicates that the implementation's rate control algorithm requires the application to specify the number of frames of each type remaining in the current group of pictures when beginning a video coding scope.
- stdSyntaxFlags is a bitmask of VkVideoEncodeH264StdFlagBitsKHR indicating capabilities related to H.264 syntax elements.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264CapabilitiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_CAPABILITIES_KHR

Bits which **may** be set in VkVideoEncodeH264CapabilitiesKHR::flags, indicating the H.264 encoding capabilities supported, are:

```
// Provided by VK_KHR_video_encode_h264
typedef enum VkVideoEncodeH264CapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR =
0x00000002,
    VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR = 0x00000010,
    VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR = 0x00000020,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR = 0x00000040,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_KHR = 0x00000080,
    VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_KHR = 0x00000100,
  // Provided by VK_KHR_video_encode_h264 with VK_KHR_video_encode_quantization_map
    VK_VIDEO_ENCODE_H264_CAPABILITY_MB_QP_DIFF_WRAPAROUND_BIT_KHR = 0x00000200,
} VkVideoEncodeH264CapabilityFlagBitsKHR;
```

- VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_KHR specifies whether the implementation

may be able to generate HRD compliant bitstreams if any of the `nal_hrd_parameters_present_flag` or `vcl_hrd_parameters_present_flag` members of `StdVideoH264SpsVuiFlags` are set to `1` in the active SPS.

- `VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR` specifies that if `StdVideoH264PpsFlags`::`weighted_pred_flag` is set to `1` or `StdVideoH264PictureParameterSet`::`weighted_bipred_idc` is set to `STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT` in the active PPS when encoding a P picture or B picture, respectively, then the implementation is able to internally decide syntax for `pred_weight_table`, as defined in section 7.4.3.2 of the ITU-T H.264 Specification, and the application is not **required** to provide a weight table in the H.264 slice header parameters.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_KHR` specifies that each slice in a frame with multiple slices may begin or finish at any offset in a macroblock row. If not supported, all slices in the frame **must** begin at the start of a macroblock row (and hence each slice **must** finish at the end of a macroblock row).
- `VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_KHR` specifies that when a frame is encoded with multiple slices, the implementation allows encoding each slice with a different `StdVideoEncodeH264SliceHeader`::`slice_type` specified in the H.264 slice header parameters. If not supported, all slices of the frame **must** be encoded with the same `slice_type` which corresponds to the picture type of the frame.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR` specifies support for using a B frame as L0 reference, as specified in `StdVideoEncodeH264ReferenceListsInfo`::`RefPicList0` in the H.264 picture information.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR` specifies support for using a B frame as L1 reference, as specified in `StdVideoEncodeH264ReferenceListsInfo`::`RefPicList1` in the H.264 picture information.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR` specifies support for specifying different QP values in the members of VkVideoEncodeH264QpKHR.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_KHR` specifies support for specifying different constant QP values for each slice.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_KHR` specifies support for generating prefix NAL units by setting VkVideoEncodeH264PictureInfoKHR::`generatePrefixNalu` to `VK_TRUE`.
- `VK_VIDEO_ENCODE_H264_CAPABILITY_MB_QP_DIFF_WRAPAROUND_BIT_KHR` indicates support for wraparound during the calculation of the QP values of subsequently encoded macroblocks, as defined in equation 7-37 of the ITU-T H.264 Specification. If not supported, equation 7-37 of the ITU-T H.264 Specification is effectively reduced to the following:

  $QP_Y = QP_{Y,PREV} + mb_qp_delta$

  NOTE The effect of this is that the maximum QP difference across subsequent macroblocks is limited to the $[-(26 + QpBdOffset_Y / 2), 25 + QpBdOffset_Y / 2]$ range.

```
// Provided by VK_KHR_video_encode_h264
typedef VkFlags VkVideoEncodeH264CapabilityFlagsKHR;
```

VkVideoEncodeH264CapabilityFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeH264CapabilityFlagBitsKHR.

Bits which **may** be set in VkVideoEncodeH264CapabilitiesKHR::stdSyntaxFlags, indicating the capabilities related to the H.264 syntax elements, are:

```
// Provided by VK_KHR_video_encode_h264
typedef enum VkVideoEncodeH264StdFlagBitsKHR {
    VK_VIDEO_ENCODE_H264_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H264_STD_QPPRIME_Y_ZERO_TRANSFORM_BYPASS_FLAG_SET_BIT_KHR =
0x00000002,
    VK_VIDEO_ENCODE_H264_STD_SCALING_MATRIX_PRESENT_FLAG_SET_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H264_STD_CHROMA_QP_INDEX_OFFSET_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H264_STD_SECOND_CHROMA_QP_INDEX_OFFSET_BIT_KHR = 0x00000010,
    VK_VIDEO_ENCODE_H264_STD_PIC_INIT_QP_MINUS26_BIT_KHR = 0x00000020,
    VK_VIDEO_ENCODE_H264_STD_WEIGHTED_PRED_FLAG_SET_BIT_KHR = 0x00000040,
    VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_EXPLICIT_BIT_KHR = 0x00000080,
    VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_IMPLICIT_BIT_KHR = 0x00000100,
    VK_VIDEO_ENCODE_H264_STD_TRANSFORM_8X8_MODE_FLAG_SET_BIT_KHR = 0x00000200,
    VK_VIDEO_ENCODE_H264_STD_DIRECT_SPATIAL_MV_PRED_FLAG_UNSET_BIT_KHR = 0x00000400,
    VK_VIDEO_ENCODE_H264_STD_ENTROPY_CODING_MODE_FLAG_UNSET_BIT_KHR = 0x00000800,
    VK_VIDEO_ENCODE_H264_STD_ENTROPY_CODING_MODE_FLAG_SET_BIT_KHR = 0x00001000,
    VK_VIDEO_ENCODE_H264_STD_DIRECT_8X8_INFERENCE_FLAG_UNSET_BIT_KHR = 0x00002000,
    VK_VIDEO_ENCODE_H264_STD_CONSTRAINED_INTRA_PRED_FLAG_SET_BIT_KHR = 0x00004000,
    VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_DISABLED_BIT_KHR = 0x00008000,
    VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_ENABLED_BIT_KHR = 0x00010000,
    VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_PARTIAL_BIT_KHR = 0x00020000,
    VK_VIDEO_ENCODE_H264_STD_SLICE_QP_DELTA_BIT_KHR = 0x00080000,
    VK_VIDEO_ENCODE_H264_STD_DIFFERENT_SLICE_QP_DELTA_BIT_KHR = 0x00100000,
} VkVideoEncodeH264StdFlagBitsKHR;
```

- VK_VIDEO_ENCODE_H264_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264SpsFlags::separate_colour_plane_flag in the SPS when that value is 1.
- VK_VIDEO_ENCODE_H264_STD_QPPRIME_Y_ZERO_TRANSFORM_BYPASS_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264SpsFlags::qpprime_y_zero_transform_bypass_flag in the SPS when that value is 1.
- VK_VIDEO_ENCODE_H264_STD_SCALING_MATRIX_PRESENT_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided values for StdVideoH264SpsFlags::seq_scaling_matrix_present_flag in the SPS and StdVideoH264PpsFlags::pic_scaling_matrix_present_flag in the PPS when any of those values are 1.
- VK_VIDEO_ENCODE_H264_STD_CHROMA_QP_INDEX_OFFSET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264PictureParameterSet::chroma_qp_index_offset in the PPS when that value is non-zero.
- VK_VIDEO_ENCODE_H264_STD_SECOND_CHROMA_QP_INDEX_OFFSET_BIT_KHR specifies whether the implementation supports using the application-provided value for

StdVideoH264PictureParameterSet::second_chroma_qp_index_offset in the PPS when that value is non-zero.

- VK_VIDEO_ENCODE_H264_STD_PIC_INIT_QP_MINUS26_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264PictureParameterSet::pic_init_qp_minus26 in the PPS when that value is non-zero.
- VK_VIDEO_ENCODE_H264_STD_WEIGHTED_PRED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264PpsFlags::weighted_pred_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_EXPLICIT_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264PictureParameterSet::weighted_bipred_idc in the PPS when that value is STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT.
- VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_IMPLICIT_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264PictureParameterSet::weighted_bipred_idc in the PPS when that value is STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_IMPLICIT.
- VK_VIDEO_ENCODE_H264_STD_TRANSFORM_8X8_MODE_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264PpsFlags::transform_8x8_mode_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H264_STD_DIRECT_SPATIAL_MV_PRED_FLAG_UNSET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeH264SliceHeaderFlags::direct_spatial_mv_pred_flag in the H.264 slice header parameters when that value is 0.
- VK_VIDEO_ENCODE_H264_STD_ENTROPY_CODING_MODE_FLAG_UNSET_BIT_KHR specifies whether the implementation supports CAVLC entropy coding, as defined in section 9.2 of the ITU-T H.264 Specification, and thus supports using the application-provided value for StdVideoH264PpsFlags::entropy_coding_mode_flag in the PPS when that value is 0.
- VK_VIDEO_ENCODE_H264_STD_ENTROPY_CODING_MODE_FLAG_SET_BIT_KHR specifies whether the implementation supports CABAC entropy coding, as defined in section 9.3 of the ITU-T H.264 Specification, and thus supports using the application-provided value for StdVideoH264PpsFlags::entropy_coding_mode_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H264_STD_DIRECT_8X8_INFERENCE_FLAG_UNSET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264SpsFlags::direct_8x8_inference_flag in the SPS when that value is 0.
- VK_VIDEO_ENCODE_H264_STD_CONSTRAINED_INTRA_PRED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH264PpsFlags::constrained_intra_pred_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_DISABLED_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeH264SliceHeader::disable_deblocking_filter_idc in the H.264 slice header parameters when that value is STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_DISABLED.
- VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_ENABLED_BIT_KHR specifies whether the implementation supports using the application-provided value for

StdVideoEncodeH264SliceHeader::disable_deblocking_filter_idc in the H.264 slice header parameters when that value is STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_ENABLED.

- VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_PARTIAL_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeH264SliceHeader::disable_deblocking_filter_idc in the H.264 slice header parameters when that value is STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_PARTIAL.
- VK_VIDEO_ENCODE_H264_STD_SLICE_QP_DELTA_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeH264SliceHeader::slice_qp_delta in the H.264 slice header parameters when that value is identical across the slices of the encoded frame.
- VK_VIDEO_ENCODE_H264_STD_DIFFERENT_SLICE_QP_DELTA_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeH264SliceHeader::slice_qp_delta in the H.264 slice header parameters when that value is different across the slices of the encoded frame.

These capability flags provide information to the application about specific H.264 syntax element values that the implementation supports without having to override them and do not otherwise restrict the values that the application **can** specify for any of the mentioned H.264 syntax elements.

```
// Provided by VK_KHR_video_encode_h264
typedef VkFlags VkVideoEncodeH264StdFlagsKHR;
```

VkVideoEncodeH264StdFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeH264StdFlagBitsKHR.

38.18.8. H.264 Encode Quality Level Properties

When calling vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR with pVideoProfile->videoCodecOperation specified as VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, the VkVideoEncodeH264QualityLevelPropertiesKHR structure **must** be included in the pNext chain of the VkVideoEncodeQualityLevelPropertiesKHR structure to retrieve additional video encode quality level properties specific to H.264 encoding.

The VkVideoEncodeH264QualityLevelPropertiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264QualityLevelPropertiesKHR {
    VkStructureType                          sType;
    void*                                    pNext;
    VkVideoEncodeH264RateControlFlagsKHR     preferredRateControlFlags;
    uint32_t                                 preferredGopFrameCount;
    uint32_t                                 preferredIdrPeriod;
    uint32_t                                 preferredConsecutiveBFrameCount;
    uint32_t                                 preferredTemporalLayerCount;
    VkVideoEncodeH264QpKHR                   preferredConstantQp;
    uint32_t                                 preferredMaxL0ReferenceCount;
    uint32_t                                 preferredMaxL1ReferenceCount;
    VkBool32                                 preferredStdEntropyCodingModeFlag;
} VkVideoEncodeH264QualityLevelPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `preferredRateControlFlags` is a bitmask of VkVideoEncodeH264RateControlFlagBitsKHR values indicating the preferred flags to use for VkVideoEncodeH264RateControlInfoKHR::`flags`.
- `preferredGopFrameCount` indicates the preferred value to use for VkVideoEncodeH264RateControlInfoKHR::`gopFrameCount`.
- `preferredIdrPeriod` indicates the preferred value to use for VkVideoEncodeH264RateControlInfoKHR::`idrPeriod`.
- `preferredConsecutiveBFrameCount` indicates the preferred value to use for VkVideoEncodeH264RateControlInfoKHR::`consecutiveBFrameCount`.
- `preferredTemporalLayerCount` indicates the preferred value to use for VkVideoEncodeH264RateControlInfoKHR::`temporalLayerCount`.
- `preferredConstantQp` indicates the preferred values to use for VkVideoEncodeH264NaluSliceInfoKHR::`constantQp` for each picture type when using rate control mode `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- `preferredMaxL0ReferenceCount` indicates the preferred maximum number of reference pictures to use in the reference list L0.
- `preferredMaxL1ReferenceCount` indicates the preferred maximum number of reference pictures to use in the reference list L1.
- `preferredStdEntropyCodingModeFlag` indicates the preferred value to use for `entropy_coding_mode_flag` in `StdVideoH264PpsFlags`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264QualityLevelPropertiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_QUALITY_LEVEL_PROPERTIES_KHR`

38.18.9. H.264 Encode Session

Additional parameters can be specified when creating a video session with an H.264 encode profile by including an instance of the VkVideoEncodeH264SessionCreateInfoKHR structure in the pNext chain of VkVideoSessionCreateInfoKHR.

The VkVideoEncodeH264SessionCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264SessionCreateInfoKHR {
    VkStructureType         sType;
    const void*             pNext;
    VkBool32                useMaxLevelIdc;
    StdVideoH264LevelIdc    maxLevelIdc;
} VkVideoEncodeH264SessionCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- useMaxLevelIdc indicates whether the value of maxLevelIdc should be used by the implementation. When it is VK_FALSE, the implementation ignores the value of maxLevelIdc and uses the value of VkVideoEncodeH264CapabilitiesKHR::maxLevelIdc, as reported by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile.
- maxLevelIdc is a StdVideoH264LevelIdc value specifying the upper bound on the H.264 level for the video bitstreams produced by the created video session, where enum constant STD_VIDEO_H264_LEVEL_IDC_<major>_<minor> identifies H.264 level <major>.<minor> as defined in section A.3 of the ITU-T H.264 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_CREATE_INFO_KHR

38.18.10. H.264 Encode Parameter Sets

Video session parameters objects created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR **can** contain the following types of parameters:

H.264 Sequence Parameter Sets (SPS)

Represented by StdVideoH264SequenceParameterSet structures and interpreted as follows:

- reserved1 and reserved2 are used only for padding purposes and are otherwise ignored;
- seq_parameter_set_id is used as the key of the SPS entry;
- level_idc is one of the enum constants STD_VIDEO_H264_LEVEL_IDC_<major>_<minor> identifying

the H.264 level `<major>.<minor>` as defined in section A.3 of the ITU-T H.264 Specification;

- if `flags.seq_scaling_matrix_present_flag` is set, then the `StdVideoH264ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
  - `scaling_list_present_mask` is a bitmask where bit index i corresponds to `seq_scaling_list_present_flag[i]` as defined in section 7.4.2.1 of the ITU-T H.264 Specification;
  - `use_default_scaling_matrix_mask` is a bitmask where bit index i corresponds to `UseDefaultScalingMatrix4x4Flag[i]`, when i < 6, or corresponds to `UseDefaultScalingMatrix8x8Flag[i-6]`, otherwise, as defined in section 7.3.2.1 of the ITU-T H.264 Specification;
  - `ScalingList4x4` and `ScalingList8x8` correspond to the identically named syntax elements defined in section 7.3.2.1 of the ITU-T H.264 Specification;
- if `flags.vui_parameters_present_flag` is set, then `pSequenceParameterSetVui` is a pointer to a `StdVideoH264SequenceParameterSetVui` structure that is interpreted as follows:
  - `reserved1` is used only for padding purposes and is otherwise ignored;
  - `flags.color_description_present_flag` is interpreted as the value of `colour_description_present_flag`, as defined in section E.2.1 of the ITU-T H.264 Specification;

    NOTE The name of `colour_description_present_flag` was misspelled in the Video Std header.

  - if `flags.nal_hrd_parameters_present_flag` or `flags.vcl_hrd_parameters_present_flag` is set, then the `StdVideoH264HrdParameters` structure pointed to by `pHrdParameters` is interpreted as follows:
    - `reserved1` is used only for padding purposes and is otherwise ignored;
    - all other members of `StdVideoH264HrdParameters` are interpreted as defined in section E.2.2 of the ITU-T H.264 Specification;
  - all other members of `StdVideoH264SequenceParameterSetVui` are interpreted as defined in section E.2.1 of the ITU-T H.264 Specification;
- all other members of `StdVideoH264SequenceParameterSet` are interpreted as defined in section 7.4.2.1 of the ITU-T H.264 Specification.

H.264 Picture Parameter Sets (PPS)

Represented by `StdVideoH264PictureParameterSet` structures and interpreted as follows:

- the pair constructed from `seq_parameter_set_id` and `pic_parameter_set_id` is used as the key of the PPS entry;
- if `flags.pic_scaling_matrix_present_flag` is set, then the `StdVideoH264ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
  - `scaling_list_present_mask` is a bitmask where bit index i corresponds to

pic_scaling_list_present_flag[i] as defined in section 7.4.2.2 of the ITU-T H.264 Specification;

- use_default_scaling_matrix_mask is a bitmask where bit index i corresponds to UseDefaultScalingMatrix4x4Flag[i], when i < 6, or corresponds to UseDefaultScalingMatrix8x8Flag[i-6], otherwise, as defined in section 7.3.2.2 of the ITU-T H.264 Specification;
- ScalingList4x4 and ScalingList8x8 correspond to the identically named syntax elements defined in section 7.3.2.2 of the ITU-T H.264 Specification;

- all other members of StdVideoH264PictureParameterSet are interpreted as defined in section 7.4.2.2 of the ITU-T H.264 Specification.

Implementations **may** override any of these parameters according to the semantics defined in the Video Encode Parameter Overrides section before storing the resulting H.264 parameter sets into the video session parameters object. Applications need to use the vkGetEncodedVideoSessionParametersKHR command to determine whether any implementation overrides happened and to retrieve the encoded H.264 parameter sets in order to be able to produce a compliant H.264 video bitstream.

Such H.264 parameter set overrides **may** also have cascading effects on the implementation overrides applied to the encoded bitstream produced by video encode operations. If the implementation supports the VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR video encode feedback query flag, then the application **can** use such queries to retrieve feedback about whether any implementation overrides have been applied to the encoded bitstream.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain **must** include a VkVideoEncodeH264SessionParametersCreateInfoKHR structure specifying the capacity and initial contents of the object.

The VkVideoEncodeH264SessionParametersCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersCreateInfoKHR {
    VkStructureType                                 sType;
    const void*                                     pNext;
    uint32_t                                        maxStdSPSCount;
    uint32_t                                        maxStdPPSCount;
    const VkVideoEncodeH264SessionParametersAddInfoKHR*    pParametersAddInfo;
} VkVideoEncodeH264SessionParametersCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxStdSPSCount is the maximum number of H.264 SPS entries the created VkVideoSessionParametersKHR **can** contain.
- maxStdPPSCount is the maximum number of H.264 PPS entries the created VkVideoSessionParametersKHR **can** contain.

- pParametersAddInfo is NULL or a pointer to a VkVideoEncodeH264SessionParametersAddInfoKHR structure specifying H.264 parameters to add upon object creation.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR
- VUID-VkVideoEncodeH264SessionParametersCreateInfoKHR-pParametersAddInfo-parameter
  If pParametersAddInfo is not NULL, pParametersAddInfo **must** be a valid pointer to a valid VkVideoEncodeH264SessionParametersAddInfoKHR structure

The VkVideoEncodeH264SessionParametersAddInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersAddInfoKHR {
    VkStructureType                              sType;
    const void*                                  pNext;
    uint32_t                                     stdSPSCount;
    const StdVideoH264SequenceParameterSet*      pStdSPSs;
    uint32_t                                     stdPPSCount;
    const StdVideoH264PictureParameterSet*       pStdPPSs;
} VkVideoEncodeH264SessionParametersAddInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stdSPSCount is the number of elements in the pStdSPSs array.
- pStdSPSs is a pointer to an array of StdVideoH264SequenceParameterSet structures describing the H.264 SPS entries to add.
- stdPPSCount is the number of elements in the pStdPPSs array.
- pStdPPSs is a pointer to an array of StdVideoH264PictureParameterSet structures describing the H.264 PPS entries to add.

This structure **can** be specified in the following places:

- In the pParametersAddInfo member of the VkVideoEncodeH264SessionParametersCreateInfoKHR structure specified in the pNext chain of VkVideoSessionParametersCreateInfoKHR used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).
- In the pNext chain of VkVideoSessionParametersUpdateInfoKHR. In this case, if the video codec operation the video session parameters object to be updated was created with is VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then it defines the set of parameters to add to it

(see Updating Video Session Parameters).

Valid Usage

- VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-None-04837
  The `seq_parameter_set_id` member of each `StdVideoH264SequenceParameterSet` structure specified in the elements of `pStdSPSs` **must** be unique within `pStdSPSs`
- VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-None-04838
  The pair constructed from the `seq_parameter_set_id` and `pic_parameter_set_id` members of each `StdVideoH264PictureParameterSet` structure specified in the elements of `pStdPPSs` **must** be unique within `pStdPPSs`

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR`
- VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-pStdSPSs-parameter
  If `stdSPSCount` is not `0`, and `pStdSPSs` is not `NULL`, `pStdSPSs` **must** be a valid pointer to an array of `stdSPSCount` `StdVideoH264SequenceParameterSet` values
- VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-pStdPPSs-parameter
  If `stdPPSCount` is not `0`, and `pStdPPSs` is not `NULL`, `pStdPPSs` **must** be a valid pointer to an array of `stdPPSCount` `StdVideoH264PictureParameterSet` values

The `VkVideoEncodeH264SessionParametersGetInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersGetInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           writeStdSPS;
    VkBool32           writeStdPPS;
    uint32_t           stdSPSId;
    uint32_t           stdPPSId;
} VkVideoEncodeH264SessionParametersGetInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `writeStdSPS` indicates whether the encoded H.264 sequence parameter set identified by `stdSPSId` is requested to be retrieved.
- `writeStdPPS` indicates whether the encoded H.264 picture parameter set identified by the pair constructed from `stdSPSId` and `stdPPSId` is requested to be retrieved.
- `stdSPSId` specifies the H.264 sequence parameter set ID used to identify the retrieved H.264 sequence and/or picture parameter set(s).

- `stdPPSId` specifies the H.264 picture parameter set ID used to identify the retrieved H.264 picture parameter set when `writeStdPPS` is `VK_TRUE`.

When this structure is specified in the `pNext` chain of the VkVideoEncodeSessionParametersGetInfoKHR structure passed to vkGetEncodedVideoSessionParametersKHR, the command will write encoded parameter data to the output buffer in the following order:

1. The H.264 sequence parameter set identified by `stdSPSId`, if `writeStdSPS` is `VK_TRUE`.
2. The H.264 picture parameter set identified by the pair constructed from `stdSPSId` and `stdPPSId`, if `writeStdPPS` is `VK_TRUE`.

Valid Usage

- VUID-VkVideoEncodeH264SessionParametersGetInfoKHR-writeStdSPS-08279
  At least one of `writeStdSPS` and `writeStdPPS` **must** be `VK_TRUE`

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersGetInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_GET_INFO_KHR`

The `VkVideoEncodeH264SessionParametersFeedbackInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersFeedbackInfoKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           hasStdSPSOverrides;
    VkBool32           hasStdPPSOverrides;
} VkVideoEncodeH264SessionParametersFeedbackInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hasStdSPSOverrides` indicates whether any of the parameters of the requested H.264 sequence parameter set, if one was requested via VkVideoEncodeH264SessionParametersGetInfoKHR ::`writeStdSPS`, were overridden by the implementation.
- `hasStdPPSOverrides` indicates whether any of the parameters of the requested H.264 picture parameter set, if one was requested via VkVideoEncodeH264SessionParametersGetInfoKHR ::`writeStdPPS`, were overridden by the implementation.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersFeedbackInfoKHR-sType-sType

sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_FEEDBACK_INFO_KHR

38.18.11. H.264 Encoding Parameters

The VkVideoEncodeH264PictureInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264PictureInfoKHR {
    VkStructureType                               sType;
    const void*                                   pNext;
    uint32_t                                      naluSliceEntryCount;
    const VkVideoEncodeH264NaluSliceInfoKHR*      pNaluSliceEntries;
    const StdVideoEncodeH264PictureInfo*          pStdPictureInfo;
    VkBool32                                      generatePrefixNalu;
} VkVideoEncodeH264PictureInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- naluSliceEntryCount is the number of elements in pNaluSliceEntries.
- pNaluSliceEntries is a pointer to an array of naluSliceEntryCount VkVideoEncodeH264NaluSliceInfoKHR structures specifying the parameters of the individual H.264 slices to encode for the input picture.
- pStdPictureInfo is a pointer to a StdVideoEncodeH264PictureInfo structure specifying H.264 picture information.
- generatePrefixNalu controls whether prefix NALUs are generated before slice NALUs into the target bitstream, as defined in sections 7.3.2.12 and 7.4.2.12 of the ITU-T H.264 Specification.

This structure is specified in the pNext chain of the VkVideoEncodeInfoKHR structure passed to vkCmdEncodeVideoKHR to specify the codec-specific picture information for an H.264 encode operation.

Encode Input Picture Information

When this structure is specified in the pNext chain of the VkVideoEncodeInfoKHR structure passed to vkCmdEncodeVideoKHR, the information related to the encode input picture is defined as follows:

- The image subregion used is determined according to the H.264 Encode Picture Data Access section.
- The encode input picture is associated with the H.264 picture information provided in pStdPictureInfo.

Std Picture Information

The members of the StdVideoEncodeH264PictureInfo structure pointed to by pStdPictureInfo are interpreted as follows:

- `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
- `flags.IdrPicFlag` as defined in section 7.4.1 of the ITU-T H.264 Specification;
- `flags.is_reference` as defined in section 3.136 of the ITU-T H.264 Specification;
- `seq_parameter_set_id` and `pic_parameter_set_id` are used to identify the active parameter sets, as described below;
- `primary_pic_type` as defined in section 7.4.2 of the ITU-T H.264 Specification;
- `PicOrderCnt` as defined in section 8.2 of the ITU-T H.264 Specification;
- `temporal_id` as defined in section G.7.4.1.1 of the ITU-T H.264 Specification;
- if `pRefLists` is not `NULL`, then it is a pointer to a `StdVideoEncodeH264ReferenceListsInfo` structure that is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - `ref_pic_list_modification_flag_l0` and `ref_pic_list_modification_flag_l1` as defined in section 7.4.3.1 of the ITU-T H.264 Specification;
  - `num_ref_idx_l0_active_minus1` and `num_ref_idx_l1_active_minus1` as defined in section 7.4.3 of the ITU-T H.264 Specification;
  - `RefPicList0` and `RefPicList1` as defined in section 8.2.4 of the ITU-T H.264 Specification where each element of these arrays either identifies an active reference picture using its DPB slot index or contains the value `STD_VIDEO_H264_NO_REFERENCE_PICTURE` to indicate “no reference picture”;
  - if `refList0ModOpCount` is not zero, then `pRefList0ModOperations` is a pointer to an array of `refList0ModOpCount` number of `StdVideoEncodeH264RefListModEntry` structures specifying the modification parameters for the reference list L0 as defined in section 7.4.3.1 of the ITU-T H.264 Specification;
  - if `refList1ModOpCount` is not zero, then `pRefList1ModOperations` is a pointer to an array of `refList1ModOpCount` number of `StdVideoEncodeH264RefListModEntry` structures specifying the modification parameters for the reference list L1 as defined in section 7.4.3.1 of the ITU-T H.264 Specification;
  - if `refPicMarkingOpCount` is not zero, then `refPicMarkingOperations` is a pointer to an array of `refPicMarkingOpCount` number of `StdVideoEncodeH264RefPicMarkingEntry` structures specifying the reference picture marking parameters as defined in section 7.4.3.3 of the ITU-T H.264 Specification;
- all other members are interpreted as defined in section 7.4.3 of the ITU-T H.264 Specification.

Reference picture setup is controlled by the value of `StdVideoEncodeH264PictureInfo::flags.is_reference`. If it is set and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the DPB slot specified in `pEncodeInfo->pSetupReferenceSlot->slotIndex`. If `StdVideoEncodeH264PictureInfo::flags.is_reference` is not set, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

Active Parameter Sets

The members of the `StdVideoEncodeH264PictureInfo` structure pointed to by `pStdPictureInfo` are

used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The *active SPS* is the SPS identified by the key specified in StdVideoEncodeH264PictureInfo::seq_parameter_set_id.
- The *active PPS* is the PPS identified by the key specified by the pair constructed from StdVideoEncodeH264PictureInfo::seq_parameter_set_id and StdVideoEncodeH264PictureInfo::pic_parameter_set_id.

H.264 encoding uses *explicit weighted sample prediction* for a slice, as defined in section 8.4.2.3 of the ITU-T H.264 Specification, if any of the following conditions are true for the active PPS and the pStdSliceHeader member of the corresponding element of pNaluSliceEntries:

- pStdSliceHeader->slice_type is STD_VIDEO_H264_SLICE_TYPE_P and weighted_pred_flag is enabled in the active PPS.
- pStdSliceHeader->slice_type is STD_VIDEO_H264_SLICE_TYPE_B and weighted_bipred_idc in the active PPS equals STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT.

Valid Usage

- VUID-VkVideoEncodeH264PictureInfoKHR-naluSliceEntryCount-08301
  naluSliceEntryCount **must** be between 1 and VkVideoEncodeH264CapabilitiesKHR::maxSliceCount, inclusive, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeH264PictureInfoKHR-flags-08304
  If VkVideoEncodeH264CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_KHR, then generatePrefixNalu **must** be VK_FALSE
- VUID-VkVideoEncodeH264PictureInfoKHR-flags-08314
  If VkVideoEncodeH264CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR and the slice corresponding to any element of pNaluSliceEntries uses explicit weighted sample prediction, then VkVideoEncodeH264NaluSliceInfoKHR::pStdSliceHeader->pWeightTable **must** not be NULL for that element of pNaluSliceEntries
- VUID-VkVideoEncodeH264PictureInfoKHR-flags-08315
  If VkVideoEncodeH264CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_KHR, then VkVideoEncodeH264NaluSliceInfoKHR::pStdSliceHeader->slice_type **must** be identical for all elements of pNaluSliceEntries

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264PictureInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PICTURE_INFO_KHR`
- VUID-VkVideoEncodeH264PictureInfoKHR-pNaluSliceEntries-parameter
  `pNaluSliceEntries` **must** be a valid pointer to an array of `naluSliceEntryCount` valid VkVideoEncodeH264NaluSliceInfoKHR structures
- VUID-VkVideoEncodeH264PictureInfoKHR-pStdPictureInfo-parameter
  `pStdPictureInfo` **must** be a valid pointer to a valid `StdVideoEncodeH264PictureInfo` value
- VUID-VkVideoEncodeH264PictureInfoKHR-naluSliceEntryCount-arraylength
  `naluSliceEntryCount` **must** be greater than `0`

The VkVideoEncodeH264NaluSliceInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264NaluSliceInfoKHR {
    VkStructureType                         sType;
    const void*                             pNext;
    int32_t                                 constantQp;
    const StdVideoEncodeH264SliceHeader*    pStdSliceHeader;
} VkVideoEncodeH264NaluSliceInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `constantQp` is the QP to use for the slice if the current rate control mode configured for the video session is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- `pStdSliceHeader` is a pointer to a `StdVideoEncodeH264SliceHeader` structure specifying H.264 slice header parameters for the slice.

Std Slice Header Parameters

The members of the `StdVideoEncodeH264SliceHeader` structure pointed to by `pStdSliceHeader` are interpreted as follows:

- `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
- if `pWeightTable` is not `NULL`, then it is a pointer to a `StdVideoEncodeH264WeightTable` that is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - all other members of `StdVideoEncodeH264WeightTable` are interpreted as defined in section 7.4.3.2 of the ITU-T H.264 Specification;
- all other members are interpreted as defined in section 7.4.3 of the ITU-T H.264 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264NaluSliceInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_NALU_SLICE_INFO_KHR`
- VUID-VkVideoEncodeH264NaluSliceInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkVideoEncodeH264NaluSliceInfoKHR-pStdSliceHeader-parameter
  `pStdSliceHeader` **must** be a valid pointer to a valid `StdVideoEncodeH264SliceHeader` value

The VkVideoEncodeH264DpbSlotInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264DpbSlotInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    const StdVideoEncodeH264ReferenceInfo*   pStdReferenceInfo;
} VkVideoEncodeH264DpbSlotInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoEncodeH264ReferenceInfo` structure specifying H.264 reference information.

This structure is specified in the `pNext` chain of VkVideoEncodeInfoKHR::`pSetupReferenceSlot`, if not `NULL`, and the `pNext` chain of the elements of VkVideoEncodeInfoKHR::`pReferenceSlots` to specify the codec-specific reference picture information for an H.264 encode operation.

Active Reference Picture Information

When this structure is specified in the `pNext` chain of the elements of VkVideoEncodeInfoKHR ::`pReferenceSlots`, one element is added to the list of active reference pictures used by the video encode operation for each element of VkVideoEncodeInfoKHR::`pReferenceSlots` as follows:

- The image subregion used is determined according to the H.264 Encode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the `slotIndex` member of the corresponding element of VkVideoEncodeInfoKHR::`pReferenceSlots`.
- The reference picture is associated with the H.264 reference information provided in `pStdReferenceInfo`.

Reconstructed Picture Information

When this structure is specified in the `pNext` chain of VkVideoEncodeInfoKHR ::`pSetupReferenceSlot`, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the H.264 Encode Picture Data Access

section.

- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in VkVideoEncodeInfoKHR::pSetupReferenceSlot->slotIndex.
- The reconstructed picture is associated with the H.264 reference information provided in pStdReferenceInfo.

Std Reference Information

The members of the StdVideoEncodeH264ReferenceInfo structure pointed to by pStdReferenceInfo are interpreted as follows:

- flags.reserved is used only for padding purposes and is otherwise ignored;
- flags.used_for_long_term_reference is used to indicate whether the picture is marked as "used for long-term reference" as defined in section 8.2.5.1 of the ITU-T H.264 Specification;
- primary_pic_type as defined in section 7.4.2 of the ITU-T H.264 Specification;
- long_term_pic_num and long_term_frame_idx as defined in section 7.4.3 of the ITU-T H.264 Specification;
- temporal_id as defined in section G.7.4.1.1 of the ITU-T H.264 Specification;
- all other members are interpreted as defined in section 8.2 of the ITU-T H.264 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264DpbSlotInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_DPB_SLOT_INFO_KHR
- VUID-VkVideoEncodeH264DpbSlotInfoKHR-pStdReferenceInfo-parameter
  pStdReferenceInfo **must** be a valid pointer to a valid StdVideoEncodeH264ReferenceInfo value

38.18.12. H.264 Encode Rate Control

Group of Pictures

In case of H.264 encoding it is common practice to follow a regular pattern of different picture types in display order when encoding subsequent frames. This pattern is referred to as the *group of pictures* (GOP).

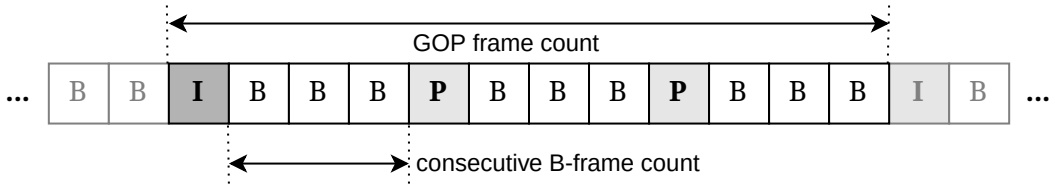
A regular GOP is defined by the following parameters:

- The number of frames in the GOP;
- The number of consecutive B frames between I and/or P frames in display order.

GOPs are further classified as *open* and *closed* GOPs.

Frame types in an open GOP follow each other in display order according to the following algorithm:

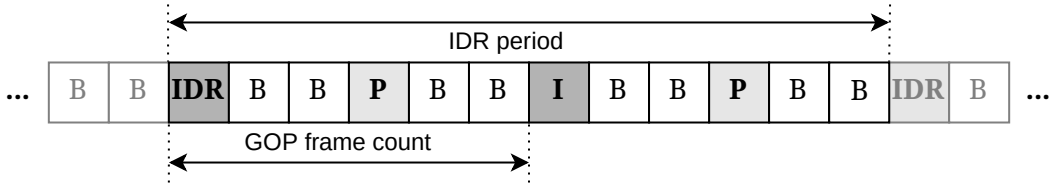
1. The first frame is always an I frame.
2. This is followed by a number of consecutive B frames, as defined above.
3. If the number of frames in the GOP is not reached yet, then the next frame is a P frame and the algorithm continues from step 2.



Text is not SVG - cannot display

Figure 26. H.264 open GOP

In case of a closed GOP, an IDR frame is used at a certain period.



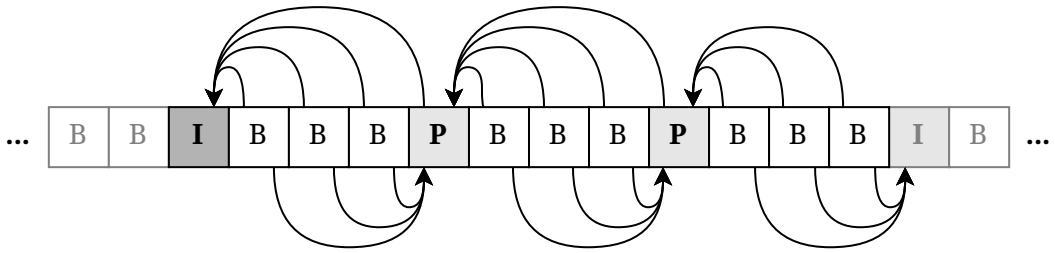
Text is not SVG - cannot display

Figure 27. H.264 closed GOP

It is also typical for H.264 encoding to use specific reference picture usage patterns across the frames of the GOP. The two most common reference patterns used are as follows:

Flat Reference Pattern

- Each P frame uses the last non-B frame, in display order, as reference.
- Each B frame uses the last non-B frame, in display order, as its forward reference, and uses the next non-B frame, in display order, as its backward reference.

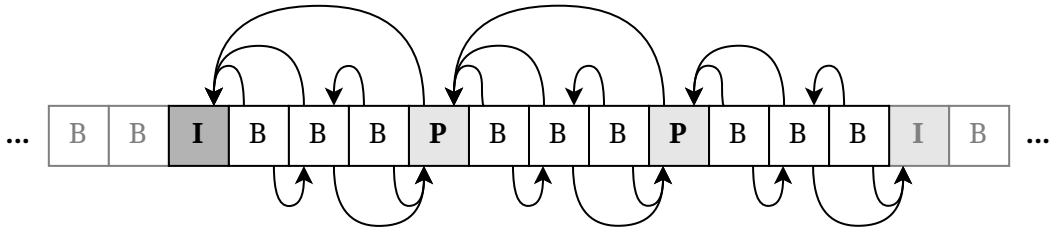


Text is not SVG - cannot display

Figure 28. H.264 flat reference pattern

Dyadic Reference Pattern

- Each P frame uses the last non-B frame, in display order, as reference.
- The following algorithm is applied to the sequence of consecutive B frames between I and/or P frames in display order:
  1. The B frame in the middle of this sequence uses the frame preceding the sequence as its forward reference, and uses the frame following the sequence as its backward reference.
  2. The algorithm is executed recursively for the following frame sequences:
     - The B frames of the original sequence preceding the frame in the middle, if any.
     - The B frames of the original sequence following the frame in the middle, if any.



Text is not SVG - cannot display

Figure 29. H.264 dyadic reference pattern

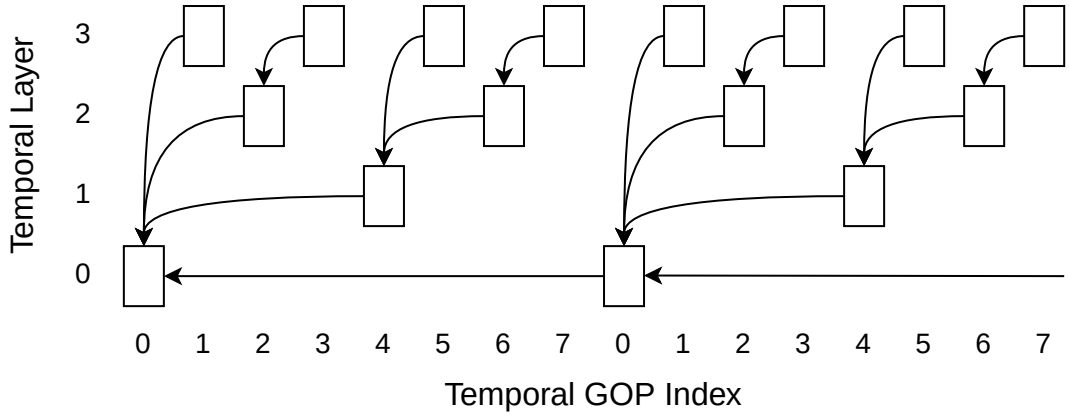
The application **can** provide guidance to the implementation's rate control algorithm about the structure of the GOP used by the application. Any such guidance about the GOP and its structure does not mandate that specific GOP structure to be used by the application, as the picture type of individual encoded pictures is still application-controlled, however, any deviation from the provided guidance **may** result in undesired rate control behavior including, but not limited, to the implementation not being able to conform to the expected average or target bitrates, or other rate control parameters specified by the application.

When an H.264 encode session is used to encode multiple temporal layers, it is also common practice to follow a regular pattern for the H.264 temporal ID for the encoded pictures in display order when encoding subsequent frames. This pattern is referred to as the *temporal GOP*. The most

common temporal layer pattern used is as follows:

Dyadic Temporal Layer Pattern

- The number of frames in the temporal GOP is 2^{n-1}, where n is the number of temporal layers.
- The i^{th} frame in the temporal GOP uses temporal ID t, if and only if the index of the least significant bit set in i equals n-t-1, except for the first frame, which is the only frame in the temporal GOP using temporal ID zero.
- The i^{th} frame in the temporal GOP uses the r^{th} frame as reference, where r is calculated from i by clearing the least significant bit set in it, except for the first frame in the temporal GOP, which uses the first frame of the previous temporal GOP, if any, as reference.



Text is not SVG - cannot display

Figure 30. H.264 dyadic temporal layer pattern

NOTE	Multi-layer rate control and multi-layer coding are typically used for streaming cases where low latency is expected, hence B pictures with backward prediction are usually not used.

The `VkVideoEncodeH264RateControlInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264RateControlInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    VkVideoEncodeH264RateControlFlagsKHR     flags;
    uint32_t                                 gopFrameCount;
    uint32_t                                 idrPeriod;
    uint32_t                                 consecutiveBFrameCount;
    uint32_t                                 temporalLayerCount;
} VkVideoEncodeH264RateControlInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkVideoEncodeH264RateControlFlagBitsKHR specifying H.264 rate control flags.
- `gopFrameCount` is the number of frames within a group of pictures (GOP) intended to be used by the application. If it is 0, the rate control algorithm **may** assume an implementation-dependent GOP length. If it is `UINT32_MAX`, the GOP length is treated as infinite.
- `idrPeriod` is the interval, in terms of number of frames, between two IDR frames (see IDR period). If it is 0, the rate control algorithm **may** assume an implementation-dependent IDR period. If it is `UINT32_MAX`, the IDR period is treated as infinite.
- `consecutiveBFrameCount` is the number of consecutive B frames between I and/or P frames within the GOP.
- `temporalLayerCount` specifies the number of H.264 temporal layers that the application intends to use.

When an instance of this structure is included in the `pNext` chain of the VkVideoCodingControlInfoKHR structure passed to the vkCmdControlVideoCodingKHR command, and VkVideoCodingControlInfoKHR::`flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, the parameters in this structure are used as guidance for the implementation's rate control algorithm (see Video Coding Control).

If `flags` includes `VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR`, then the rate control state is reset to an initial state to meet HRD compliance requirements. Otherwise the new rate control state **may** be applied without a reset depending on the implementation and the specified rate control parameters.

NOTE It would be possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided to the video encode operation.

Valid Usage

- VUID-VkVideoEncodeH264RateControlInfoKHR-flags-08280
  If VkVideoEncodeH264CapabilitiesKHR::`flags`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include `VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_KHR`, then `flags` **must** not contain `VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR`
- VUID-VkVideoEncodeH264RateControlInfoKHR-flags-08281
  If `flags` contains `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR` or `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`, then it **must** also contain `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_KHR`
- VUID-VkVideoEncodeH264RateControlInfoKHR-flags-08282
  If `flags` contains `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR`, then it **must** not also contain `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`

- VUID-VkVideoEncodeH264RateControlInfoKHR-flags-08283
  If `flags` contains `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_KHR`, then `gopFrameCount` **must** be greater than `0`
- VUID-VkVideoEncodeH264RateControlInfoKHR-idrPeriod-08284
  If `idrPeriod` is not `0`, then it **must** be greater than or equal to `gopFrameCount`
- VUID-VkVideoEncodeH264RateControlInfoKHR-consecutiveBFrameCount-08285
  If `consecutiveBFrameCount` is not `0`, then it **must** be less than `gopFrameCount`

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264RateControlInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_INFO_KHR`
- VUID-VkVideoEncodeH264RateControlInfoKHR-flags-parameter
  `flags` **must** be a valid combination of VkVideoEncodeH264RateControlFlagBitsKHR values

Bits which **can** be set in VkVideoEncodeH264RateControlInfoKHR::`flags`, specifying H.264 rate control flags, are:

```
// Provided by VK_KHR_video_encode_h264
typedef enum VkVideoEncodeH264RateControlFlagBitsKHR {
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_TEMPORAL_LAYER_PATTERN_DYADIC_BIT_KHR =
0x00000010,
} VkVideoEncodeH264RateControlFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR` specifies that rate control **should** attempt to produce an HRD compliant bitstream, as defined in annex C of the ITU-T H.264 Specification.
- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_KHR` specifies that the application intends to use a regular GOP structure according to the parameters specified in the `gopFrameCount`, `idrPeriod`, and `consecutiveBFrameCount` members of the VkVideoEncodeH264RateControlInfoKHR structure.
- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR` specifies that the application intends to follow a flat reference pattern in the GOP.
- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR` specifies that the application intends to follow a dyadic reference pattern in the GOP.
- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_TEMPORAL_LAYER_PATTERN_DYADIC_BIT_KHR` specifies that the application intends to follow a dyadic temporal layer pattern.

```
// Provided by VK_KHR_video_encode_h264
typedef VkFlags VkVideoEncodeH264RateControlFlagsKHR;
```

VkVideoEncodeH264RateControlFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeH264RateControlFlagBitsKHR.

Rate Control Layers

The VkVideoEncodeH264RateControlLayerInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264RateControlLayerInfoKHR {
    VkStructureType                  sType;
    const void*                      pNext;
    VkBool32                         useMinQp;
    VkVideoEncodeH264QpKHR           minQp;
    VkBool32                         useMaxQp;
    VkVideoEncodeH264QpKHR           maxQp;
    VkBool32                         useMaxFrameSize;
    VkVideoEncodeH264FrameSizeKHR    maxFrameSize;
} VkVideoEncodeH264RateControlLayerInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- useMinQp indicates whether the QP values determined by rate control will be clamped to the lower bounds on the QP values specified in minQp.
- minQp specifies the lower bounds on the QP values, for each picture type, that the implementation's rate control algorithm will use when useMinQp is VK_TRUE.
- useMaxQp indicates whether the QP values determined by rate control will be clamped to the upper bounds on the QP values specified in maxQp.
- maxQp specifies the upper bounds on the QP values, for each picture type, that the implementation's rate control algorithm will use when useMaxQp is VK_TRUE.
- useMaxFrameSize indicates whether the implementation's rate control algorithm **should** use the values specified in maxFrameSize as the upper bounds on the encoded frame size for each picture type.
- maxFrameSize specifies the upper bounds on the encoded frame size, for each picture type, when useMaxFrameSize is VK_TRUE.

When used, the values in minQp and maxQp guarantee that the effective QP values used by the implementation will respect those lower and upper bounds, respectively. However, limiting the range of QP values that the implementation is able to use will also limit the capabilities of the implementation's rate control algorithm to comply to other constraints. In particular, the implementation **may** not be able to comply to the following:

- The average and/or peak bitrate values to be used for the encoded bitstream specified in the

`averageBitrate` and `maxBitrate` members of the VkVideoEncodeRateControlLayerInfoKHR structure.

- The upper bounds on the encoded frame size, for each picture type, specified in the `maxFrameSize` member of `VkVideoEncodeH264RateControlLayerInfoKHR`.

NOTE	In general, applications need to configure rate control parameters appropriately in order to be able to get the desired rate control behavior, as described in the Video Encode Rate Control section.

When an instance of this structure is included in the `pNext` chain of a VkVideoEncodeRateControlLayerInfoKHR structure specified in one of the elements of the `pLayers` array member of the VkVideoEncodeRateControlInfoKHR structure passed to the vkCmdControlVideoCodingKHR command, VkVideoCodingControlInfoKHR::`flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, and the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, it specifies the H.264-specific rate control parameters of the rate control layer corresponding to that element of `pLayers`.

Valid Usage

- VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMinQp-08286
  If `useMinQp` is `VK_TRUE`, then the `qpI`, `qpP`, and `qpB` members of `minQp` **must** all be between VkVideoEncodeH264CapabilitiesKHR::`minQp` and VkVideoEncodeH264CapabilitiesKHR::`maxQp`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMaxQp-08287
  If `useMaxQp` is `VK_TRUE`, then the `qpI`, `qpP`, and `qpB` members of `maxQp` **must** all be between VkVideoEncodeH264CapabilitiesKHR::`minQp` and VkVideoEncodeH264CapabilitiesKHR::`maxQp`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMinQp-08288
  If `useMinQp` is `VK_TRUE` and VkVideoEncodeH264CapabilitiesKHR::`flags`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include `VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR`, then the `qpI`, `qpP`, and `qpB` members of `minQp` **must** all specify the same value
- VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMaxQp-08289
  If `useMaxQp` is `VK_TRUE` and VkVideoEncodeH264CapabilitiesKHR::`flags`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include `VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR`, then the `qpI`, `qpP`, and `qpB` members of `maxQp` **must** all specify the same value
- VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMinQp-08374
  If `useMinQp` and `useMaxQp` are both `VK_TRUE`, then the `qpI`, `qpP`, and `qpB` members of `minQp` **must** all be less than or equal to the respective members of `maxQp`

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264RateControlLayerInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_LAYER_INFO_KHR`
- VUID-VkVideoEncodeH264RateControlLayerInfoKHR-minQp-parameter
  `minQp` **must** be a valid VkVideoEncodeH264QpKHR structure
- VUID-VkVideoEncodeH264RateControlLayerInfoKHR-maxQp-parameter
  `maxQp` **must** be a valid VkVideoEncodeH264QpKHR structure
- VUID-VkVideoEncodeH264RateControlLayerInfoKHR-maxFrameSize-parameter
  `maxFrameSize` **must** be a valid VkVideoEncodeH264FrameSizeKHR structure

The `VkVideoEncodeH264QpKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264QpKHR {
    int32_t    qpI;
    int32_t    qpP;
    int32_t    qpB;
} VkVideoEncodeH264QpKHR;
```

- `qpI` is the QP to be used for I pictures.
- `qpP` is the QP to be used for P pictures.
- `qpB` is the QP to be used for B pictures.

The `VkVideoEncodeH264FrameSizeKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264FrameSizeKHR {
    uint32_t    frameISize;
    uint32_t    framePSize;
    uint32_t    frameBSize;
} VkVideoEncodeH264FrameSizeKHR;
```

- `frameISize` is the size in bytes to be used for I pictures.
- `framePSize` is the size in bytes to be used for P pictures.
- `frameBSize` is the size in bytes to be used for B pictures.

GOP Remaining Frames

Besides session level rate control configuration, the application **can** specify the number of frames per frame type remaining in the group of pictures (GOP).

The `VkVideoEncodeH264GopRemainingFrameInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264GopRemainingFrameInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           useGopRemainingFrames;
    uint32_t           gopRemainingI;
    uint32_t           gopRemainingP;
    uint32_t           gopRemainingB;
} VkVideoEncodeH264GopRemainingFrameInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `useGopRemainingFrames` indicates whether the implementation's rate control algorithm **should** use the values specified in `gopRemainingI`, `gopRemainingP`, and `gopRemainingB`. If `useGopRemainingFrames` is `VK_FALSE`, then the values of `gopRemainingI`, `gopRemainingP`, and `gopRemainingB` are ignored.
- `gopRemainingI` specifies the number of I frames the implementation's rate control algorithm **should** assume to be remaining in the GOP prior to executing the video encode operation.
- `gopRemainingP` specifies the number of P frames the implementation's rate control algorithm **should** assume to be remaining in the GOP prior to executing the video encode operation.
- `gopRemainingB` specifies the number of B frames the implementation's rate control algorithm **should** assume to be remaining in the GOP prior to executing the video encode operation.

Setting `useGopRemainingFrames` to `VK_TRUE` and including this structure in the `pNext` chain of VkVideoBeginCodingInfoKHR is only mandatory if the VkVideoEncodeH264CapabilitiesKHR ::`requiresGopRemainingFrames` reported for the used video profile is `VK_TRUE`. However, implementations **may** use these remaining frame counts, when specified, even when it is not required. In particular, when the application does not use a regular GOP structure, these values **may** provide additional guidance for the implementation's rate control algorithm.

The VkVideoEncodeH264CapabilitiesKHR::`prefersGopRemainingFrames` capability is also used to indicate that the implementation's rate control algorithm **may** operate more accurately if the application specifies the remaining frame counts using this structure.

As with other rate control guidance values, if the effective order and number of frames encoded by the application are not in line with the remaining frame counts specified in this structure at any given point, then the behavior of the implementation's rate control algorithm **may** deviate from the one expected by the application.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264GopRemainingFrameInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_GOP_REMAINING_FRAME_INFO_KHR`

H.264 QP Delta Maps

Quantization delta maps used with an H.264 encode profile are referred to as *QP delta maps* and their texels contain integer values representing QP delta values that are applied in the process of determining the quantization parameters of the encoded picture.

Accordingly, H.264 QP delta maps always have single channel integer formats, as reported in VkVideoFormatPropertiesKHR::`format`.

When the rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, the QP delta values are added to the per slice constant QP values that, in effect, enable the application to explicitly control the used QP values at the granularity of the used quantization map texel size.

For all other rate control modes, the QP delta values **can** be used to offset the QP values that the rate control algorithm would otherwise produce.

H.264 Encode Quantization

Performing H.264 encode operations involves the process of assigning QP values to individual H.264 macroblocks. This process depends on the used rate control mode, as well as other encode and rate control parameters, as described below:

- If the configured rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR`, then the QP value is initialized by the implementation-specific default rate control algorithm.
  - If the video encode operation is issued with a quantization delta map, the QP delta value corresponding to the macroblock, as fetched from the quantization map, is added to the previously determined QP value. If the fetched QP delta value falls outside the supported QP delta value range reported in the `minQpDelta` and `maxQpDelta` members of VkVideoEncodeH264QuantizationMapCapabilitiesKHR, then the QP value used for the macroblock becomes undefined.
- If the configured rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, then the QP value is initialized from the constant QP value specified for the H.264 slice the macroblock is part of.
  - If the video encode operation is issued with a quantization delta map, the QP delta value corresponding to the macroblock, as fetched from the quantization map, is added to the previously determined QP value. If the fetched QP delta value falls outside the supported QP delta value range reported in the `minQpDelta` and `maxQpDelta` members of VkVideoEncodeH264QuantizationMapCapabilitiesKHR, then the QP value used for the macroblock becomes undefined.
- If the configured rate control mode is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, then the QP value is initialized by the corresponding rate control algorithm.
  - If the video encode operation is issued with a quantization delta map, the QP delta value corresponding to the macroblock, as fetched from the quantization map, is added to the previously determined QP value. If the fetched QP delta value falls outside the supported QP delta value range reported in the `minQpDelta` and `maxQpDelta` members of VkVideoEncodeH264QuantizationMapCapabilitiesKHR, then the QP value used for the

macroblock becomes undefined.

- If the video encode operation is issued with an emphasis map, the rate control will adjust the QP value based on the emphasis value corresponding to the macroblock, as fetched from the quantization map, according to the following equation:

  $QP_{new} = f(QP_{prev},e)$

  Where QP_{new} is the resulting QP value, QP_{prev} is the previously determined QP value, e is the emphasis value corresponding to the macroblock, and f is an implementation-defined function for which the following implication is true:

  $e_1 < e_2 \Rightarrow f(QP,e_1) \geq f(QP,e_2)$

  > **NOTE** This means that lower emphasis values will result in higher QP values, whereas higher emphasis values will result in lower QP values, but the function is not strictly decreasing with respect to the input emphasis value for a given input QP value.

- If clamping to minimum QP values is enabled in the applied rate control layer, then the QP value is clamped to the corresponding minimum QP value.
- If clamping to maximum QP values is enabled in the applied rate control layer, then the QP value is clamped to the corresponding maximum QP value.

- If `VK_VIDEO_ENCODE_H264_CAPABILITY_MB_QP_DIFF_WRAPAROUND_BIT_KHR` is not supported, then the determined QP value is clamped in such a way that the `mb_qp_delta` value of the encoded macroblock complies to the modified version of equation 7-37 of the ITU-T H.264 Specification.

  > **NOTE** The effect of this is that the maximum QP difference across subsequent macroblocks is limited to the $[-(26 + QpBdOffset_Y / 2), 25 + QpBdOffset_Y / 2]$ range and only has an observable change in behavior when the video encode operation is issued with a QP delta map.

- In all cases, the final QP value is clamped to the QP value range supported by the video profile, as reported in the `minQp` and `maxQp` members of VkVideoEncodeH264CapabilitiesKHR.

38.18.13. H.264 Encode Requirements

This section described the **required** H.264 encoding capabilities for physical devices that have at least one queue family that supports the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, as returned by vkGetPhysicalDeviceQueueFamilyProperties2KHR in VkQueueFamilyVideoPropertiesKHR ::`videoCodecOperations`.

Table 53. Required Video Std Header Versions

Video Std Header Name	Version
`vulkan_video_codec_h264std_encode`	1.0.0

Table 54. Required Video Capabilities

Video Capability	Requirement	Requirement Type[1]
VkVideoCapabilitiesKHR		
flags	-	min
minBitstreamBufferOffsetAlignment	4096	max
minBitstreamBufferSizeAlignment	4096	max
pictureAccessGranularity	(64,64)	max
minCodedExtent	-	max
maxCodedExtent	-	min
maxDpbSlots	0	min
maxActiveReferencePictures	0	min
VkVideoEncodeCapabilitiesKHR		
flags	-	min
rateControlModes	-	min
maxBitrate	64000	min
maxQualityLevels	1	min
encodeInputPictureGranularity	(64,64)	max
supportedEncodeFeedbackFlags	VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR	min
VkVideoEncodeH264CapabilitiesKHR		
flags	-	min
maxLevelIdc	STD_VIDEO_H264_LEVEL_IDC_1_0	min
maxSliceCount	1	min
maxPPictureL0ReferenceCount	0	min
maxBPictureL0ReferenceCount	0	min
maxL1ReferenceCount	0	min
maxTemporalLayerCount	1	min
expectDyadicTemporalLayerPattern	-	implementation-dependent
minQp	-	max
maxQp	-	min
prefersGopRemainingFrames	-	implementation-dependent

Video Capability	Requirement	Requirement Type[1]
`requiresGopRemainingFrames`	-	implementation-dependent
`stdSyntaxFlags`	-	min
VkVideoEncodeQuantizationMapCapabilitiesKHR		
`maxQuantizationMapExtent`	-[2]	min
VkVideoEncodeH264QuantizationMapCapabilitiesKHR		
`minQpDelta`	-[3]	max
`maxQpDelta`	-[3]	min

1 The **Requirement Type** column specifies the requirement is either the minimum value all implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

2 If VkVideoCapabilitiesKHR::`flags` includes `VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR` or `VK_VIDEO_ENCODE_CAPABILITY_EMPHASIS_MAP_BIT_KHR`, then the `width` and `height` members of `maxQuantizationMapExtent` **must** be greater than zero.

3 If VkVideoCapabilitiesKHR::`flags` includes `VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR`, then `maxQpDelta` **must** be greater than `minQpDelta`.

38.19. H.265 Encode Operations

Video encode operations using an H.265 encode profile **can** be used to encode elementary video stream sequences compliant to the ITU-T H.265 Specification.

> **NOTE** Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video encode operation steps with the codec-specific semantics defined in section 8 of the ITU-T H.265 Specification as follows:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The `StdVideoH265VideoParameterSet` structure corresponding to the active VPS specifying the

H.265 video parameter set.

  - The `StdVideoH265SequenceParameterSet` structure corresponding to the active SPS specifying the H.265 sequence parameter set.
  - The `StdVideoH265PictureParameterSet` structure corresponding to the active PPS specifying the H.265 picture parameter set.
  - The `StdVideoEncodeH265PictureInfo` structure specifying the H.265 picture information.
  - The `StdVideoEncodeH265SliceSegmentHeader` structures specifying the H.265 slice segment header parameters for each encoded H.265 slice segment.
  - The `StdVideoEncodeH265ReferenceInfo` structures specifying the H.265 reference information corresponding to the optional reconstructed picture and any active reference pictures.

- The encoded bitstream data is written to the destination video bitstream buffer range as defined in the H.265 Encode Bitstream Data Access section.
- Picture data in the video picture resources corresponding to the used encode input picture, active reference pictures, and optional reconstructed picture is accessed as defined in the H.265 Encode Picture Data Access section.
- The decision on reference picture setup is made according to the parameters specified in the H.265 picture information.

If the parameters adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.265 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video encode operation will complete successfully. Otherwise, the video encode operation **may** complete unsuccessfully.

38.19.1. H.265 Encode Parameter Overrides

Implementations **may** override, unless otherwise specified, any of the H.265 encode parameters specified in the following Video Std structures:

- `StdVideoH265VideoParameterSet`
- `StdVideoH265SequenceParameterSet`
- `StdVideoH265PictureParameterSet`
- `StdVideoEncodeH265PictureInfo`
- `StdVideoEncodeH265SliceSegmentHeader`
- `StdVideoEncodeH265ReferenceInfo`

All such H.265 encode parameter overrides **must** fulfill the conditions defined in the Video Encode Parameter Overrides section.

In addition, implementations **must** not override any of the following H.265 encode parameters:

- `StdVideoEncodeH265PictureInfo`::`pic_type`
- `StdVideoEncodeH265SliceSegmentHeader`::`slice_type`

In case of a video session parameters object created with

VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, the following H.265 SPS and PPS parameters **may** be overridden by the implementation according to the quantization map texel size the video session parameters object was created with:

- StdVideoH265SequenceParameterSet::log2_min_luma_coding_block_size_minus3
- StdVideoH265SequenceParameterSet::log2_diff_max_min_luma_coding_block_size
- StdVideoH265SequenceParameterSet::log2_min_pcm_luma_coding_block_size_minus3
- StdVideoH265SequenceParameterSet::log2_diff_max_min_pcm_luma_coding_block_size
- StdVideoH265PictureParameterSet::diff_cu_qp_delta_depth

This **may** be necessary in order to limit the set of H.265 coding unit and coding tree unit sizes used during picture encoding to those that are supported by the implementation when using the specific quantization map texel size.

In case of H.265 encode parameters stored in video session parameters objects, applications need to use the vkGetEncodedVideoSessionParametersKHR command to determine whether any implementation overrides happened. If the query indicates that implementation overrides were applied, then the application needs to retrieve and use the encoded H.265 parameter sets in the bitstream in order to be able to produce a compliant H.265 video bitstream using the H.265 encode parameters stored in the video session parameters object.

In case of any H.265 encode parameters stored in the encoded bitstream produced by video encode operations, if the implementation supports the VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR video encode feedback query flag, the application **can** use such queries to retrieve feedback about whether any implementation overrides have been applied to those H.265 encode parameters.

38.19.2. H.265 Encode Bitstream Data Access

Each video encode operation writes one or more VCL NAL units comprising of slice segment headers and data of the encoded picture, in the format defined in sections 7.3.6 and 7.3.8, according to the semantics defined in sections 7.4.7 and 7.4.9 of the ITU-T H.265 Specification, respectively. The number of VCL NAL units written is specified by VkVideoEncodeH265PictureInfoKHR::naluSliceSegmentEntryCount.

38.19.3. H.265 Encode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::pictureAccessGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. Accordingly, the complete image subregion of a encode input picture, reference picture, or reconstructed picture accessed by video coding operations using an H.265 encode profile is defined as the set of texels within the coordinate range:

([0,endX), [0,endY))

Where:

- endX equals codedExtent.width rounded up to the nearest integer multiple of pictureAccessGranularity.width and clamped to the width of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;
- endY equals codedExtent.height rounded up to the nearest integer multiple of pictureAccessGranularity.height and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;

Where codedExtent is the member of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.

In case of video encode operations using an H.265 encode profile, any access to a picture at the coordinates (x,y), as defined by the ITU-T H.265 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel coordinates (x,y).

Implementations **may** choose not to access some or all texels within particular reference pictures available to a video encode operation (e.g. due to video encode parameter overrides restricting the effective set of used reference pictures, or if the encoding algorithm chooses not to use certain subregions of the reference picture data for sample prediction).

38.19.4. H.265 Frame, Picture, Slice Segments, and Tiles

H.265 pictures consist of one or more slices, slice segments, and tiles, as defined in section 6.3.1 of the ITU-T H.265 Specification.

For the purposes of this specification, the H.265 slice segments comprising a picture are referred to as the *picture partitions* of the picture.

Video encode operations using an H.265 encode profile **can** encode slice segments of different types, as defined in section 7.4.7.1 of the ITU-T H.265 Specification, by specifying the corresponding enumeration constant value in StdVideoEncodeH265SliceSegmentHeader::slice_type in the H.265 slice segment header parameters from the Video Std enumeration type StdVideoH265SliceType:

- STD_VIDEO_H265_SLICE_TYPE_B indicates that the slice segment is part of a *B slice* as defined in section 3.12 of the ITU-T H.265 Specification.
- STD_VIDEO_H265_SLICE_TYPE_P indicates that the slice segment is part of a *P slice* as defined in section 3.111 of the ITU-T H.265 Specification.
- STD_VIDEO_H265_SLICE_TYPE_I indicates that the slice segment is part of an *I slice* as defined in section 3.74 of the ITU-T H.265 Specification.

Pictures constructed from such slice segments **can** be of different types, as defined in section 7.4.3.5 of the ITU-T H.265 Specification. Video encode operations using an H.265 encode profile **can** encode pictures of a specific type by specifying the corresponding enumeration constant value in StdVideoEncodeH265PictureInfo::pic_type in the H.265 picture information from the Video Std enumeration type StdVideoH265PictureType:

- STD_VIDEO_H265_PICTURE_TYPE_P indicates that the picture is a *P picture*. A frame consisting of a P picture is also referred to as a *P frame*.

- STD_VIDEO_H265_PICTURE_TYPE_B indicates that the picture is a *B picture*. A frame consisting of a B picture is also referred to as a *B frame*.
- STD_VIDEO_H265_PICTURE_TYPE_I indicates that the picture is an *I picture*. A frame consisting of an I picture is also referred to as an *I frame*.
- STD_VIDEO_H265_PICTURE_TYPE_IDR indicates that the picture is a special type of I picture called an *IDR picture* as defined in section 3.67 of the ITU-T H.265 Specification. A frame consisting of an IDR picture is also referred to as an *IDR frame*.

38.19.5. H.265 Coding Blocks

H.265 encode supports two types of coding blocks:

- *Coding tree unit*, as defined in section 3.35 of the ITU-T H.265 Specification.
- *Coding unit*, as defined in section 3.36 of the ITU-T H.265 Specification.

38.19.6. H.265 Encode Profile

A video profile supporting H.265 video encode operations is specified by setting VkVideoProfileInfoKHR::videoCodecOperation to VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and adding a VkVideoEncodeH265ProfileInfoKHR structure to the VkVideoProfileInfoKHR::pNext chain.

The VkVideoEncodeH265ProfileInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265ProfileInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    StdVideoH265ProfileIdc    stdProfileIdc;
} VkVideoEncodeH265ProfileInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stdProfileIdc is a StdVideoH265ProfileIdc value specifying the H.265 codec profile IDC, as defined in section A.3 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265ProfileInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PROFILE_INFO_KHR

38.19.7. H.265 Encode Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities for an H.265 encode profile, the VkVideoCapabilitiesKHR::pNext chain **must** include a VkVideoEncodeH265CapabilitiesKHR structure that will be filled with the profile-specific capabilities.

The VkVideoEncodeH265CapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265CapabilitiesKHR {
    VkStructureType                                 sType;
    void*                                           pNext;
    VkVideoEncodeH265CapabilityFlagsKHR             flags;
    StdVideoH265LevelIdc                            maxLevelIdc;
    uint32_t                                        maxSliceSegmentCount;
    VkExtent2D                                      maxTiles;
    VkVideoEncodeH265CtbSizeFlagsKHR                ctbSizes;
    VkVideoEncodeH265TransformBlockSizeFlagsKHR     transformBlockSizes;
    uint32_t                                        maxPPictureL0ReferenceCount;
    uint32_t                                        maxBPictureL0ReferenceCount;
    uint32_t                                        maxL1ReferenceCount;
    uint32_t                                        maxSubLayerCount;
    VkBool32
expectDyadicTemporalSubLayerPattern;
    int32_t                                         minQp;
    int32_t                                         maxQp;
    VkBool32                                        prefersGopRemainingFrames;
    VkBool32                                        requiresGopRemainingFrames;
    VkVideoEncodeH265StdFlagsKHR                    stdSyntaxFlags;
} VkVideoEncodeH265CapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkVideoEncodeH265CapabilityFlagBitsKHR indicating supported H.265 encoding capabilities.
- maxLevelIdc is a StdVideoH265LevelIdc value indicating the maximum H.265 level supported by the profile, where enum constant STD_VIDEO_H265_LEVEL_IDC_<major>_<minor> identifies H.265 level <major>.<minor> as defined in section A.4 of the ITU-T H.265 Specification.
- maxSliceSegmentCount indicates the maximum number of slice segments that **can** be encoded for a single picture. Further restrictions **may** apply to the number of slice segments that **can** be encoded for a single picture depending on other capabilities and codec-specific rules.
- maxTiles indicates the maximum number of H.265 tile columns and rows, as defined in sections 3.175 and 3.176 of the ITU-T H.265 Specification that **can** be encoded for a single picture. Further restrictions **may** apply to the number of H.265 tiles that **can** be encoded for a single picture depending on other capabilities and codec-specific rules.
- ctbSizes is a bitmask of VkVideoEncodeH265CtbSizeFlagBitsKHR describing the supported CTB sizes.
- transformBlockSizes is a bitmask of VkVideoEncodeH265TransformBlockSizeFlagBitsKHR describing the supported transform block sizes.
- maxPPictureL0ReferenceCount indicates the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.

NOTE	As implementations **may** override the reference lists, `maxPPictureL0ReferenceCount` does not limit the number of elements that the application **can** specify in the L0 reference list for P pictures. However, if `maxPPictureL0ReferenceCount` is zero, then the use of P pictures is not allowed. In case of H.265 encoding, pictures **can** be encoded using only forward prediction even if P pictures are not supported, as the ITU-T H.265 Specification supports *generalized P & B frames* (also known as low delay B frames) whereas B frames **can** refer to past frames through both the L0 and L1 reference lists.

- `maxBPictureL0ReferenceCount` indicates the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures.
- `maxL1ReferenceCount` indicates the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported.

NOTE	As implementations **may** override the reference lists, `maxBPictureL0ReferenceCount` and `maxL1ReferenceCount` does not limit the number of elements that the application **can** specify in the L0 and L1 reference lists for B pictures. However, if `maxBPictureL0ReferenceCount` and `maxL1ReferenceCount` are both zero, then the use of B pictures is not allowed.

- `maxSubLayerCount` indicates the maximum number of H.265 sub-layers supported by the implementation.
- `expectDyadicTemporalSubLayerPattern` indicates that the implementation's rate control algorithms expect the application to use a dyadic temporal sub-layer pattern when encoding multiple temporal sub-layers.
- `minQp` indicates the minimum QP value supported.
- `maxQp` indicates the maximum QP value supported.
- `prefersGopRemainingFrames` indicates that the implementation's rate control algorithm prefers the application to specify the number of frames of each type remaining in the current group of pictures when beginning a video coding scope.
- `requiresGopRemainingFrames` indicates that the implementation's rate control algorithm requires the application to specify the number of frames of each type remaining in the current group of pictures when beginning a video coding scope.
- `stdSyntaxFlags` is a bitmask of VkVideoEncodeH265StdFlagBitsKHR indicating capabilities related to H.265 syntax elements.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265CapabilitiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_CAPABILITIES_KHR`

Bits which **may** be set in VkVideoEncodeH265CapabilitiesKHR::`flags`, indicating the H.265 encoding capabilities supported, are:

```
// Provided by VK_KHR_video_encode_h265
typedef enum VkVideoEncodeH265CapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR =
0x00000002,
    VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR = 0x00000010,
    VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR = 0x00000020,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR = 0x00000040,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_KHR =
0x00000080,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_KHR =
0x00000100,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_TILE_BIT_KHR =
0x00000200,
  // Provided by VK_KHR_video_encode_h265 with VK_KHR_video_encode_quantization_map
    VK_VIDEO_ENCODE_H265_CAPABILITY_CU_QP_DIFF_WRAPAROUND_BIT_KHR = 0x00000400,
} VkVideoEncodeH265CapabilityFlagBitsKHR;
```

- VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_KHR specifies whether the implementation **may** be able to generate HRD compliant bitstreams if any of the nal_hrd_parameters_present_flag, vcl_hrd_parameters_present_flag, or sub_pic_hrd_params_present_flag members of StdVideoH265HrdFlags are set to 1 in the HRD parameters of the active VPS or active SPS, or if StdVideoH265SpsVuiFlags ::vui_hrd_parameters_present_flag is set to 1 in the active SPS.
- VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR specifies that if the weighted_pred_flag or the weighted_bipred_flag member of StdVideoH265PpsFlags is set to 1 in the active PPS when encoding a P picture or B picture, respectively, then the implementation is able to internally decide syntax for pred_weight_table, as defined in section 7.4.7.3 of the ITU-T H.265 Specification, and the application is not **required** to provide a weight table in the H.265 slice segment header parameters.
- VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_KHR specifies that each slice segment in a frame with a single or multiple tiles per slice may begin or finish at any offset in a CTB row. If not supported, all slice segments in such a frame **must** begin at the start of a CTB row (and hence each slice segment **must** finish at the end of a CTB row). Also indicates that each slice segment in a frame with multiple slices per tile may begin or finish at any offset within the enclosing tile's CTB row. If not supported, slice segments in such a frame **must** begin at the start of the enclosing tile's CTB row (and hence each slice segment **must** finish at the end of the enclosing tile's CTB row).
- VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_KHR specifies that when a frame is encoded with multiple slice segments, the implementation allows encoding each slice segment with a different StdVideoEncodeH265SliceSegmentHeader::slice_type specified in the H.265 slice segment header parameters. If not supported, all slice segments of the frame **must** be encoded with the same slice_type which corresponds to the picture type of the frame.
- VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR specifies support for using a B

frame as L0 reference, as specified in StdVideoEncodeH265ReferenceListsInfo::RefPicList0 in the H.265 picture information.

- VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR specifies support for using a B frame as L1 reference, as specified in StdVideoEncodeH265ReferenceListsInfo::RefPicList1 in the H.265 picture information.
- VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR specifies support for specifying different QP values in the members of VkVideoEncodeH265QpKHR.
- VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_KHR specifies support for specifying different constant QP values for each slice segment.
- VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_KHR specifies whether encoding multiple tiles per slice segment, as defined in section 6.3.1 of the ITU-T H.265 Specification, is supported. If this capability flag is not present, then the implementation is only able to encode a single tile for each slice segment.
- VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_TILE_BIT_KHR specifies whether encoding multiple slice segments per tile, as defined in section 6.3.1 of the ITU-T H.265 Specification, is supported. If this capability flag is not present, then the implementation is only able to encode a single slice segment for each tile.
- VK_VIDEO_ENCODE_H265_CAPABILITY_CU_QP_DIFF_WRAPAROUND_BIT_KHR indicates support for wraparound during the calculation of the QP values of subsequently encoded coding units, as defined in section 7.4.9.14 of the ITU-T H.265 Specification. If not supported, equation 8-283 of the ITU-T H.265 Specification is effectively reduced to the following:

  $Qp_Y = qP_{Y_PRED} + \texttt{CuQpDeltaVal}$

  NOTE The effect of this is that the maximum QP difference across subsequent coding units is limited to the $[-(26 + QpBdOffset_Y / 2), 25 + QpBdOffset_Y / 2]$ range.

```
// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265CapabilityFlagsKHR;
```

VkVideoEncodeH265CapabilityFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeH265CapabilityFlagBitsKHR.

Bits which **may** be set in VkVideoEncodeH265CapabilitiesKHR::stdSyntaxFlags, indicating the capabilities related to the H.265 syntax elements, are:

```
// Provided by VK_KHR_video_encode_h265
typedef enum VkVideoEncodeH265StdFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_STD_SAMPLE_ADAPTIVE_OFFSET_ENABLED_FLAG_SET_BIT_KHR =
0x00000002,
    VK_VIDEO_ENCODE_H265_STD_SCALING_LIST_DATA_PRESENT_FLAG_SET_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H265_STD_PCM_ENABLED_FLAG_SET_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H265_STD_SPS_TEMPORAL_MVP_ENABLED_FLAG_SET_BIT_KHR = 0x00000010,
    VK_VIDEO_ENCODE_H265_STD_INIT_QP_MINUS26_BIT_KHR = 0x00000020,
    VK_VIDEO_ENCODE_H265_STD_WEIGHTED_PRED_FLAG_SET_BIT_KHR = 0x00000040,
    VK_VIDEO_ENCODE_H265_STD_WEIGHTED_BIPRED_FLAG_SET_BIT_KHR = 0x00000080,
    VK_VIDEO_ENCODE_H265_STD_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_KHR = 0x00000100,
    VK_VIDEO_ENCODE_H265_STD_SIGN_DATA_HIDING_ENABLED_FLAG_SET_BIT_KHR = 0x00000200,
    VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_SET_BIT_KHR = 0x00000400,
    VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_UNSET_BIT_KHR = 0x00000800,
    VK_VIDEO_ENCODE_H265_STD_PPS_SLICE_CHROMA_QP_OFFSETS_PRESENT_FLAG_SET_BIT_KHR =
0x00001000,
    VK_VIDEO_ENCODE_H265_STD_TRANSQUANT_BYPASS_ENABLED_FLAG_SET_BIT_KHR = 0x00002000,

    VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENTS_ENABLED_FLAG_SET_BIT_KHR =
0x00020000,
    VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENT_FLAG_SET_BIT_KHR = 0x00040000,
    VK_VIDEO_ENCODE_H265_STD_SLICE_QP_DELTA_BIT_KHR = 0x00080000,
    VK_VIDEO_ENCODE_H265_STD_DIFFERENT_SLICE_QP_DELTA_BIT_KHR = 0x00100000,
} VkVideoEncodeH265StdFlagBitsKHR;
```

- VK_VIDEO_ENCODE_H265_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265SpsFlags ::separate_colour_plane_flag in the SPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_SAMPLE_ADAPTIVE_OFFSET_ENABLED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265SpsFlags ::sample_adaptive_offset_enabled_flag in the SPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_SCALING_LIST_DATA_PRESENT_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for the scaling_list_enabled_flag and sps_scaling_list_data_present_flag members of StdVideoH265SpsFlags in the SPS, and the application-provided value for StdVideoH265PpsFlags ::pps_scaling_list_data_present_flag in the PPS when those values are 1.
- VK_VIDEO_ENCODE_H265_STD_PCM_ENABLED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265SpsFlags::pcm_enable_flag in the SPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_SPS_TEMPORAL_MVP_ENABLED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265SpsFlags ::sps_temporal_mvp_enabled_flag in the SPS when that value is 1.

- VK_VIDEO_ENCODE_H265_STD_INIT_QP_MINUS26_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PictureParameterSet ::init_qp_minus26 in the PPS when that value is non-zero.
- VK_VIDEO_ENCODE_H265_STD_WEIGHTED_PRED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags ::weighted_pred_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_WEIGHTED_BIPRED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags ::weighted_bipred_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PictureParameterSet::log2_parallel_merge_level_minus2 in the PPS when that value is non-zero.
- VK_VIDEO_ENCODE_H265_STD_SIGN_DATA_HIDING_ENABLED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags ::sign_data_hiding_enabled_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags ::transform_skip_enabled_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_UNSET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags ::transform_skip_enabled_flag in the PPS when that value is 0.
- VK_VIDEO_ENCODE_H265_STD_PPS_SLICE_CHROMA_QP_OFFSETS_PRESENT_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags::pps_slice_chroma_qp_offsets_present_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_TRANSQUANT_BYPASS_ENABLED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags ::transquant_bypass_enabled_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_CONSTRAINED_INTRA_PRED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags ::constrained_intra_pred_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_ENTROPY_CODING_SYNC_ENABLED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags ::entropy_coding_sync_enabled_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_DEBLOCKING_FILTER_OVERRIDE_ENABLED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags::deblocking_filter_override_enabled_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENTS_ENABLED_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoH265PpsFlags ::dependent_slice_segments_enabled_flag in the PPS when that value is 1.
- VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENT_FLAG_SET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeH265SliceSegmentHeader::dependent_slice_segment_flag in the H.265 slice segment

header parameters when that value is 1.

- VK_VIDEO_ENCODE_H265_STD_SLICE_QP_DELTA_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeH265SliceSegmentHeader::slice_qp_delta in the H.265 slice segment header parameters when that value is identical across the slice segments of the encoded frame.
- VK_VIDEO_ENCODE_H265_STD_DIFFERENT_SLICE_QP_DELTA_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeH265SliceSegmentHeader::slice_qp_delta in the H.265 slice segment header parameters when that value is different across the slice segments of the encoded frame.

These capability flags provide information to the application about specific H.265 syntax element values that the implementation supports without having to override them and do not otherwise restrict the values that the application **can** specify for any of the mentioned H.265 syntax elements.

```
// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265StdFlagsKHR;
```

VkVideoEncodeH265StdFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeH265StdFlagBitsKHR.

Bits which **may** be set in VkVideoEncodeH265CapabilitiesKHR::ctbSizes, indicating the CTB sizes supported by the implementation, are:

```
// Provided by VK_KHR_video_encode_h265
typedef enum VkVideoEncodeH265CtbSizeFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_KHR = 0x00000004,
} VkVideoEncodeH265CtbSizeFlagBitsKHR;
```

- VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_KHR specifies that a CTB size of 16x16 is supported.
- VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_KHR specifies that a CTB size of 32x32 is supported.
- VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_KHR specifies that a CTB size of 64x64 is supported.

```
// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265CtbSizeFlagsKHR;
```

VkVideoEncodeH265CtbSizeFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeH265CtbSizeFlagBitsKHR.

Implementations **must** support at least one of VkVideoEncodeH265CtbSizeFlagBitsKHR.

Bits which **may** be set in VkVideoEncodeH265CapabilitiesKHR::transformBlockSizes, indicating the transform block sizes supported by the implementation, are:

```
// Provided by VK_KHR_video_encode_h265
typedef enum VkVideoEncodeH265TransformBlockSizeFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_KHR = 0x00000008,
} VkVideoEncodeH265TransformBlockSizeFlagBitsKHR;
```

- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_KHR specifies that a transform block size of 4x4 is supported.
- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_KHR specifies that a transform block size of 8x8 is supported.
- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_KHR specifies that a transform block size of 16x16 is supported.
- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_KHR specifies that a transform block size of 32x32 is supported.

```
// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265TransformBlockSizeFlagsKHR;
```

VkVideoEncodeH265TransformBlockSizeFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeH265TransformBlockSizeFlagBitsKHR.

Implementations **must** support at least one of VkVideoEncodeH265TransformBlockSizeFlagBitsKHR.

38.19.8. H.265 Encode Quality Level Properties

When calling vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR with pVideoProfile->videoCodecOperation specified as VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the VkVideoEncodeH265QualityLevelPropertiesKHR structure **must** be included in the pNext chain of the VkVideoEncodeQualityLevelPropertiesKHR structure to retrieve additional video encode quality level properties specific to H.265 encoding.

The VkVideoEncodeH265QualityLevelPropertiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265QualityLevelPropertiesKHR {
    VkStructureType                          sType;
    void*                                    pNext;
    VkVideoEncodeH265RateControlFlagsKHR     preferredRateControlFlags;
    uint32_t                                 preferredGopFrameCount;
    uint32_t                                 preferredIdrPeriod;
    uint32_t                                 preferredConsecutiveBFrameCount;
    uint32_t                                 preferredSubLayerCount;
    VkVideoEncodeH265QpKHR                   preferredConstantQp;
    uint32_t                                 preferredMaxL0ReferenceCount;
    uint32_t                                 preferredMaxL1ReferenceCount;
} VkVideoEncodeH265QualityLevelPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `preferredRateControlFlags` is a bitmask of VkVideoEncodeH265RateControlFlagBitsKHR values indicating the preferred flags to use for VkVideoEncodeH265RateControlInfoKHR::`flags`.
- `preferredGopFrameCount` indicates the preferred value to use for VkVideoEncodeH265RateControlInfoKHR::`gopFrameCount`.
- `preferredIdrPeriod` indicates the preferred value to use for VkVideoEncodeH265RateControlInfoKHR::`idrPeriod`.
- `preferredConsecutiveBFrameCount` indicates the preferred value to use for VkVideoEncodeH265RateControlInfoKHR::`consecutiveBFrameCount`.
- `preferredSubLayerCount` indicates the preferred value to use for VkVideoEncodeH265RateControlInfoKHR::`subLayerCount`.
- `preferredConstantQp` indicates the preferred values to use for VkVideoEncodeH265NaluSliceSegmentInfoKHR::`constantQp` for each picture type when using rate control mode `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- `preferredMaxL0ReferenceCount` indicates the preferred maximum number of reference pictures to use in the reference list L0.
- `preferredMaxL1ReferenceCount` indicates the preferred maximum number of reference pictures to use in the reference list L1.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265QualityLevelPropertiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_QUALITY_LEVEL_PROPERTIES_KHR`

38.19.9. H.265 Encode Session

Additional parameters can be specified when creating a video session with an H.265 encode profile by including an instance of the VkVideoEncodeH265SessionCreateInfoKHR structure in the `pNext`

chain of VkVideoSessionCreateInfoKHR.

The VkVideoEncodeH265SessionCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265SessionCreateInfoKHR {
    VkStructureType         sType;
    const void*             pNext;
    VkBool32                useMaxLevelIdc;
    StdVideoH265LevelIdc    maxLevelIdc;
} VkVideoEncodeH265SessionCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- useMaxLevelIdc indicates whether the value of maxLevelIdc should be used by the implementation. When it is VK_FALSE, the implementation ignores the value of maxLevelIdc and uses the value of VkVideoEncodeH265CapabilitiesKHR::maxLevelIdc, as reported by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile.
- maxLevelIdc is a StdVideoH265LevelIdc value specifying the upper bound on the H.265 level for the video bitstreams produced by the created video session, where enum constant STD_VIDEO_H265_LEVEL_IDC_<major>_<minor> identifies H.265 level <major>.<minor> as defined in section A.4 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_CREATE_INFO_KHR

38.19.10. H.265 Encode Parameter Sets

Video session parameters objects created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR **can** contain the following types of parameters:

H.265 Video Parameter Sets (VPS)

Represented by StdVideoH265VideoParameterSet structures and interpreted as follows:

- reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
- vps_video_parameter_set_id is used as the key of the VPS entry;
- the max_latency_increase_plus1, max_dec_pic_buffering_minus1, and max_num_reorder_pics members of the StdVideoH265DecPicBufMgr structure pointed to by pDecPicBufMgr correspond to vps_max_latency_increase_plus1, vps_max_dec_pic_buffering_minus1, and vps_max_num_reorder_pics, respectively, as defined in section 7.4.3.1 of the ITU-T H.265

Specification;

- the `StdVideoH265HrdParameters` structure pointed to by `pHrdParameters` is interpreted as follows:
  - `reserved` is used only for padding purposes and is otherwise ignored;
  - `flags.fixed_pic_rate_general_flag` is a bitmask where bit index i corresponds to `fixed_pic_rate_general_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
  - `flags.fixed_pic_rate_within_cvs_flag` is a bitmask where bit index i corresponds to `fixed_pic_rate_within_cvs_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
  - `flags.low_delay_hrd_flag` is a bitmask where bit index i corresponds to `low_delay_hrd_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
  - if `flags.nal_hrd_parameters_present_flag` is set, then `pSubLayerHrdParametersNal` is a pointer to an array of `vps_max_sub_layers_minus1 + 1` number of `StdVideoH265SubLayerHrdParameters` structures where `vps_max_sub_layers_minus1` is the corresponding member of the encompassing `StdVideoH265VideoParameterSet` structure and each element is interpreted as follows:
    - `cbr_flag` is a bitmask where bit index i corresponds to `cbr_flag[i]` as defined in section E.3.3 of the ITU-T H.265 Specification;
    - all other members of the `StdVideoH265SubLayerHrdParameters` structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
  - if `flags.vcl_hrd_parameters_present_flag` is set, then `pSubLayerHrdParametersVcl` is a pointer to an array of `vps_max_sub_layers_minus1 + 1` number of `StdVideoH265SubLayerHrdParameters` structures where `vps_max_sub_layers_minus1` is the corresponding member of the encompassing `StdVideoH265VideoParameterSet` structure and each element is interpreted as follows:
    - `cbr_flag` is a bitmask where bit index i corresponds to `cbr_flag[i]` as defined in section E.3.3 of the ITU-T H.265 Specification;
    - all other members of the `StdVideoH265SubLayerHrdParameters` structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
  - all other members of `StdVideoH265HrdParameters` are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;
- the `StdVideoH265ProfileTierLevel` structure pointed to by `pProfileTierLevel` are interpreted as follows:
  - `general_level_idc` is one of the enum constants `STD_VIDEO_H265_LEVEL_IDC_<major>_<minor>` identifying the H.265 level `<major>.<minor>` as defined in section A.4 of the ITU-T H.265 Specification;
  - all other members of `StdVideoH265ProfileTierLevel` are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;
- all other members of `StdVideoH265VideoParameterSet` are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

H.265 Sequence Parameter Sets (SPS)

Represented by `StdVideoH265SequenceParameterSet` structures and interpreted as follows:

- `reserved1` and `reserved2` are used only for padding purposes and are otherwise ignored;
- the pair constructed from `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` is used as the key of the SPS entry;
- the `StdVideoH265ProfileTierLevel` structure pointed to by `pProfileTierLevel` are interpreted as follows:
  - `general_level_idc` is one of the enum constants `STD_VIDEO_H265_LEVEL_IDC_<major>_<minor>` identifying the H.265 level `<major>.<minor>` as defined in section A.4 of the ITU-T H.265 Specification;
  - all other members of `StdVideoH265ProfileTierLevel` are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;
- the `max_latency_increase_plus1`, `max_dec_pic_buffering_minus1`, and `max_num_reorder_pics` members of the `StdVideoH265DecPicBufMgr` structure pointed to by `pDecPicBufMgr` correspond to `sps_max_latency_increase_plus1`, `sps_max_dec_pic_buffering_minus1`, and `sps_max_num_reorder_pics`, respectively, as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
- if `flags.sps_scaling_list_data_present_flag` is set, then the `StdVideoH265ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
  - `ScalingList4x4`, `ScalingList8x8`, `ScalingList16x16`, and `ScalingList32x32` correspond to `ScalingList[0]`, `ScalingList[1]`, `ScalingList[2]`, and `ScalingList[3]`, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
  - `ScalingListDCCoef16x16` and `ScalingListDCCoef32x32` correspond to `scaling_list_dc_coef_minus8[0]` and `scaling_list_dc_coef_minus8[1]`, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
- `pShortTermRefPicSet` is a pointer to an array of `num_short_term_ref_pic_sets` number of `StdVideoH265ShortTermRefPicSet` structures where each element is interpreted as follows:
  - `reserved1`, `reserved2`, and `reserved3` are used only for padding purposes and are otherwise ignored;
  - `used_by_curr_pic_flag` is a bitmask where bit index i corresponds to `used_by_curr_pic_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - `use_delta_flag` is a bitmask where bit index i corresponds to `use_delta_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - `used_by_curr_pic_s0_flag` is a bitmask where bit index i corresponds to `used_by_curr_pic_s0_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - `used_by_curr_pic_s1_flag` is a bitmask where bit index i corresponds to `used_by_curr_pic_s1_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - all other members of `StdVideoH265ShortTermRefPicSet` are interpreted as defined in section 7.4.8 of the ITU-T H.265 Specification;

- if `flags.long_term_ref_pics_present_flag` is set then the `StdVideoH265LongTermRefPicsSps` structure pointed to by `pLongTermRefPicsSps` is interpreted as follows:
  - `used_by_curr_pic_lt_sps_flag` is a bitmask where bit index i corresponds to `used_by_curr_pic_lt_sps_flag[i]` as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
  - all other members of `StdVideoH265LongTermRefPicsSps` are interpreted as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
- if `flags.vui_parameters_present_flag` is set, then the `StdVideoH265SequenceParameterSetVui` structure pointed to by `pSequenceParameterSetVui` is interpreted as follows:
  - `reserved1`, `reserved2`, and `reserved3` are used only for padding purposes and are otherwise ignored;
  - the `StdVideoH265HrdParameters` structure pointed to by `pHrdParameters` is interpreted as follows:
    - `flags.fixed_pic_rate_general_flag` is a bitmask where bit index i corresponds to `fixed_pic_rate_general_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
    - `flags.fixed_pic_rate_within_cvs_flag` is a bitmask where bit index i corresponds to `fixed_pic_rate_within_cvs_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
    - `flags.low_delay_hrd_flag` is a bitmask where bit index i corresponds to `low_delay_hrd_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
    - if `flags.nal_hrd_parameters_present_flag` is set, then `pSubLayerHrdParametersNal` is a pointer to an array of `sps_max_sub_layers_minus1` + 1 number of `StdVideoH265SubLayerHrdParameters` structures where `sps_max_sub_layers_minus1` is the corresponding member of the encompassing `StdVideoH265SequenceParameterSet` structure and each element is interpreted as follows:
      - `cbr_flag` is a bitmask where bit index i corresponds to `cbr_flag[i]` as defined in section E.3.3 of the ITU-T H.265 Specification;
      - all other members of the `StdVideoH265SubLayerHrdParameters` structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
    - if `flags.vcl_hrd_parameters_present_flag` is set, then `pSubLayerHrdParametersVcl` is a pointer to an array of `sps_max_sub_layers_minus1` + 1 number of `StdVideoH265SubLayerHrdParameters` structures where `sps_max_sub_layers_minus1` is the corresponding member of the encompassing `StdVideoH265SequenceParameterSet` structure and each element is interpreted as follows:
      - `cbr_flag` is a bitmask where bit index i corresponds to `cbr_flag[i]` as defined in section E.3.3 of the ITU-T H.265 Specification;
      - all other members of the `StdVideoH265SubLayerHrdParameters` structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
    - all other members of `StdVideoH265HrdParameters` are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;

    - all other members of `pSequenceParameterSetVui` are interpreted as defined in section E.3.1 of the ITU-T H.265 Specification;
- if `flags.sps_palette_predictor_initializer_present_flag` is set, then the `PredictorPaletteEntries` member of the `StdVideoH265PredictorPaletteEntries` structure pointed to by `pPredictorPaletteEntries` is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;
- all other members of `StdVideoH265SequenceParameterSet` are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

H.265 Picture Parameter Sets (PPS)

Represented by `StdVideoH265PictureParameterSet` structures and interpreted as follows:

- `reserved1`, `reserved2`, and `reserved3` are used only for padding purposes and are otherwise ignored;
- the triplet constructed from `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` is used as the key of the PPS entry;
- if `flags.pps_scaling_list_data_present_flag` is set, then the `StdVideoH265ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
    - `ScalingList4x4`, `ScalingList8x8`, `ScalingList16x16`, and `ScalingList32x32` correspond to `ScalingList[0]`, `ScalingList[1]`, `ScalingList[2]`, and `ScalingList[3]`, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
    - `ScalingListDCCoef16x16` and `ScalingListDCCoef32x32` correspond to `scaling_list_dc_coef_minus8[0]` and `scaling_list_dc_coef_minus8[1]`, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
- if `flags.pps_palette_predictor_initializer_present_flag` is set, then the `PredictorPaletteEntries` member of the `StdVideoH265PredictorPaletteEntries` structure pointed to by `pPredictorPaletteEntries` is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;
- all other members of `StdVideoH265PictureParameterSet` are interpreted as defined in section 7.4.3.3 of the ITU-T H.265 Specification.

Implementations **may** override any of these parameters according to the semantics defined in the Video Encode Parameter Overrides section before storing the resulting H.265 parameter sets into the video session parameters object. Applications need to use the vkGetEncodedVideoSessionParametersKHR command to determine whether any implementation overrides happened and to retrieve the encoded H.265 parameter sets in order to be able to produce a compliant H.265 video bitstream.

Such H.265 parameter set overrides **may** also have cascading effects on the implementation overrides applied to the encoded bitstream produced by video encode operations. If the implementation supports the `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR` video encode feedback query flag, then the application **can** use such queries to retrieve feedback about whether any implementation overrides have been applied to the encoded bitstream.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain **must** include a VkVideoEncodeH265SessionParametersCreateInfoKHR structure specifying the capacity and initial contents of the object.

The VkVideoEncodeH265SessionParametersCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersCreateInfoKHR {
    VkStructureType                                       sType;
    const void*                                           pNext;
    uint32_t                                              maxStdVPSCount;
    uint32_t                                              maxStdSPSCount;
    uint32_t                                              maxStdPPSCount;
    const VkVideoEncodeH265SessionParametersAddInfoKHR*   pParametersAddInfo;
} VkVideoEncodeH265SessionParametersCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxStdVPSCount is the maximum number of H.265 VPS entries the created VkVideoSessionParametersKHR **can** contain.
- maxStdSPSCount is the maximum number of H.265 SPS entries the created VkVideoSessionParametersKHR **can** contain.
- maxStdPPSCount is the maximum number of H.265 PPS entries the created VkVideoSessionParametersKHR **can** contain.
- pParametersAddInfo is NULL or a pointer to a VkVideoEncodeH265SessionParametersAddInfoKHR structure specifying H.265 parameters to add upon object creation.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_CREATE_INFO_KHR
- VUID-VkVideoEncodeH265SessionParametersCreateInfoKHR-pParametersAddInfo-parameter
  If pParametersAddInfo is not NULL, pParametersAddInfo **must** be a valid pointer to a valid VkVideoEncodeH265SessionParametersAddInfoKHR structure

The VkVideoEncodeH265SessionParametersAddInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersAddInfoKHR {
    VkStructureType                              sType;
    const void*                                  pNext;
    uint32_t                                     stdVPSCount;
    const StdVideoH265VideoParameterSet*         pStdVPSs;
    uint32_t                                     stdSPSCount;
    const StdVideoH265SequenceParameterSet*      pStdSPSs;
    uint32_t                                     stdPPSCount;
    const StdVideoH265PictureParameterSet*       pStdPPSs;
} VkVideoEncodeH265SessionParametersAddInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdVPSCount` is the number of elements in the `pStdVPSs` array.
- `pStdVPSs` is a pointer to an array of `StdVideoH265VideoParameterSet` structures describing the H.265 VPS entries to add.
- `stdSPSCount` is the number of elements in the `pStdSPSs` array.
- `pStdSPSs` is a pointer to an array of `StdVideoH265SequenceParameterSet` structures describing the H.265 SPS entries to add.
- `stdPPSCount` is the number of elements in the `pStdPPSs` array.
- `pStdPPSs` is a pointer to an array of `StdVideoH265PictureParameterSet` structures describing the H.265 PPS entries to add.

This structure **can** be specified in the following places:

- In the `pParametersAddInfo` member of the VkVideoEncodeH265SessionParametersCreateInfoKHR structure specified in the `pNext` chain of VkVideoSessionParametersCreateInfoKHR used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).
- In the `pNext` chain of VkVideoSessionParametersUpdateInfoKHR. In this case, if the video codec operation the video session parameters object to be updated was created with is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then it defines the set of parameters to add to it (see Updating Video Session Parameters).

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_ADD_INFO_KHR`
- VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-pStdVPSs-parameter
  If `stdVPSCount` is not `0`, and `pStdVPSs` is not `NULL`, `pStdVPSs` **must** be a valid pointer to an array of `stdVPSCount` `StdVideoH265VideoParameterSet` values

- VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-pStdSPSs-parameter
  If `stdSPSCount` is not `0`, and `pStdSPSs` is not `NULL`, `pStdSPSs` **must** be a valid pointer to an array of `stdSPSCount` `StdVideoH265SequenceParameterSet` values
- VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-pStdPPSs-parameter
  If `stdPPSCount` is not `0`, and `pStdPPSs` is not `NULL`, `pStdPPSs` **must** be a valid pointer to an array of `stdPPSCount` `StdVideoH265PictureParameterSet` values

Valid Usage

- VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-None-06438
  The `vps_video_parameter_set_id` member of each `StdVideoH265VideoParameterSet` structure specified in the elements of `pStdVPSs` **must** be unique within `pStdVPSs`
- VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-None-06439
  The pair constructed from the `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` members of each `StdVideoH265SequenceParameterSet` structure specified in the elements of `pStdSPSs` **must** be unique within `pStdSPSs`
- VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-None-06440
  The triplet constructed from the `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` members of each `StdVideoH265PictureParameterSet` structure specified in the elements of `pStdPPSs` **must** be unique within `pStdPPSs`

The `VkVideoEncodeH265SessionParametersGetInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersGetInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           writeStdVPS;
    VkBool32           writeStdSPS;
    VkBool32           writeStdPPS;
    uint32_t           stdVPSId;
    uint32_t           stdSPSId;
    uint32_t           stdPPSId;
} VkVideoEncodeH265SessionParametersGetInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `writeStdVPS` indicates whether the encoded H.265 video parameter set identified by `stdVPSId` is requested to be retrieved.
- `writeStdSPS` indicates whether the encoded H.265 sequence parameter set identified by the pair constructed from `stdVPSId` and `stdSPSId` is requested to be retrieved.
- `writeStdPPS` indicates whether the encoded H.265 picture parameter set identified by the triplet constructed from `stdVPSId`, `stdSPSId`, and `stdPPSId` is requested to be retrieved.

- `stdVPSId` specifies the H.265 video parameter set ID used to identify the retrieved H.265 video, sequence, and/or picture parameter set(s).
- `stdSPSId` specifies the H.265 sequence parameter set ID used to identify the retrieved H.265 sequence and/or picture parameter set(s) when `writeStdSPS` and/or `writeStdPPS` is `VK_TRUE`.
- `stdPPSId` specifies the H.265 picture parameter set ID used to identify the retrieved H.265 picture parameter set when `writeStdPPS` is `VK_TRUE`.

When this structure is specified in the `pNext` chain of the VkVideoEncodeSessionParametersGetInfoKHR structure passed to vkGetEncodedVideoSessionParametersKHR, the command will write encoded parameter data to the output buffer in the following order:

1. The H.265 video parameter set identified by `stdVPSId`, if `writeStdVPS` is `VK_TRUE`.
2. The H.265 sequence parameter set identified by the pair constructed from `stdVPSId` and `stdSPSId`, if `writeStdSPS` is `VK_TRUE`.
3. The H.265 picture parameter set identified by the triplet constructed from `stdVPSId`, `stdSPSId`, and `stdPPSId`, if `writeStdPPS` is `VK_TRUE`.

Valid Usage

- VUID-VkVideoEncodeH265SessionParametersGetInfoKHR-writeStdVPS-08290
  At least one of `writeStdVPS`, `writeStdSPS`, and `writeStdPPS` **must** be `VK_TRUE`

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersGetInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_GET_INFO_KHR`

The `VkVideoEncodeH265SessionParametersFeedbackInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersFeedbackInfoKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           hasStdVPSOverrides;
    VkBool32           hasStdSPSOverrides;
    VkBool32           hasStdPPSOverrides;
} VkVideoEncodeH265SessionParametersFeedbackInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hasStdVPSOverrides` indicates whether any of the parameters of the requested H.265 video parameter set, if one was requested via VkVideoEncodeH265SessionParametersGetInfoKHR

::writeStdVPS, were overridden by the implementation.

- hasStdSPSOverrides indicates whether any of the parameters of the requested H.265 sequence parameter set, if one was requested via VkVideoEncodeH265SessionParametersGetInfoKHR ::writeStdSPS, were overridden by the implementation.
- hasStdPPSOverrides indicates whether any of the parameters of the requested H.265 picture parameter set, if one was requested via VkVideoEncodeH265SessionParametersGetInfoKHR ::writeStdPPS, were overridden by the implementation.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersFeedbackInfoKHR-sType-sType sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_FEEDBACK_INFO_KHR

38.19.11. H.265 Encoding Parameters

The VkVideoEncodeH265PictureInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265PictureInfoKHR {
    VkStructureType                                   sType;
    const void*                                       pNext;
    uint32_t                                          naluSliceSegmentEntryCount;
    const VkVideoEncodeH265NaluSliceSegmentInfoKHR*   pNaluSliceSegmentEntries;
    const StdVideoEncodeH265PictureInfo*              pStdPictureInfo;
} VkVideoEncodeH265PictureInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- naluSliceSegmentEntryCount is the number of elements in pNaluSliceSegmentEntries.
- pNaluSliceSegmentEntries is a pointer to an array of naluSliceSegmentEntryCount VkVideoEncodeH265NaluSliceSegmentInfoKHR structures specifying the parameters of the individual H.265 slice segments to encode for the input picture.
- pStdPictureInfo is a pointer to a StdVideoEncodeH265PictureInfo structure specifying H.265 picture information.

This structure is specified in the pNext chain of the VkVideoEncodeInfoKHR structure passed to vkCmdEncodeVideoKHR to specify the codec-specific picture information for an H.265 encode operation.

Encode Input Picture Information

When this structure is specified in the pNext chain of the VkVideoEncodeInfoKHR structure passed to vkCmdEncodeVideoKHR, the information related to the encode input picture is defined as follows:

- The image subregion used is determined according to the H.265 Encode Picture Data Access section.
- The encode input picture is associated with the H.265 picture information provided in `pStdPictureInfo`.

Std Picture Information

The members of the `StdVideoEncodeH265PictureInfo` structure pointed to by `pStdPictureInfo` are interpreted as follows:

- `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
- `flags.is_reference` as defined in section 3.132 of the ITU-T H.265 Specification;
- `flags.IrapPicFlag` as defined in section 3.73 of the ITU-T H.265 Specification;
- `flags.used_for_long_term_reference` is used to indicate whether the picture is marked as "used for long-term reference" as defined in section 8.3.2 of the ITU-T H.265 Specification;
- `flags.discardable_flag` and `cross_layer_bla_flag` as defined in section F.7.4.7.1 of the ITU-T H.265 Specification;
- `pic_type` as defined in section 7.4.3.5 of the ITU-T H.265 Specification;
- `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` are used to identify the active parameter sets, as described below;
- `PicOrderCntVal` as defined in section 8.3.1 of the ITU-T H.265 Specification;
- `TemporalId` as defined in section 7.4.2.2 of the ITU-T H.265 Specification;
- if `pRefLists` is not `NULL`, then it is a pointer to a `StdVideoEncodeH265ReferenceListsInfo` structure that is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - `ref_pic_list_modification_flag_l0` and `ref_pic_list_modification_flag_l1` as defined in section 7.4.7.2 of the ITU-T H.265 Specification;
  - `num_ref_idx_l0_active_minus1` and `num_ref_idx_l1_active_minus1` as defined in section 7.4.7.1 of the ITU-T H.265 Specification;
  - `RefPicList0` and `RefPicList1` as defined in section 8.3.4 of the ITU-T H.265 Specification where each element of these arrays either identifies an active reference picture using its DPB slot index or contains the value `STD_VIDEO_H265_NO_REFERENCE_PICTURE` to indicate "no reference picture";
  - `list_entry_l0` and `list_entry_l1` as defined in section 7.4.7.2 of the ITU-T H.265 Specification;
- if `flags.short_term_ref_pic_set_sps_flag` is set, then the `StdVideoH265ShortTermRefPicSet` structure pointed to by `pShortTermRefPicSet` is interpreted as defined for the elements of the `pShortTermRefPicSet` array specified in H.265 sequence parameter sets.
- if `flags.long_term_ref_pics_present_flag` is set in the active SPS, then the `StdVideoEncodeH265LongTermRefPics` structure pointed to by `pLongTermRefPics` is interpreted as follows:
  - `used_by_curr_pic_lt_flag` is a bitmask where bit index i corresponds to

used_by_curr_pic_lt_flag[i] as defined in section 7.4.7.1 of the ITU-T H.265 Specification;

- all other members of StdVideoEncodeH265LongTermRefPics are interpreted as defined in section 7.4.7.1 of the ITU-T H.265 Specification;

- all other members are interpreted as defined in section 7.4.7.1 of the ITU-T H.265 Specification.

Reference picture setup is controlled by the value of StdVideoEncodeH265PictureInfo::flags.is_reference. If it is set and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the DPB slot specified in pEncodeInfo->pSetupReferenceSlot->slotIndex. If StdVideoEncodeH265PictureInfo::flags.is_reference is not set, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

Active Parameter Sets

The members of the StdVideoEncodeH265PictureInfo structure pointed to by pStdPictureInfo are used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The *active VPS* is the VPS identified by the key specified in StdVideoEncodeH265PictureInfo::sps_video_parameter_set_id.
- The *active SPS* is the SPS identified by the key specified by the pair constructed from StdVideoEncodeH265PictureInfo::sps_video_parameter_set_id and StdVideoEncodeH265PictureInfo::pps_seq_parameter_set_id.
- The *active PPS* is the PPS identified by the key specified by the triplet constructed from StdVideoEncodeH265PictureInfo::sps_video_parameter_set_id, StdVideoEncodeH265PictureInfo::pps_seq_parameter_set_id, and StdVideoEncodeH265PictureInfo::pps_pic_parameter_set_id.

H.265 encoding uses *explicit weighted sample prediction* for a slice segment, as defined in section 8.5.3.3.4 of the ITU-T H.265 Specification, if any of the following conditions are true for the active PPS and the pStdSliceSegmentHeader member of the corresponding element of pNaluSliceSegmentEntries:

- pStdSliceSegmentHeader->slice_type is STD_VIDEO_H265_SLICE_TYPE_P and weighted_pred_flag is enabled in the active PPS.
- pStdSliceSegmentHeader->slice_type is STD_VIDEO_H265_SLICE_TYPE_B and weighted_bipred_flag is enabled in the active PPS.

The number of H.265 tiles, as defined in section 3.174 of the ITU-T H.265 Specification, is derived from the num_tile_columns_minus1 and num_tile_rows_minus1 members of the active PPS as follows:

$$(\texttt{num_tile_columns_minus1} + 1) \times (\texttt{num_tile_rows_minus1} + 1)$$

Valid Usage

- VUID-VkVideoEncodeH265PictureInfoKHR-naluSliceSegmentEntryCount-08306
  naluSliceSegmentEntryCount **must** be between 1 and VkVideoEncodeH265CapabilitiesKHR

::maxSliceSegmentCount, inclusive, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile

- VUID-VkVideoEncodeH265PictureInfoKHR-flags-08323
  If VkVideoEncodeH265CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_KHR, then naluSliceSegmentEntryCount **must** be greater than or equal to the number of H.265 tiles in the picture
- VUID-VkVideoEncodeH265PictureInfoKHR-flags-08324
  If VkVideoEncodeH265CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_TILE_BIT_KHR, then naluSliceSegmentEntryCount **must** be less than or equal to the number of H.265 tiles in the picture
- VUID-VkVideoEncodeH265PictureInfoKHR-flags-08316
  If VkVideoEncodeH265CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR and the slice segment corresponding to any element of pNaluSliceSegmentEntries uses explicit weighted sample prediction, then VkVideoEncodeH265NaluSliceSegmentInfoKHR::pStdSliceSegmentHeader->pWeightTable **must** not be NULL for that element of pNaluSliceSegmentEntries
- VUID-VkVideoEncodeH265PictureInfoKHR-flags-08317
  If VkVideoEncodeH265CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_KHR, then VkVideoEncodeH265NaluSliceSegmentInfoKHR::pStdSliceSegmentHeader->slice_type **must** be identical for all elements of pNaluSliceSegmentEntries

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265PictureInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PICTURE_INFO_KHR
- VUID-VkVideoEncodeH265PictureInfoKHR-pNaluSliceSegmentEntries-parameter
  pNaluSliceSegmentEntries **must** be a valid pointer to an array of naluSliceSegmentEntryCount valid VkVideoEncodeH265NaluSliceSegmentInfoKHR structures
- VUID-VkVideoEncodeH265PictureInfoKHR-pStdPictureInfo-parameter
  pStdPictureInfo **must** be a valid pointer to a valid StdVideoEncodeH265PictureInfo value
- VUID-VkVideoEncodeH265PictureInfoKHR-naluSliceSegmentEntryCount-arraylength
  naluSliceSegmentEntryCount **must** be greater than 0

The VkVideoEncodeH265NaluSliceSegmentInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265NaluSliceSegmentInfoKHR {
    VkStructureType                                 sType;
    const void*                                     pNext;
    int32_t                                         constantQp;
    const StdVideoEncodeH265SliceSegmentHeader*     pStdSliceSegmentHeader;
} VkVideoEncodeH265NaluSliceSegmentInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `constantQp` is the QP to use for the slice segment if the current rate control mode configured for the video session is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- `pStdSliceSegmentHeader` is a pointer to a `StdVideoEncodeH265SliceSegmentHeader` structure specifying H.265 slice segment header parameters for the slice segment.

Std Slice Segment Header Parameters

The members of the `StdVideoEncodeH265SliceSegmentHeader` structure pointed to by `pStdSliceSegmentHeader` are interpreted as follows:

- `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
- if `pWeightTable` is not `NULL`, then it is a pointer to a `StdVideoEncodeH265WeightTable` that is interpreted as follows:
  - `flags.luma_weight_l0_flag`, `flags.chroma_weight_l0_flag`, `flags.luma_weight_l1_flag`, and `flags.chroma_weight_l1_flag` are bitmasks where bit index i corresponds to `luma_weight_l0_flag[i]`, `chroma_weight_l0_flag[i]`, `luma_weight_l1_flag[i]`, and `chroma_weight_l1_flag[i]`, respectively, as defined in section 7.4.7.3 of the ITU-T H.265 Specification;
  - all other members of `StdVideoEncodeH265WeightTable` are interpreted as defined in section 7.4.7.3 of the ITU-T H.265 Specification;
- all other members are interpreted as defined in section 7.4.7.1 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265NaluSliceSegmentInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_NALU_SLICE_SEGMENT_INFO_KHR`
- VUID-VkVideoEncodeH265NaluSliceSegmentInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkVideoEncodeH265NaluSliceSegmentInfoKHR-pStdSliceSegmentHeader-parameter
  `pStdSliceSegmentHeader` **must** be a valid pointer to a valid `StdVideoEncodeH265SliceSegmentHeader` value

The VkVideoEncodeH265DpbSlotInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265DpbSlotInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    const StdVideoEncodeH265ReferenceInfo*   pStdReferenceInfo;
} VkVideoEncodeH265DpbSlotInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoEncodeH265ReferenceInfo` structure specifying H.265 reference information.

This structure is specified in the `pNext` chain of VkVideoEncodeInfoKHR::`pSetupReferenceSlot`, if not `NULL`, and the `pNext` chain of the elements of VkVideoEncodeInfoKHR::`pReferenceSlots` to specify the codec-specific reference picture information for an H.265 encode operation.

Active Reference Picture Information

When this structure is specified in the `pNext` chain of the elements of VkVideoEncodeInfoKHR::`pReferenceSlots`, one element is added to the list of active reference pictures used by the video encode operation for each element of VkVideoEncodeInfoKHR::`pReferenceSlots` as follows:

- The image subregion used is determined according to the H.265 Encode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the `slotIndex` member of the corresponding element of VkVideoEncodeInfoKHR::`pReferenceSlots`.
- The reference picture is associated with the H.265 reference information provided in `pStdReferenceInfo`.

Reconstructed Picture Information

When this structure is specified in the `pNext` chain of VkVideoEncodeInfoKHR::`pSetupReferenceSlot`, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the H.265 Encode Picture Data Access section.
- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in VkVideoEncodeInfoKHR::`pSetupReferenceSlot->slotIndex`.
- The reconstructed picture is associated with the H.265 reference information provided in `pStdReferenceInfo`.

Std Reference Information

The members of the `StdVideoEncodeH265ReferenceInfo` structure pointed to by `pStdReferenceInfo` are interpreted as follows:

- `flags.reserved` is used only for padding purposes and is otherwise ignored;
- `flags.used_for_long_term_reference` is used to indicate whether the picture is marked as "used for long-term reference" as defined in section 8.3.2 of the ITU-T H.265 Specification;
- `flags.unused_for_reference` is used to indicate whether the picture is marked as "unused for reference" as defined in section 8.3.2 of the ITU-T H.265 Specification;
- `pic_type` as defined in section 7.4.3.5 of the ITU-T H.265 Specification;
- `PicOrderCntVal` as defined in section 8.3.1 of the ITU-T H.265 Specification;
- `TemporalId` as defined in section 7.4.2.2 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265DpbSlotInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_DPB_SLOT_INFO_KHR`
- VUID-VkVideoEncodeH265DpbSlotInfoKHR-pStdReferenceInfo-parameter
  `pStdReferenceInfo` **must** be a valid pointer to a valid `StdVideoEncodeH265ReferenceInfo` value

38.19.12. H.265 Encode Rate Control

Group of Pictures

In case of H.265 encoding it is common practice to follow a regular pattern of different picture types in display order when encoding subsequent frames. This pattern is referred to as the *group of pictures* (GOP).

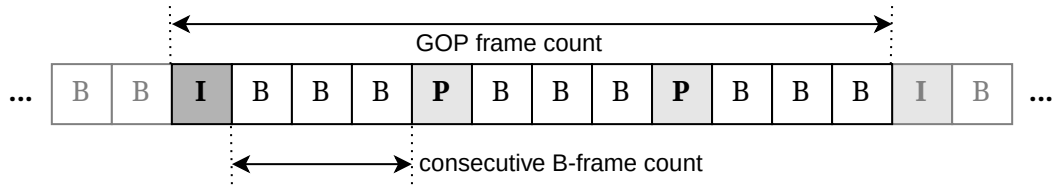
A regular GOP is defined by the following parameters:

- The number of frames in the GOP;
- The number of consecutive B frames between I and/or P frames in display order.

GOPs are further classified as *open* and *closed* GOPs.

Frame types in an open GOP follow each other in display order according to the following algorithm:

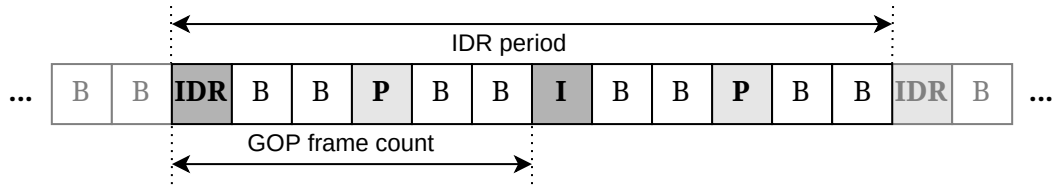
1. The first frame is always an I frame.
2. This is followed by a number of consecutive B frames, as defined above.
3. If the number of frames in the GOP is not reached yet, then the next frame is a P frame and the algorithm continues from step 2.



Text is not SVG - cannot display

Figure 31. H.265 open GOP

In case of a closed GOP, an IDR frame is used at a certain period.



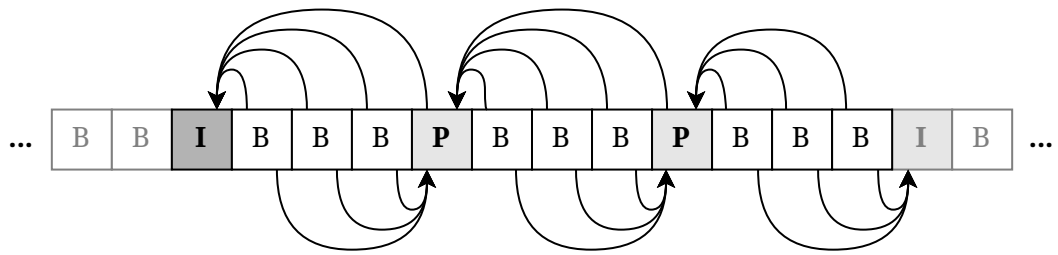
Text is not SVG - cannot display

Figure 32. H.265 closed GOP

It is also typical for H.265 encoding to use specific reference picture usage patterns across the frames of the GOP. The two most common reference patterns used are as follows:

Flat Reference Pattern

- Each P frame uses the last non-B frame, in display order, as reference.
- Each B frame uses the last non-B frame, in display order, as its forward reference, and uses the next non-B frame, in display order, as its backward reference.



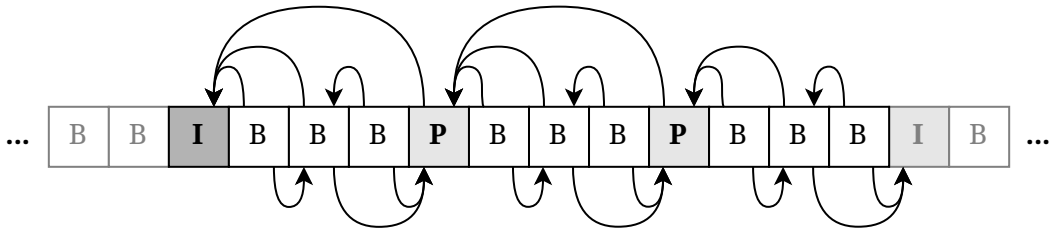
Text is not SVG - cannot display

Figure 33. H.265 flat reference pattern

Dyadic Reference Pattern

- Each P frame uses the last non-B frame, in display order, as reference.

- The following algorithm is applied to the sequence of consecutive B frames between I and/or P frames in display order:
  1. The B frame in the middle of this sequence uses the frame preceding the sequence as its forward reference, and uses the frame following the sequence as its backward reference.
  2. The algorithm is executed recursively for the following frame sequences:
     - The B frames of the original sequence preceding the frame in the middle, if any.
     - The B frames of the original sequence following the frame in the middle, if any.



Text is not SVG - cannot display

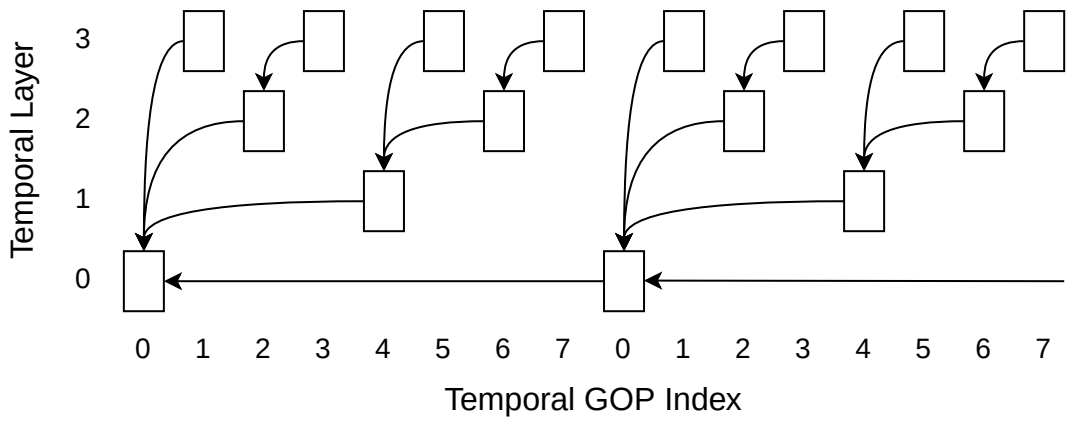
Figure 34. H.265 dyadic reference pattern

The application **can** provide guidance to the implementation's rate control algorithm about the structure of the GOP used by the application. Any such guidance about the GOP and its structure does not mandate that specific GOP structure to be used by the application, as the picture type of individual encoded pictures is still application-controlled, however, any deviation from the provided guidance **may** result in undesired rate control behavior including, but not limited, to the implementation not being able to conform to the expected average or target bitrates, or other rate control parameters specified by the application.

When an H.265 encode session is used to encode multiple temporal sub-layers, it is also common practice to follow a regular pattern for the H.265 temporal ID for the encoded pictures in display order when encoding subsequent frames. This pattern is referred to as the *temporal GOP*. The most common temporal layer pattern used is as follows:

Dyadic Temporal Sub-Layer Pattern

- The number of frames in the temporal GOP is 2^{n-1}, where n is the number of temporal sub-layers.
- The i^{th} frame in the temporal GOP uses temporal ID t, if and only if the index of the least significant bit set in i equals n-t-1, except for the first frame, which is the only frame in the temporal GOP using temporal ID zero.
- The i^{th} frame in the temporal GOP uses the r^{th} frame as reference, where r is calculated from i by clearing the least significant bit set in it, except for the first frame in the temporal GOP, which uses the first frame of the previous temporal GOP, if any, as reference.



Text is not SVG - cannot display

Figure 35. H.265 dyadic temporal sub-layer pattern

NOTE	Multi-layer rate control and multi-layer coding are typically used for streaming cases where low latency is expected, hence B pictures with backward prediction are usually not used.

The `VkVideoEncodeH265RateControlInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265RateControlInfoKHR {
    VkStructureType                           sType;
    const void*                               pNext;
    VkVideoEncodeH265RateControlFlagsKHR      flags;
    uint32_t                                  gopFrameCount;
    uint32_t                                  idrPeriod;
    uint32_t                                  consecutiveBFrameCount;
    uint32_t                                  subLayerCount;
} VkVideoEncodeH265RateControlInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkVideoEncodeH265RateControlFlagBitsKHR specifying H.265 rate control flags.
- `gopFrameCount` is the number of frames within a group of pictures (GOP) intended to be used by the application. If it is 0, the rate control algorithm **may** assume an implementation-dependent GOP length. If it is `UINT32_MAX`, the GOP length is treated as infinite.
- `idrPeriod` is the interval, in terms of number of frames, between two IDR frames (see IDR period). If it is 0, the rate control algorithm **may** assume an implementation-dependent IDR period. If it is `UINT32_MAX`, the IDR period is treated as infinite.
- `consecutiveBFrameCount` is the number of consecutive B frames between I and/or P frames within

the GOP.

- `subLayerCount` specifies the number of H.265 sub-layers that the application intends to use.

When an instance of this structure is included in the `pNext` chain of the VkVideoCodingControlInfoKHR structure passed to the vkCmdControlVideoCodingKHR command, and VkVideoCodingControlInfoKHR::`flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, the parameters in this structure are used as guidance for the implementation's rate control algorithm (see Video Coding Control).

If `flags` includes `VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR`, then the rate control state is reset to an initial state to meet HRD compliance requirements. Otherwise the new rate control state **may** be applied without a reset depending on the implementation and the specified rate control parameters.

NOTE

It would be possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided to the video encode operation.

Valid Usage

- VUID-VkVideoEncodeH265RateControlInfoKHR-flags-08291
  If VkVideoEncodeH265CapabilitiesKHR::`flags`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_KHR`, then `flags` **must** not contain `VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR`
- VUID-VkVideoEncodeH265RateControlInfoKHR-flags-08292
  If `flags` contains `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR` or `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`, then it **must** also contain `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_KHR`
- VUID-VkVideoEncodeH265RateControlInfoKHR-flags-08293
  If `flags` contains `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR`, then it **must** not also contain `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`
- VUID-VkVideoEncodeH265RateControlInfoKHR-flags-08294
  If `flags` contains `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_KHR`, then `gopFrameCount` **must** be greater than `0`
- VUID-VkVideoEncodeH265RateControlInfoKHR-idrPeriod-08295
  If `idrPeriod` is not `0`, then it **must** be greater than or equal to `gopFrameCount`
- VUID-VkVideoEncodeH265RateControlInfoKHR-consecutiveBFrameCount-08296
  If `consecutiveBFrameCount` is not `0`, then it **must** be less than `gopFrameCount`

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265RateControlInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_INFO_KHR`
- VUID-VkVideoEncodeH265RateControlInfoKHR-flags-parameter
  `flags` **must** be a valid combination of VkVideoEncodeH265RateControlFlagBitsKHR values

Bits which **can** be set in VkVideoEncodeH265RateControlInfoKHR::`flags`, specifying H.265 rate control flags, are:

```
// Provided by VK_KHR_video_encode_h265
typedef enum VkVideoEncodeH265RateControlFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_TEMPORAL_SUB_LAYER_PATTERN_DYADIC_BIT_KHR =
0x00000010,
} VkVideoEncodeH265RateControlFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR` specifies that rate control **should** attempt to produce an HRD compliant bitstream, as defined in annex C of the ITU-T H.265 Specification.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_KHR` specifies that the application intends to use a regular GOP structure according to the parameters specified in the `gopFrameCount`, `idrPeriod`, and `consecutiveBFrameCount` members of the VkVideoEncodeH265RateControlInfoKHR structure.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR` specifies that the application intends to follow a flat reference pattern in the GOP.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR` specifies that the application intends to follow a dyadic reference pattern in the GOP.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_TEMPORAL_SUB_LAYER_PATTERN_DYADIC_BIT_KHR` specifies that the application intends to follow a dyadic temporal sub-layer pattern.

```
// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265RateControlFlagsKHR;
```

`VkVideoEncodeH265RateControlFlagsKHR` is a bitmask type for setting a mask of zero or more VkVideoEncodeH265RateControlFlagBitsKHR.

Rate Control Layers

The `VkVideoEncodeH265RateControlLayerInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265RateControlLayerInfoKHR {
    VkStructureType                  sType;
    const void*                      pNext;
    VkBool32                         useMinQp;
    VkVideoEncodeH265QpKHR           minQp;
    VkBool32                         useMaxQp;
    VkVideoEncodeH265QpKHR           maxQp;
    VkBool32                         useMaxFrameSize;
    VkVideoEncodeH265FrameSizeKHR    maxFrameSize;
} VkVideoEncodeH265RateControlLayerInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `useMinQp` indicates whether the QP values determined by rate control will be clamped to the lower bounds on the QP values specified in `minQp`.
- `minQp` specifies the lower bounds on the QP values, for each picture type, that the implementation's rate control algorithm will use when `useMinQp` is `VK_TRUE`.
- `useMaxQp` indicates whether the QP values determined by rate control will be clamped to the upper bounds on the QP values specified in `maxQp`.
- `maxQp` specifies the upper bounds on the QP values, for each picture type, that the implementation's rate control algorithm will use when `useMaxQp` is `VK_TRUE`.
- `useMaxFrameSize` indicates whether the implementation's rate control algorithm **should** use the values specified in `maxFrameSize` as the upper bounds on the encoded frame size for each picture type.
- `maxFrameSize` specifies the upper bounds on the encoded frame size, for each picture type, when `useMaxFrameSize` is `VK_TRUE`.

When used, the values in `minQp` and `maxQp` guarantee that the effective QP values used by the implementation will respect those lower and upper bounds, respectively. However, limiting the range of QP values that the implementation is able to use will also limit the capabilities of the implementation's rate control algorithm to comply to other constraints. In particular, the implementation **may** not be able to comply to the following:

- The average and/or peak bitrate values to be used for the encoded bitstream specified in the `averageBitrate` and `maxBitrate` members of the VkVideoEncodeRateControlLayerInfoKHR structure.
- The upper bounds on the encoded frame size, for each picture type, specified in the `maxFrameSize` member of `VkVideoEncodeH265RateControlLayerInfoKHR`.

NOTE	In general, applications need to configure rate control parameters appropriately in order to be able to get the desired rate control behavior, as described in the Video Encode Rate Control section.

When an instance of this structure is included in the `pNext` chain of a

VkVideoEncodeRateControlLayerInfoKHR structure specified in one of the elements of the pLayers array member of the VkVideoEncodeRateControlInfoKHR structure passed to the vkCmdControlVideoCodingKHR command, VkVideoCodingControlInfoKHR::flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, and the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, it specifies the H.265-specific rate control parameters of the rate control layer corresponding to that element of pLayers.

Valid Usage

- VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMinQp-08297
  If useMinQp is VK_TRUE, then the qpI, qpP, and qpB members of minQp **must** all be between VkVideoEncodeH265CapabilitiesKHR::minQp and VkVideoEncodeH265CapabilitiesKHR::maxQp, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMaxQp-08298
  If useMaxQp is VK_TRUE, then the qpI, qpP, and qpB members of maxQp **must** all be between VkVideoEncodeH265CapabilitiesKHR::minQp and VkVideoEncodeH265CapabilitiesKHR::maxQp, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMinQp-08299
  If useMinQp is VK_TRUE and VkVideoEncodeH265CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR, then the qpI, qpP, and qpB members of minQp **must** all specify the same value
- VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMaxQp-08300
  If useMaxQp is VK_TRUE and VkVideoEncodeH265CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR, then the qpI, qpP, and qpB members of maxQp **must** all specify the same value
- VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMinQp-08375
  If useMinQp and useMaxQp are both VK_TRUE, then the qpI, qpP, and qpB members of minQp **must** all be less than or equal to the respective members of maxQp

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265RateControlLayerInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_LAYER_INFO_KHR
- VUID-VkVideoEncodeH265RateControlLayerInfoKHR-minQp-parameter
  minQp **must** be a valid VkVideoEncodeH265QpKHR structure
- VUID-VkVideoEncodeH265RateControlLayerInfoKHR-maxQp-parameter
  maxQp **must** be a valid VkVideoEncodeH265QpKHR structure
- VUID-VkVideoEncodeH265RateControlLayerInfoKHR-maxFrameSize-parameter

maxFrameSize **must** be a valid VkVideoEncodeH265FrameSizeKHR structure

The VkVideoEncodeH265QpKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265QpKHR {
    int32_t    qpI;
    int32_t    qpP;
    int32_t    qpB;
} VkVideoEncodeH265QpKHR;
```

- qpI is the QP to be used for I pictures.
- qpP is the QP to be used for P pictures.
- qpB is the QP to be used for B pictures.

The VkVideoEncodeH265FrameSizeKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265FrameSizeKHR {
    uint32_t    frameISize;
    uint32_t    framePSize;
    uint32_t    frameBSize;
} VkVideoEncodeH265FrameSizeKHR;
```

- frameISize is the size in bytes to be used for I frames.
- framePSize is the size in bytes to be used for P frames.
- frameBSize is the size in bytes to be used for B frames.

GOP Remaining Frames

Besides session level rate control configuration, the application **can** specify the number of frames per frame type remaining in the group of pictures (GOP).

The VkVideoEncodeH265GopRemainingFrameInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265GopRemainingFrameInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           useGopRemainingFrames;
    uint32_t           gopRemainingI;
    uint32_t           gopRemainingP;
    uint32_t           gopRemainingB;
} VkVideoEncodeH265GopRemainingFrameInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `useGopRemainingFrames` indicates whether the implementation's rate control algorithm **should** use the values specified in `gopRemainingI`, `gopRemainingP`, and `gopRemainingB`. If `useGopRemainingFrames` is `VK_FALSE`, then the values of `gopRemainingI`, `gopRemainingP`, and `gopRemainingB` are ignored.
- `gopRemainingI` specifies the number of I frames the implementation's rate control algorithm **should** assume to be remaining in the GOP prior to executing the video encode operation.
- `gopRemainingP` specifies the number of P frames the implementation's rate control algorithm **should** assume to be remaining in the GOP prior to executing the video encode operation.
- `gopRemainingB` specifies the number of B frames the implementation's rate control algorithm **should** assume to be remaining in the GOP prior to executing the video encode operation.

Setting `useGopRemainingFrames` to `VK_TRUE` and including this structure in the `pNext` chain of VkVideoBeginCodingInfoKHR is only mandatory if the VkVideoEncodeH265CapabilitiesKHR::`requiresGopRemainingFrames` reported for the used video profile is `VK_TRUE`. However, implementations **may** use these remaining frame counts, when specified, even when it is not required. In particular, when the application does not use a regular GOP structure, these values **may** provide additional guidance for the implementation's rate control algorithm.

The VkVideoEncodeH265CapabilitiesKHR::`prefersGopRemainingFrames` capability is also used to indicate that the implementation's rate control algorithm **may** operate more accurately if the application specifies the remaining frame counts using this structure.

As with other rate control guidance values, if the effective order and number of frames encoded by the application are not in line with the remaining frame counts specified in this structure at any given point, then the behavior of the implementation's rate control algorithm **may** deviate from the one expected by the application.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265GopRemainingFrameInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_GOP_REMAINING_FRAME_INFO_KHR`

H.265 QP Delta Maps

Quantization delta maps used with an H.265 encode profile are referred to as *QP delta maps* and their texels contain integer values representing QP delta values that are applied in the process of determining the quantization parameters of the encoded picture.

Accordingly, H.265 QP delta maps always have single channel integer formats, as reported in VkVideoFormatPropertiesKHR::`format`.

When the rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, the QP delta values are added to the per slice segment constant QP values that, in effect, enable the application to explicitly control the used QP values at the granularity of the used quantization map texel size.

For all other rate control modes, the QP delta values **can** be used to offset the QP values that the rate control algorithm would otherwise produce.

H.265 Encode Quantization

Performing H.265 encode operations involves the process of assigning QP values to individual H.265 coding units. This process depends on the used rate control mode, as well as other encode and rate control parameters, as described below:

- If the configured rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR`, then the QP value is initialized by the implementation-specific default rate control algorithm.
  - If the video encode operation is issued with a quantization delta map, the QP delta value corresponding to the coding unit, as fetched from the quantization map, is added to the previously determined QP value. If the fetched QP delta value falls outside the supported QP delta value range reported in the `minQpDelta` and `maxQpDelta` members of VkVideoEncodeH265QuantizationMapCapabilitiesKHR, then the QP value used for the coding unit becomes undefined.
- If the configured rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, then the QP value is initialized from the constant QP value specified for the H.265 slice segment the coding unit is part of.
  - If the video encode operation is issued with a quantization delta map, the QP delta value corresponding to the coding unit, as fetched from the quantization map, is added to the previously determined QP value. If the fetched QP delta value falls outside the supported QP delta value range reported in the `minQpDelta` and `maxQpDelta` members of VkVideoEncodeH265QuantizationMapCapabilitiesKHR, then the QP value used for the coding unit becomes undefined.
- If the configured rate control mode is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, then the QP value is initialized by the corresponding rate control algorithm.
  - If the video encode operation is issued with a quantization delta map, the QP delta value corresponding to the coding unit, as fetched from the quantization map, is added to the previously determined QP value. If the fetched QP delta value falls outside the supported QP delta value range reported in the `minQpDelta` and `maxQpDelta` members of VkVideoEncodeH265QuantizationMapCapabilitiesKHR, then the QP value used for the coding unit becomes undefined.
  - If the video encode operation is issued with an emphasis map, the rate control will adjust the QP value based on the emphasis value corresponding to the coding unit, as fetched from the quantization map, according to the following equation:

    $QP_{new} = f(QP_{prev},e)$

    Where QP_{new} is the resulting QP value, QP_{prev} is the previously determined QP value, e is the emphasis value corresponding to the coding unit, and f is an implementation-defined function for which the following implication is true:

    $e_1 < e_2 \Rightarrow f(QP,e_1) \geq f(QP,e_2)$

NOTE	This means that lower emphasis values will result in higher QP values, whereas higher emphasis values will result in lower QP values, but the function is not strictly decreasing with respect to the input emphasis value for a given input QP value.

    - If clamping to minimum QP values is enabled in the applied rate control layer, then the QP value is clamped to the corresponding minimum QP value.
    - If clamping to maximum QP values is enabled in the applied rate control layer, then the QP value is clamped to the corresponding maximum QP value.
- If `VK_VIDEO_ENCODE_H265_CAPABILITY_CU_QP_DIFF_WRAPAROUND_BIT_KHR` is not supported, then the determined QP value is clamped in such a way that the `CuQpDeltaVal` value of the encoded coding unit complies to the modified version of equation 8-283 of the ITU-T H.265 Specification.

NOTE	The effect of this is that the maximum QP difference across subsequent coding units is limited to the [-(26 + $QpBdOffset_Y$ / 2), 25 + $QpBdOffset_Y$ / 2] range and only has an observable change in behavior when the video encode operation is issued with a QP delta map.

- In all cases, the final QP value is clamped to the QP value range supported by the video profile, as reported in the `minQp` and `maxQp` members of VkVideoEncodeH265CapabilitiesKHR.

38.19.13. H.265 Encode Requirements

This section described the **required** H.265 encoding capabilities for physical devices that have at least one queue family that supports the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, as returned by vkGetPhysicalDeviceQueueFamilyProperties2KHR in VkQueueFamilyVideoPropertiesKHR ::`videoCodecOperations`.

Table 55. Required Video Std Header Versions

Video Std Header Name	Version
`vulkan_video_codec_h265std_encode`	1.0.0

Table 56. Required Video Capabilities

Video Capability	Requirement	Requirement Type[1]
VkVideoCapabilitiesKHR		
`flags`	-	min
`minBitstreamBufferOffsetAlignment`	4096	max
`minBitstreamBufferSizeAlignment`	4096	max
`pictureAccessGranularity`	(64,64)	max
`minCodedExtent`	-	max
`maxCodedExtent`	-	min

Video Capability	Requirement	Requirement Type[1]
maxDpbSlots	0	min
maxActiveReferencePictures	0	min
VkVideoEncodeCapabilitiesKHR		
flags	-	min
rateControlModes	-	min
maxBitrate	128000	min
maxQualityLevels	1	min
encodeInputPictureGranularity	(64,64)	max
supportedEncodeFeedbackFlags	VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR	min
VkVideoEncodeH265CapabilitiesKHR		
flags	-	min
maxLevelIdc	STD_VIDEO_H265_LEVEL_IDC_1_0	min
maxSliceSegmentCount	1	min
maxTiles	(1,1)	min
ctbSizes	at least one bit set	implementation-dependent
transformBlockSizes	at least one bit set	implementation-dependent
maxPPictureL0ReferenceCount	0	min
maxBPictureL0ReferenceCount	0	min
maxL1ReferenceCount	0	min
maxSubLayerCount	1	min
expectDyadicTemporalSubLayerPattern	-	implementation-dependent
minQp	-	max
maxQp	-	min
prefersGopRemainingFrames	-	implementation-dependent
requiresGopRemainingFrames	-	implementation-dependent

Video Capability	Requirement	Requirement Type[1]
stdSyntaxFlags	-	min
VkVideoEncodeQuantizationMapCapabilitiesKHR		
maxQuantizationMapExtent	-[2]	min
VkVideoEncodeH265QuantizationMapCapabilitiesKHR		
minQpDelta	-[3]	max
maxQpDelta	-[3]	min

1

The **Requirement Type** column specifies the requirement is either the minimum value all implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

2

If VkVideoCapabilitiesKHR::flags includes VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_VIDEO_ENCODE_CAPABILITY_EMPHASIS_MAP_BIT_KHR, then the width and height members of maxQuantizationMapExtent **must** be greater than zero.

3

If VkVideoCapabilitiesKHR::flags includes VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR, then maxQpDelta **must** be greater than minQpDelta.

38.20. AV1 Encode Operations

Video encode operations using an AV1 encode profile **can** be used to encode elementary video stream sequences compliant with the AV1 Specification.

NOTE Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video encode operation steps with the codec-specific semantics defined in section 7 of the AV1 Specification:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The StdVideoAV1SequenceHeader structure, the optional StdVideoEncodeAV1DecoderModelInfo structure, and the optional array of StdVideoEncodeAV1OperatingPointInfo structures stored in the bound video session parameters object specifying the active sequence header.

    - The `StdVideoEncodeAV1PictureInfo` structure specifying the AV1 picture information.
    - The `StdVideoEncodeAV1ReferenceInfo` structures specifying the AV1 reference information corresponding to the optional reconstructed picture and any active reference pictures.
    - The encoded bitstream data is written to the destination video bitstream buffer range as defined in the AV1 Encode Bitstream Data Access section.
    - Picture data in the video picture resources corresponding to the used encode input picture, active reference pictures, and optional reconstructed picture is accessed as defined in the AV1 Encode Picture Data Access section.
- The decision on reference picture setup is made according to the parameters specified in the AV1 picture information.

If the parameters adhere to the syntactic and semantic requirements defined in the corresponding sections of the AV1 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video encode operation will complete successfully. Otherwise, the video encode operation **may** complete unsuccessfully.

38.20.1. AV1 Encode Parameter Overrides

Implementations **may** override, unless otherwise specified, any of the AV1 encode parameters specified in the following Video Std structures:

- `StdVideoAV1SequenceHeader`
- `StdVideoEncodeAV1DecoderModelInfo`
- `StdVideoEncodeAV1OperatingPointInfo`
- `StdVideoEncodeAV1PictureInfo`
- `StdVideoEncodeAV1ReferenceInfo`

All such AV1 encode parameter overrides **must** fulfill the conditions defined in the Video Encode Parameter Overrides section.

In addition, implementations **must** not override any of the following AV1 encode parameters:

- the following parameters specified in `StdVideoAV1SequenceHeader`:
    - `flags.still_picture`
    - `flags.enable_order_hint`
    - `flags.frame_id_numbers_present_flag`
    - `flags.film_grain_params_present`
    - `flags.timing_info_present_flag`
    - `flags.initial_display_delay_present_flag`
    - `delta_frame_id_length_minus_2`
    - `additional_frame_id_length_minus_1`
    - `order_hint_bits_minus_1`

- the following parameters specified in the StdVideoAV1ColorConfig structure pointed to by StdVideoAV1SequenceHeader::pColorConfig:
  - flags.mono_chrome
  - flags.color_range
  - BitDepth
  - subsampling_x
  - subsampling_y
  - color_primaries
  - transfer_characteristics
  - matrix_coefficients
  - chroma_sample_position
- the following parameters specified in the StdVideoAV1TimingInfo structure pointed to by StdVideoAV1SequenceHeader::pTimingInfo:
  - flags.equal_picture_interval
  - num_units_in_display_tick
  - time_scale
  - num_ticks_per_picture_minus_1
- the parameters specified in StdVideoEncodeAV1DecoderModelInfo
- the parameters specified in StdVideoEncodeAV1OperatingPointInfo
- the following parameters specified in StdVideoEncodeAV1PictureInfo:
  - flags.show_frame
  - flags.showable_frame
  - frame_type
  - frame_presentation_time
  - current_frame_id
  - order_hint
  - refresh_frame_flags
  - render_width_minus_1
  - render_height_minus_1
  - ref_order_hint
  - ref_frame_idx
  - delta_frame_id_minus_1
- the following parameters specified in the StdVideoEncodeAV1ExtensionHeader structure pointed to by StdVideoEncodeAV1PictureInfo::pExtensionHeader when VkVideoEncodeAV1PictureInfoKHR::generateObuExtensionHeader is set to VK_TRUE:
  - temporal_id

- spatial_id

If VkVideoEncodeAV1PictureInfoKHR::primaryReferenceCdfOnly is set to VK_TRUE for a video encode operation, the implementation will not override StdVideoEncodeAV1PictureInfo::primary_ref_frame.

NOTE

Implementations supporting the VK_VIDEO_ENCODE_AV1_STD_PRIMARY_REF_FRAME_BIT_KHR AV1 syntax element capability reported in VkVideoEncodeAV1CapabilitiesKHR::stdSyntaxFlag also guarantee the use of the application-specified value for StdVideoEncodeAV1PictureInfo::primary_ref_frame. While support for VK_VIDEO_ENCODE_AV1_STD_PRIMARY_REF_FRAME_BIT_KHR guarantees that the implementation will not override the application-specified primary_ref_frame, it does not mandate the implementation to use the reference picture indicated by primary_ref_frame for sample prediction as implementations can always decide to use only a subset of the application-specified reference pictures for sample prediction. This means that implementations supporting VK_VIDEO_ENCODE_AV1_STD_PRIMARY_REF_FRAME_BIT_KHR may end up using the reference picture indicated by primary_ref_frame only for CDF data reference even if the application did not set VkVideoEncodeAV1PictureInfoKHR::primaryReferenceCdfOnly to VK_TRUE.

If VkVideoEncodeAV1CapabilitiesKHR::codedPictureAlignment is not equal to {8,8} for the used video profile, implementations will override the coded picture's resolution and parameters related to the width and height in the following manner:

- Let w and h be the codedExtent.width and codedExtent.height of the VkVideoPictureResourceInfoKHR structure corresponding to the encode input picture, rounded up to the nearest integer multiple of 8.
- Let aW and aH be w and h rounded up to the nearest integer multiple of codedPictureAlignment.width and codedPictureAlignment.height respectively.
- If w equals aW, no override will occur. Otherwise the coded width will be aW.
- If h equals aH, no override will occur. Otherwise the coded height will be aH.

NOTE

The AV1 specification codes all resolutions to an 8x8 alignment, but supports unaligned resolutions through implicit cropping. Thus, if the original coded extent, aligned to 8x8, meets the implementation required alignment, no override needs to occur. Otherwise, the implementation cannot code the requested coded extent, so the final resolution in the bitstream is overridden to be aligned to the implementation required alignment.

For example, consider an implementation that is only able to output bitstreams that are 16x16 aligned (as indicated by VkVideoEncodeAV1CapabilitiesKHR::codedPictureAlignment). If an application requests the coded extent to be 1920x1080, the resulting bitstream will be 1920x1088. On the other hand, a request of 1920x1082 will result in no override, since the 8x8 alignment of this resolution (1920x1088) is 16x16 aligned.

In case of a video session parameters object created with VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR, the following AV1 sequence header parameters **may** be overridden by the implementation according to the quantization map texel size the video session parameters object was created with:

- StdVideoAV1SequenceHeader::flags.use_128x128_superblock

This **may** be necessary to change the AV1 superblock size used during encoding to be compatible with the used quantization map texel size.

In case of AV1 encode parameters stored in video session parameters objects, applications need to use the vkGetEncodedVideoSessionParametersKHR command to determine whether any implementation overrides happened. If the query indicates that implementation overrides were applied, then the application needs to retrieve and use the encoded AV1 sequence header in the bitstream in order to be able to produce a compliant AV1 video bitstream using the AV1 encode parameters stored in the video session parameters object.

In case of any AV1 encode parameters stored in the encoded bitstream produced by video encode operations, if the implementation supports the VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR video encode feedback query flag, the application **can** use such queries to retrieve feedback about whether any implementation overrides have been applied to those AV1 encode parameters.

38.20.2. AV1 Encode Bitstream Data Access

Each video encode operation writes either:

- A single OBU with obu_type equal to OBU_FRAME comprising of the frame header and tile data of the encoded picture, or
- An OBU with obu_type equal to OBU_FRAME_HEADER encapsulating the frame header of the encoded picture, followed by one or more OBUs with obu_type equal to OBU_TILE_GROUP comprising of the tile data of the encoded picture.

In addition, if VkVideoEncodeAV1PictureInfoKHR::generateObuExtensionHeader is set to VK_TRUE for the video encode operation, then OBU extension headers are included in the generated bitstream as defined in sections 5.3.1, 5.3.2, and 5.3.3 of the AV1 Specification.

38.20.3. AV1 Encode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::pictureAccessGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. Accordingly, the complete image subregion of a encode input picture, reference picture, or reconstructed picture accessed by video coding operations using an AV1 encode profile is defined as the set of texels within the coordinate range:

([0,endX),[0,endY))

Where:

- endX equals codedExtent.width rounded up to the nearest integer multiple of pictureAccessGranularity.width and clamped to the width of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;
- endY equals codedExtent.height rounded up to the nearest integer multiple of pictureAccessGranularity.height and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;

Where codedExtent is the member of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.

In case of video encode operations using an AV1 encode profile, any access to a picture at the coordinates (x,y), as defined by the AV1 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel coordinates (x,y).

Implementations **may** choose not to access some or all texels within particular reference pictures available to a video encode operation (e.g. due to video encode parameter overrides restricting the effective set of used reference pictures, or if the encoding algorithm chooses not to use certain subregions of the reference picture data for sample prediction).

38.20.4. AV1 Reference Names and Semantics

Individual reference frames used in the encoding process have different semantics, as defined in section 6.10.24 of the AV1 Specification. The AV1 semantics associated with a reference picture is indicated by the corresponding enumeration constant defined in the Video Std enumeration type StdVideoAV1ReferenceName:

- STD_VIDEO_AV1_REFERENCE_NAME_INTRA_FRAME identifies the reference used for intra coding (INTRA_FRAME), as defined in sections 2 and 7.11.2 of the AV1 Specification.
- All other enumeration constants refer to backward or forward references used for inter coding, as defined in sections 2 and 7.11.3 of the AV1 Specification:
  - STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME identifies the LAST_FRAME reference
  - STD_VIDEO_AV1_REFERENCE_NAME_LAST2_FRAME identifies the LAST2_FRAME reference
  - STD_VIDEO_AV1_REFERENCE_NAME_LAST3_FRAME identifies the LAST3_FRAME reference
  - STD_VIDEO_AV1_REFERENCE_NAME_GOLDEN_FRAME identifies the GOLDEN_FRAME reference
  - STD_VIDEO_AV1_REFERENCE_NAME_BWDREF_FRAME identifies the BWDREF_FRAME reference
  - STD_VIDEO_AV1_REFERENCE_NAME_ALTREF2_FRAME identifies the ALTREF2_FRAME reference
  - STD_VIDEO_AV1_REFERENCE_NAME_ALTREF_FRAME identifies the ALTREF_FRAME reference

These enumeration constants are not directly used in any APIs but are used to indirectly index into certain Video Std and Vulkan API parameter arrays.

38.20.5. AV1 Prediction Modes

AV1 encoding supports multiple types of prediction modes, as described in section 6.10.24 of the

AV1 Specification.

Possible AV1 encode prediction modes are as follows:

```
// Provided by VK_KHR_video_encode_av1
typedef enum VkVideoEncodeAV1PredictionModeKHR {
    VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_INTRA_ONLY_KHR = 0,
    VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_SINGLE_REFERENCE_KHR = 1,
    VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_UNIDIRECTIONAL_COMPOUND_KHR = 2,
    VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_BIDIRECTIONAL_COMPOUND_KHR = 3,
} VkVideoEncodeAV1PredictionModeKHR;
```

- VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_INTRA_ONLY_KHR specifies the use of *intra-only prediction mode*, used when encoding AV1 frames of type STD_VIDEO_AV1_FRAME_TYPE_KEY or STD_VIDEO_AV1_FRAME_TYPE_INTRA_ONLY.
- VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_SINGLE_REFERENCE_KHR specifies the use of *single reference prediction mode*, used when encoding AV1 frames of type STD_VIDEO_AV1_FRAME_TYPE_INTER or STD_VIDEO_AV1_FRAME_TYPE_SWITCH with reference_select, as defined in section 6.8.23 of the AV1 Specification, equal to 0. When using this prediction mode, the application **must** specify a reference picture for at least one AV1 reference name in VkVideoEncodeAV1PictureInfoKHR::referenceNameSlotIndices that is supported by the implementation, as reported in VkVideoEncodeAV1CapabilitiesKHR::singleReferenceNameMask.
- VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_UNIDIRECTIONAL_COMPOUND_KHR specifies the use of *unidirectional compound prediction mode*, used when encoding AV1 frames of type STD_VIDEO_AV1_FRAME_TYPE_INTER or STD_VIDEO_AV1_FRAME_TYPE_SWITCH with reference_select, as defined in section 6.8.23 of the AV1 Specification, equal to 1, and both reference names used for prediction are from the same reference frame group, as defined in section 6.10.24 of the AV1 Specification. When using this prediction mode, the application **must** specify a reference picture for at least two AV1 reference names in VkVideoEncodeAV1PictureInfoKHR::referenceNameSlotIndices that is supported by the implementation, as reported in VkVideoEncodeAV1CapabilitiesKHR::unidirectionalCompoundReferenceNameMask, where those two reference names are one of the allowed pairs of reference names, as defined in section 5.11.25 of the AV1 Specification, listed below:
  - LAST_FRAME and LAST2_FRAME,
  - LAST_FRAME and LAST3_FRAME,
  - LAST_FRAME and GOLDEN_FRAME, or
  - BWDREF_FRAME and ALTREF_FRAME.
- VK_VIDEO_ENCODE_AV1_PREDICTION_MODE_BIDIRECTIONAL_COMPOUND_KHR specifies the use of *bidirectional compound prediction mode*, used when encoding AV1 frames of type STD_VIDEO_AV1_FRAME_TYPE_INTER or STD_VIDEO_AV1_FRAME_TYPE_SWITCH with reference_select, as defined in section 6.8.23 of the AV1 Specification, equal to 1, and the two reference names used for prediction are from different reference frame groups, as defined in section 6.10.24 of the AV1 Specification. When using this prediction mode, the application **must** specify a reference picture for at least one AV1 reference name from each reference frame group in VkVideoEncodeAV1PictureInfoKHR::referenceNameSlotIndices that is supported by the

implementation, as reported in VkVideoEncodeAV1CapabilitiesKHR::bidirectionalCompoundReferenceNameMask.

The effective prediction mode used to encode individual AV1 mode info blocks **may** use simpler prediction modes than the one set by the application for the frame, as allowed by the AV1 Specification, in particular:

- Frames encoded with single reference prediction mode **may** contain mode info blocks encoded with intra-only prediction mode.
- Frames encoded with unidirectional compound prediction mode **may** contain mode info blocks encoded with intra-only or single reference prediction mode.
- Frames encoded with bidirectional compound prediction mode **may** contain mode info blocks encoded with intra-only, single reference, or unidirectional compound prediction mode.

38.20.6. AV1 Coding Blocks

AV1 encode supports two types of coding blocks, as defined in section 2 of the AV1 Specification:

- *Superblock*.
- *Mode info block*.

38.20.7. AV1 Encode Profile

A video profile supporting AV1 video encode operations is specified by setting VkVideoProfileInfoKHR::videoCodecOperation to VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR and adding a VkVideoEncodeAV1ProfileInfoKHR structure to the VkVideoProfileInfoKHR::pNext chain.

The VkVideoEncodeAV1ProfileInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1ProfileInfoKHR {
    VkStructureType       sType;
    const void*           pNext;
    StdVideoAV1Profile    stdProfile;
} VkVideoEncodeAV1ProfileInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stdProfile is a StdVideoAV1Profile value specifying the AV1 codec profile, as defined in section A.2 of the AV1 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1ProfileInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_PROFILE_INFO_KHR

38.20.8. AV1 Encode Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities for an AV1 encode profile, the VkVideoCapabilitiesKHR::pNext chain **must** include a VkVideoEncodeAV1CapabilitiesKHR structure that will be filled with the profile-specific capabilities.

The VkVideoEncodeAV1CapabilitiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1CapabilitiesKHR {
    VkStructureType                           sType;
    void*                                     pNext;
    VkVideoEncodeAV1CapabilityFlagsKHR        flags;
    StdVideoAV1Level                          maxLevel;
    VkExtent2D                                codedPictureAlignment;
    VkExtent2D                                maxTiles;
    VkExtent2D                                minTileSize;
    VkExtent2D                                maxTileSize;
    VkVideoEncodeAV1SuperblockSizeFlagsKHR    superblockSizes;
    uint32_t                                  maxSingleReferenceCount;
    uint32_t                                  singleReferenceNameMask;
    uint32_t                                  maxUnidirectionalCompoundReferenceCount;
    uint32_t
maxUnidirectionalCompoundGroup1ReferenceCount;
    uint32_t                                  unidirectionalCompoundReferenceNameMask;
    uint32_t                                  maxBidirectionalCompoundReferenceCount;
    uint32_t
maxBidirectionalCompoundGroup1ReferenceCount;
    uint32_t
maxBidirectionalCompoundGroup2ReferenceCount;
    uint32_t                                  bidirectionalCompoundReferenceNameMask;
    uint32_t                                  maxTemporalLayerCount;
    uint32_t                                  maxSpatialLayerCount;
    uint32_t                                  maxOperatingPoints;
    uint32_t                                  minQIndex;
    uint32_t                                  maxQIndex;
    VkBool32                                  prefersGopRemainingFrames;
    VkBool32                                  requiresGopRemainingFrames;
    VkVideoEncodeAV1StdFlagsKHR               stdSyntaxFlags;
} VkVideoEncodeAV1CapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkVideoEncodeAV1CapabilityFlagBitsKHR indicating supported AV1 encoding capabilities.
- maxLevel is a StdVideoAV1Level value indicating the maximum AV1 level supported by the profile, as defined in section A.3 of the AV1 Specification.
- codedPictureAlignment indicates the alignment at which the implementation will code pictures.

This capability does not impose any valid usage constraints on the application. However, depending on the codedExtent of the encode input picture resource, this capability **may** result in a change of the resolution of the encoded picture, as described in more detail below.

- maxTiles indicates the maximum number of AV1 tile columns and rows the implementation supports.
- minTileSize indicates the minimum extent of individual AV1 tiles the implementation supports.
- maxTileSize indicates the maximum extent of individual AV1 tiles the implementation supports.
- superblockSizes is a bitmask of VkVideoEncodeAV1SuperblockSizeFlagBitsKHR values indicating the supported AV1 superblock sizes.
- maxSingleReferenceCount indicates the maximum number of reference pictures the implementation supports when using single reference prediction mode.
- singleReferenceNameMask is a bitmask of supported AV1 reference names when using single reference prediction mode.
- maxUnidirectionalCompoundReferenceCount indicates the maximum number of reference pictures the implementation supports when using unidirectional compound prediction mode.
- maxUnidirectionalCompoundGroup1ReferenceCount indicates the maximum number of reference pictures the implementation supports when using unidirectional compound prediction mode from reference frame group 1, as defined in section 6.10.24 of the AV1 Specification.
- unidirectionalCompoundReferenceNameMask is a bitmask of supported AV1 reference names when using unidirectional compound prediction mode.
- maxBidirectionalCompoundReferenceCount indicates the maximum number of reference pictures the implementation supports when using bidirectional compound prediction mode.
- maxBidirectionalCompoundGroup1ReferenceCount indicates the maximum number of reference pictures the implementation supports when using bidirectional compound prediction mode from reference frame group 1, as defined in section 6.10.24 of the AV1 Specification.
- maxBidirectionalCompoundGroup2ReferenceCount indicates the maximum number of reference pictures the implementation supports when using bidirectional compound prediction mode from reference frame group 2, as defined in section 6.10.24 of the AV1 Specification.
- bidirectionalCompoundReferenceNameMask is a bitmask of supported AV1 reference names when using bidirectional compound prediction mode.
- maxTemporalLayerCount indicates the maximum number of AV1 temporal layers supported by the implementation.
- maxSpatialLayerCount indicates the maximum number of AV1 spatial layers supported by the implementation.
- maxOperatingPoints indicates the maximum number of AV1 operating points supported by the implementation.
- minQIndex indicates the minimum quantizer index value supported.
- maxQIndex indicates the maximum quantizer index value supported.
- prefersGopRemainingFrames indicates that the implementation's rate control algorithm prefers the application to specify the number of frames in each AV1 rate control group remaining in the

current group of pictures when beginning a video coding scope.

- `requiresGopRemainingFrames` indicates that the implementation's rate control algorithm requires the application to specify the number of frames in each AV1 rate control group remaining in the current group of pictures when beginning a video coding scope.
- `stdSyntaxFlags` is a bitmask of VkVideoEncodeAV1StdFlagBitsKHR indicating capabilities related to AV1 syntax elements.

`singleReferenceNameMask`, `unidirectionalCompoundReferenceNameMask`, and `bidirectionalCompoundReferenceNameMask` are encoded such that when bit index i is set, it indicates support for the AV1 reference name `STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME` + i.

NOTE These masks indicate which elements of the `referenceNameSlotIndices` member of VkVideoEncodeAV1PictureInfoKHR are supported to be used by the implementation. It is important to note that both the bits of these masks and the elements of `referenceNameSlotIndices` are indexed such that the first value specifies the support bit and DPB slot index, respectively, for the AV1 reference name `STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME` (i.e. there is no bit or element for `STD_VIDEO_AV1_REFERENCE_NAME_INTRA_FRAME`).

`codedPictureAlignment` provides information about implementation limitations to encode arbitrary resolutions. In particular, some implementations **may** not be able to generate bitstreams aligned to the requirements of the AV1 Specification (8x8). In such cases, the implementation **may** override the width and height of the bitstream, in order to produce a bitstream compliant to the AV1 Specification. If such an override occurs, the encoded resolution of the coded picture is enlargened, with the texel values used for the texel coordinates outside of the bounds of the `codedExtent` of the encode input picture resource being first governed by the rules regarding the encode input picture granularity. Any texel values outside of the region described by the encode input picture granularity are implementation-defined. Implementations **should** use well-defined values to minimize impact on the produced encoded content.

NOTE This capability does not impose additional application requirements. However, these overrides change the effective resolution of the bitstream and add padding pixels. Applications sensitive to such overrides **can** use this capability and the corresponding override behavior to compute the cropping needed to reproduce the original input of the encoding and transmit it in a side channel (i.e. by using cropping fields available in a container). Additionally, applications **can** explicitly consider this alignment in their coded extent, to avoid implementation-defined texel values being included in the encoded content.

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1CapabilitiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_CAPABILITIES_KHR`

Bits which **may** be set in VkVideoEncodeAV1CapabilitiesKHR::`flags`, indicating the AV1 encoding capabilities supported, are:

```
// Provided by VK_KHR_video_encode_av1
typedef enum VkVideoEncodeAV1CapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_AV1_CAPABILITY_PER_RATE_CONTROL_GROUP_MIN_MAX_Q_INDEX_BIT_KHR =
0x00000001,
    VK_VIDEO_ENCODE_AV1_CAPABILITY_GENERATE_OBU_EXTENSION_HEADER_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_AV1_CAPABILITY_PRIMARY_REFERENCE_CDF_ONLY_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_AV1_CAPABILITY_FRAME_SIZE_OVERRIDE_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_AV1_CAPABILITY_MOTION_VECTOR_SCALING_BIT_KHR = 0x00000010,
} VkVideoEncodeAV1CapabilityFlagBitsKHR;
```

- VK_VIDEO_ENCODE_AV1_CAPABILITY_PER_RATE_CONTROL_GROUP_MIN_MAX_Q_INDEX_BIT_KHR indicates support for specifying different quantizer index values in the members of VkVideoEncodeAV1QIndexKHR.
- VK_VIDEO_ENCODE_AV1_CAPABILITY_GENERATE_OBU_EXTENSION_HEADER_BIT_KHR indicates support for generating OBU extension headers, as defined in section 5.3.3 of the AV1 Specification.
- VK_VIDEO_ENCODE_AV1_CAPABILITY_PRIMARY_REFERENCE_CDF_ONLY_BIT_KHR indicates support for using the primary reference frame indicated by the value of StdVideoEncodeAV1PictureInfo ::primary_ref_frame in the AV1 picture information only for CDF data reference, as defined in section 6.8.2 of the AV1 Specification.
- VK_VIDEO_ENCODE_AV1_CAPABILITY_FRAME_SIZE_OVERRIDE_BIT_KHR indicates support for encoding a picture with a frame size different from the maximum frame size defined in the active AV1 sequence header. If this capability is not supported, then frame_size_override_flag **must** not be set in the AV1 picture information of the encoded frame and the coded extent of the encode input picture **must** match the maximum coded extent allowed by the active AV1 sequence header, i.e. (max_frame_width_minus_1 + 1, max_frame_height_minus_1 + 1).
- VK_VIDEO_ENCODE_AV1_CAPABILITY_MOTION_VECTOR_SCALING_BIT_KHR indicates support for motion vector scaling, as defined in section 7.11.3.3 of the AV1 Specification. If this capability is not supported, then the coded extent of all active reference pictures **must** match the coded extent of the encode input picture. This capability **may** only be supported by a video profile when VK_VIDEO_ENCODE_AV1_CAPABILITY_FRAME_SIZE_OVERRIDE_BIT_KHR is also supported.

```
// Provided by VK_KHR_video_encode_av1
typedef VkFlags VkVideoEncodeAV1CapabilityFlagsKHR;
```

VkVideoEncodeAV1CapabilityFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeAV1CapabilityFlagBitsKHR.

Bits which **may** be set in VkVideoEncodeAV1CapabilitiesKHR::stdSyntaxFlags, indicating the capabilities related to the AV1 syntax elements, are:

```
// Provided by VK_KHR_video_encode_av1
typedef enum VkVideoEncodeAV1StdFlagBitsKHR {
    VK_VIDEO_ENCODE_AV1_STD_UNIFORM_TILE_SPACING_FLAG_SET_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_AV1_STD_SKIP_MODE_PRESENT_UNSET_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_AV1_STD_PRIMARY_REF_FRAME_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_AV1_STD_DELTA_Q_BIT_KHR = 0x00000008,
} VkVideoEncodeAV1StdFlagBitsKHR;
```

- VK_VIDEO_ENCODE_AV1_STD_UNIFORM_TILE_SPACING_FLAG_SET_BIT_KHR indicates whether the implementation supports using the application-provided value for StdVideoAV1TileInfoFlags::uniform_tile_spacing_flag in the AV1 tile parameters when that value is 1, indifferent of the coded extent of the encode input picture and the number of tile columns and rows requested in the TileCols and TileRows members of StdVideoAV1TileInfo.
- VK_VIDEO_ENCODE_AV1_STD_SKIP_MODE_PRESENT_UNSET_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeAV1PictureInfoFlags::skip_mode_present when that value is 0.
- VK_VIDEO_ENCODE_AV1_STD_PRIMARY_REF_FRAME_BIT_KHR specifies whether the implementation supports using the application-provided value for StdVideoEncodeAV1PictureInfo::primary_ref_frame.
- VK_VIDEO_ENCODE_AV1_STD_DELTA_Q_BIT_KHR specifies whether the implementation supports using the application-provided values for the DeltaQYDc, DeltaQUDc, DeltaQUAc, DeltaQVDc, and DeltaQVAc members of StdVideoAV1Quantization.

These capability flags provide information to the application about specific AV1 syntax element values that the implementation supports without having to override them and do not otherwise restrict the values that the application **can** specify for any of the mentioned AV1 syntax elements.

```
// Provided by VK_KHR_video_encode_av1
typedef VkFlags VkVideoEncodeAV1StdFlagsKHR;
```

VkVideoEncodeAV1StdFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeAV1StdFlagBitsKHR.

Bits which **may** be set in VkVideoEncodeAV1CapabilitiesKHR::superblockSizes, indicating the superblock sizes supported by the implementation, are:

```
// Provided by VK_KHR_video_encode_av1
typedef enum VkVideoEncodeAV1SuperblockSizeFlagBitsKHR {
    VK_VIDEO_ENCODE_AV1_SUPERBLOCK_SIZE_64_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_AV1_SUPERBLOCK_SIZE_128_BIT_KHR = 0x00000002,
} VkVideoEncodeAV1SuperblockSizeFlagBitsKHR;
```

- VK_VIDEO_ENCODE_AV1_SUPERBLOCK_SIZE_64_BIT_KHR specifies that a superblock size of 64x64 is supported.

- VK_VIDEO_ENCODE_AV1_SUPERBLOCK_SIZE_128_BIT_KHR specifies that a superblock size of 128x128 is supported.

```
// Provided by VK_KHR_video_encode_av1
typedef VkFlags VkVideoEncodeAV1SuperblockSizeFlagsKHR;
```

VkVideoEncodeAV1SuperblockSizeFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeAV1SuperblockSizeFlagBitsKHR.

Implementations **must** support at least one of VkVideoEncodeAV1SuperblockSizeFlagBitsKHR.

38.20.9. AV1 Encode Quality Level Properties

When calling vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR with pVideoProfile->videoCodecOperation specified as VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, the VkVideoEncodeAV1QualityLevelPropertiesKHR structure **must** be included in the pNext chain of the VkVideoEncodeQualityLevelPropertiesKHR structure to retrieve additional video encode quality level properties specific to AV1 encoding.

The VkVideoEncodeAV1QualityLevelPropertiesKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1QualityLevelPropertiesKHR {
    VkStructureType                       sType;
    void*                                 pNext;
    VkVideoEncodeAV1RateControlFlagsKHR   preferredRateControlFlags;
    uint32_t                              preferredGopFrameCount;
    uint32_t                              preferredKeyFramePeriod;
    uint32_t                              preferredConsecutiveBipredictiveFrameCount;
    uint32_t                              preferredTemporalLayerCount;
    VkVideoEncodeAV1QIndexKHR             preferredConstantQIndex;
    uint32_t                              preferredMaxSingleReferenceCount;
    uint32_t                              preferredSingleReferenceNameMask;
    uint32_t
preferredMaxUnidirectionalCompoundReferenceCount;
    uint32_t
preferredMaxUnidirectionalCompoundGroup1ReferenceCount;
    uint32_t
preferredUnidirectionalCompoundReferenceNameMask;
    uint32_t
preferredMaxBidirectionalCompoundReferenceCount;
    uint32_t
preferredMaxBidirectionalCompoundGroup1ReferenceCount;
    uint32_t
preferredMaxBidirectionalCompoundGroup2ReferenceCount;
    uint32_t
preferredBidirectionalCompoundReferenceNameMask;
} VkVideoEncodeAV1QualityLevelPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `preferredRateControlFlags` is a bitmask of VkVideoEncodeAV1RateControlFlagBitsKHR values indicating the preferred flags to use for VkVideoEncodeAV1RateControlInfoKHR::`flags`.
- `preferredGopFrameCount` indicates the preferred value to use for VkVideoEncodeAV1RateControlInfoKHR::`gopFrameCount`.
- `preferredKeyFramePeriod` indicates the preferred value to use for VkVideoEncodeAV1RateControlInfoKHR::`keyFramePeriod`.
- `preferredConsecutiveBipredictiveFrameCount` indicates the preferred value to use for VkVideoEncodeAV1RateControlInfoKHR::`consecutiveBipredictiveFrameCount`.
- `preferredTemporalLayerCount` indicates the preferred value to use for VkVideoEncodeAV1RateControlInfoKHR::`temporalLayerCount`.
- `preferredConstantQIndex` indicates the preferred value to use for VkVideoEncodeAV1PictureInfoKHR::`constantQIndex` when using rate control mode `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- `preferredMaxSingleReferenceCount` indicates the preferred maximum number of reference pictures to use with single reference prediction mode.
- `preferredSingleReferenceNameMask` is a bitmask of preferred AV1 reference names when using single reference prediction mode.
- `preferredMaxUnidirectionalCompoundReferenceCount` indicates the preferred maximum number of reference pictures to use with unidirectional compound prediction mode.
- `preferredMaxUnidirectionalCompoundGroup1ReferenceCount` indicates the preferred maximum number of reference pictures to use with unidirectional compound prediction mode from reference frame group 1, as defined in section 6.10.24 of the AV1 Specification.
- `preferredUnidirectionalCompoundReferenceNameMask` is a bitmask of preferred AV1 reference names when using unidirectional compound prediction mode.
- `preferredMaxBidirectionalCompoundReferenceCount` indicates the preferred maximum number of reference pictures to use with bidirectional compound prediction mode.
- `preferredMaxBidirectionalCompoundGroup1ReferenceCount` indicates the preferred maximum number of reference pictures to use with bidirectional compound prediction mode from reference frame group 1, as defined in section 6.10.24 of the AV1 Specification.
- `preferredMaxBidirectionalCompoundGroup2ReferenceCount` indicates the preferred maximum number of reference pictures to use with bidirectional compound prediction mode from reference frame group 2, as defined in section 6.10.24 of the AV1 Specification.
- `preferredBidirectionalCompoundReferenceNameMask` is a bitmask of preferred AV1 reference names when using bidirectional compound prediction mode.

`preferredSingleReferenceNameMask`, `preferredUnidirectionalCompoundReferenceNameMask`, and `preferredBidirectionalCompoundReferenceNameMask` are encoded such that when bit index i is set, it indicates preference for using the AV1 reference name `STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME` + i.

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1QualityLevelPropertiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_QUALITY_LEVEL_PROPERTIES_KHR`

38.20.10. AV1 Encode Session

Additional parameters can be specified when creating a video session with an AV1 encode profile by including an instance of the VkVideoEncodeAV1SessionCreateInfoKHR structure in the `pNext` chain of VkVideoSessionCreateInfoKHR.

The `VkVideoEncodeAV1SessionCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1SessionCreateInfoKHR {
    VkStructureType     sType;
    const void*         pNext;
    VkBool32            useMaxLevel;
    StdVideoAV1Level    maxLevel;
} VkVideoEncodeAV1SessionCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `useMaxLevel` indicates whether the value of `maxLevel` should be used by the implementation. When it is set to `VK_FALSE`, the implementation ignores the value of `maxLevel` and uses the value of VkVideoEncodeAV1CapabilitiesKHR::`maxLevel`, as reported by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile.
- `maxLevel` is a `StdVideoAV1Level` value specifying the upper bound on the AV1 level for the video bitstreams produced by the created video session.

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1SessionCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_SESSION_CREATE_INFO_KHR`

38.20.11. AV1 Encode Parameter Sets

Video session parameters objects created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR` contain a single instance of the following parameter set:

AV1 Sequence Header

Represented by `StdVideoAV1SequenceHeader` structures and interpreted as follows:

- `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
- the `StdVideoAV1ColorConfig` structure pointed to by `pColorConfig` is interpreted as follows:
  - `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
  - all other members of `StdVideoAV1ColorConfig` are interpreted as defined in section 6.4.2 of the AV1 Specification;
- if `flags.timing_info_present_flag` is set, then the `StdVideoAV1TimingInfo` structure pointed to by `pTimingInfo` is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - all other members of `StdVideoAV1TimingInfo` are interpreted as defined in section 6.4.3 of the AV1 Specification;
- all other members of `StdVideoAV1SequenceHeader` are interpreted as defined in section 6.4 of the AV1 Specification.

When `StdVideoAV1SequenceHeader`::`flags.timing_info_present_flag` is set, the AV1 sequence header **can** be amended with AV1 decoder model information, represented by a `StdVideoEncodeAV1DecoderModelInfo` structure and interpreted as follows:

- `reserved1` is used only for padding purposes and is otherwise ignored;
- all other members of `StdVideoEncodeAV1DecoderModelInfo` are interpreted as defined in section 6.4.4 of the AV1 Specification.

When `StdVideoAV1SequenceHeader`::`flags.reduced_still_picture_header` is not set, the AV1 sequence header **can** be amended with AV1 operating point information, represented by an array of `StdVideoEncodeAV1OperatingPointInfo` structures and interpreted as follows:

- `flags.reserved` is used only for padding purposes and is otherwise ignored;
- all other members of `StdVideoEncodeAV1OperatingPointInfo` are interpreted as the corresponding element of the respective arrays defined in section 6.4 of the AV1 Specification.

Implementations **may** override any of these parameters according to the semantics defined in the Video Encode Parameter Overrides section before storing the resulting AV1 sequence header into the video session parameters object. Applications need to use the vkGetEncodedVideoSessionParametersKHR command to determine whether any implementation overrides happened and to retrieve the encoded AV1 sequence header in order to be able to produce a compliant AV1 video bitstream.

The encoded AV1 sequence header retrieved using the vkGetEncodedVideoSessionParametersKHR command is encoded as a single OBU with `obu_type` equal to `OBU_SEQUENCE_HEADER`, as defined in section 5.3 of the AV1 Specification.

Such AV1 sequence header overrides **may** also have cascading effects on the implementation overrides applied to the encoded bitstream produced by video encode operations. If the

implementation supports the VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR video encode feedback query flag, then the application **can** use such queries to retrieve feedback about whether any implementation overrides have been applied to the encoded bitstream.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain **must** include a VkVideoEncodeAV1SessionParametersCreateInfoKHR structure specifying the contents of the object.

The VkVideoEncodeAV1SessionParametersCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1SessionParametersCreateInfoKHR {
    VkStructureType                                 sType;
    const void*                                     pNext;
    const StdVideoAV1SequenceHeader*                pStdSequenceHeader;
    const StdVideoEncodeAV1DecoderModelInfo*        pStdDecoderModelInfo;
    uint32_t                                        stdOperatingPointCount;
    const StdVideoEncodeAV1OperatingPointInfo*      pStdOperatingPoints;
} VkVideoEncodeAV1SessionParametersCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pStdSequenceHeader is a pointer to a StdVideoAV1SequenceHeader structure describing parameters of the AV1 sequence header entry to store in the created object.
- pStdDecoderModelInfo is NULL or a pointer to a StdVideoEncodeAV1DecoderModelInfo structure specifying the AV1 decoder model information to store in the created object.
- stdOperatingPointCount is the number of elements in the pStdOperatingPoints array.
- pStdOperatingPoints is NULL or a pointer to an array of stdOperatingPointCount number of StdVideoEncodeAV1OperatingPointInfo structures specifying the AV1 operating point information to store in the created object. Each element i specifies the parameter values corresponding to element i of the syntax elements defined in section 6.4 of the AV1 Specification.

Valid Usage

- VUID-VkVideoEncodeAV1SessionParametersCreateInfoKHR-pStdSequenceHeader-10288
  pStdSequenceHeader->flags.film_grain_params_present **must** be zero

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1SessionParametersCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_SESSION_PARAMETERS_CREATE_INFO_KHR
- VUID-VkVideoEncodeAV1SessionParametersCreateInfoKHR-pStdSequenceHeader-parameter

pStdSequenceHeader **must** be a valid pointer to a valid StdVideoAV1SequenceHeader value

- VUID-VkVideoEncodeAV1SessionParametersCreateInfoKHR-pStdDecoderModelInfo-parameter
  If pStdDecoderModelInfo is not NULL, pStdDecoderModelInfo **must** be a valid pointer to a valid StdVideoEncodeAV1DecoderModelInfo value
- VUID-VkVideoEncodeAV1SessionParametersCreateInfoKHR-pStdOperatingPoints-parameter
  If stdOperatingPointCount is not 0, and pStdOperatingPoints is not NULL, pStdOperatingPoints **must** be a valid pointer to an array of stdOperatingPointCount StdVideoEncodeAV1OperatingPointInfo values

38.20.12. AV1 Encoding Parameters

The VkVideoEncodeAV1PictureInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1PictureInfoKHR {
    VkStructureType                         sType;
    const void*                             pNext;
    VkVideoEncodeAV1PredictionModeKHR       predictionMode;
    VkVideoEncodeAV1RateControlGroupKHR     rateControlGroup;
    uint32_t                                constantQIndex;
    const StdVideoEncodeAV1PictureInfo*     pStdPictureInfo;
    int32_t                                 referenceNameSlotIndices
[VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR];
    VkBool32                                primaryReferenceCdfOnly;
    VkBool32                                generateObuExtensionHeader;
} VkVideoEncodeAV1PictureInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- predictionMode specifies the AV1 prediction mode to use for the encoded frame.
- rateControlGroup specifies the AV1 rate control group to use for the encoded frame when the current rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR. Otherwise it is ignored.
- constantQIndex is the quantizer index to use for the encoded frame if the current rate control mode configured for the video session is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR.
- pStdPictureInfo is a pointer to a StdVideoEncodeAV1PictureInfo structure specifying AV1 picture information.
- referenceNameSlotIndices is an array of seven (VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR, which is equal to the Video Std definition STD_VIDEO_AV1_REFS_PER_FRAME) signed integer values specifying the index of the DPB slot or a negative integer value for each AV1 reference name used for inter coding. In particular, the DPB slot index for the AV1 reference name frame is specified in referenceNameSlotIndices[frame - STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME].

- `primaryReferenceCdfOnly` controls whether the primary reference frame indicated by the value of `pStdPictureInfo->primary_ref_frame` is used only for CDF data reference, as defined in sections 6.8.2 of the AV1 Specification. If set to `VK_TRUE`, then the primary reference frame's picture data will not be used for sample prediction.
- `generateObuExtensionHeader` controls whether OBU extension headers are generated into the target bitstream, as defined in sections 5.3.1, 5.3.2, and 5.3.3 of the AV1 Specification.

This structure is specified in the `pNext` chain of the VkVideoEncodeInfoKHR structure passed to vkCmdEncodeVideoKHR to specify the codec-specific picture information for an AV1 encode operation.

Encode Input Picture Information

When this structure is specified in the `pNext` chain of the VkVideoEncodeInfoKHR structure passed to vkCmdEncodeVideoKHR, the information related to the encode input picture is defined as follows:

- The image subregion used is determined according to the AV1 Encode Picture Data Access section.
- The encode input picture is associated with the AV1 picture information provided in `pStdPictureInfo`.

Std Picture Information

The members of the `StdVideoEncodeAV1PictureInfo` structure pointed to by `pStdPictureInfo` are interpreted as follows:

- `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
- `pSegmentation` **must** be `NULL`

> **NOTE** AV1 segmentation is currently not supported in video encode operations. Accordingly, the application needs to set `flags.segmentation_enabled` to `0` and `pSegmentation` to `NULL`.

- `pTileInfo` is `NULL` or a pointer to a `StdVideoAV1TileInfo` structure specifying AV1 tile parameters;
- the `StdVideoAV1Quantization` structure pointed to by `pQuantization` is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - all other members of `StdVideoAV1Quantization` are interpreted as defined in section 6.8.11 of the AV1 Specification;
- the `StdVideoAV1LoopFilter` structure pointed to by `pLoopFilter` is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - `update_ref_delta` is a bitmask where bit index i is interpreted as the value of `update_ref_delta` corresponding to element i of `loop_filter_ref_deltas` as defined in section 6.8.10 of the AV1 Specification;
  - `update_mode_delta` is a bitmask where bit index i is interpreted as the value of `update_mode_delta` corresponding to element i of `loop_filter_mode_deltas` as defined in

section 6.8.10 of the AV1 Specification;

  - all other members of StdVideoAV1LoopFilter are interpreted as defined in section 6.8.10 of the AV1 Specification;

- if flags.enable_cdef is set in the active sequence header, then the members of the StdVideoAV1CDEF structure pointed to by pCDEF are interpreted as follows:

  - cdef_y_sec_strength and cdef_uv_sec_strength are the bitstream values of the corresponding syntax elements defined in section 5.9.19 of the AV1 Specification;

  - all other members of StdVideoAV1CDEF are interpreted as defined in section 6.10.14 of the AV1 Specification;

- if flags.UsesLr is set in the active sequence header, then the StdVideoAV1LoopRestoration structure pointed to by pLoopRestoration is interpreted as follows:

  - LoopRestorationSize[plane] is interpreted as log2(size) - 5, where size is the value of LoopRestorationSize[plane] as defined in section 6.10.15 of the AV1 Specification;

  - all other members of StdVideoAV1LoopRestoration are defined as in section 6.10.15 of the AV1 Specification;

- the members of the StdVideoAV1GlobalMotion structure provided in global_motion are interpreted as defined in section 7.10 of the AV1 Specification;

- pExtensionHeader is NULL or a pointer to a StdVideoEncodeAV1ExtensionHeader structure whose temporal_id and spatial_id members specify the temporal and spatial layer ID of the reference frame, respectively (these IDs are encoded into the OBU extension header if VkVideoEncodeAV1PictureInfoKHR::generateObuExtensionHeader is set to VK_TRUE for the encode operation);

- if flags.buffer_removal_time_present_flag is set, then pBufferRemovalTimes is a pointer to an array of N number of unsigned integer values specifying the elements of the buffer_removal_time array, as defined in section 6.8.2 of the AV1 Specification, where N is the number of operating points specified for the active sequence header through VkVideoEncodeAV1SessionParametersCreateInfoKHR::stdOperatingPointCount;

- all other members are interpreted as defined in section 6.8 of the AV1 Specification.

Reference picture setup is controlled by the value of StdVideoEncodeAV1PictureInfo::refresh_frame_flags. If it is not zero and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the DPB slot specified in pEncodeInfo->pSetupReferenceSlot->slotIndex. If StdVideoEncodeAV1PictureInfo::refresh_frame_flags is zero, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

Std Tile Parameters

Specifying AV1 tile parameters is optional. If StdVideoEncodeAV1PictureInfo::pTileInfo is NULL, then the implementation determines the values of AV1 tile parameters defined in section 6.8.14 of the AV1 Specification in an implementation-dependent manner. If StdVideoEncodeAV1PictureInfo::pTileInfo is not NULL, then the members of the StdVideoAV1TileInfo structure pointed to by StdVideoEncodeAV1PictureInfo::pTileInfo are interpreted as follows:

- `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
- `TileCols` and `TileRows` specify the number of tile columns and tile rows as defined in section 6.8.14 of the AV1 Specification;
- `tile_size_bytes_minus_1` is ignored, as its value, as defined in section 6.8.14 of the AV1 Specification, is determined as the result of the encoding process;
- `pMiColStarts` and `pMiRowStarts` are ignored, as the elements of the `MiColStarts` and `MiRowStarts` arrays defined in section 6.8.14 of the AV1 Specification are determined by the implementation based on the tile widths and heights determined by the implementation or specified through the `pWidthInSbsMinus1` and `pHeightInSbsMinus1` arrays, respectively;
- `pWidthInSbsMinus1` is `NULL` or a pointer to an array of `TileCols` number of unsigned integers that corresponds to `width_in_sbs_minus_1` defined in section 6.8.14 of the AV1 Specification;
- `pHeightInSbsMinus1` is `NULL` or is a pointer to an array of `TileRows` number of unsigned integers that corresponds to `height_in_sbs_minus_1` defined in section 6.8.14 of the AV1 Specification;
- all other members of `StdVideoAV1TileInfo` are interpreted as defined in section 6.8.14 of the AV1 Specification.

If `flags.uniform_tile_spacing_flag` is set, then `pWidthInSbsMinus1` and `pHeightInSbsMinus1` are ignored.

If `flags.uniform_tile_spacing_flag` is not set and `pWidthInSbsMinus1` is `NULL`, then the width of individual tile columns is determined in an implementation-dependent manner.

If `flags.uniform_tile_spacing_flag` is not set and `pHeightInSbsMinus1` is `NULL`, then the height of individual tile rows is determined in an implementation-dependent manner.

NOTE

In general, implementations are expected to respect the application-specified AV1 tile parameters. However, as implementations may have restrictions on the combination of tile column and row counts, and tile widths and heights with respect to the extent of the encoded frame beyond the restrictions specified in the AV1 Specification and this specification (through video profile capabilities), certain parameter combinations may require the implementation to override them in order to conform to such implementation-specific limitations.

Active Parameter Sets

The *active sequence header* is the AV1 sequence header stored in the bound video session parameters object.

Valid Usage

- VUID-VkVideoEncodeAV1PictureInfoKHR-flags-10289
  If VkVideoEncodeAV1CapabilitiesKHR::`flags`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include `VK_VIDEO_ENCODE_AV1_CAPABILITY_PRIMARY_REFERENCE_CDF_ONLY_BIT_KHR`, then `primaryReferenceCdfOnly` **must** be `VK_FALSE`
- VUID-VkVideoEncodeAV1PictureInfoKHR-primaryReferenceCdfOnly-10290

If primaryReferenceCdfOnly is set to VK_TRUE, then pStdPictureInfo->primary_ref_frame **must** be less than VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR

- VUID-VkVideoEncodeAV1PictureInfoKHR-pStdPictureInfo-10291
  If pStdPictureInfo->primary_ref_frame is less than VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR, then referenceNameSlotIndices [pStdPictureInfo->primary_ref_frame] **must** not be negative
- VUID-VkVideoEncodeAV1PictureInfoKHR-flags-10292
  If VkVideoEncodeAV1CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_AV1_CAPABILITY_GENERATE_OBU_EXTENSION_HEADER_BIT_KHR, then generateObuExtensionHeader **must** be VK_FALSE
- VUID-VkVideoEncodeAV1PictureInfoKHR-generateObuExtensionHeader-10293
  If generateObuExtensionHeader is set to VK_TRUE, then pStdPictureInfo->pExtensionHeader **must** not be NULL

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1PictureInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_PICTURE_INFO_KHR
- VUID-VkVideoEncodeAV1PictureInfoKHR-predictionMode-parameter
  predictionMode **must** be a valid VkVideoEncodeAV1PredictionModeKHR value
- VUID-VkVideoEncodeAV1PictureInfoKHR-rateControlGroup-parameter
  rateControlGroup **must** be a valid VkVideoEncodeAV1RateControlGroupKHR value
- VUID-VkVideoEncodeAV1PictureInfoKHR-pStdPictureInfo-parameter
  pStdPictureInfo **must** be a valid pointer to a valid StdVideoEncodeAV1PictureInfo value

The VkVideoEncodeAV1DpbSlotInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1DpbSlotInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    const StdVideoEncodeAV1ReferenceInfo*    pStdReferenceInfo;
} VkVideoEncodeAV1DpbSlotInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pStdReferenceInfo is a pointer to a StdVideoEncodeAV1ReferenceInfo structure specifying AV1 reference information.

This structure is specified in the pNext chain of VkVideoEncodeInfoKHR::pSetupReferenceSlot, if not NULL, and the pNext chain of the elements of VkVideoEncodeInfoKHR::pReferenceSlots to specify the codec-specific reference picture information for an AV1 encode operation.

Active Reference Picture Information

When this structure is specified in the pNext chain of the elements of VkVideoEncodeInfoKHR::pReferenceSlots, one element is added to the list of active reference pictures used by the video encode operation for each element of VkVideoEncodeInfoKHR::pReferenceSlots as follows:

- The image subregion used is determined according to the AV1 Encode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the slotIndex member of the corresponding element of VkVideoEncodeInfoKHR::pReferenceSlots.
- The reference picture is associated with the AV1 reference information provided in pStdReferenceInfo.

Reconstructed Picture Information

When this structure is specified in the pNext chain of VkVideoEncodeInfoKHR::pSetupReferenceSlot, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the AV1 Encode Picture Data Access section.
- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in VkVideoEncodeInfoKHR::pSetupReferenceSlot->slotIndex.
- The reconstructed picture is associated with the AV1 reference information provided in pStdReferenceInfo.

Std Reference Information

The members of the StdVideoEncodeAV1ReferenceInfo structure pointed to by pStdReferenceInfo are interpreted as follows:

- flags.reserved and reserved1 are used only for padding purposes and are otherwise ignored;
- flags.disable_frame_end_update_cdf is interpreted as defined in section 6.8.2 of the AV1 Specification;
- flags.segmentation_enabled is interpreted as defined in section 6.8.13 of the AV1 Specification;
- RefFrameId is interpreted as the element of the RefFrameId array defined in section 6.8.2 of the AV1 Specification corresponding to the reference frame;
- frame_type is interpreted as defined in section 6.8.2 of the AV1 Specification;
- OrderHint is interpreted as defined in section 6.8.2 of the AV1 Specification;
- pExtensionHeader is NULL or a pointer to a StdVideoEncodeAV1ExtensionHeader structure whose temporal_id and spatial_id members specify the temporal and spatial layer ID of the reference frame, respectively.

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1DpbSlotInfoKHR-sType-sType

sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_DPB_SLOT_INFO_KHR

- VUID-VkVideoEncodeAV1DpbSlotInfoKHR-pStdReferenceInfo-parameter pStdReferenceInfo **must** be a valid pointer to a valid StdVideoEncodeAV1ReferenceInfo value

38.20.13. AV1 Encode Rate Control

Group of Pictures

In case of AV1 encoding it is common practice to follow a regular pattern of frame types and prediction directions in display order when encoding subsequent frames. This pattern is referred to as the *group of pictures* (GOP).

The AV1 Specification, unlike some other video compression standards, does not restrict the direction in display order of the referenced frames based on the used frame type or AV1 prediction mode. Accordingly, this specification introduces the concept of *rate control groups* for which the application **can** specify separate rate control configuration parameters. When encoding a frame, the application specifies the rate control group the encoded frame belongs to through a VkVideoEncodeAV1RateControlGroupKHR value in VkVideoEncodeAV1PictureInfoKHR::rateControlGroup. This value is then used by the implementation's rate control algorithm to determine which rate control configuration parameters apply to it.

Possible AV1 encode rate control groups are as follows:

```
// Provided by VK_KHR_video_encode_av1
typedef enum VkVideoEncodeAV1RateControlGroupKHR {
    VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_INTRA_KHR = 0,
    VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_PREDICTIVE_KHR = 1,
    VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR = 2,
} VkVideoEncodeAV1RateControlGroupKHR;
```

- VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_INTRA_KHR **should** be specified when encoding AV1 frames that use intra-only prediction (e.g. when encoding AV1 frames of type STD_VIDEO_AV1_FRAME_TYPE_KEY or STD_VIDEO_AV1_FRAME_TYPE_INTRA_ONLY).
- VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_PREDICTIVE_KHR **should** be specified when encoding AV1 frames that only have forward references in display order.
- VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR **should** be specified when encoding AV1 frames that have backward references in display order.

NOTE While the application can specify any rate control group for any frame, indifferent of the frame type, prediction mode, or prediction direction, specifying a rate control group that does not reflect the prediction direction used by the encoded frame may result in unexpected behavior of the implementation's rate control algorithm.

A regular GOP is defined by the following parameters:

- The number of frames in the GOP;

- The number of consecutive frames encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR` between frames encoded with other rate control groups in display order.

GOPs are further classified as *open* and *closed* GOPs.

Frame types in an open GOP follow each other in display order according to the following algorithm:

1. The first frame is always a frame encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_INTRA_KHR`.
2. This is followed by a number of consecutive frames encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR`.
3. If the number of frames in the GOP is not reached yet, then the next frame is a frame encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_PREDICTIVE_KHR` and the algorithm continues from step 2.

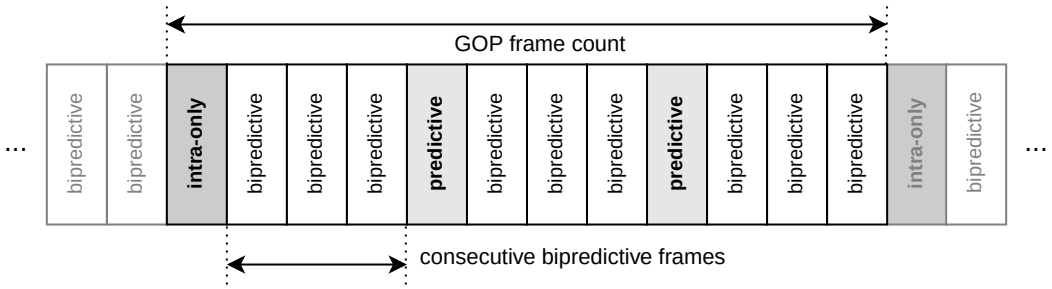


Figure 36. AV1 open GOP

In case of a closed GOP, a frame with the AV1 frame type `STD_VIDEO_AV1_FRAME_TYPE_KEY` is used at a certain period.

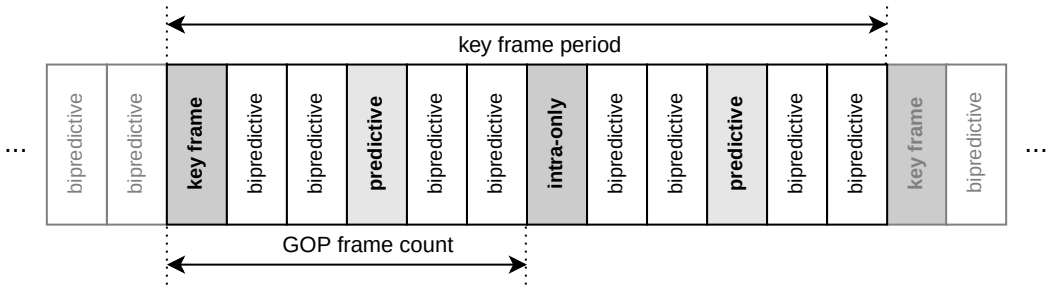

Figure 37. AV1 closed GOP

It is also typical for AV1 encoding to use specific reference picture usage patterns across the frames

of the GOP. The two most common reference patterns used are as follows:

Flat Reference Pattern

- Each frame encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_PREDICTIVE_KHR` refers to the last frame that was not encoded using `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR`, in display order, as its forward reference.
- Each frame encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR` refers to the last frame that was not encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR`, in display order, as its forward reference, and refers to the next frame that was not encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR`, in display order, as its backward reference.

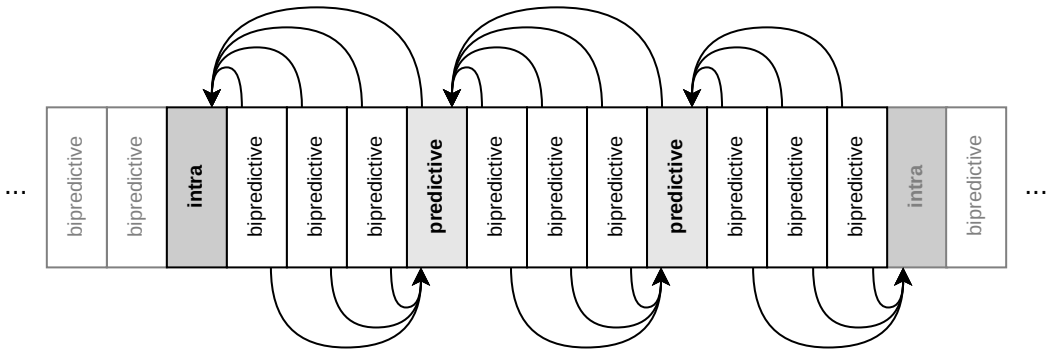

Figure 38. AV1 flat reference pattern

Dyadic Reference Pattern

- Each frame encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_PREDICTIVE_KHR` refers to the last frame that was not encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR`, in display order, as its forward reference.
- The following algorithm is applied to the sequence of consecutive frames encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR` between frames using other rate control groups in display order:
  1. The frame in the middle of this sequence uses the frame preceding the sequence as its forward reference, and uses the frame following the sequence as its backward reference.
  2. The algorithm is executed recursively for the following frame sequences:
     - The frames of the original sequence preceding the frame in the middle, if any.
     - The frames of the original sequence following the frame in the middle, if any.

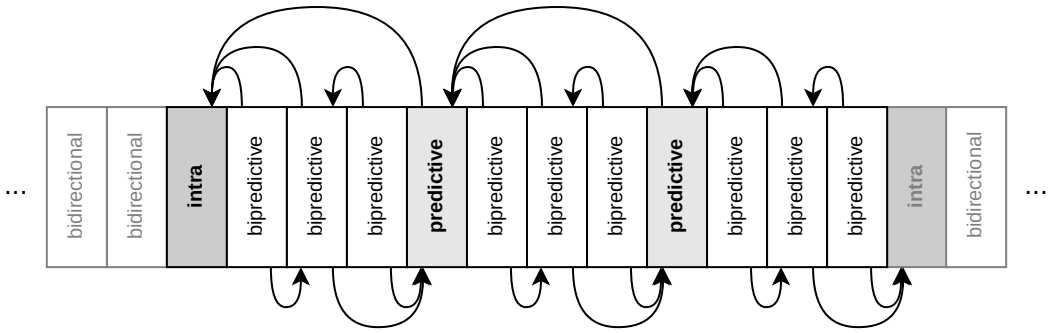

Figure 39. AV1 dyadic reference pattern

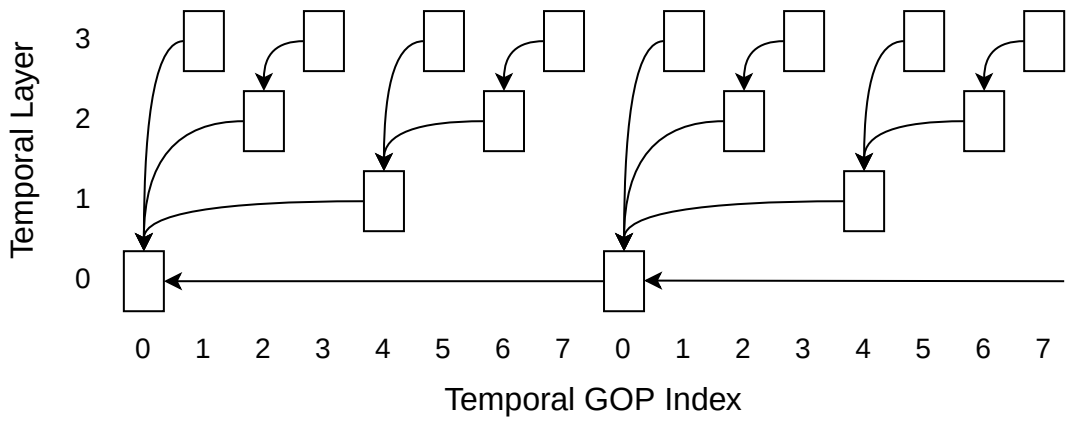
The application **can** provide guidance to the implementation's rate control algorithm about the structure of the GOP used by the application. Any such guidance about the GOP and its structure does not mandate that specific GOP structure to be used by the application, as the frame type and the selected rate control group is still application-controlled, however, any deviation from the provided guidance **may** result in undesired rate control behavior including, but not limited, to the implementation not being able to conform to the expected average or target bitrates, or other rate control parameters specified by the application.

When an AV1 encode session is used to encode multiple temporal layers, it is also common practice to follow a regular pattern for the AV1 temporal ID for the encoded frames in display order when encoding subsequent frames. This pattern is referred to as the *temporal GOP*. The most common temporal layer pattern used is as follows:

Dyadic Temporal Layer Pattern

- The number of frames in the temporal GOP is 2^{n-1}, where n is the number of temporal layers.
- The i^{th} frame in the temporal GOP uses temporal ID t, if and only if the index of the least significant bit set in i equals n-t-1, except for the first frame, which is the only frame in the temporal GOP using temporal ID zero.
- The i^{th} frame in the temporal GOP uses the r^{th} frame as reference, where r is calculated from i by clearing the least significant bit set in it, except for the first frame in the temporal GOP, which uses the first frame of the previous temporal GOP, if any, as reference.



Text is not SVG - cannot display

Figure 40. AV1 dyadic temporal layer pattern

NOTE Multi-layer rate control and multi-layer coding are typically used for streaming cases where low latency is expected, hence frames usually do not use backward references in display order.

The `VkVideoEncodeAV1RateControlInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1RateControlInfoKHR {
    VkStructureType                          sType;
    const void*                              pNext;
    VkVideoEncodeAV1RateControlFlagsKHR      flags;
    uint32_t                                 gopFrameCount;
    uint32_t                                 keyFramePeriod;
    uint32_t                                 consecutiveBipredictiveFrameCount;
    uint32_t                                 temporalLayerCount;
} VkVideoEncodeAV1RateControlInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkVideoEncodeAV1RateControlFlagBitsKHR specifying AV1 rate control flags.
- `gopFrameCount` is the number of frames within a group of pictures (GOP) intended to be used by the application. If it is set to 0, the rate control algorithm **may** assume an implementation-dependent GOP length. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- `keyFramePeriod` is the interval, in terms of number of frames, between two frames with the AV1 frame type `STD_VIDEO_AV1_FRAME_TYPE_KEY` (see key frame period). If it is set to 0, the rate control algorithm **may** assume an implementation-dependent key frame period. If it is set to `UINT32_MAX`, the key frame period is treated as infinite.

- `consecutiveBipredictiveFrameCount` is the number of consecutive frames encoded with `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR` between frames encoded with other rate control groups within the GOP.
- `temporalLayerCount` specifies the number of AV1 temporal layers that the application intends to use.

When an instance of this structure is included in the `pNext` chain of the VkVideoCodingControlInfoKHR structure passed to the vkCmdControlVideoCodingKHR command, and VkVideoCodingControlInfoKHR::`flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, the parameters in this structure are used as guidance for the implementation's rate control algorithm (see Video Coding Control).

Valid Usage

- VUID-VkVideoEncodeAV1RateControlInfoKHR-flags-10294
  If `flags` contains `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR` or `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`, then it **must** also contain `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REGULAR_GOP_BIT_KHR`
- VUID-VkVideoEncodeAV1RateControlInfoKHR-flags-10295
  If `flags` contains `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR`, then it **must** not also contain `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`
- VUID-VkVideoEncodeAV1RateControlInfoKHR-flags-10296
  If `flags` contains `VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REGULAR_GOP_BIT_KHR`, then `gopFrameCount` **must** be greater than `0`
- VUID-VkVideoEncodeAV1RateControlInfoKHR-keyFramePeriod-10297
  If `keyFramePeriod` is not `0`, then it **must** be greater than or equal to `gopFrameCount`
- VUID-VkVideoEncodeAV1RateControlInfoKHR-consecutiveBipredictiveFrameCount-10298
  If `consecutiveBipredictiveFrameCount` is not `0`, then it **must** be less than `gopFrameCount`
- VUID-VkVideoEncodeAV1RateControlInfoKHR-temporalLayerCount-10299
  `temporalLayerCount` **must** be less than or equal to VkVideoEncodeAV1CapabilitiesKHR::`maxTemporalLayerCount`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1RateControlInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_RATE_CONTROL_INFO_KHR`
- VUID-VkVideoEncodeAV1RateControlInfoKHR-flags-parameter
  `flags` **must** be a valid combination of VkVideoEncodeAV1RateControlFlagBitsKHR values

Bits which **can** be set in VkVideoEncodeAV1RateControlInfoKHR::`flags`, specifying AV1 rate control flags, are:

```
// Provided by VK_KHR_video_encode_av1
typedef enum VkVideoEncodeAV1RateControlFlagBitsKHR {
    VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REGULAR_GOP_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_AV1_RATE_CONTROL_TEMPORAL_LAYER_PATTERN_DYADIC_BIT_KHR =
0x00000002,
    VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR = 0x00000008,
} VkVideoEncodeAV1RateControlFlagBitsKHR;
```

- VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REGULAR_GOP_BIT_KHR specifies that the application intends to use a regular GOP structure according to the parameters specified in the gopFrameCount and keyFramePeriod members of the VkVideoEncodeAV1RateControlInfoKHR structure.
- VK_VIDEO_ENCODE_AV1_RATE_CONTROL_TEMPORAL_LAYER_PATTERN_DYADIC_BIT_KHR specifies that the application intends to follow a dyadic temporal layer pattern.
- VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR specifies that the application intends to follow a flat reference pattern in the GOP.
- VK_VIDEO_ENCODE_AV1_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR specifies that the application intends to follow a dyadic reference pattern in the GOP.

```
// Provided by VK_KHR_video_encode_av1
typedef VkFlags VkVideoEncodeAV1RateControlFlagsKHR;
```

VkVideoEncodeAV1RateControlFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeAV1RateControlFlagBitsKHR.

Rate Control Layers

The VkVideoEncodeAV1RateControlLayerInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1RateControlLayerInfoKHR {
    VkStructureType                 sType;
    const void*                     pNext;
    VkBool32                        useMinQIndex;
    VkVideoEncodeAV1QIndexKHR       minQIndex;
    VkBool32                        useMaxQIndex;
    VkVideoEncodeAV1QIndexKHR       maxQIndex;
    VkBool32                        useMaxFrameSize;
    VkVideoEncodeAV1FrameSizeKHR    maxFrameSize;
} VkVideoEncodeAV1RateControlLayerInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- useMinQIndex indicates whether the quantizer index values determined by rate control will be

clamped to the lower bounds on the quantizer index values specified in minQIndex.

- minQIndex specifies the lower bounds on the quantizer index values, for each rate control group, that the implementation's rate control algorithm will use when useMinQIndex is set to VK_TRUE.
- useMaxQIndex indicates whether the quantizer index values determined by rate control will be clamped to the upper bounds on the quantizer index values specified in maxQIndex.
- maxQIndex specifies the upper bounds on the quantizer index values, for each rate control group, that the implementation's rate control algorithm will use when useMaxQIndex is set to VK_TRUE.
- useMaxFrameSize indicates whether the implementation's rate control algorithm **should** use the values specified in maxFrameSize as the upper bounds on the encoded frame size for each rate control group.
- maxFrameSize specifies the upper bounds on the encoded frame size, for each rate control group, when useMaxFrameSize is set to VK_TRUE.

When used, the values in minQIndex and maxQIndex guarantee that the effective quantizer index values used by the implementation will respect those lower and upper bounds, respectively. However, limiting the range of quantizer index values that the implementation is able to use will also limit the capabilities of the implementation's rate control algorithm to comply to other constraints. In particular, the implementation **may** not be able to comply to the following:

- The average and/or peak bitrate values to be used for the encoded bitstream specified in the averageBitrate and maxBitrate members of the VkVideoEncodeRateControlLayerInfoKHR structure.
- The upper bounds on the encoded frame size, for each rate control group, specified in the maxFrameSize member of VkVideoEncodeAV1RateControlLayerInfoKHR.

NOTE	In general, applications need to configure rate control parameters appropriately in order to be able to get the desired rate control behavior, as described in the Video Encode Rate Control section.

When an instance of this structure is included in the pNext chain of a VkVideoEncodeRateControlLayerInfoKHR structure specified in one of the elements of the pLayers array member of the VkVideoEncodeRateControlInfoKHR structure passed to the vkCmdControlVideoCodingKHR command, VkVideoCodingControlInfoKHR::flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, and the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, it specifies the AV1-specific rate control parameters of the rate control layer corresponding to that element of pLayers.

Valid Usage

- VUID-VkVideoEncodeAV1RateControlLayerInfoKHR-useMinQIndex-10300
  If useMinQIndex is VK_TRUE, then the intraQIndex, predictiveQIndex, and bipredictiveQIndex members of minQIndex **must** all be between VkVideoEncodeAV1CapabilitiesKHR::minQIndex and VkVideoEncodeAV1CapabilitiesKHR::maxQIndex, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeAV1RateControlLayerInfoKHR-useMinQIndex-10301

If useMinQIndex is VK_TRUE and VkVideoEncodeAV1CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_AV1_CAPABILITY_PER_RATE_CONTROL_GROUP_MIN_MAX_Q_INDEX_BIT_KHR, then the intraQIndex, predictiveQIndex, and bipredictiveQIndex members of minQIndex **must** all specify the same value

- VUID-VkVideoEncodeAV1RateControlLayerInfoKHR-useMaxQIndex-10302
  If useMaxQIndex is VK_TRUE, then the intraQIndex, predictiveQIndex, and bipredictiveQIndex members of maxQIndex **must** all be between VkVideoEncodeAV1CapabilitiesKHR::minQIndex and VkVideoEncodeAV1CapabilitiesKHR::maxQIndex, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile
- VUID-VkVideoEncodeAV1RateControlLayerInfoKHR-useMaxQIndex-10303
  If useMaxQIndex is VK_TRUE and VkVideoEncodeAV1CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_AV1_CAPABILITY_PER_RATE_CONTROL_GROUP_MIN_MAX_Q_INDEX_BIT_KHR, then the intraQIndex, predictiveQIndex, and bipredictiveQIndex members of maxQIndex **must** all specify the same value
- VUID-VkVideoEncodeAV1RateControlLayerInfoKHR-useMinQIndex-10304
  If useMinQIndex and useMaxQIndex are both VK_TRUE, then the intraQIndex, predictiveQIndex, and bipredictiveQIndex members of minQIndex **must** all be less than or equal to the respective members of maxQIndex

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1RateControlLayerInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_RATE_CONTROL_LAYER_INFO_KHR
- VUID-VkVideoEncodeAV1RateControlLayerInfoKHR-minQIndex-parameter
  minQIndex **must** be a valid VkVideoEncodeAV1QIndexKHR structure
- VUID-VkVideoEncodeAV1RateControlLayerInfoKHR-maxQIndex-parameter
  maxQIndex **must** be a valid VkVideoEncodeAV1QIndexKHR structure
- VUID-VkVideoEncodeAV1RateControlLayerInfoKHR-maxFrameSize-parameter
  maxFrameSize **must** be a valid VkVideoEncodeAV1FrameSizeKHR structure

The VkVideoEncodeAV1QIndexKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1QIndexKHR {
    uint32_t    intraQIndex;
    uint32_t    predictiveQIndex;
    uint32_t    bipredictiveQIndex;
} VkVideoEncodeAV1QIndexKHR;
```

- intraQIndex is the quantizer index to be used for frames encoded with VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_INTRA_KHR.

- predictiveQIndex is the quantizer index to be used for frames encoded with VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_PREDICTIVE_KHR.
- bipredictiveQIndex is the quantizer index to be used for frames encoded with VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR.

The VkVideoEncodeAV1FrameSizeKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1FrameSizeKHR {
    uint32_t    intraFrameSize;
    uint32_t    predictiveFrameSize;
    uint32_t    bipredictiveFrameSize;
} VkVideoEncodeAV1FrameSizeKHR;
```

- intraFrameSize is the size in bytes to be used for frames encoded with VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_INTRA_KHR.
- predictiveFrameSize is the size in bytes to be used for frames encoded with VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_PREDICTIVE_KHR.
- bipredictiveFrameSize is the size in bytes to be used for frames encoded with VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR.

GOP Remaining Frames

Besides session level rate control configuration, the application **can** specify the number of frames per frame type remaining in the group of pictures (GOP).

The VkVideoEncodeAV1GopRemainingFrameInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_av1
typedef struct VkVideoEncodeAV1GopRemainingFrameInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           useGopRemainingFrames;
    uint32_t           gopRemainingIntra;
    uint32_t           gopRemainingPredictive;
    uint32_t           gopRemainingBipredictive;
} VkVideoEncodeAV1GopRemainingFrameInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- useGopRemainingFrames indicates whether the implementation's rate control algorithm **should** use the values specified in gopRemainingIntra, gopRemainingPredictive, and gopRemainingBipredictive. If useGopRemainingFrames is VK_FALSE, then the values of gopRemainingIntra, gopRemainingPredictive, and gopRemainingBipredictive are ignored.
- gopRemainingIntra specifies the number of frames encoded with

VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_INTRA_KHR the implementation's rate control algorithm **should** assume to be remaining in the GOP prior to executing the next video encode operation.

- gopRemainingPredictive specifies the number of frames encoded with VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_PREDICTIVE_KHR the implementation's rate control algorithm **should** assume to be remaining in the GOP prior to executing the next video encode operation.
- gopRemainingBipredictive specifies the number of frames encoded with VK_VIDEO_ENCODE_AV1_RATE_CONTROL_GROUP_BIPREDICTIVE_KHR the implementation's rate control algorithm **should** assume to be remaining in the GOP prior to executing the next video encode operation.

Setting useGopRemainingFrames to VK_TRUE and including this structure in the pNext chain of VkVideoBeginCodingInfoKHR is only mandatory if the VkVideoEncodeAV1CapabilitiesKHR ::requiresGopRemainingFrames reported for the used video profile is VK_TRUE. However, implementations **may** use these remaining frame counts, when specified, even when it is not required. In particular, when the application does not use a regular GOP structure, these values **may** provide additional guidance for the implementation's rate control algorithm.

The VkVideoEncodeAV1CapabilitiesKHR::prefersGopRemainingFrames capability is also used to indicate that the implementation's rate control algorithm **may** operate more accurately if the application specifies the remaining frame counts using this structure.

As with other rate control guidance values, if the effective order and number of frames encoded by the application are not in line with the remaining frame counts specified in this structure at any given point, then the behavior of the implementation's rate control algorithm **may** deviate from the one expected by the application.

Valid Usage (Implicit)

- VUID-VkVideoEncodeAV1GopRemainingFrameInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_GOP_REMAINING_FRAME_INFO_KHR

AV1 Quantizer Index Delta Maps

Quantization delta maps used with an AV1 encode profile are referred to as *quantizer index delta maps* and their texels contain integer values representing quantizer index delta values that are applied in the process of determining the quantizer indices of the encoded picture.

Accordingly, AV1 quantizer index delta maps always have single channel integer formats, as reported in VkVideoFormatPropertiesKHR::format.

When the rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, the quantizer index delta values are added to the constant quantizer index value that, in effect, enable the application to explicitly control the used quantizer index values at the granularity of the used quantization map texel size.

For all other rate control modes, the quantizer index delta values **can** be used to offset the

quantizer index values that the rate control algorithm would otherwise produce.

AV1 Encode Quantization

Performing AV1 encode operations involves the process of assigning quantizer index values to individual AV1 mode info blocks. This process depends on the used rate control mode, as well as other encode and rate control parameters, as described below:

- If the configured rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR`, then the quantizer index value is initialized by the implementation-specific default rate control algorithm.
  - If the video encode operation is issued with a quantization delta map, the quantizer index delta value corresponding to the mode info block, as fetched from the quantization map, is added to the previously determined quantizer index value. If the fetched quantizer index delta value falls outside the supported quantizer index delta value range reported in the `minQIndexDelta` and `maxQIndexDelta` members of VkVideoEncodeAV1QuantizationMapCapabilitiesKHR, then the quantizer index value used for the mode info block becomes undefined.
- If the configured rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, then the quantizer index value is initialized from the constant quantizer index value specified for the encoded frame.
  - If the video encode operation is issued with a quantization delta map, the quantizer index delta value corresponding to the mode info block, as fetched from the quantization map, is added to the previously determined quantizer index value. If the fetched quantizer index delta value falls outside the supported quantizer index delta value range reported in the `minQIndexDelta` and `maxQIndexDelta` members of VkVideoEncodeAV1QuantizationMapCapabilitiesKHR, then the quantizer index value used for the mode info block becomes undefined.
- If the configured rate control mode is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, then the quantizer index value is initialized by the corresponding rate control algorithm.
  - If the video encode operation is issued with a quantization delta map, the quantizer index delta value corresponding to the mode info block, as fetched from the quantization map, is added to the previously determined quantizer index value. If the fetched quantizer index delta value falls outside the supported quantizer index delta value range reported in the `minQIndexDelta` and `maxQIndexDelta` members of VkVideoEncodeAV1QuantizationMapCapabilitiesKHR, then the quantizer index value used for the mode info block becomes undefined.
  - If the video encode operation is issued with an emphasis map, the rate control will adjust the quantizer index value based on the emphasis value corresponding to the mode info block, as fetched from the quantization map, according to the following equation:

    $QIndex_{new} = f(QIndex_{prev}, e)$

    Where $QIndex_{new}$ is the resulting quantizer index value, $QIndex_{prev}$ is the previously determined quantizer index value, e is the emphasis value corresponding to the

macroblock, and f is an implementation-defined function for which the following implication is true:

$e_1 < e_2 \Rightarrow f(QIndex,e_1) \geq f(QIndex,e_2)$

> **NOTE** This means that lower emphasis values will result in higher quantizer index values, whereas higher emphasis values will result in lower quantizer index values, but the function is not strictly decreasing with respect to the input emphasis value for a given input quantizer index value.

  - If clamping to minimum quantizer index values is enabled in the applied rate control layer, then the quantizer index value is clamped to the corresponding minimum quantizer index value.
  - If clamping to maximum quantizer index values is enabled in the applied rate control layer, then the quantizer index value is clamped to the corresponding maximum quantizer index value.
- In all cases, the final quantizer index value is clamped to the minimum and maximum quantizer index values supported by the video profile.

38.20.14. AV1 Encode Requirements

This section described the **required** AV1 encoding capabilities for physical devices that have at least one queue family that supports the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR`, as returned by vkGetPhysicalDeviceQueueFamilyProperties2KHR in VkQueueFamilyVideoPropertiesKHR ::`videoCodecOperations`.

Table 57. Required Video Std Header Versions

Video Std Header Name	Version
`vulkan_video_codec_av1std_encode`	1.0.0

Table 58. Required Video Capabilities

Video Capability	Requirement	Requirement Type[1]
VkVideoCapabilitiesKHR		
`flags`	-	min
`minBitstreamBufferOffsetAlignment`	4096	max

maxQuantizationMapExtent	-[6]	min
VkVideoEncodeAV1QuantizationMapCapabilitiesKHR		
minQIndexDelta	-[7]	max
maxQIndexDelta	-[7]	min

1

The **Requirement Type** column specifies the requirement is either the minimum value all implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

2

These masks **must** only have bits set in the least significant VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR bits (bit index i indicates support for the AV1 reference name STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME + i when using the corresponding AV1 prediction mode), and **must** have at least as many bits set in any *ReferenceNameMask capability as the value of the corresponding max*ReferenceCount capability.

3

If greater than zero, it **must** be at least 2.

4

maxUnidirectionalCompoundGroup1ReferenceCount **must** be less than or equal to maxUnidirectionalCompoundReferenceCount

5

The sum of maxBidirectionalCompoundGroup1ReferenceCount and maxBidirectionalCompoundGroup2ReferenceCount **must** be greater than or equal to maxBidirectionalCompoundReferenceCount

6

If VkVideoCapabilitiesKHR::flags includes VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_VIDEO_ENCODE_CAPABILITY_EMPHASIS_MAP_BIT_KHR, then the width and height members of maxQuantizationMapExtent **must** be greater than zero.

7

If VkVideoCapabilitiesKHR::flags includes VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR, then maxQIndexDelta **must** be greater than minQIndexDelta.

Chapter 39. Extending Vulkan

New functionality **may** be added to Vulkan via either new extensions or new versions of the core, or new versions of an extension in some cases.

This chapter describes how Vulkan is versioned, how compatibility is affected between different versions, and compatibility rules that are followed by the Vulkan Working Group.

39.1. Instance and Device Functionality

Commands that enumerate instance properties, or that accept a VkInstance object as a parameter, are considered instance-level functionality.

Commands that dispatch from a VkDevice object or a child object of a VkDevice, or take any of them as a parameter, are considered device-level functionality. Types defined by a device extension are also considered device-level functionality.

Commands that dispatch from VkPhysicalDevice, or accept a VkPhysicalDevice object as a parameter, are considered either instance-level or device-level functionality depending if the functionality is specified by an instance extension or device extension respectively.

Additionally, commands that enumerate physical device properties are considered device-level functionality.

NOTE Vulkan 1.0 initially specified new physical device enumeration functionality as instance-level, requiring it to be included in an instance extension. As the capabilities of device-level functionality require discovery via physical device enumeration, this led to the situation where many device extensions required an instance extension as well. To alleviate this extra work, `VK_KHR_get_physical_device_properties2` (and subsequently Vulkan 1.1) redefined device-level functionality to include physical device enumeration.

39.2. Core Versions

The Vulkan Specification is regularly updated with bug fixes and clarifications. Occasionally new functionality is added to the core and at some point it is expected that there will be a desire to perform a large, breaking change to the API. In order to indicate to developers how and when these changes are made to the specification, and to provide a way to identify each set of changes, the Vulkan API maintains a version number.

39.2.1. Version Numbers

The Vulkan version number comprises four parts indicating the variant, major, minor and patch version of the Vulkan API Specification.

The *variant* indicates the variant of the Vulkan API supported by the implementation. This is always 0 for the Vulkan API.

NOTE	A non-zero variant indicates the API is a variant of the Vulkan API and applications will typically need to be modified to run against it. The variant field was a later addition to the version number, added in version 1.2.175 of the Specification. As Vulkan uses variant 0, this change is fully backwards compatible with the previous version number format for Vulkan implementations. New version number macros have been added for this change and the old macros deprecated. For existing applications using the older format and macros, an implementation with non-zero variant will decode as a very high Vulkan version. The high version number should be detectable by applications performing suitable version checking.

The *major version* indicates a significant change in the API, which will encompass a wholly new version of the specification.

The *minor version* indicates the incorporation of new functionality into the core specification.

The *patch version* indicates bug fixes, clarifications, and language improvements have been incorporated into the specification.

Compatibility guarantees made about versions of the API sharing any of the same version numbers are documented in Core Versions

The version number is used in several places in the API. In each such use, the version numbers are packed into a 32-bit integer as follows:

- The variant is a 3-bit integer packed into bits 31-29.
- The major version is a 7-bit integer packed into bits 28-22.
- The minor version number is a 10-bit integer packed into bits 21-12.
- The patch version number is a 12-bit integer packed into bits 11-0.

`VK_API_VERSION_VARIANT` extracts the API variant number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_VARIANT(version) ((uint32_t)(version) >> 29U)
```

`VK_API_VERSION_MAJOR` extracts the API major version number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MAJOR(version) (((uint32_t)(version) >> 22U) & 0x7FU)
```

`VK_VERSION_MAJOR` extracts the API major version number from a packed version number:

```
// Provided by VK_VERSION_1_0
// VK_VERSION_MAJOR is deprecated, but no reason was given in the API XML
// DEPRECATED: This define is deprecated. VK_API_VERSION_MAJOR should be used instead.
#define VK_VERSION_MAJOR(version) ((uint32_t)(version) >> 22U)
```

VK_API_VERSION_MINOR extracts the API minor version number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MINOR(version) (((uint32_t)(version) >> 12U) & 0x3FFU)
```

VK_VERSION_MINOR extracts the API minor version number from a packed version number:

```
// Provided by VK_VERSION_1_0
// VK_VERSION_MINOR is deprecated, but no reason was given in the API XML
// DEPRECATED: This define is deprecated. VK_API_VERSION_MINOR should be used instead.
#define VK_VERSION_MINOR(version) (((uint32_t)(version) >> 12U) & 0x3FFU)
```

VK_API_VERSION_PATCH extracts the API patch version number from a packed version number:

```
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFU)
```

VK_VERSION_PATCH extracts the API patch version number from a packed version number:

```
// Provided by VK_VERSION_1_0
// VK_VERSION_PATCH is deprecated, but no reason was given in the API XML
// DEPRECATED: This define is deprecated. VK_API_VERSION_PATCH should be used instead.
#define VK_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFU)
```

VK_MAKE_API_VERSION constructs an API version number.

```
// Provided by VK_VERSION_1_0
#define VK_MAKE_API_VERSION(variant, major, minor, patch) \
    ((((uint32_t)(variant)) << 29U) | (((uint32_t)(major)) << 22U) |
(((uint32_t)(minor)) << 12U) | ((uint32_t)(patch)))
```

- variant is the variant number.
- major is the major version number.
- minor is the minor version number.
- patch is the patch version number.

VK_MAKE_VERSION constructs an API version number.

```
// Provided by VK_VERSION_1_0
// VK_MAKE_VERSION is deprecated, but no reason was given in the API XML
// DEPRECATED: This define is deprecated. VK_MAKE_API_VERSION should be used instead.
#define VK_MAKE_VERSION(major, minor, patch) \
    ((((uint32_t)(major)) << 22U) | (((uint32_t)(minor)) << 12U) |
((uint32_t)(patch)))
```

- `major` is the major version number.
- `minor` is the minor version number.
- `patch` is the patch version number.

`VK_API_VERSION_1_0` returns the API version number for Vulkan 1.0.0.

```
// Provided by VK_VERSION_1_0
// Vulkan 1.0 version number
#define VK_API_VERSION_1_0 VK_MAKE_API_VERSION(0, 1, 0, 0)// Patch version should
always be set to 0
```

39.2.2. Querying Version Support

NOTE

In Vulkan 1.0, there is no mechanism to detect the separate versions of instance-level and device-level functionality supported. However, the `vkEnumerateInstanceVersion` command was added in Vulkan 1.1 to determine the supported version of instance-level functionality - querying for this function via vkGetInstanceProcAddr will return `NULL` on implementations that only support Vulkan 1.0 functionality. For more information on this, please refer to the Vulkan 1.1 specification.

The version of device-level functionality can be queried by calling vkGetPhysicalDeviceProperties or vkGetPhysicalDeviceProperties2KHR, and is returned in VkPhysicalDeviceProperties::`apiVersion`, encoded as described in Version Numbers.

39.3. Layers

When a layer is enabled, it inserts itself into the call chain for Vulkan commands the layer is interested in. Layers **can** be used for a variety of tasks that extend the base behavior of Vulkan beyond what is required by the specification - such as call logging, tracing, validation, or providing additional extensions.

NOTE

For example, an implementation is not expected to check that the value of enums used by the application fall within allowed ranges. Instead, a validation layer would do those checks and flag issues. This avoids a performance penalty during production use of the application because those layers would not be enabled in production.

NOTE

Vulkan layers **may** wrap object handles (i.e. return a different handle value to the application than that generated by the implementation). This is generally discouraged, as it increases the probability of incompatibilities with new extensions. The validation layers wrap handles in order to track the proper use and destruction of each object. See the "Architecture of the Vulkan Loader Interfaces" document for additional information.

To query the available layers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceLayerProperties(
    uint32_t*                                   pPropertyCount,
    VkLayerProperties*                          pProperties);
```

- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of VkLayerProperties structures.

If `pProperties` is `NULL`, then the number of layer properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of layer properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The list of available layers may change at any time due to actions outside of the Vulkan implementation, so two calls to `vkEnumerateInstanceLayerProperties` with the same parameters **may** return different results, or retrieve different `pPropertyCount` values or `pProperties` contents. Once an instance has been created, the layers enabled for that instance will continue to be enabled and valid for the lifetime of that instance, even if some of them become unavailable for future instances.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceLayerProperties-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateInstanceLayerProperties-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkLayerProperties structures

Return Codes

Success

- `VK_SUCCESS`

- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkLayerProperties structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkLayerProperties {
    char        layerName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t    specVersion;
    uint32_t    implementationVersion;
    char        description[VK_MAX_DESCRIPTION_SIZE];
} VkLayerProperties;
```

- layerName is an array of VK_MAX_EXTENSION_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the layer. Use this name in the ppEnabledLayerNames array passed in the VkInstanceCreateInfo structure to enable this layer for an instance.
- specVersion is the Vulkan version the layer was written to, encoded as described in Version Numbers.
- implementationVersion is the version of this layer. It is an integer, increasing with backward compatible changes.
- description is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which provides additional details that **can** be used by the application to identify the layer.

VK_MAX_EXTENSION_NAME_SIZE is the length in char values of an array containing a layer or extension name string, as returned in VkLayerProperties::layerName, VkExtensionProperties::extensionName, and other queries.

```
#define VK_MAX_EXTENSION_NAME_SIZE        256U
```

VK_MAX_DESCRIPTION_SIZE is the length in char values of an array containing a string with additional descriptive information about a query, as returned in VkLayerProperties::description and other queries.

```
#define VK_MAX_DESCRIPTION_SIZE           256U
```

To enable a layer, the name of the layer **should** be added to the ppEnabledLayerNames member of VkInstanceCreateInfo when creating a VkInstance.

Loader implementations **may** provide mechanisms outside the Vulkan API for enabling specific layers. Layers enabled through such a mechanism are *implicitly enabled*, while layers enabled by including the layer name in the ppEnabledLayerNames member of VkInstanceCreateInfo are *explicitly*

enabled. Implicitly enabled layers are loaded before explicitly enabled layers, such that implicitly enabled layers are closer to the application, and explicitly enabled layers are closer to the driver. Except where otherwise specified, implicitly enabled and explicitly enabled layers differ only in the way they are enabled, and the order in which they are loaded. Explicitly enabling a layer that is implicitly enabled results in this layer being loaded as an implicitly enabled layer; it has no additional effect.

39.3.1. Device Layer Deprecation

Previous versions of this specification distinguished between instance and device layers. Instance layers were only able to intercept commands that operate on `VkInstance` and `VkPhysicalDevice`, except they were not able to intercept vkCreateDevice. Device layers were enabled for individual devices when they were created, and could only intercept commands operating on that device or its child objects.

Device-only layers are now deprecated, and this specification no longer distinguishes between instance and device layers. Layers are enabled during instance creation, and are able to intercept all commands operating on that instance or any of its child objects. At the time of deprecation there were no known device-only layers and no compelling reason to create one.

In order to maintain compatibility with implementations released prior to device-layer deprecation, applications **should** still enumerate and enable device layers. The behavior of `vkEnumerateDeviceLayerProperties` and valid usage of the `ppEnabledLayerNames` member of VkDeviceCreateInfo maximizes compatibility with applications written to work with the previous requirements.

To enumerate device layers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceLayerProperties(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkLayerProperties*                          pProperties);
```

- `physicalDevice` is the physical device that will be queried.
- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of VkLayerProperties structures.

If `pProperties` is `NULL`, then the number of layer properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of layer properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The list of layers enumerated by `vkEnumerateDeviceLayerProperties` **must** be exactly the sequence of layers enabled for the instance. The members of `VkLayerProperties` for each enumerated layer **must**

be the same as the properties when the layer was enumerated by `vkEnumerateInstanceLayerProperties`.

NOTE	Due to platform details on Android, `vkEnumerateDeviceLayerProperties` may be called with `physicalDevice` equal to `NULL` during layer discovery. This behavior will only be observed by layer implementations, and not the underlying Vulkan driver.

Valid Usage (Implicit)

- VUID-vkEnumerateDeviceLayerProperties-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkEnumerateDeviceLayerProperties-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateDeviceLayerProperties-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkLayerProperties structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `ppEnabledLayerNames` and `enabledLayerCount` members of VkDeviceCreateInfo are deprecated and their values **must** be ignored by implementations. However, for compatibility, only an empty list of layers or a list that exactly matches the sequence enabled at instance creation time are valid, and validation layers **should** issue diagnostics for other cases.

Regardless of the enabled layer list provided in VkDeviceCreateInfo, the sequence of layers active for a device will be exactly the sequence of layers enabled when the parent instance was created.

39.4. Extensions

Extensions **may** define new Vulkan commands, structures, and enumerants. For compilation purposes, the interfaces defined by registered extensions, including new structures and enumerants as well as function pointer types for new commands, are defined in the Khronos-supplied `vulkan_core.h` together with the core API. However, commands defined by extensions **may** not be available for static linking - in which case function pointers to these commands **should** be queried at runtime as described in Command Function Pointers. Extensions **may** be provided by layers as well as by a Vulkan implementation.

Because extensions **may** extend or change the behavior of the Vulkan API, extension authors **should** add support for their extensions to the Khronos validation layers. This is especially important for new commands whose parameters have been wrapped by the validation layers. See the "Architecture of the Vulkan Loader Interfaces" document for additional information.

NOTE

To enable an instance extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of `VkInstanceCreateInfo` when creating a `VkInstance`.

To enable a device extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of `VkDeviceCreateInfo` when creating a `VkDevice`.

Physical-Device-Level functionality does not have any enabling mechanism and **can** be used as long as the `VkPhysicalDevice` supports the device extension as determined by `vkEnumerateDeviceExtensionProperties`.

Enabling an extension (with no further use of that extension) does not change the behavior of functionality exposed by the core Vulkan API or any other extension, other than making valid the use of the commands, enums and structures defined by that extension.

Valid Usage sections for individual commands and structures do not currently contain which extensions have to be enabled in order to make their use valid, although they might do so in the future. It is defined only in the Valid Usage for Extensions section.

39.4.1. Instance Extensions

Instance extensions add new instance-level functionality to the API, outside of the core specification.

To query the available instance extensions, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceExtensionProperties(
    const char*                                 pLayerName,
    uint32_t*                                   pPropertyCount,
    VkExtensionProperties*                      pProperties);
```

- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the instance extensions provided by that layer are returned.

If pProperties is NULL, then the number of extensions properties available is returned in pPropertyCount. Otherwise, pPropertyCount **must** point to a variable set by the application to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of extension properties available, at most pPropertyCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

Because the list of available layers may change externally between calls to vkEnumerateInstanceExtensionProperties, two calls may retrieve different results if a pLayerName is available in one call but not in another. The extensions supported by a layer may also change between two calls, e.g. if the layer implementation is replaced by a different version between those calls.

Implementations **must** not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceExtensionProperties-pLayerName-parameter
  If pLayerName is not NULL, pLayerName **must** be a null-terminated UTF-8 string
- VUID-vkEnumerateInstanceExtensionProperties-pPropertyCount-parameter
  pPropertyCount **must** be a valid pointer to a uint32_t value
- VUID-vkEnumerateInstanceExtensionProperties-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties **must** be a valid pointer to an array of pPropertyCount VkExtensionProperties structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_LAYER_NOT_PRESENT

39.4.2. Device Extensions

Device extensions add new device-level functionality to the API, outside of the core specification.

To query the extensions available to a given physical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceExtensionProperties(
    VkPhysicalDevice                            physicalDevice,
    const char*                                 pLayerName,
    uint32_t*                                   pPropertyCount,
    VkExtensionProperties*                      pProperties);
```

- `physicalDevice` is the physical device that will be queried.
- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, and is treated in the same fashion as the vkEnumerateInstanceExtensionProperties ::`pPropertyCount` parameter.
- `pProperties` is either `NULL` or a pointer to an array of VkExtensionProperties structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the device extensions provided by that layer are returned.

Implementations **must** not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

If the `VK_KHR_ray_tracing_pipeline` extension is advertised as supported by this query, the `VK_KHR_pipeline_library` extension **must** also be supported.

NOTE	Due to platform details on Android, `vkEnumerateDeviceExtensionProperties` may be called with `physicalDevice` equal to `NULL` during layer discovery. This behavior will only be observed by layer implementations, and not the underlying Vulkan driver.

Valid Usage (Implicit)

- VUID-vkEnumerateDeviceExtensionProperties-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkEnumerateDeviceExtensionProperties-pLayerName-parameter
  If `pLayerName` is not `NULL`, `pLayerName` **must** be a null-terminated UTF-8 string
- VUID-vkEnumerateDeviceExtensionProperties-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateDeviceExtensionProperties-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkExtensionProperties structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_LAYER_NOT_PRESENT

The VkExtensionProperties structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkExtensionProperties {
    char        extensionName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t    specVersion;
} VkExtensionProperties;
```

- extensionName is an array of VK_MAX_EXTENSION_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the extension.
- specVersion is the version of this extension. It is an integer, incremented with backward compatible changes.

Accessing Device-Level Functionality From a VkPhysicalDevice

Some device extensions also add support for physical-device-level functionality. Physical-device-level functionality **can** be used, if the required extension is supported as advertised by vkEnumerateDeviceExtensionProperties for a given VkPhysicalDevice.

Accessing Device-Level Functionality From a VkDevice

For commands that are dispatched from a VkDevice, or from a child object of a VkDevice, device extensions **must** be enabled in vkCreateDevice.

39.5. Extension Dependencies

Some extensions are dependent on other extensions, or on specific core API versions, to function. To enable extensions with dependencies, any *required extensions* **must** also be enabled through the same API mechanisms when creating an instance with vkCreateInstance or a device with vkCreateDevice. Each extension which has such dependencies documents them in the appendix summarizing that extension.

If an extension is supported (as queried by vkEnumerateInstanceExtensionProperties or vkEnumerateDeviceExtensionProperties), then *required extensions* of that extension **must** also be

supported for the same instance or physical device.

Any device extension that has an instance extension dependency that is not enabled by vkCreateInstance is considered to be unsupported, hence it **must** not be returned by vkEnumerateDeviceExtensionProperties for any VkPhysicalDevice child of the instance. Instance extensions do not have dependencies on device extensions.

If a required extension has been promoted to another extension or to a core API version, then as a *general* rule, the dependency is also satisfied by the promoted extension or core version. This will be true so long as any features required by the original extension are also required or enabled by the promoted extension or core version. However, in some cases an extension is promoted while making some of its features optional in the promoted extension or core version. In this case, the dependency **may** not be satisfied. The only way to be certain is to look at the descriptions of the original dependency and the promoted version in the Layers & Extensions and Core Revisions appendices.

NOTE

There is metadata in `vk.xml` describing some aspects of promotion, especially `requires`, `promotedto` and `deprecatedby` attributes of `<extension>` tags. However, the metadata does not yet fully describe this scenario. In the future, we may extend the XML schema to describe the full set of extensions and versions satisfying a dependency. As discussed in more detail for Promotion below, when an extension is promoted it does not mean that a mechanical substitution of an extension API by the corresponding promoted API will work in exactly the same fashion; be supported at runtime; or even exist.

39.6. Compatibility Guarantees (Informative)

This section is marked as informal as there is no binding responsibility on implementations of the Vulkan API - these guarantees are however a contract between the Vulkan Working Group and developers using this Specification.

39.6.1. Core Versions

Each of the major, minor, and patch versions of the Vulkan specification provide different compatibility guarantees.

Patch Versions

A difference in the patch version indicates that a set of bug fixes or clarifications have been made to the Specification. Informative enums returned by Vulkan commands that will not affect the runtime behavior of a valid application may be added in a patch version (e.g. VkVendorId).

The specification's patch version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the patch version being increased by 1. Patch versions are applied to all minor versions, even if a given minor version is not affected by the provoking change.

Specifications with different patch versions but the same major and minor version are *fully*

compatible with each other - such that a valid application written against one will work with an implementation of another.

NOTE	If a patch version includes a bug fix or clarification that could have a significant impact on developer expectations, these will be highlighted in the change log. Generally the Vulkan Working Group tries to avoid these kinds of changes, instead fixing them in either an extension or core version.

Minor Versions

Changes in the minor version of the specification indicate that new functionality has been added to the core specification. This will usually include new interfaces in the header, and **may** also include behavior changes and bug fixes. Core functionality **may** be deprecated in a minor version, but will not be obsoleted or removed.

The specification's minor version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the minor version being increased by 1. Changes that can be accommodated in a patch version will not increase the minor version.

Specifications with a lower minor version are *backwards compatible* with an implementation of a specification with a higher minor version for core functionality and extensions issued with the KHR vendor tag. Vendor and multi-vendor extensions are not guaranteed to remain functional across minor versions, though in general they are with few exceptions - see Obsoletion for more information.

Major Versions

A difference in the major version of specifications indicates a large set of changes which will likely include interface changes, behavioral changes, removal of deprecated functionality, and the modification, addition, or replacement of other functionality.

The specification's major version is monotonically increasing; any change to the specification as described above will result in the major version being increased. Changes that can be accommodated in a patch or minor version will not increase the major version.

The Vulkan Working Group intends to only issue a new major version of the Specification in order to realize significant improvements to the Vulkan API that will necessarily require breaking compatibility.

A new major version will likely include a wholly new version of the specification to be issued - which could include an overhaul of the versioning semantics for the minor and patch versions. The patch and minor versions of a specification are therefore not meaningful across major versions. If a major version of the specification includes similar versioning semantics, it is expected that the patch and the minor version will be reset to 0 for that major version.

39.6.2. Extensions

A KHR extension **must** be able to be enabled alongside any other KHR extension, and for any minor

or patch version of the core Specification beyond the minimum version it requires. A multi-vendor extension **should** be able to be enabled alongside any KHR extension or other multi-vendor extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **should** be able to be enabled alongside any KHR extension, multi-vendor extension, or other vendor extension from the same vendor, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **may** be able to be enabled alongside vendor extensions from another vendor.

The one other exception to this is if a vendor or multi-vendor extension is made obsolete by either a core version or another extension, which will be highlighted in the extension appendix.

Promotion

Extensions, or features of an extension, **may** be promoted to a new core version of the API, or a newer extension which an equal or greater number of implementors are in favor of.

NOTE Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are defined in terms of the equivalent Vulkan core interfaces in that version and its successors. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

When extension functionality is promoted, minor changes **may** be introduced, limited to the following:

- Naming
- Non-intrusive parameter changes
- Feature advertisement/enablement
- Combining structure parameters into larger structures
- Author ID suffixes changed or removed

NOTE If extension functionality is promoted, there is no guarantee of direct compatibility, however it should require little effort to port code from the original feature to the promoted one.

The Vulkan Working Group endeavors to ensure that larger changes are marked as either deprecated or obsoleted as appropriate, and can do so retroactively if necessary.

Extensions that are promoted are listed as being promoted in their extension appendices, with reference to where they were promoted to.

When an extension is promoted, any backwards compatibility aliases which exist in the extension will **not** be promoted.

NOTE As a hypothetical example, if the `VK_KHR_surface` extension were promoted to part of a future core version, the `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` token defined by that extension would be promoted to `VK_COLOR_SPACE_SRGB_NONLINEAR`. However, the

> `VK_COLORSPACE_SRGB_NONLINEAR_KHR` token aliases `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR`. The `VK_COLORSPACE_SRGB_NONLINEAR_KHR` would not be promoted, because it is a backwards compatibility alias that exists only due to a naming mistake when the extension was initially published.

Deprecation

Extensions **may** be marked as deprecated when the intended use cases either become irrelevant or can be solved in other ways. Generally, a new feature will become available to solve the use case in another extension or core version of the API, but it is not guaranteed.

> **NOTE** Features that are intended to replace deprecated functionality have no guarantees of compatibility, and applications may require drastic modification in order to make use of the new features.

Extensions that are deprecated are listed as being deprecated in their extension appendices, with an explanation of the deprecation and any features that are relevant.

Obsoletion

Occasionally, an extension will be marked as obsolete if a new version of the core API or a new extension is fundamentally incompatible with it. An obsoleted extension **must** not be used with the extension or core version that obsoleted it.

Extensions that are obsoleted are listed as being obsoleted in their extension appendices, with reference to what they were obsoleted by.

Aliases

When an extension is promoted or deprecated by a newer feature, some or all of its functionality **may** be replicated into the newer feature. Rather than duplication of all the documentation and definitions, the specification instead identifies the identical commands and types as *aliases* of one another. Each alias is mentioned together with the definition it aliases, with the older aliases marked as “equivalents”. Each alias of the same command has identical behavior, and each alias of the same type has identical meaning - they can be used interchangeably in an application with no compatibility issues.

> **NOTE** For promoted types, the aliased extension type is semantically identical to the new core type. The C99 headers simply `typedef` the older aliases to the promoted types.
>
> For promoted command aliases, however, there are two separate command definitions, due to the fact that the C99 ABI has no way to alias command definitions without resorting to macros. Calling either command will produce identical behavior within the bounds of the specification, and should still invoke the same path in the implementation. Debug tools may use separate commands with different debug behavior; to write the appropriate command name to an output log, for instance.

Special Use Extensions

Some extensions exist only to support a specific purpose or specific class of application. These are referred to as “special use extensions”. Use of these extensions in applications not meeting the special use criteria is not recommended.

Special use cases are restricted, and only those defined below are used to describe extensions:

Table 59. Extension Special Use Cases

Special Use	XML Tag	Full Description
CAD support	cadsupport	Extension is intended to support specialized functionality used by CAD/CAM applications.
D3D support	d3demulation	Extension is intended to support D3D emulation layers, and applications ported from D3D, by adding functionality specific to D3D.
Developer tools	devtools	Extension is intended to support developer tools such as capture-replay libraries.
Debugging tools	debugging	Extension is intended for use by applications when debugging.
OpenGL / ES support	glemulation	Extension is intended to support OpenGL and/or OpenGL ES emulation layers, and applications ported from those APIs, by adding functionality specific to those APIs.

Special use extensions are identified in the metadata for each such extension in the Layers & Extensions appendix, using the name in the “Special Use” column above.

Special use extensions are also identified in `vk.xml` with the short name in “XML Tag” column above, as described in the “API Extensions (`extension` tag)” section of the registry schema documentation.

Chapter 40. Features

Features advertise additional functionality which **can** be enabled in the API. If a feature is *supported* by a physical device, it **must** be *enabled* when creating a VkDevice in order to use its associated functionality with that VkDevice. If a feature is *unsupported*, that functionality **cannot** be used with that VkDevice.

NOTE

Features are reported via the basic VkPhysicalDeviceFeatures structure, as well as the extensible structure `VkPhysicalDeviceFeatures2`, which was added in the `VK_KHR_get_physical_device_properties2` extension and included in Vulkan 1.1. When new features are added in future Vulkan versions or extensions, each extension **should** introduce one new feature structure, if needed. This structure **can** be added to the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure.

For convenience, new core versions of Vulkan **may** introduce new unified feature structures for features promoted from extensions. At the same time, the extension's original feature structure (if any) is also promoted to the core API, and is an alias of the extension's structure. This results in multiple names for the same feature: in the original extension's feature structure and the promoted structure alias, in the unified feature structure. When a feature was implicitly supported and enabled in the extension, but an explicit name was added during promotion, then the extension itself acts as an alias for the feature as listed in the table below.

All aliases of the same feature in the core API **must** be reported consistently: either all **must** be reported as supported, or none of them. When a promoted extension is available, any corresponding feature aliases **must** be supported.

Table 60. Extension Feature Aliases

Extension	Feature(s)

To query supported features, call:

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFeatures(
    VkPhysicalDevice                            physicalDevice,
    VkPhysicalDeviceFeatures*                   pFeatures);
```

- `physicalDevice` is the physical device from which to query the supported features.
- `pFeatures` is a pointer to a VkPhysicalDeviceFeatures structure in which the physical device features are returned. For each feature, a value of `VK_TRUE` specifies that the feature is supported on this physical device, and `VK_FALSE` specifies that the feature is not supported.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFeatures-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceFeatures-pFeatures-parameter
  `pFeatures` **must** be a valid pointer to a VkPhysicalDeviceFeatures structure

Fine-grained features used by a logical device **must** be enabled at `VkDevice` creation time. If a feature is enabled that the physical device does not support, `VkDevice` creation will fail and return `VK_ERROR_FEATURE_NOT_PRESENT`.

The fine-grained features are enabled by passing a pointer to the `VkPhysicalDeviceFeatures` structure via the `pEnabledFeatures` member of the VkDeviceCreateInfo structure that is passed into the `vkCreateDevice` call. If a member of `pEnabledFeatures` is `VK_TRUE` or `VK_FALSE`, then the device will be created with the indicated feature enabled or disabled, respectively. Features **can** also be enabled by using the VkPhysicalDeviceFeatures2 structure.

If an application wishes to enable all features supported by a device, it **can** simply pass in the `VkPhysicalDeviceFeatures` structure that was previously returned by `vkGetPhysicalDeviceFeatures`. To disable an individual feature, the application **can** set the desired member to `VK_FALSE` in the same structure. Setting `pEnabledFeatures` to `NULL` and not including a VkPhysicalDeviceFeatures2 in the `pNext` chain of VkDeviceCreateInfo is equivalent to setting all members of the structure to `VK_FALSE`.

NOTE	Some features, such as `robustBufferAccess`, **may** incur a runtime performance cost. Application writers **should** carefully consider the implications of enabling all supported features.

To query supported features defined by the core or extensions, call:

```
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceFeatures2KHR(
    VkPhysicalDevice                            physicalDevice,
    VkPhysicalDeviceFeatures2*                  pFeatures);
```

- `physicalDevice` is the physical device from which to query the supported features.
- `pFeatures` is a pointer to a VkPhysicalDeviceFeatures2 structure in which the physical device features are returned.

Each structure in `pFeatures` and its `pNext` chain contains members corresponding to fine-grained features. Each structure in `pFeatures` and its `pNext` chain contains VkBool32 members corresponding to fine-grained features. Each such member is returned with a `VK_TRUE` value indicating that feature is supported on this physical device, or a `VK_FALSE` value indicating it is unsupported.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFeatures2-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceFeatures2-pFeatures-parameter
  `pFeatures` **must** be a valid pointer to a VkPhysicalDeviceFeatures2 structure

The VkPhysicalDeviceFeatures2 structure is defined as:

```
typedef struct VkPhysicalDeviceFeatures2 {
    VkStructureType             sType;
    void*                       pNext;
    VkPhysicalDeviceFeatures    features;
} VkPhysicalDeviceFeatures2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceFeatures2 VkPhysicalDeviceFeatures2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- features is a VkPhysicalDeviceFeatures structure describing the fine-grained features of the Vulkan 1.0 API.

The pNext chain of this structure is used to extend the structure with features defined by extensions. This structure **can** be used in vkGetPhysicalDeviceFeatures2KHR or **can** be included in the pNext chain of a VkDeviceCreateInfo structure, in which case it controls which features are enabled in lieu of pEnabledFeatures.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFeatures2-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2

The VkPhysicalDeviceFeatures structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceFeatures {
    VkBool32    robustBufferAccess;
    VkBool32    fullDrawIndexUint32;
    VkBool32    imageCubeArray;
    VkBool32    independentBlend;
    VkBool32    geometryShader;
    VkBool32    tessellationShader;
    VkBool32    sampleRateShading;
    VkBool32    dualSrcBlend;
    VkBool32    logicOp;
    VkBool32    multiDrawIndirect;
    VkBool32    drawIndirectFirstInstance;
    VkBool32    depthClamp;
    VkBool32    depthBiasClamp;
```

```
    VkBool32    fillModeNonSolid;
    VkBool32    depthBounds;
    VkBool32    wideLines;
    VkBool32    largePoints;
    VkBool32    alphaToOne;
    VkBool32    multiViewport;
    VkBool32    samplerAnisotropy;
    VkBool32    textureCompressionETC2;
    VkBool32    textureCompressionASTC_LDR;
    VkBool32    textureCompressionBC;
    VkBool32    occlusionQueryPrecise;
    VkBool32    pipelineStatisticsQuery;
    VkBool32    vertexPipelineStoresAndAtomics;
    VkBool32    fragmentStoresAndAtomics;
    VkBool32    shaderTessellationAndGeometryPointSize;
    VkBool32    shaderImageGatherExtended;
    VkBool32    shaderStorageImageExtendedFormats;
    VkBool32    shaderStorageImageMultisample;
    VkBool32    shaderStorageImageReadWithoutFormat;
    VkBool32    shaderStorageImageWriteWithoutFormat;
    VkBool32    shaderUniformBufferArrayDynamicIndexing;
    VkBool32    shaderSampledImageArrayDynamicIndexing;
    VkBool32    shaderStorageBufferArrayDynamicIndexing;
    VkBool32    shaderStorageImageArrayDynamicIndexing;
    VkBool32    shaderClipDistance;
    VkBool32    shaderCullDistance;
    VkBool32    shaderFloat64;
    VkBool32    shaderInt64;
    VkBool32    shaderInt16;
    VkBool32    shaderResourceResidency;
    VkBool32    shaderResourceMinLod;
    VkBool32    sparseBinding;
    VkBool32    sparseResidencyBuffer;
    VkBool32    sparseResidencyImage2D;
    VkBool32    sparseResidencyImage3D;
    VkBool32    sparseResidency2Samples;
    VkBool32    sparseResidency4Samples;
    VkBool32    sparseResidency8Samples;
    VkBool32    sparseResidency16Samples;
    VkBool32    sparseResidencyAliased;
    VkBool32    variableMultisampleRate;
    VkBool32    inheritedQueries;
} VkPhysicalDeviceFeatures;
```

This structure describes the following features:

- `robustBufferAccess` specifies that accesses to buffers are bounds-checked against the range of the buffer descriptor (as determined by `VkDescriptorBufferInfo`::`range`, VkBufferViewCreateInfo::`range`, or the size of the buffer). Out of bounds accesses **must** not cause application termination, and the effects of shader loads, stores, and atomics **must**

conform to an implementation-dependent behavior as described below.

- A buffer access is considered to be out of bounds if any of the following are true:
  - The pointer was formed by `OpImageTexelPointer` and the coordinate is less than zero or greater than or equal to the number of whole elements in the bound range.
  - The pointer was not formed by `OpImageTexelPointer` and the object pointed to is not wholly contained within the bound range. This includes accesses performed via *variable pointers* where the buffer descriptor being accessed cannot be statically determined. Uninitialized pointers and pointers equal to `OpConstantNull` are treated as pointing to a zero-sized object, so all accesses through such pointers are considered to be out of bounds. Buffer accesses through buffer device addresses are not bounds-checked.
  - If the `VkPhysicalDeviceCooperativeMatrixFeaturesKHR::cooperativeMatrixRobustBufferAccess` feature is not enabled, then accesses using `OpCooperativeMatrixLoadKHR` and `OpCooperativeMatrixStoreKHR` **may** not be bounds-checked.

    > **NOTE** If a SPIR-V `OpLoad` instruction loads a structure and the tail end of the structure is out of bounds, then all members of the structure are considered out of bounds even if the members at the end are not statically used.

  - If the `robustBufferAccess2` feature is not enabled and any buffer access is determined to be out of bounds, then any other access of the same type (load, store, or atomic) to the same buffer that accesses an address less than 16 bytes away from the out of bounds address **may** also be considered out of bounds.
  - If the access is a load that reads from the same memory locations as a prior store in the same shader invocation, with no other intervening accesses to the same memory locations in that shader invocation, then the result of the load **may** be the value stored by the store instruction, even if the access is out of bounds. If the load is `Volatile`, then an out of bounds load **must** return the appropriate out of bounds value.
- Accesses to descriptors written with a VK_NULL_HANDLE resource or view are not considered to be out of bounds. Instead, each type of descriptor access defines a specific behavior for accesses to a null descriptor.
- Out-of-bounds buffer loads will return any of the following values:
  - If the access is to a uniform buffer and the `robustBufferAccess2` feature is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of `robustUniformBufferAccessSizeAlignment` bytes **must** return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of `robustUniformBufferAccessSizeAlignment` bytes **must** return zero values.
  - If the access is to a storage buffer and the `robustBufferAccess2` feature is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of `robustStorageBufferAccessSizeAlignment` bytes **must** return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of

`robustStorageBufferAccessSizeAlignment` bytes **must** return zero values. Similarly, stores to addresses between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of `robustStorageBufferAccessSizeAlignment` bytes **may** be discarded.

- Non-atomic accesses to storage buffers that are a multiple of 32 bits **may** be decomposed into 32-bit accesses that are individually bounds-checked.
- If the access is to an index buffer and the `robustBufferAccess2` feature is enabled, zero values **must** be returned.
- If the access is to a uniform texel buffer or storage texel buffer and the `robustBufferAccess2` feature is enabled, zero values **must** be returned, and then Conversion to RGBA is applied based on the buffer view's format.
- Values from anywhere within the memory range(s) bound to the buffer (possibly including bytes of memory past the end of the buffer, up to the end of the bound range).
- Zero values, or (0,0,0,x) vectors for vector reads where x is a valid value represented in the type of the vector components and **may** be any of:
  - 0, 1, or the maximum representable positive integer value, for signed or unsigned integer components
  - 0.0 or 1.0, for floating-point components

◦ Out-of-bounds writes **may** modify values within the memory range(s) bound to the buffer, but **must** not modify any other memory.

- If the `robustBufferAccess2` feature is enabled, out of bounds writes **must** not modify any memory.

◦ Out-of-bounds atomics **may** modify values within the memory range(s) bound to the buffer, but **must** not modify any other memory, and return an undefined value.

- If the `robustBufferAccess2` feature is enabled, out of bounds atomics **must** not modify any memory, and return an undefined value.

◦ If the `robustBufferAccess2` feature is not enabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than either:

- `vertexBufferRangeSize`, if `bindingStride` == 0; or
- (`vertexBufferRangeSize` - (`vertexBufferRangeSize` % `bindingStride`))

  where `vertexBufferRangeSize` is the byte size of the memory range bound to the vertex buffer binding and `bindingStride` is the byte stride of the corresponding vertex input binding. Further, if any vertex input attribute using a specific vertex input binding is out of bounds, then all vertex input attributes using that vertex input binding for that vertex shader invocation are considered out of bounds.

- If a vertex input attribute is out of bounds, it will be assigned one of the following values:
  - Values from anywhere within the memory range(s) bound to the buffer, converted according to the format of the attribute.

        - Zero values, format converted according to the format of the attribute.
        - Zero values, or (0,0,0,x) vectors, as described above.
    - If the `robustBufferAccess2` feature is enabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than the byte size of the memory range bound to the vertex buffer binding.
        - If a vertex input attribute is out of bounds, the raw data extracted are zero values, and missing G, B, or A components are filled with (0,0,1).
    - If `robustBufferAccess` is not enabled, applications **must** not perform out of bounds accesses .
- `fullDrawIndexUint32` specifies the full 32-bit range of indices is supported for indexed draw calls when using a VkIndexType of `VK_INDEX_TYPE_UINT32`. `maxDrawIndexedIndexValue` is the maximum index value that **may** be used (aside from the primitive restart index, which is always 2^{32}-1 when the VkIndexType is `VK_INDEX_TYPE_UINT32`). If this feature is supported, `maxDrawIndexedIndexValue` **must** be 2^{32}-1; otherwise it **must** be no smaller than 2^{24}-1. See `maxDrawIndexedIndexValue`.
- `imageCubeArray` specifies whether image views with a VkImageViewType of `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` **can** be created, and that the corresponding `SampledCubeArray` and `ImageCubeArray` SPIR-V capabilities **can** be used in shader code.
- `independentBlend` specifies whether the `VkPipelineColorBlendAttachmentState` settings are controlled independently per-attachment. If this feature is not enabled, the `VkPipelineColorBlendAttachmentState` settings for all color attachments **must** be identical. Otherwise, a different `VkPipelineColorBlendAttachmentState` **can** be provided for each bound color attachment.
- `geometryShader` specifies whether geometry shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_GEOMETRY_BIT` and `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT` enum values **must** not be used. This also specifies whether shader modules **can** declare the `Geometry` capability.
- `tessellationShader` specifies whether tessellation control and evaluation shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`, `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`, and `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO` enum values **must** not be used. This also specifies whether shader modules **can** declare the `Tessellation` capability.
- `sampleRateShading` specifies whether Sample Shading and multisample interpolation are supported. If this feature is not enabled, the `sampleShadingEnable` member of the VkPipelineMultisampleStateCreateInfo structure **must** be `VK_FALSE` and the `minSampleShading` member is ignored. This also specifies whether shader modules **can** declare the `SampleRateShading` capability.
- `dualSrcBlend` specifies whether blend operations which take two sources are supported. If this feature is not enabled, the `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, and `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA` enum values **must** not be used as source or destination blending factors. See Dual-Source Blending.
- `logicOp` specifies whether logic operations are supported. If this feature is not enabled, the

`logicOpEnable` member of the VkPipelineColorBlendStateCreateInfo structure **must** be `VK_FALSE`, and the `logicOp` member is ignored.

- `multiDrawIndirect` specifies whether multiple draw indirect is supported. If this feature is not enabled, the `drawCount` parameter to the vkCmdDrawIndirect and vkCmdDrawIndexedIndirect commands **must** be 0 or 1. The `maxDrawIndirectCount` member of the `VkPhysicalDeviceLimits` structure **must** also be 1 if this feature is not supported. See `maxDrawIndirectCount`.
- `drawIndirectFirstInstance` specifies whether indirect drawing calls support the `firstInstance` parameter. If this feature is not enabled, the `firstInstance` member of all `VkDrawIndirectCommand` and `VkDrawIndexedIndirectCommand` structures that are provided to the vkCmdDrawIndirect and vkCmdDrawIndexedIndirect commands **must** be 0.
- `depthClamp` specifies whether depth clamping is supported. If this feature is not enabled, the `depthClampEnable` member of the VkPipelineRasterizationStateCreateInfo structure **must** be `VK_FALSE`. Otherwise, setting `depthClampEnable` to `VK_TRUE` will enable depth clamping.
- `depthBiasClamp` specifies whether depth bias clamping is supported. If this feature is not enabled, the `depthBiasClamp` member of the VkPipelineRasterizationStateCreateInfo structure **must** be 0.0 unless the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state is enabled, in which case the `depthBiasClamp` parameter to vkCmdSetDepthBias **must** be 0.0.
- `fillModeNonSolid` specifies whether point and wireframe fill modes are supported. If this feature is not enabled, the `VK_POLYGON_MODE_POINT` and `VK_POLYGON_MODE_LINE` enum values **must** not be used.
- `depthBounds` specifies whether depth bounds tests are supported. If this feature is not enabled, the `depthBoundsTestEnable` member of the VkPipelineDepthStencilStateCreateInfo structure **must** be `VK_FALSE` unless the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state is enabled, in which case the `depthBoundsTestEnable` parameter to vkCmdSetDepthBoundsTestEnableEXT **must** be `VK_FALSE`. When `depthBoundsTestEnable` is `VK_FALSE`, the `minDepthBounds` and `maxDepthBounds` members of the VkPipelineDepthStencilStateCreateInfo structure are ignored.
- `wideLines` specifies whether lines with width other than 1.0 are supported. If this feature is not enabled, the `lineWidth` member of the VkPipelineRasterizationStateCreateInfo structure **must** be 1.0 unless the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state is enabled, in which case the `lineWidth` parameter to vkCmdSetLineWidth **must** be 1.0. When this feature is supported, the range and granularity of supported line widths are indicated by the `lineWidthRange` and `lineWidthGranularity` members of the `VkPhysicalDeviceLimits` structure, respectively.
- `largePoints` specifies whether points with size greater than 1.0 are supported. If this feature is not enabled, only a point size of 1.0 written by a shader is supported. The range and granularity of supported point sizes are indicated by the `pointSizeRange` and `pointSizeGranularity` members of the `VkPhysicalDeviceLimits` structure, respectively.
- `alphaToOne` specifies whether the implementation is able to replace the alpha value of the fragment shader color output in the Multisample Coverage fragment operation. If this feature is not enabled, then the `alphaToOneEnable` member of the VkPipelineMultisampleStateCreateInfo structure **must** be `VK_FALSE`. Otherwise setting `alphaToOneEnable` to `VK_TRUE` will enable alpha-to-one behavior.
- `multiViewport` specifies whether more than one viewport is supported. If this feature is not enabled:

    - The `viewportCount` and `scissorCount` members of the VkPipelineViewportStateCreateInfo structure **must** be 1.
    - The `firstViewport` and `viewportCount` parameters to the vkCmdSetViewport command **must** be 0 and 1, respectively.
    - The `firstScissor` and `scissorCount` parameters to the vkCmdSetScissor command **must** be 0 and 1, respectively.
- `samplerAnisotropy` specifies whether anisotropic filtering is supported. If this feature is not enabled, the `anisotropyEnable` member of the VkSamplerCreateInfo structure **must** be `VK_FALSE`.
- `textureCompressionETC2` specifies whether all of the ETC2 and EAC compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:
    - `VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK`
    - `VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK`
    - `VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK`
    - `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK`
    - `VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK`
    - `VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK`
    - `VK_FORMAT_EAC_R11_UNORM_BLOCK`
    - `VK_FORMAT_EAC_R11_SNORM_BLOCK`
    - `VK_FORMAT_EAC_R11G11_UNORM_BLOCK`
    - `VK_FORMAT_EAC_R11G11_SNORM_BLOCK`

    To query for additional properties, or if the feature is not enabled, vkGetPhysicalDeviceFormatProperties and vkGetPhysicalDeviceImageFormatProperties **can** be used to check for supported properties of individual formats as normal.
- `textureCompressionASTC_LDR` specifies whether all of the ASTC LDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:
    - `VK_FORMAT_ASTC_4x4_UNORM_BLOCK`
    - `VK_FORMAT_ASTC_4x4_SRGB_BLOCK`
    - `VK_FORMAT_ASTC_5x4_UNORM_BLOCK`
    - `VK_FORMAT_ASTC_5x4_SRGB_BLOCK`
    - `VK_FORMAT_ASTC_5x5_UNORM_BLOCK`
    - `VK_FORMAT_ASTC_5x5_SRGB_BLOCK`
    - `VK_FORMAT_ASTC_6x5_UNORM_BLOCK`
    - `VK_FORMAT_ASTC_6x5_SRGB_BLOCK`

- VK_FORMAT_ASTC_6x6_UNORM_BLOCK
- VK_FORMAT_ASTC_6x6_SRGB_BLOCK
- VK_FORMAT_ASTC_8x5_UNORM_BLOCK
- VK_FORMAT_ASTC_8x5_SRGB_BLOCK
- VK_FORMAT_ASTC_8x6_UNORM_BLOCK
- VK_FORMAT_ASTC_8x6_SRGB_BLOCK
- VK_FORMAT_ASTC_8x8_UNORM_BLOCK
- VK_FORMAT_ASTC_8x8_SRGB_BLOCK
- VK_FORMAT_ASTC_10x5_UNORM_BLOCK
- VK_FORMAT_ASTC_10x5_SRGB_BLOCK
- VK_FORMAT_ASTC_10x6_UNORM_BLOCK
- VK_FORMAT_ASTC_10x6_SRGB_BLOCK
- VK_FORMAT_ASTC_10x8_UNORM_BLOCK
- VK_FORMAT_ASTC_10x8_SRGB_BLOCK
- VK_FORMAT_ASTC_10x10_UNORM_BLOCK
- VK_FORMAT_ASTC_10x10_SRGB_BLOCK
- VK_FORMAT_ASTC_12x10_UNORM_BLOCK
- VK_FORMAT_ASTC_12x10_SRGB_BLOCK
- VK_FORMAT_ASTC_12x12_UNORM_BLOCK
- VK_FORMAT_ASTC_12x12_SRGB_BLOCK

  To query for additional properties, or if the feature is not enabled, vkGetPhysicalDeviceFormatProperties and vkGetPhysicalDeviceImageFormatProperties **can** be used to check for supported properties of individual formats as normal.

- textureCompressionBC specifies whether all of the BC compressed texture formats are supported. If this feature is enabled, then the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT, VK_FORMAT_FEATURE_BLIT_SRC_BIT and VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT features **must** be supported in optimalTilingFeatures for the following formats:
  - VK_FORMAT_BC1_RGB_UNORM_BLOCK
  - VK_FORMAT_BC1_RGB_SRGB_BLOCK
  - VK_FORMAT_BC1_RGBA_UNORM_BLOCK
  - VK_FORMAT_BC1_RGBA_SRGB_BLOCK
  - VK_FORMAT_BC2_UNORM_BLOCK
  - VK_FORMAT_BC2_SRGB_BLOCK
  - VK_FORMAT_BC3_UNORM_BLOCK
  - VK_FORMAT_BC3_SRGB_BLOCK

    - VK_FORMAT_BC4_UNORM_BLOCK
    - VK_FORMAT_BC4_SNORM_BLOCK
    - VK_FORMAT_BC5_UNORM_BLOCK
    - VK_FORMAT_BC5_SNORM_BLOCK
    - VK_FORMAT_BC6H_UFLOAT_BLOCK
    - VK_FORMAT_BC6H_SFLOAT_BLOCK
    - VK_FORMAT_BC7_UNORM_BLOCK
    - VK_FORMAT_BC7_SRGB_BLOCK

    To query for additional properties, or if the feature is not enabled, vkGetPhysicalDeviceFormatProperties and vkGetPhysicalDeviceImageFormatProperties **can** be used to check for supported properties of individual formats as normal.

- occlusionQueryPrecise specifies whether occlusion queries returning actual sample counts are supported. Occlusion queries are created in a VkQueryPool by specifying the queryType of VK_QUERY_TYPE_OCCLUSION in the VkQueryPoolCreateInfo structure which is passed to vkCreateQueryPool. If this feature is enabled, queries of this type **can** enable VK_QUERY_CONTROL_PRECISE_BIT in the flags parameter to vkCmdBeginQuery. If this feature is not supported, the implementation supports only boolean occlusion queries. When any samples are passed, boolean queries will return a non-zero result value, otherwise a result value of zero is returned. When this feature is enabled and VK_QUERY_CONTROL_PRECISE_BIT is set, occlusion queries will report the actual number of samples passed.
- pipelineStatisticsQuery specifies whether the pipeline statistics queries are supported. If this feature is not enabled, queries of type VK_QUERY_TYPE_PIPELINE_STATISTICS **cannot** be created, and none of the VkQueryPipelineStatisticFlagBits bits **can** be set in the pipelineStatistics member of the VkQueryPoolCreateInfo structure.
- vertexPipelineStoresAndAtomics specifies whether storage buffers and images support stores and atomic operations in the vertex, tessellation, and geometry shader stages. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by these stages in shader modules **must** be decorated with the NonWritable decoration (or the readonly memory qualifier in GLSL).
- fragmentStoresAndAtomics specifies whether storage buffers and images support stores and atomic operations in the fragment shader stage. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by the fragment stage in shader modules **must** be decorated with the NonWritable decoration (or the readonly memory qualifier in GLSL).
- shaderTessellationAndGeometryPointSize specifies whether the PointSize built-in decoration is available in the tessellation control, tessellation evaluation, and geometry shader stages. If this feature is not enabled, members decorated with the PointSize built-in decoration **must** not be read from or written to and all points written from a tessellation or geometry shader will have a size of 1.0. This also specifies whether shader modules **can** declare the TessellationPointSize capability for tessellation control and evaluation shaders, or if the shader modules **can** declare the GeometryPointSize capability for geometry shaders. An implementation supporting this feature **must** also support one or both of the tessellationShader or geometryShader features.

- `shaderImageGatherExtended` specifies whether the extended set of image gather instructions are available in shader code. If this feature is not enabled, the `OpImage*Gather` instructions do not support the `Offset` and `ConstOffsets` operands. This also specifies whether shader modules **can** declare the `ImageGatherExtended` capability.
- `shaderStorageImageExtendedFormats` specifies whether all the “storage image extended formats” below are supported; if this feature is supported, then the `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` **must** be supported in `optimalTilingFeatures` for the following formats:
  - `VK_FORMAT_R16G16_SFLOAT`
  - `VK_FORMAT_B10G11R11_UFLOAT_PACK32`
  - `VK_FORMAT_R16_SFLOAT`
  - `VK_FORMAT_R16G16B16A16_UNORM`
  - `VK_FORMAT_A2B10G10R10_UNORM_PACK32`
  - `VK_FORMAT_R16G16_UNORM`
  - `VK_FORMAT_R8G8_UNORM`
  - `VK_FORMAT_R16_UNORM`
  - `VK_FORMAT_R8_UNORM`
  - `VK_FORMAT_R16G16B16A16_SNORM`
  - `VK_FORMAT_R16G16_SNORM`
  - `VK_FORMAT_R8G8_SNORM`
  - `VK_FORMAT_R16_SNORM`
  - `VK_FORMAT_R8_SNORM`
  - `VK_FORMAT_R16G16_SINT`
  - `VK_FORMAT_R8G8_SINT`
  - `VK_FORMAT_R16_SINT`
  - `VK_FORMAT_R8_SINT`
  - `VK_FORMAT_A2B10G10R10_UINT_PACK32`
  - `VK_FORMAT_R16G16_UINT`
  - `VK_FORMAT_R8G8_UINT`
  - `VK_FORMAT_R16_UINT`
  - `VK_FORMAT_R8_UINT`

NOTE

`shaderStorageImageExtendedFormats` feature only adds a guarantee of format support, which is specified for the whole physical device. Therefore enabling or disabling the feature via vkCreateDevice has no practical effect.

To query for additional properties, or if the feature is not supported, vkGetPhysicalDeviceFormatProperties and vkGetPhysicalDeviceImageFormatProperties **can** be used to check for supported properties of individual formats, as usual rules allow.

> VK_FORMAT_R32G32_UINT, VK_FORMAT_R32G32_SINT, and VK_FORMAT_R32G32_SFLOAT from StorageImageExtendedFormats SPIR-V capability, are already covered by core Vulkan mandatory format support.

- shaderStorageImageMultisample specifies whether multisampled storage images are supported. If this feature is not enabled, images that are created with a usage that includes VK_IMAGE_USAGE_STORAGE_BIT **must** be created with samples equal to VK_SAMPLE_COUNT_1_BIT. This also specifies whether shader modules **can** declare the StorageImageMultisample and ImageMSArray capabilities.
- shaderStorageImageReadWithoutFormat specifies whether storage images and storage texel buffers require a format qualifier to be specified when reading. shaderStorageImageReadWithoutFormat applies only to formats listed in the storage without format list.
- shaderStorageImageWriteWithoutFormat specifies whether storage images and storage texel buffers require a format qualifier to be specified when writing. shaderStorageImageWriteWithoutFormat applies only to formats listed in the storage without format list.
- shaderUniformBufferArrayDynamicIndexing specifies whether arrays of uniform buffers **can** be indexed by integer expressions that are dynamically uniform within the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the UniformBufferArrayDynamicIndexing capability.
- shaderSampledImageArrayDynamicIndexing specifies whether arrays of samplers or sampled images **can** be indexed by integer expressions that are dynamically uniform within the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the SampledImageArrayDynamicIndexing capability.
- shaderStorageBufferArrayDynamicIndexing specifies whether arrays of storage buffers **can** be indexed by integer expressions that are dynamically uniform within the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the StorageBufferArrayDynamicIndexing capability.
- shaderStorageImageArrayDynamicIndexing specifies whether arrays of storage images **can** be indexed by integer expressions that are dynamically uniform within the invocation group in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE **must** be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules **can** declare the StorageImageArrayDynamicIndexing capability.
- shaderClipDistance specifies whether clip distances are supported in shader code. If this feature is not enabled, any members decorated with the ClipDistance built-in decoration **must** not be

read from or written to in shader modules. This also specifies whether shader modules **can** declare the `ClipDistance` capability.

- `shaderCullDistance` specifies whether cull distances are supported in shader code. If this feature is not enabled, any members decorated with the `CullDistance` built-in decoration **must** not be read from or written to in shader modules. This also specifies whether shader modules **can** declare the `CullDistance` capability.
- `shaderFloat64` specifies whether 64-bit floats (doubles) are supported in shader code. If this feature is not enabled, 64-bit floating-point types **must** not be used in shader code. This also specifies whether shader modules **can** declare the `Float64` capability. Declaring and using 64-bit floats is enabled for all storage classes that SPIR-V allows with the `Float64` capability.
- `shaderInt64` specifies whether 64-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 64-bit integer types **must** not be used in shader code. This also specifies whether shader modules **can** declare the `Int64` capability. Declaring and using 64-bit integers is enabled for all storage classes that SPIR-V allows with the `Int64` capability.
- `shaderInt16` specifies whether 16-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 16-bit integer types **must** not be used in shader code. This also specifies whether shader modules **can** declare the `Int16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int16` SPIR-V capability: Declaring and using 16-bit integers in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.
- `shaderResourceResidency` specifies whether image operations that return resource residency information are supported in shader code. If this feature is not enabled, the `OpImageSparse*` instructions **must** not be used in shader code. This also specifies whether shader modules **can** declare the `SparseResidency` capability. The feature requires at least one of the `sparseResidency*` features to be supported.
- `shaderResourceMinLod` specifies whether image operations specifying the minimum resource LOD are supported in shader code. If this feature is not enabled, the `MinLod` image operand **must** not be used in shader code. This also specifies whether shader modules **can** declare the `MinLod` capability.
- `sparseBinding` specifies whether resource memory **can** be managed at opaque sparse block level instead of at the object level. If this feature is not enabled, resource memory **must** be bound only on a per-object basis using the vkBindBufferMemory and vkBindImageMemory commands. In this case, buffers and images **must** not be created with `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in the `flags` member of the VkBufferCreateInfo and VkImageCreateInfo structures, respectively. Otherwise resource memory **can** be managed as described in Sparse Resource Features.
- `sparseResidencyBuffer` specifies whether the device **can** access partially resident buffers. If this feature is not enabled, buffers **must** not be created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the VkBufferCreateInfo structure.
- `sparseResidencyImage2D` specifies whether the device **can** access partially resident 2D images with 1 sample per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_1_BIT` **must** not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the VkImageCreateInfo

structure.

- sparseResidencyImage3D specifies whether the device **can** access partially resident 3D images. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_3D **must** not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure.
- sparseResidency2Samples specifies whether the physical device **can** access partially resident 2D images with 2 samples per pixel. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_2D and samples set to VK_SAMPLE_COUNT_2_BIT **must** not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure.
- sparseResidency4Samples specifies whether the physical device **can** access partially resident 2D images with 4 samples per pixel. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_2D and samples set to VK_SAMPLE_COUNT_4_BIT **must** not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure.
- sparseResidency8Samples specifies whether the physical device **can** access partially resident 2D images with 8 samples per pixel. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_2D and samples set to VK_SAMPLE_COUNT_8_BIT **must** not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure.
- sparseResidency16Samples specifies whether the physical device **can** access partially resident 2D images with 16 samples per pixel. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_2D and samples set to VK_SAMPLE_COUNT_16_BIT **must** not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure.
- sparseResidencyAliased specifies whether the physical device **can** correctly access data aliased into multiple locations. If this feature is not enabled, the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT enum values **must** not be used in flags members of the VkBufferCreateInfo and VkImageCreateInfo structures, respectively.
- variableMultisampleRate specifies whether all pipelines that will be bound to a command buffer during a subpass which uses no attachments **must** have the same value for VkPipelineMultisampleStateCreateInfo::rasterizationSamples. If set to VK_TRUE, the implementation supports variable multisample rates in a subpass which uses no attachments. If set to VK_FALSE, then all pipelines bound in such a subpass **must** have the same multisample rate. This has no effect in situations where a subpass uses any attachments.
- inheritedQueries specifies whether a secondary command buffer **may** be executed while a query is active.

The VkPhysicalDeviceVariablePointersFeatures structure is defined as:

```
typedef struct VkPhysicalDeviceVariablePointersFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           variablePointersStorageBuffer;
    VkBool32           variablePointers;
} VkPhysicalDeviceVariablePointersFeatures;
```

or the equivalent

```
// Provided by VK_KHR_variable_pointers
typedef VkPhysicalDeviceVariablePointersFeatures
VkPhysicalDeviceVariablePointersFeaturesKHR;
```

```
// Provided by VK_KHR_variable_pointers
typedef VkPhysicalDeviceVariablePointersFeatures
VkPhysicalDeviceVariablePointerFeaturesKHR;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `variablePointersStorageBuffer` specifies whether the implementation supports the SPIR-V `VariablePointersStorageBuffer` capability. When this feature is not enabled, shader modules **must** not declare the `SPV_KHR_variable_pointers` extension or the `VariablePointersStorageBuffer` capability.
- `variablePointers` specifies whether the implementation supports the SPIR-V `VariablePointers` capability. When this feature is not enabled, shader modules **must** not declare the `VariablePointers` capability.

If the `VkPhysicalDeviceVariablePointersFeatures` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVariablePointersFeatures` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage

- VUID-VkPhysicalDeviceVariablePointersFeatures-variablePointers-01431
  If `variablePointers` is enabled then `variablePointersStorageBuffer` **must** also be enabled

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVariablePointersFeatures-sType-sType

sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES

The VkPhysicalDeviceMultiviewFeatures structure is defined as:

```
typedef struct VkPhysicalDeviceMultiviewFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           multiview;
    VkBool32           multiviewGeometryShader;
    VkBool32           multiviewTessellationShader;
} VkPhysicalDeviceMultiviewFeatures;
```

or the equivalent

```
// Provided by VK_KHR_multiview
typedef VkPhysicalDeviceMultiviewFeatures VkPhysicalDeviceMultiviewFeaturesKHR;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- multiview specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass **must** always be zero.
- multiviewGeometryShader specifies whether the implementation supports multiview rendering within a render pass, with geometry shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include a geometry shader.
- multiviewTessellationShader specifies whether the implementation supports multiview rendering within a render pass, with tessellation shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include any tessellation shaders.

If the VkPhysicalDeviceMultiviewFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceMultiviewFeatures **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage

- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewGeometryShader-00580
  If multiviewGeometryShader is enabled then multiview **must** also be enabled
- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewTessellationShader-00581
  If multiviewTessellationShader is enabled then multiview **must** also be enabled

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiviewFeatures-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_FEATURES`

The VkPhysicalDeviceShaderAtomicFloatFeaturesEXT structure is defined as:

```
// Provided by VK_EXT_shader_atomic_float
typedef struct VkPhysicalDeviceShaderAtomicFloatFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderBufferFloat32Atomics;
    VkBool32           shaderBufferFloat32AtomicAdd;
    VkBool32           shaderBufferFloat64Atomics;
    VkBool32           shaderBufferFloat64AtomicAdd;
    VkBool32           shaderSharedFloat32Atomics;
    VkBool32           shaderSharedFloat32AtomicAdd;
    VkBool32           shaderSharedFloat64Atomics;
    VkBool32           shaderSharedFloat64AtomicAdd;
    VkBool32           shaderImageFloat32Atomics;
    VkBool32           shaderImageFloat32AtomicAdd;
    VkBool32           sparseImageFloat32Atomics;
    VkBool32           sparseImageFloat32AtomicAdd;
} VkPhysicalDeviceShaderAtomicFloatFeaturesEXT;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderBufferFloat32Atomics` indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on storage buffers.
- `shaderBufferFloat32AtomicAdd` indicates whether shaders **can** perform 32-bit floating-point add atomic operations on storage buffers.
- `shaderBufferFloat64Atomics` indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on storage buffers.
- `shaderBufferFloat64AtomicAdd` indicates whether shaders **can** perform 64-bit floating-point add atomic operations on storage buffers.
- `shaderSharedFloat32Atomics` indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on shared memory.
- `shaderSharedFloat32AtomicAdd` indicates whether shaders **can** perform 32-bit floating-point add atomic operations on shared memory.
- `shaderSharedFloat64Atomics` indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on shared memory.

- shaderSharedFloat64AtomicAdd indicates whether shaders **can** perform 64-bit floating-point add atomic operations on shared memory.
- shaderImageFloat32Atomics indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic image operations.
- shaderImageFloat32AtomicAdd indicates whether shaders **can** perform 32-bit floating-point add atomic image operations.
- sparseImageFloat32Atomics indicates whether 32-bit floating-point load, store and exchange atomic operations **can** be used on sparse images.
- sparseImageFloat32AtomicAdd indicates whether 32-bit floating-point add atomic operations **can** be used on sparse images.

If the VkPhysicalDeviceShaderAtomicFloatFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderAtomicFloatFeaturesEXT **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderAtomicFloatFeaturesEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_FEATURES_EXT

The VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT structure is defined as:

```
// Provided by VK_EXT_shader_atomic_float2
typedef struct VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderBufferFloat16Atomics;
    VkBool32           shaderBufferFloat16AtomicAdd;
    VkBool32           shaderBufferFloat16AtomicMinMax;
    VkBool32           shaderBufferFloat32AtomicMinMax;
    VkBool32           shaderBufferFloat64AtomicMinMax;
    VkBool32           shaderSharedFloat16Atomics;
    VkBool32           shaderSharedFloat16AtomicAdd;
    VkBool32           shaderSharedFloat16AtomicMinMax;
    VkBool32           shaderSharedFloat32AtomicMinMax;
    VkBool32           shaderSharedFloat64AtomicMinMax;
    VkBool32           shaderImageFloat32AtomicMinMax;
    VkBool32           sparseImageFloat32AtomicMinMax;
} VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.
- shaderBufferFloat16Atomics indicates whether shaders **can** perform 16-bit floating-point load, store, and exchange atomic operations on storage buffers.
- shaderBufferFloat16AtomicAdd indicates whether shaders **can** perform 16-bit floating-point add atomic operations on storage buffers.
- shaderBufferFloat16AtomicMinMax indicates whether shaders **can** perform 16-bit floating-point min and max atomic operations on storage buffers.
- shaderBufferFloat32AtomicMinMax indicates whether shaders **can** perform 32-bit floating-point min and max atomic operations on storage buffers.
- shaderBufferFloat64AtomicMinMax indicates whether shaders **can** perform 64-bit floating-point min and max atomic operations on storage buffers.
- shaderSharedFloat16Atomics indicates whether shaders **can** perform 16-bit floating-point load, store and exchange atomic operations on shared memory.
- shaderSharedFloat16AtomicAdd indicates whether shaders **can** perform 16-bit floating-point add atomic operations on shared memory.
- shaderSharedFloat16AtomicMinMax indicates whether shaders **can** perform 16-bit floating-point min and max atomic operations on shared memory.
- shaderSharedFloat32AtomicMinMax indicates whether shaders **can** perform 32-bit floating-point min and max atomic operations on shared memory.
- shaderSharedFloat64AtomicMinMax indicates whether shaders **can** perform 64-bit floating-point min and max atomic operations on shared memory.
- shaderImageFloat32AtomicMinMax indicates whether shaders **can** perform 32-bit floating-point min and max atomic image operations.
- sparseImageFloat32AtomicMinMax indicates whether 32-bit floating-point min and max atomic operations **can** be used on sparse images.

If the VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_2_FEATURES_EXT

The VkPhysicalDeviceShaderAtomicInt64Features structure is defined as:

```
typedef struct VkPhysicalDeviceShaderAtomicInt64Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderBufferInt64Atomics;
    VkBool32           shaderSharedInt64Atomics;
} VkPhysicalDeviceShaderAtomicInt64Features;
```

or the equivalent

```
// Provided by VK_KHR_shader_atomic_int64
typedef VkPhysicalDeviceShaderAtomicInt64Features
VkPhysicalDeviceShaderAtomicInt64FeaturesKHR;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderBufferInt64Atomics` indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on buffers.
- `shaderSharedInt64Atomics` indicates whether shaders **can** perform 64-bit unsigned and signed integer atomic operations on shared memory.

If the `VkPhysicalDeviceShaderAtomicInt64Features` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicInt64Features` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderAtomicInt64Features-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES`

The VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT structure is defined as:

```
// Provided by VK_EXT_shader_image_atomic_int64
typedef struct VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderImageInt64Atomics;
    VkBool32           sparseImageInt64Atomics;
} VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- shaderImageInt64Atomics indicates whether shaders **can** support 64-bit unsigned and signed integer atomic operations on images.
- sparseImageInt64Atomics indicates whether 64-bit integer atomics **can** be used on sparse images.

If the VkPhysicalDeviceShaderAtomicInt64FeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderAtomicInt64FeaturesEXT **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_ATOMIC_INT64_FEATURES_EXT

The VkPhysicalDevice8BitStorageFeatures structure is defined as:

```
typedef struct VkPhysicalDevice8BitStorageFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           storageBuffer8BitAccess;
    VkBool32           uniformAndStorageBuffer8BitAccess;
    VkBool32           storagePushConstant8;
} VkPhysicalDevice8BitStorageFeatures;
```

or the equivalent

```
// Provided by VK_KHR_8bit_storage
typedef VkPhysicalDevice8BitStorageFeatures VkPhysicalDevice8BitStorageFeaturesKHR;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- storageBuffer8BitAccess indicates whether objects in the StorageBuffer, ShaderRecordBufferKHR, or PhysicalStorageBuffer storage class with the Block decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the StorageBuffer8BitAccess capability.
- uniformAndStorageBuffer8BitAccess indicates whether objects in the Uniform storage class with the Block decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer

members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `UniformAndStorageBuffer8BitAccess` capability.

- `storagePushConstant8` indicates whether objects in the `PushConstant` storage class **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StoragePushConstant8` capability.

If the `VkPhysicalDevice8BitStorageFeatures` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice8BitStorageFeatures` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevice8BitStorageFeatures-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_8BIT_STORAGE_FEATURES`

The VkPhysicalDevice16BitStorageFeatures structure is defined as:

```
typedef struct VkPhysicalDevice16BitStorageFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           storageBuffer16BitAccess;
    VkBool32           uniformAndStorageBuffer16BitAccess;
    VkBool32           storagePushConstant16;
    VkBool32           storageInputOutput16;
} VkPhysicalDevice16BitStorageFeatures;
```

or the equivalent

```
// Provided by VK_KHR_16bit_storage
typedef VkPhysicalDevice16BitStorageFeatures VkPhysicalDevice16BitStorageFeaturesKHR;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `storageBuffer16BitAccess` specifies whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StorageBuffer16BitAccess` capability.
- `uniformAndStorageBuffer16BitAccess` specifies whether objects in the `Uniform` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is

not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `UniformAndStorageBuffer16BitAccess` capability.

- `storagePushConstant16` specifies whether objects in the `PushConstant` storage class **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StoragePushConstant16` capability.
- `storageInputOutput16` specifies whether objects in the `Input` and `Output` storage classes **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StorageInputOutput16` capability.

If the `VkPhysicalDevice16BitStorageFeatures` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice16BitStorageFeatures` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevice16BitStorageFeatures-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES`

The `VkPhysicalDeviceShaderFloat16Int8Features` structure is defined as:

```
typedef struct VkPhysicalDeviceShaderFloat16Int8Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderFloat16;
    VkBool32           shaderInt8;
} VkPhysicalDeviceShaderFloat16Int8Features;
```

or the equivalent

```
// Provided by VK_KHR_shader_float16_int8
typedef VkPhysicalDeviceShaderFloat16Int8Features
VkPhysicalDeviceShaderFloat16Int8FeaturesKHR;
```

```
// Provided by VK_KHR_shader_float16_int8
typedef VkPhysicalDeviceShaderFloat16Int8Features
VkPhysicalDeviceFloat16Int8FeaturesKHR;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.
- shaderFloat16 indicates whether 16-bit floats (halfs) are supported in shader code. This also indicates whether shader modules **can** declare the Float16 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Float16 SPIR-V capability: Declaring and using 16-bit floats in the Private, Workgroup (for non-Block variables), and Function storage classes is enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.
- shaderInt8 indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules **can** declare the Int8 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Int8 SPIR-V capability: Declaring and using 8-bit integers in the Private, Workgroup (for non-Block variables), and Function storage classes is enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

If the VkPhysicalDeviceShaderFloat16Int8Features structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderFloat16Int8Features **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderFloat16Int8Features-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_FLOAT16_INT8_FEATURES

The VkPhysicalDeviceShaderClockFeaturesKHR structure is defined as:

```
// Provided by VK_KHR_shader_clock
typedef struct VkPhysicalDeviceShaderClockFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderSubgroupClock;
    VkBool32           shaderDeviceClock;
} VkPhysicalDeviceShaderClockFeaturesKHR;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- shaderSubgroupClock indicates whether shaders **can** perform Subgroup scoped clock reads.
- shaderDeviceClock indicates whether shaders **can** perform Device scoped clock reads.

If the VkPhysicalDeviceShaderClockFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderClockFeaturesKHR

can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderClockFeaturesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CLOCK_FEATURES_KHR

The VkPhysicalDeviceSamplerYcbcrConversionFeatures structure is defined as:

```
typedef struct VkPhysicalDeviceSamplerYcbcrConversionFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           samplerYcbcrConversion;
} VkPhysicalDeviceSamplerYcbcrConversionFeatures;
```

or the equivalent

```
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkPhysicalDeviceSamplerYcbcrConversionFeatures
VkPhysicalDeviceSamplerYcbcrConversionFeaturesKHR;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- samplerYcbcrConversion specifies whether the implementation supports sampler $Y'C_BC_R$ conversion. If samplerYcbcrConversion is VK_FALSE, sampler $Y'C_BC_R$ conversion is not supported, and samplers using sampler $Y'C_BC_R$ conversion **must** not be used.

If the VkPhysicalDeviceSamplerYcbcrConversionFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceSamplerYcbcrConversionFeatures **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSamplerYcbcrConversionFeatures-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_YCBCR_CONVERSION_FEATURES

The VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT structure is defined as:

```
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           advancedBlendCoherentOperations;
} VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `advancedBlendCoherentOperations` specifies whether blending using advanced blend operations is guaranteed to execute atomically and in primitive order. If this is `VK_TRUE`, `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` is treated the same as `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`, and advanced blending needs no additional synchronization over basic blending. If this is `VK_FALSE`, then memory dependencies are required to guarantee order between two advanced blending operations that occur on the same sample.

If the `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BLEND_OPERATION_ADVANCED_FEATURES_EXT`

The `VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           vertexAttributeInstanceRateDivisor;
    VkBool32           vertexAttributeInstanceRateZeroDivisor;
} VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexAttributeInstanceRateDivisor` specifies whether vertex attribute fetching may be repeated

in the case of instanced rendering.

- `vertexAttributeInstanceRateZeroDivisor` specifies whether a zero value for `VkVertexInputBindingDivisorDescriptionEXT::divisor` is supported.

If the `VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2KHR`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES_KHR`

The `VkPhysicalDeviceASTCDecodeFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_astc_decode_mode
typedef struct VkPhysicalDeviceASTCDecodeFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           decodeModeSharedExponent;
} VkPhysicalDeviceASTCDecodeFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `decodeModeSharedExponent` indicates whether the implementation supports decoding ASTC compressed formats to `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32` internal precision.

If the `VkPhysicalDeviceASTCDecodeFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2KHR`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceASTCDecodeFeaturesEXT` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceASTCDecodeFeaturesEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT`

The `VkPhysicalDeviceTransformFeedbackFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_transform_feedback
typedef struct VkPhysicalDeviceTransformFeedbackFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           transformFeedback;
    VkBool32           geometryStreams;
} VkPhysicalDeviceTransformFeedbackFeaturesEXT;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `transformFeedback` indicates whether the implementation supports transform feedback and shader modules **can** declare the `TransformFeedback` capability.
- `geometryStreams` indicates whether the implementation supports the `GeometryStreams` SPIR-V capability.

If the `VkPhysicalDeviceTransformFeedbackFeaturesEXT` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTransformFeedbackFeaturesEXT` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTransformFeedbackFeaturesEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_FEATURES_EXT`

The `VkPhysicalDeviceVulkanMemoryModelFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceVulkanMemoryModelFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           vulkanMemoryModel;
    VkBool32           vulkanMemoryModelDeviceScope;
    VkBool32           vulkanMemoryModelAvailabilityVisibilityChains;
} VkPhysicalDeviceVulkanMemoryModelFeatures;
```

or the equivalent

```
// Provided by VK_KHR_vulkan_memory_model
typedef VkPhysicalDeviceVulkanMemoryModelFeatures
VkPhysicalDeviceVulkanMemoryModelFeaturesKHR;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- vulkanMemoryModel indicates whether shader modules **can** declare the VulkanMemoryModel capability.
- vulkanMemoryModelDeviceScope indicates whether the Vulkan Memory Model can use Device scope synchronization. This also indicates whether shader modules **can** declare the VulkanMemoryModelDeviceScope capability.
- vulkanMemoryModelAvailabilityVisibilityChains indicates whether the Vulkan Memory Model can use availability and visibility chains with more than one element.

If the VkPhysicalDeviceVulkanMemoryModelFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVulkanMemoryModelFeaturesKHR **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkanMemoryModelFeatures-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_MEMORY_MODEL_FEATURES

The VkPhysicalDeviceComputeShaderDerivativesFeaturesKHR structure is defined as:

```
// Provided by VK_KHR_compute_shader_derivatives
typedef struct VkPhysicalDeviceComputeShaderDerivativesFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           computeDerivativeGroupQuads;
    VkBool32           computeDerivativeGroupLinear;
} VkPhysicalDeviceComputeShaderDerivativesFeaturesKHR;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- computeDerivativeGroupQuads indicates that the implementation supports the ComputeDerivativeGroupQuadsKHR SPIR-V capability.
- computeDerivativeGroupLinear indicates that the implementation supports the ComputeDerivativeGroupLinearKHR SPIR-V capability.

See Quad shader scope for more information.

If the VkPhysicalDeviceComputeShaderDerivativesFeaturesKHR. structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceComputeShaderDerivativesFeaturesKHR. **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceComputeShaderDerivativesFeaturesKHR-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_FEATURES_KHR

The VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR structure is defined as:

```
// Provided by VK_KHR_fragment_shader_barycentric
typedef struct VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           fragmentShaderBarycentric;
} VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fragmentShaderBarycentric indicates that the implementation supports the BaryCoordKHR and BaryCoordNoPerspKHR SPIR-V fragment shader built-ins and supports the PerVertexKHR SPIR-V decoration on fragment shader input variables.

See Barycentric Interpolation for more information.

If the VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_FEATURES_KHR

The VkPhysicalDeviceFragmentDensityMapFeaturesEXT structure is defined as:

```
// Provided by VK_EXT_fragment_density_map
typedef struct VkPhysicalDeviceFragmentDensityMapFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           fragmentDensityMap;
    VkBool32           fragmentDensityMapDynamic;
    VkBool32           fragmentDensityMapNonSubsampledImages;
} VkPhysicalDeviceFragmentDensityMapFeaturesEXT;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMap` specifies whether the implementation supports render passes with a fragment density map attachment. If this feature is not enabled and the `pNext` chain of VkRenderPassCreateInfo includes a VkRenderPassFragmentDensityMapCreateInfoEXT structure, `fragmentDensityMapAttachment` **must** be `VK_ATTACHMENT_UNUSED`.
- `fragmentDensityMapDynamic` specifies whether the implementation supports dynamic fragment density map image views. If this feature is not enabled, `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` **must** not be included in VkImageViewCreateInfo::`flags`.
- `fragmentDensityMapNonSubsampledImages` specifies whether the implementation supports regular non-subsampled image attachments with fragment density map render passes. If this feature is not enabled, render passes with a fragment density map attachment **must** only have subsampled attachments bound.

If the `VkPhysicalDeviceFragmentDensityMapFeaturesEXT` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentDensityMapFeaturesEXT` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMapFeaturesEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_FEATURES_EXT`

The `VkPhysicalDeviceFragmentDensityMap2FeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_fragment_density_map2
typedef struct VkPhysicalDeviceFragmentDensityMap2FeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           fragmentDensityMapDeferred;
} VkPhysicalDeviceFragmentDensityMap2FeaturesEXT;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMapDeferred` specifies whether the implementation supports deferred reads of fragment density map image views. If this feature is not enabled, `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT` **must** not be included in `VkImageViewCreateInfo::flags`.

If the `VkPhysicalDeviceFragmentDensityMap2FeaturesEXT` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentDensityMap2FeaturesEXT` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMap2FeaturesEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_2_FEATURES_EXT`

The `VkPhysicalDeviceUniformBufferStandardLayoutFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceUniformBufferStandardLayoutFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           uniformBufferStandardLayout;
} VkPhysicalDeviceUniformBufferStandardLayoutFeatures;
```

or the equivalent

```
// Provided by VK_KHR_uniform_buffer_standard_layout
typedef VkPhysicalDeviceUniformBufferStandardLayoutFeatures
VkPhysicalDeviceUniformBufferStandardLayoutFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.
- uniformBufferStandardLayout indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See Standard Buffer Layout.

If the VkPhysicalDeviceUniformBufferStandardLayoutFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceUniformBufferStandardLayoutFeatures **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceUniformBufferStandardLayoutFeatures-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_UNIFORM_BUFFER_STANDARD_LAYOUT_FEATURES

The VkPhysicalDeviceDepthClipEnableFeaturesEXT structure is defined as:

```
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPhysicalDeviceDepthClipEnableFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           depthClipEnable;
} VkPhysicalDeviceDepthClipEnableFeaturesEXT;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- depthClipEnable indicates that the implementation supports setting the depth clipping operation explicitly via the VkPipelineRasterizationDepthClipStateCreateInfoEXT pipeline state. Otherwise depth clipping is only enabled when VkPipelineRasterizationStateCreateInfo::depthClampEnable is VK_FALSE.

If the VkPhysicalDeviceDepthClipEnableFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDepthClipEnableFeaturesEXT **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDepthClipEnableFeaturesEXT-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_ENABLE_FEATURES_EXT

The VkPhysicalDeviceMemoryPriorityFeaturesEXT structure is defined as:

```
// Provided by VK_EXT_memory_priority
typedef struct VkPhysicalDeviceMemoryPriorityFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           memoryPriority;
} VkPhysicalDeviceMemoryPriorityFeaturesEXT;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memoryPriority indicates that the implementation supports memory priorities specified at memory allocation time via VkMemoryPriorityAllocateInfoEXT.

If the VkPhysicalDeviceMemoryPriorityFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceMemoryPriorityFeaturesEXT **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryPriorityFeaturesEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PRIORITY_FEATURES_EXT

The VkPhysicalDeviceBufferDeviceAddressFeatures structure is defined as:

```
typedef struct VkPhysicalDeviceBufferDeviceAddressFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           bufferDeviceAddress;
    VkBool32           bufferDeviceAddressCaptureReplay;
    VkBool32           bufferDeviceAddressMultiDevice;
} VkPhysicalDeviceBufferDeviceAddressFeatures;
```

or the equivalent

```
// Provided by VK_KHR_buffer_device_address
typedef VkPhysicalDeviceBufferDeviceAddressFeatures
VkPhysicalDeviceBufferDeviceAddressFeaturesKHR;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `bufferDeviceAddress` indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from vkGetBufferDeviceAddressKHR.
- `bufferDeviceAddressCaptureReplay` indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.
- `bufferDeviceAddressMultiDevice` indicates that the implementation supports the `bufferDeviceAddress` , `rayTracingPipeline` and `rayQuery` features for logical devices created with multiple physical devices. If this feature is not supported, buffer and acceleration structure addresses **must** not be queried on a logical device created with more than one physical device.

NOTE	`bufferDeviceAddressMultiDevice` exists to allow certain legacy platforms to be able to support `bufferDeviceAddress` without needing to support shared GPU virtual addresses for multi-device configurations.

See vkGetBufferDeviceAddressKHR for more information.

If the `VkPhysicalDeviceBufferDeviceAddressFeatures` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBufferDeviceAddressFeatures` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBufferDeviceAddressFeatures-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES`

The `VkPhysicalDeviceImagelessFramebufferFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceImagelessFramebufferFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           imagelessFramebuffer;
} VkPhysicalDeviceImagelessFramebufferFeatures;
```

or the equivalent

```
// Provided by VK_KHR_imageless_framebuffer
typedef VkPhysicalDeviceImagelessFramebufferFeatures
VkPhysicalDeviceImagelessFramebufferFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imagelessFramebuffer` indicates that the implementation supports specifying the image view for attachments at render pass begin time via VkRenderPassAttachmentBeginInfo.

If the `VkPhysicalDeviceImagelessFramebufferFeatures` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceImagelessFramebufferFeatures` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImagelessFramebufferFeatures-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGELESS_FRAMEBUFFER_FEATURES`

The `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_fragment_shader_interlock
typedef struct VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           fragmentShaderSampleInterlock;
    VkBool32           fragmentShaderPixelInterlock;
    VkBool32           fragmentShaderShadingRateInterlock;
} VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentShaderSampleInterlock` indicates that the implementation supports the `FragmentShaderSampleInterlockEXT` SPIR-V capability.
- `fragmentShaderPixelInterlock` indicates that the implementation supports the `FragmentShaderPixelInterlockEXT` SPIR-V capability.
- `fragmentShaderShadingRateInterlock` indicates that the implementation supports the `FragmentShaderShadingRateInterlockEXT` SPIR-V capability.

If the `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT-sType-sType sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_INTERLOCK_FEATURES_EXT

The VkPhysicalDeviceCooperativeMatrixFeaturesKHR structure is defined as:

```
// Provided by VK_KHR_cooperative_matrix
typedef struct VkPhysicalDeviceCooperativeMatrixFeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           cooperativeMatrix;
    VkBool32           cooperativeMatrixRobustBufferAccess;
} VkPhysicalDeviceCooperativeMatrixFeaturesKHR;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- cooperativeMatrix indicates that the implementation supports the CooperativeMatrixKHR SPIR-V capability.
- cooperativeMatrixRobustBufferAccess indicates that the implementation supports robust buffer access for SPIR-V OpCooperativeMatrixLoadKHR and OpCooperativeMatrixStoreKHR instructions.

If the VkPhysicalDeviceCooperativeMatrixFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceCooperativeMatrixFeaturesKHR **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCooperativeMatrixFeaturesKHR-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_FEATURES_KHR

The VkPhysicalDeviceYcbcrImageArraysFeaturesEXT structure is defined as:

```
// Provided by VK_EXT_ycbcr_image_arrays
typedef struct VkPhysicalDeviceYcbcrImageArraysFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           ycbcrImageArrays;
} VkPhysicalDeviceYcbcrImageArraysFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `ycbcrImageArrays` indicates that the implementation supports creating images with a format that requires $Y'C_BC_R$ conversion and has multiple array layers.

If the `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceYcbcrImageArraysFeaturesEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_IMAGE_ARRAYS_FEATURES_EXT`

The `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is defined as:

```
typedef struct VkPhysicalDeviceTimelineSemaphoreFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           timelineSemaphore;
} VkPhysicalDeviceTimelineSemaphoreFeatures;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkPhysicalDeviceTimelineSemaphoreFeatures
VkPhysicalDeviceTimelineSemaphoreFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `timelineSemaphore` indicates whether semaphores created with a VkSemaphoreType of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.

If the `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTimelineSemaphoreFeatures` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTimelineSemaphoreFeatures-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_FEATURES`

The `VkPhysicalDeviceIndexTypeUint8FeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_index_type_uint8
typedef struct VkPhysicalDeviceIndexTypeUint8FeaturesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           indexTypeUint8;
} VkPhysicalDeviceIndexTypeUint8FeaturesKHR;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `indexTypeUint8` indicates that `VK_INDEX_TYPE_UINT8_KHR` can be used with vkCmdBindIndexBuffer2KHR and vkCmdBindIndexBuffer.

If the `VkPhysicalDeviceIndexTypeUint8FeaturesKHR` structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceIndexTypeUint8FeaturesKHR` **can** also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceIndexTypeUint8FeaturesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INDEX_TYPE_UINT8_FEATURES_KHR`

The `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_primitive_topology_list_restart
typedef struct VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           primitiveTopologyListRestart;
    VkBool32           primitiveTopologyPatchListRestart;
} VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.
- primitiveTopologyListRestart indicates that list type primitives, VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY and VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, **can** use the primitive restart index value in index buffers.
- primitiveTopologyPatchListRestart indicates that the VK_PRIMITIVE_TOPOLOGY_PATCH_LIST topology **can** use the primitive restart index value in index buffers.

If the VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIMITIVE_TOPOLOGY_LIST_RESTART_FEATURES_EXT

The VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures structure is defined as:

```
typedef struct VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           separateDepthStencilLayouts;
} VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures;
```

or the equivalent

```
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures
VkPhysicalDeviceSeparateDepthStencilLayoutsFeaturesKHR;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- separateDepthStencilLayouts indicates whether the implementation supports a VkImageMemoryBarrier for a depth/stencil image with only one of VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT set, and whether VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL can be used.

If the VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2KHR, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures **can** also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SEPARATE_DEPTH_STENCIL_LAYOUTS_FEATURES

The VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR structure is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR {
    VkStructureType    sType;
