    VkDeviceSize          extendedSparseAddressSpaceSize;
    VkImageUsageFlags     extendedSparseImageUsageFlags;
    VkBufferUsageFlags    extendedSparseBufferUsageFlags;
} VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.

- `extendedSparseAddressSpaceSize` is the total amount of address space available, in bytes, for sparse memory resources of all usages if the `extendedSparseAddressSpace` feature is enabled. This **must** be greater than or equal to `VkPhysicalDeviceLimits`::`sparseAddressSpaceSize`, and the difference in space **must** only be used with usages allowed below. This is an upper bound on the sum of the sizes of all sparse resources, regardless of whether any memory is bound to them.
- `extendedSparseImageUsageFlags` is a bitmask of VkImageUsageFlagBits of usages which **may** allow an implementation to use the full `extendedSparseAddressSpaceSize` space.
- `extendedSparseBufferUsageFlags` is a bitmask of VkBufferUsageFlagBits of usages which **may** allow an implementation to use the full `extendedSparseAddressSpaceSize` space.

If the `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV` structure is included in the `pNext` chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_SPARSE_ADDRESS_SPACE_PROPERTIES_NV`

The `VkPhysicalDeviceCudaKernelLaunchPropertiesNV` structure is defined as:

```
// Provided by VK_NV_cuda_kernel_launch
typedef struct VkPhysicalDeviceCudaKernelLaunchPropertiesNV {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           computeCapabilityMinor;
    uint32_t           computeCapabilityMajor;
} VkPhysicalDeviceCudaKernelLaunchPropertiesNV;
```

The members of the `VkPhysicalDeviceCudaKernelLaunchPropertiesNV` structure describe the following features:

- `computeCapabilityMinor` indicates the minor version number of the compute code.
- `computeCapabilityMajor` indicates the major version number of the compute code.

If the `VkPhysicalDeviceCudaKernelLaunchPropertiesNV` structure is included in the `pNext` chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCudaKernelLaunchPropertiesNV-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUDA_KERNEL_LAUNCH_PROPERTIES_NV`

The VkPhysicalDeviceExternalFormatResolvePropertiesANDROID structure is defined as:

```
// Provided by VK_ANDROID_external_format_resolve
typedef struct VkPhysicalDeviceExternalFormatResolvePropertiesANDROID {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            nullColorAttachmentWithExternalFormatResolve;
    VkChromaLocation    externalFormatResolveChromaOffsetX;
    VkChromaLocation    externalFormatResolveChromaOffsetY;
} VkPhysicalDeviceExternalFormatResolvePropertiesANDROID;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- nullColorAttachmentWithExternalFormatResolve indicates that there **must** be no color attachment image when performing external format resolves if it is VK_TRUE.
- externalFormatResolveChromaOffsetX indicates the VkChromaLocation that an implementation uses in the X axis for accesses to an external format image as a resolve attachment. This **must** be consistent between external format resolves and load operations from external format resolve attachments to color attachments when nullColorAttachmentWithExternalFormatResolve is VK_TRUE.
- externalFormatResolveChromaOffsetY indicates the VkChromaLocation that an implementation uses in the Y axis for accesses to an external format image as a resolve attachment. This **must** be consistent between external format resolves and load operations from external format resolve attachments to color attachments when nullColorAttachmentWithExternalFormatResolve is VK_TRUE.

If the VkPhysicalDeviceExternalFormatResolvePropertiesANDROID structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalFormatResolvePropertiesANDROID-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_FORMAT_RESOLVE_PROPERTIES_ANDROID

The VkPhysicalDevicePipelineBinaryPropertiesKHR structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPhysicalDevicePipelineBinaryPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           pipelineBinaryInternalCache;
    VkBool32           pipelineBinaryInternalCacheControl;
    VkBool32           pipelineBinaryPrefersInternalCache;
    VkBool32           pipelineBinaryPrecompiledInternalCache;
    VkBool32           pipelineBinaryCompressedData;
} VkPhysicalDevicePipelineBinaryPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineBinaryInternalCache` specifies that the implementation maintains a pipeline cache internal to the implementation. If this is `VK_TRUE`, applications **can** create pipeline binaries with only a pipeline create info, and in this case, an implementation **may** be able to create a pipeline binary directly without application needing to capture the binary itself.
- `pipelineBinaryInternalCacheControl` specifies whether the driver's internal cache **can** be disabled. If this property is `VK_TRUE` VkDevicePipelineBinaryInternalCacheControlKHR ::`disableInternalCache` **can** be used to disable the driver's internal cache, allowing an application to take full control of both memory and disk usage.
- `pipelineBinaryPrefersInternalCache` specifies that the implementation prefers to maintain an internal cache, and applications **should** not store pipeline binaries in their own on-disk caches to avoid increased on-disk storage requirements. Applications are encouraged to only store pipeline keys instead, and aim to create pipeline binaries from key alone on subsequent runs of the application.
- `pipelineBinaryPrecompiledInternalCache` specifies that the implementation **may** have pipeline binaries in its internal cache, which is populated without the application ever having generated that pipeline itself. Applications **can** attempt to create binaries without extracting pipeline binary data from the pipeline prior for a set of pipeline keys, including from previous runs of the application.
- `pipelineBinaryCompressedData` specifies that the binary data is already compressed and so applications **should** not attempt to compress it.

NOTE

These properties tend to be platform specific and may change depending on external configuration which is outside the scope of this specification. These properties are intended to guide applications when implementations have dedicated caching solutions available. In particular, if the `pipelineBinaryPrefersInternalCache` limit is exposed, relying on the internal cache may provide some advantage compared to an application-specific solution. An application with its own dedicated solution may still use its own caching system even with this limit exposed.

If the `VkPhysicalDevicePipelineBinaryPropertiesKHR` structure is included in the `pNext` chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with

each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePipelineBinaryPropertiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_BINARY_PROPERTIES_KHR`

The `VkPhysicalDeviceRenderPassStripedPropertiesARM` structure is defined as:

```
// Provided by VK_ARM_render_pass_striped
typedef struct VkPhysicalDeviceRenderPassStripedPropertiesARM {
    VkStructureType    sType;
    void*              pNext;
    VkExtent2D         renderPassStripeGranularity;
    uint32_t           maxRenderPassStripes;
} VkPhysicalDeviceRenderPassStripedPropertiesARM;
```

The members of the `VkPhysicalDeviceRenderPassStripedPropertiesARM` structure describe the following limits:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPassStripeGranularity` indicates the minimum supported granularity of striped render pass regions.
- `maxRenderPassStripes` indicates the maximum number of stripes supported in striped rendering.

If the `VkPhysicalDeviceRenderPassStripedPropertiesARM` structure is included in the `pNext` chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRenderPassStripedPropertiesARM-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RENDER_PASS_STRIPED_PROPERTIES_ARM`

The `VkPhysicalDeviceComputeShaderDerivativesPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_compute_shader_derivatives
typedef struct VkPhysicalDeviceComputeShaderDerivativesPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           meshAndTaskShaderDerivatives;
} VkPhysicalDeviceComputeShaderDerivativesPropertiesKHR;
```

The members of the VkPhysicalDeviceComputeShaderDerivativesPropertiesKHR structure describe the following:

- meshAndTaskShaderDerivatives indicates whether the mesh and task shader stages support the ComputeDerivativeGroupQuadsKHR and ComputeDerivativeGroupLinearKHR SPIR-V capabilities.

If the VkPhysicalDeviceComputeShaderDerivativesPropertiesKHR structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceComputeShaderDerivativesPropertiesKHR-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_PROPERTIES_KHR

The VkPhysicalDeviceMapMemoryPlacedPropertiesEXT structure is defined as:

```
// Provided by VK_EXT_map_memory_placed
typedef struct VkPhysicalDeviceMapMemoryPlacedPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       minPlacedMemoryMapAlignment;
} VkPhysicalDeviceMapMemoryPlacedPropertiesEXT;
```

The members of the VkPhysicalDeviceMapMemoryPlacedPropertiesEXT structure describe the following:

- minPlacedMemoryMapAlignment is the minimum alignment required for memory object offsets and virtual address ranges when using placed memory mapping.

If the VkPhysicalDeviceMapMemoryPlacedPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMapMemoryPlacedPropertiesEXT-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAP_MEMORY_PLACED_PROPERTIES_EXT

The VkPhysicalDeviceImageAlignmentControlPropertiesMESA structure is defined as:

```
// Provided by VK_MESA_image_alignment_control
typedef struct VkPhysicalDeviceImageAlignmentControlPropertiesMESA {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           supportedImageAlignmentMask;
} VkPhysicalDeviceImageAlignmentControlPropertiesMESA;
```

The members of the VkPhysicalDeviceImageAlignmentControlPropertiesMESA structure describe the following:

- supportedImageAlignmentMask is a bitwise-or of all potentially supported image alignments for a given physical device when using VK_IMAGE_TILING_OPTIMAL. If a given alignment is supported, the application **can** request an image to have that alignment. A given set of image creation parameters **may** support a subset of these alignments. To determine if a particular alignment is supported for a given set of image creation parameters, check VkMemoryRequirements ::alignment after chaining in VkImageAlignmentControlCreateInfoMESA.

If the VkPhysicalDeviceImageAlignmentControlPropertiesMESA structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageAlignmentControlPropertiesMESA-sType-sType sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ALIGNMENT_CONTROL_PROPERTIES_MESA

47.1. Limit Requirements

The following table specifies the **required** minimum/maximum for all Vulkan graphics implementations. Where a limit corresponds to a fine-grained device feature which is **optional**, the feature name is listed with two **required** limits, one when the feature is supported and one when it is not supported. If an implementation supports a feature, the limits reported are the same whether or not the feature is enabled.

Table 68. Required Limit Types

Type	Limit	Feature
uint32_t	maxImageDimension1D	-
uint32_t	maxImageDimension2D	-
uint32_t	maxImageDimension3D	-
uint32_t	maxImageDimensionCube	-
uint32_t	maxImageArrayLayers	-
uint32_t	maxTexelBufferElements	-

Type	Limit	Feature
uint32_t	maxUniformBufferRange	-
uint32_t	maxStorageBufferRange	-
uint32_t	maxPushConstantsSize	-
uint32_t	maxMemoryAllocationCount	-
uint32_t	maxSamplerAllocationCount	-
VkDeviceSize	bufferImageGranularity	-
VkDeviceSize	sparseAddressSpaceSize	sparseBinding
uint32_t	maxBoundDescriptorSets	-
uint32_t	maxPerStageDescriptorSamplers	-
uint32_t	maxPerStageDescriptorUniformBuffers	-
uint32_t	maxPerStageDescriptorStorageBuffers	-
uint32_t	maxPerStageDescriptorSampledImages	-
uint32_t	maxPerStageDescriptorStorageImages	-
uint32_t	maxPerStageDescriptorInputAttachments	-
uint32_t	maxPerStageResources	-
uint32_t	maxDescriptorSetSamplers	-
uint32_t	maxDescriptorSetUniformBuffers	-
uint32_t	maxDescriptorSetUniformBuffersDynamic	-
uint32_t	maxDescriptorSetStorageBuffers	-
uint32_t	maxDescriptorSetStorageBuffersDynamic	-
uint32_t	maxDescriptorSetSampledImages	-
uint32_t	maxDescriptorSetStorageImages	-
uint32_t	maxDescriptorSetInputAttachments	-
uint32_t	maxVertexInputAttributes	-
uint32_t	maxVertexInputBindings	-
uint32_t	maxVertexInputAttributeOffset	-
uint32_t	maxVertexInputBindingStride	-
uint32_t	maxVertexOutputComponents	-
uint32_t	maxTessellationGenerationLevel	tessellationShader
uint32_t	maxTessellationPatchSize	tessellationShader
uint32_t	maxTessellationControlPerVertexInputComponents	tessellationShader
uint32_t	maxTessellationControlPerVertexOutputComponents	tessellationShader
uint32_t	maxTessellationControlPerPatchOutputComponents	tessellationShader

Type	Limit	Feature
uint32_t	maxTessellationControlTotalOutputComponents	tessellationShader
uint32_t	maxTessellationEvaluationInputComponents	tessellationShader
uint32_t	maxTessellationEvaluationOutputComponents	tessellationShader
uint32_t	maxGeometryShaderInvocations	geometryShader
uint32_t	maxGeometryInputComponents	geometryShader
uint32_t	maxGeometryOutputComponents	geometryShader
uint32_t	maxGeometryOutputVertices	geometryShader

1

The **Limit Type** column specifies the limit is either the minimum limit all implementations **must** support, the maximum limit all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum limit is the least bits all

implementations **must** set, but they **may** have additional bits set beyond this minimum.

2

The `maxPerStageResources` **must** be at least the smallest of the following:

- the sum of the `maxPerStageDescriptorUniformBuffers`, `maxPerStageDescriptorStorageBuffers`, `maxPerStageDescriptorSampledImages`, `maxPerStageDescriptorStorageImages`, `maxPerStageDescriptorInputAttachments`, `maxColorAttachments` limits, or
- 128.

  It **may** not be possible to reach this limit in every stage.

3

See `maxViewportDimensions` for the **required** relationship to other limits.

4

See `viewportBoundsRange` for the **required** relationship to other limits.

5

The values `minInterpolationOffset` and `maxInterpolationOffset` describe the closed interval of supported interpolation offsets: [`minInterpolationOffset`, `maxInterpolationOffset`]. The ULP is determined by `subPixelInterpolationOffsetBits`. If `subPixelInterpolationOffsetBits` is 4, this provides increments of $(1/2^4) = 0.0625$, and thus the range of supported interpolation offsets would be [-0.5, 0.4375].

6

The point size ULP is determined by `pointSizeGranularity`. If the `pointSizeGranularity` is 0.125, the range of supported point sizes **must** be at least [1.0, 63.875].

7

The line width ULP is determined by `lineWidthGranularity`. If the `lineWidthGranularity` is 0.0625, the range of supported line widths **must** be at least [1.0, 7.9375].

8

The minimum `maxDescriptorSet*` limit is n times the corresponding *specification* minimum `maxPerStageDescriptor*` limit, where n is the number of shader stages supported by the VkPhysicalDevice. If all shader stages are supported, $n = 6$ (vertex, tessellation control, tessellation evaluation, geometry, fragment, compute).

9

The `UpdateAfterBind` descriptor limits **must** each be greater than or equal to the corresponding `non`-UpdateAfterBind limit.

10

If the `VK_KHR_portability_subset` extension is enabled, the required minimum value of `maxVertexInputBindings` is `8`.

`maxResourceDescriptorSize` is defined as the maximum value of `storageImageDescriptorSize`, `sampledImageDescriptorSize`, `robustUniformTexelBufferDescriptorSize`, `robustStorageTexelBufferDescriptorSize`, `robustUniformBufferDescriptorSize`, `robustStorageBufferDescriptorSize`, `inputAttachmentDescriptorSize`, and `accelerationStructureDescriptorSize`.

47.2. Additional Multisampling Capabilities

To query additional multisampling capabilities which **may** be supported for a specific sample count, beyond the minimum capabilities described for Limits above, call:

```
// Provided by VK_EXT_sample_locations
void vkGetPhysicalDeviceMultisamplePropertiesEXT(
    VkPhysicalDevice                            physicalDevice,
    VkSampleCountFlagBits                       samples,
    VkMultisamplePropertiesEXT*                 pMultisampleProperties);
```

- `physicalDevice` is the physical device from which to query the additional multisampling capabilities.
- `samples` is a VkSampleCountFlagBits value specifying the sample count to query capabilities for.
- `pMultisampleProperties` is a pointer to a VkMultisamplePropertiesEXT structure in which information about additional multisampling capabilities specific to the sample count is returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-physicalDevice-parameter `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-samples-parameter `samples` **must** be a valid VkSampleCountFlagBits value
- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-pMultisampleProperties-parameter `pMultisampleProperties` **must** be a valid pointer to a VkMultisamplePropertiesEXT structure

The `VkMultisamplePropertiesEXT` structure is defined as

```
// Provided by VK_EXT_sample_locations
typedef struct VkMultisamplePropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkExtent2D         maxSampleLocationGridSize;
} VkMultisamplePropertiesEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxSampleLocationGridSize` is the maximum size of the pixel grid in which sample locations **can** vary.

Valid Usage (Implicit)

- VUID-VkMultisamplePropertiesEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_MULTISAMPLE_PROPERTIES_EXT`
- VUID-VkMultisamplePropertiesEXT-pNext-pNext
  `pNext` **must** be `NULL`

If the sample count for which additional multisampling capabilities are requested using `vkGetPhysicalDeviceMultisamplePropertiesEXT` is set in `sampleLocationSampleCounts` the `width` and `height` members of `VkMultisamplePropertiesEXT`::`maxSampleLocationGridSize` **must** be greater than or equal to the corresponding members of `maxSampleLocationGridSize`, respectively, otherwise both members **must** be `0`.

Chapter 48. Formats

Supported buffer and image formats **may** vary across implementations. A minimum set of format features are guaranteed, but others **must** be explicitly queried before use to ensure they are supported by the implementation.

The features for the set of formats (VkFormat) supported by the implementation are queried individually using the vkGetPhysicalDeviceFormatProperties command.

48.1. Format Definition

The following image formats **can** be passed to, and **may** be returned from Vulkan commands. The memory required to store each format is discussed with that format, and also summarized in the Representation and Texel Block Size section and the Compatible formats table.

```
// Provided by VK_VERSION_1_0
typedef enum VkFormat {
    VK_FORMAT_UNDEFINED = 0,
    VK_FORMAT_R4G4_UNORM_PACK8 = 1,
    VK_FORMAT_R4G4B4A4_UNORM_PACK16 = 2,
    VK_FORMAT_B4G4R4A4_UNORM_PACK16 = 3,
    VK_FORMAT_R5G6B5_UNORM_PACK16 = 4,

```

- VK_FORMAT_UNDEFINED specifies that the format is not specified.
- VK_FORMAT_R4G4_UNORM_PACK8 specifies a two-component, 8-bit packed unsigned normalized format that has a 4-bit R component in bits 4..7, and a 4-bit G component in bits 0..3.
- VK_FORMAT_R4G4B4A4_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit R component in bits 12..15, a 4-bit G component in bits 8..11, a 4-bit B component in bits 4..7, and a 4-bit A component in bits 0..3.
- VK_FORMAT_B4G4R4A4_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit B component in bits 12..15, a 4-bit G component in bits 8..11, a 4-bit R component in bits 4..7, and a 4-bit A component in bits 0..3.

- VK_FORMAT_A4R4G4B4_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit A component in bits 12..15, a 4-bit R component in bits 8..11, a 4-bit G component in bits 4..7, and a 4-bit B component in bits 0..3.
- VK_FORMAT_A4B4G4R4_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit A component in bits 12..15, a 4-bit B component in bits 8..11, a 4-bit G component in bits 4..7, and a 4-bit R component in bits 0..3.
- VK_FORMAT_R5G6B5_UNORM_PACK16 specifies a three-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 6-bit G component in bits 5..10, and a 5-bit B component in bits 0..4.
- VK_FORMAT_B5G6R5_UNORM_PACK16 specifies a three-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 6-bit G component in bits 5..10, and a 5-bit R component in bits 0..4.
- VK_FORMAT_R5G5B5A1_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 5-bit G component in bits 6..10, a 5-bit B component in bits 1..5, and a 1-bit A component in bit 0.
- VK_FORMAT_B5G5R5A1_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 5-bit G component in bits 6..10, a 5-bit R component in bits 1..5, and a 1-bit A component in bit 0.
- VK_FORMAT_A1R5G5B5_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 1-bit A component in bit 15, a 5-bit R component in bits 10..14, a 5-bit G component in bits 5..9, and a 5-bit B component in bits 0..4.
- VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR specifies a four-component, 16-bit packed unsigned normalized format that has a 1-bit A component in bit 15, a 5-bit B component in bits 10..14, a 5-bit G component in bits 5..9, and a 5-bit R component in bits 0..4.
- VK_FORMAT_A8_UNORM_KHR specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit A component.
- VK_FORMAT_R8_UNORM specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component.
- VK_FORMAT_R8_SNORM specifies a one-component, 8-bit signed normalized format that has a single 8-bit R component.
- VK_FORMAT_R8_USCALED specifies a one-component, 8-bit unsigned scaled integer format that has a single 8-bit R component.
- VK_FORMAT_R8_SSCALED specifies a one-component, 8-bit signed scaled integer format that has a single 8-bit R component.
- VK_FORMAT_R8_UINT specifies a one-component, 8-bit unsigned integer format that has a single 8-bit R component.
- VK_FORMAT_R8_SINT specifies a one-component, 8-bit signed integer format that has a single 8-bit R component.
- VK_FORMAT_R8_SRGB specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component stored with sRGB nonlinear encoding.
- VK_FORMAT_R8G8_UNORM specifies a two-component, 16-bit unsigned normalized format that has an

8-bit R component in byte 0, and an 8-bit G component in byte 1.

- VK_FORMAT_R8G8_SNORM specifies a two-component, 16-bit signed normalized format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- VK_FORMAT_R8G8_USCALED specifies a two-component, 16-bit unsigned scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- VK_FORMAT_R8G8_SSCALED specifies a two-component, 16-bit signed scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- VK_FORMAT_R8G8_UINT specifies a two-component, 16-bit unsigned integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- VK_FORMAT_R8G8_SINT specifies a two-component, 16-bit signed integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.
- VK_FORMAT_R8G8_SRGB specifies a two-component, 16-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, and an 8-bit G component stored with sRGB nonlinear encoding in byte 1.
- VK_FORMAT_R8G8B8_UNORM specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- VK_FORMAT_R8G8B8_SNORM specifies a three-component, 24-bit signed normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- VK_FORMAT_R8G8B8_USCALED specifies a three-component, 24-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- VK_FORMAT_R8G8B8_SSCALED specifies a three-component, 24-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- VK_FORMAT_R8G8B8_UINT specifies a three-component, 24-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- VK_FORMAT_R8G8B8_SINT specifies a three-component, 24-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- VK_FORMAT_R8G8B8_SRGB specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit B component stored with sRGB nonlinear encoding in byte 2.
- VK_FORMAT_B8G8R8_UNORM specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- VK_FORMAT_B8G8R8_SNORM specifies a three-component, 24-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- VK_FORMAT_B8G8R8_USCALED specifies a three-component, 24-bit unsigned scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- VK_FORMAT_B8G8R8_SSCALED specifies a three-component, 24-bit signed scaled format that has an 8-

bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

- VK_FORMAT_B8G8R8_UINT specifies a three-component, 24-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- VK_FORMAT_B8G8R8_SINT specifies a three-component, 24-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.
- VK_FORMAT_B8G8R8_SRGB specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit R component stored with sRGB nonlinear encoding in byte 2.
- VK_FORMAT_R8G8B8A8_UNORM specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_R8G8B8A8_SNORM specifies a four-component, 32-bit signed normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_R8G8B8A8_USCALED specifies a four-component, 32-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_R8G8B8A8_SSCALED specifies a four-component, 32-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_R8G8B8A8_UINT specifies a four-component, 32-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_R8G8B8A8_SINT specifies a four-component, 32-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_R8G8B8A8_SRGB specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit B component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_B8G8R8A8_UNORM specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_B8G8R8A8_SNORM specifies a four-component, 32-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_B8G8R8A8_USCALED specifies a four-component, 32-bit unsigned scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_B8G8R8A8_SSCALED specifies a four-component, 32-bit signed scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and

an 8-bit A component in byte 3.

- VK_FORMAT_B8G8R8A8_UINT specifies a four-component, 32-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_B8G8R8A8_SINT specifies a four-component, 32-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_B8G8R8A8_SRGB specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit R component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.
- VK_FORMAT_A8B8G8R8_UNORM_PACK32 specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- VK_FORMAT_A8B8G8R8_SNORM_PACK32 specifies a four-component, 32-bit packed signed normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- VK_FORMAT_A8B8G8R8_USCALED_PACK32 specifies a four-component, 32-bit packed unsigned scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- VK_FORMAT_A8B8G8R8_SSCALED_PACK32 specifies a four-component, 32-bit packed signed scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- VK_FORMAT_A8B8G8R8_UINT_PACK32 specifies a four-component, 32-bit packed unsigned integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- VK_FORMAT_A8B8G8R8_SINT_PACK32 specifies a four-component, 32-bit packed signed integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
- VK_FORMAT_A8B8G8R8_SRGB_PACK32 specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component stored with sRGB nonlinear encoding in bits 16..23, an 8-bit G component stored with sRGB nonlinear encoding in bits 8..15, and an 8-bit R component stored with sRGB nonlinear encoding in bits 0..7.
- VK_FORMAT_A2R10G10B10_UNORM_PACK32 specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- VK_FORMAT_A2R10G10B10_SNORM_PACK32 specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- VK_FORMAT_A2R10G10B10_USCALED_PACK32 specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

- VK_FORMAT_A2R10G10B10_SSCALED_PACK32 specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- VK_FORMAT_A2R10G10B10_UINT_PACK32 specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- VK_FORMAT_A2R10G10B10_SINT_PACK32 specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.
- VK_FORMAT_A2B10G10R10_UNORM_PACK32 specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- VK_FORMAT_A2B10G10R10_SNORM_PACK32 specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- VK_FORMAT_A2B10G10R10_USCALED_PACK32 specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- VK_FORMAT_A2B10G10R10_SSCALED_PACK32 specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- VK_FORMAT_A2B10G10R10_UINT_PACK32 specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- VK_FORMAT_A2B10G10R10_SINT_PACK32 specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
- VK_FORMAT_R16_UNORM specifies a one-component, 16-bit unsigned normalized format that has a single 16-bit R component.
- VK_FORMAT_R16_SNORM specifies a one-component, 16-bit signed normalized format that has a single 16-bit R component.
- VK_FORMAT_R16_USCALED specifies a one-component, 16-bit unsigned scaled integer format that has a single 16-bit R component.
- VK_FORMAT_R16_SSCALED specifies a one-component, 16-bit signed scaled integer format that has a single 16-bit R component.
- VK_FORMAT_R16_UINT specifies a one-component, 16-bit unsigned integer format that has a single 16-bit R component.
- VK_FORMAT_R16_SINT specifies a one-component, 16-bit signed integer format that has a single 16-bit R component.
- VK_FORMAT_R16_SFLOAT specifies a one-component, 16-bit signed floating-point format that has a single 16-bit R component.

- VK_FORMAT_R16G16_UNORM specifies a two-component, 32-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- VK_FORMAT_R16G16_SNORM specifies a two-component, 32-bit signed normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- VK_FORMAT_R16G16_USCALED specifies a two-component, 32-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- VK_FORMAT_R16G16_SSCALED specifies a two-component, 32-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- VK_FORMAT_R16G16_UINT specifies a two-component, 32-bit unsigned integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- VK_FORMAT_R16G16_SINT specifies a two-component, 32-bit signed integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- VK_FORMAT_R16G16_SFLOAT specifies a two-component, 32-bit signed floating-point format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- VK_FORMAT_R16G16B16_UNORM specifies a three-component, 48-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- VK_FORMAT_R16G16B16_SNORM specifies a three-component, 48-bit signed normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- VK_FORMAT_R16G16B16_USCALED specifies a three-component, 48-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- VK_FORMAT_R16G16B16_SSCALED specifies a three-component, 48-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- VK_FORMAT_R16G16B16_UINT specifies a three-component, 48-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- VK_FORMAT_R16G16B16_SINT specifies a three-component, 48-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- VK_FORMAT_R16G16B16_SFLOAT specifies a three-component, 48-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- VK_FORMAT_R16G16B16A16_UNORM specifies a four-component, 64-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- VK_FORMAT_R16G16B16A16_SNORM specifies a four-component, 64-bit signed normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.

- VK_FORMAT_R16G16B16A16_USCALED specifies a four-component, 64-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- VK_FORMAT_R16G16B16A16_SSCALED specifies a four-component, 64-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- VK_FORMAT_R16G16B16A16_UINT specifies a four-component, 64-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- VK_FORMAT_R16G16B16A16_SINT specifies a four-component, 64-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- VK_FORMAT_R16G16B16A16_SFLOAT specifies a four-component, 64-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- VK_FORMAT_R32_UINT specifies a one-component, 32-bit unsigned integer format that has a single 32-bit R component.
- VK_FORMAT_R32_SINT specifies a one-component, 32-bit signed integer format that has a single 32-bit R component.
- VK_FORMAT_R32_SFLOAT specifies a one-component, 32-bit signed floating-point format that has a single 32-bit R component.
- VK_FORMAT_R32G32_UINT specifies a two-component, 64-bit unsigned integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.
- VK_FORMAT_R32G32_SINT specifies a two-component, 64-bit signed integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.
- VK_FORMAT_R32G32_SFLOAT specifies a two-component, 64-bit signed floating-point format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.
- VK_FORMAT_R32G32B32_UINT specifies a three-component, 96-bit unsigned integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.
- VK_FORMAT_R32G32B32_SINT specifies a three-component, 96-bit signed integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.
- VK_FORMAT_R32G32B32_SFLOAT specifies a three-component, 96-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.
- VK_FORMAT_R32G32B32A32_UINT specifies a four-component, 128-bit unsigned integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.
- VK_FORMAT_R32G32B32A32_SINT specifies a four-component, 128-bit signed integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.

- VK_FORMAT_R32G32B32A32_SFLOAT specifies a four-component, 128-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.
- VK_FORMAT_R64_UINT specifies a one-component, 64-bit unsigned integer format that has a single 64-bit R component.
- VK_FORMAT_R64_SINT specifies a one-component, 64-bit signed integer format that has a single 64-bit R component.
- VK_FORMAT_R64_SFLOAT specifies a one-component, 64-bit signed floating-point format that has a single 64-bit R component.
- VK_FORMAT_R64G64_UINT specifies a two-component, 128-bit unsigned integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.
- VK_FORMAT_R64G64_SINT specifies a two-component, 128-bit signed integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.
- VK_FORMAT_R64G64_SFLOAT specifies a two-component, 128-bit signed floating-point format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.
- VK_FORMAT_R64G64B64_UINT specifies a three-component, 192-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.
- VK_FORMAT_R64G64B64_SINT specifies a three-component, 192-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.
- VK_FORMAT_R64G64B64_SFLOAT specifies a three-component, 192-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.
- VK_FORMAT_R64G64B64A64_UINT specifies a four-component, 256-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
- VK_FORMAT_R64G64B64A64_SINT specifies a four-component, 256-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
- VK_FORMAT_R64G64B64A64_SFLOAT specifies a four-component, 256-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
- VK_FORMAT_B10G11R11_UFLOAT_PACK32 specifies a three-component, 32-bit packed unsigned floating-point format that has a 10-bit B component in bits 22..31, an 11-bit G component in bits 11..21, an 11-bit R component in bits 0..10. See Unsigned 10-Bit Floating-Point Numbers and Unsigned 11-Bit Floating-Point Numbers.
- VK_FORMAT_E5B9G9R9_UFLOAT_PACK32 specifies a three-component, 32-bit packed unsigned floating-point format that has a 5-bit shared exponent in bits 27..31, a 9-bit B component mantissa in bits 18..26, a 9-bit G component mantissa in bits 9..17, and a 9-bit R component mantissa in bits 0..8.
- VK_FORMAT_D16_UNORM specifies a one-component, 16-bit unsigned normalized format that has a single 16-bit depth component.

- VK_FORMAT_X8_D24_UNORM_PACK32 specifies a two-component, 32-bit format that has 24 unsigned normalized bits in the depth component and, **optionally**, 8 bits that are unused.
- VK_FORMAT_D32_SFLOAT specifies a one-component, 32-bit signed floating-point format that has 32 bits in the depth component.
- VK_FORMAT_S8_UINT specifies a one-component, 8-bit unsigned integer format that has 8 bits in the stencil component.
- VK_FORMAT_D16_UNORM_S8_UINT specifies a two-component, 24-bit format that has 16 unsigned normalized bits in the depth component and 8 unsigned integer bits in the stencil component.
- VK_FORMAT_D24_UNORM_S8_UINT specifies a two-component, 32-bit packed format that has 8 unsigned integer bits in the stencil component, and 24 unsigned normalized bits in the depth component.
- VK_FORMAT_D32_SFLOAT_S8_UINT specifies a two-component format that has 32 signed float bits in the depth component and 8 unsigned integer bits in the stencil component. There are **optionally** 24 bits that are unused.
- VK_FORMAT_BC1_RGB_UNORM_BLOCK specifies a three-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.
- VK_FORMAT_BC1_RGB_SRGB_BLOCK specifies a three-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.
- VK_FORMAT_BC1_RGBA_UNORM_BLOCK specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data, and provides 1 bit of alpha.
- VK_FORMAT_BC1_RGBA_SRGB_BLOCK specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.
- VK_FORMAT_BC2_UNORM_BLOCK specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.
- VK_FORMAT_BC2_SRGB_BLOCK specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.
- VK_FORMAT_BC3_UNORM_BLOCK specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.
- VK_FORMAT_BC3_SRGB_BLOCK specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.
- VK_FORMAT_BC4_UNORM_BLOCK specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.

- VK_FORMAT_BC4_SNORM_BLOCK specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.
- VK_FORMAT_BC5_UNORM_BLOCK specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- VK_FORMAT_BC5_SNORM_BLOCK specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- VK_FORMAT_BC6H_UFLOAT_BLOCK specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned floating-point RGB texel data.
- VK_FORMAT_BC6H_SFLOAT_BLOCK specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGB texel data.
- VK_FORMAT_BC7_UNORM_BLOCK specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_BC7_SRGB_BLOCK specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.
- VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.
- VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data, and provides 1 bit of alpha.
- VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.
- VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.
- VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding applied.
- VK_FORMAT_EAC_R11_UNORM_BLOCK specifies a one-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.
- VK_FORMAT_EAC_R11_SNORM_BLOCK specifies a one-component, ETC2 compressed format where each

64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.

- VK_FORMAT_EAC_R11G11_UNORM_BLOCK specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- VK_FORMAT_EAC_R11G11_SNORM_BLOCK specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.
- VK_FORMAT_ASTC_4x4_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_4x4_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_5x4_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_5x4_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_5x5_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_5x5_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_6x5_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_6x5_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of signed floating-point RGBA texel

data.

- VK_FORMAT_ASTC_6x6_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_6x6_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_8x5_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×5 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_8x5_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8×5 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_8x6_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×6 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_8x6_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8×6 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_8x8_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_8x8_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8×8 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_10x5_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_10x5_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA

texel data with sRGB nonlinear encoding applied to the RGB components.

- VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_10x6_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_10x6_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_10x8_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_10x8_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_10x10_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_10x10_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_12x10_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_ASTC_12x10_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_ASTC_12x12_UNORM_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA

texel data.

- VK_FORMAT_ASTC_12x12_SRGB_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of signed floating-point RGBA texel data.
- VK_FORMAT_G8B8G8R8_422_UNORM specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each *i* coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit G component for the even *i* coordinate in byte 0, an 8-bit B component in byte 1, an 8-bit G component for the odd *i* coordinate in byte 2, and an 8-bit R component in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- VK_FORMAT_B8G8R8G8_422_UNORM specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each *i* coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit B component in byte 0, an 8-bit G component for the even *i* coordinate in byte 1, an 8-bit R component in byte 2, and an 8-bit G component for the odd *i* coordinate in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width and height that is a multiple of two.
- VK_FORMAT_G8_B8R8_2PLANE_420_UNORM specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width and height that is a multiple of two.
- VK_FORMAT_G8_B8_R8_3PLANE_422_UNORM specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component

in plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width that is a multiple of two.

- VK_FORMAT_G8_B8R8_2PLANE_422_UNORM specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width that is a multiple of two.
- VK_FORMAT_G8_B8_R8_3PLANE_444_UNORM specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane.
- VK_FORMAT_R10X6_UNORM_PACK16 specifies a one-component, 16-bit unsigned normalized format that has a single 10-bit R component in the top 10 bits of a 16-bit word, with the bottom 6 bits unused.
- VK_FORMAT_R10X6G10X6_UNORM_2PACK16 specifies a two-component, 32-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, and a 10-bit G component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused.
- VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16 specifies a four-component, 64-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, a 10-bit G component in the top 10 bits of the word in bytes 2..3, a 10-bit B component in the top 10 bits of the word in bytes 4..5, and a 10-bit A component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused.
- VK_FORMAT_G10X6B10X6G10X6R10X6_422_UNORM_4PACK16 specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 0..1, a 10-bit B component in the top 10 bits of the word in bytes 2..3, a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 4..5, and a 10-bit R component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- VK_FORMAT_B10X6G10X6R10X6G10X6_422_UNORM_4PACK16 specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a

2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit B component in the top 10 bits of the word in bytes 0..1, a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 2..3, a 10-bit R component in the top 10 bits of the word in bytes 4..5, and a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width and height that is a multiple of two.
- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width and height that is a multiple of two.
- VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_422_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width that is a multiple of two.
- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_422_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for

which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width that is a multiple of two.

- VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_444_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane.
- VK_FORMAT_R12X4_UNORM_PACK16 specifies a one-component, 16-bit unsigned normalized format that has a single 12-bit R component in the top 12 bits of a 16-bit word, with the bottom 4 bits unused.
- VK_FORMAT_R12X4G12X4_UNORM_2PACK16 specifies a two-component, 32-bit unsigned normalized format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, and a 12-bit G component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused.
- VK_FORMAT_R12X4G12X4B12X4A12X4_UNORM_4PACK16 specifies a four-component, 64-bit unsigned normalized format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, a 12-bit G component in the top 12 bits of the word in bytes 2..3, a 12-bit B component in the top 12 bits of the word in bytes 4..5, and a 12-bit A component in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused.
- VK_FORMAT_G12X4B12X4G12X4R12X4_422_UNORM_4PACK16 specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 12-bit G component for the even i coordinate in the top 12 bits of the word in bytes 0..1, a 12-bit B component in the top 12 bits of the word in bytes 2..3, a 12-bit G component for the odd i coordinate in the top 12 bits of the word in bytes 4..5, and a 12-bit R component in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- VK_FORMAT_B12X4G12X4R12X4G12X4_422_UNORM_4PACK16 specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 12-bit B component in the top 12 bits of the word in bytes 0..1, a 12-bit G component for the even i coordinate in the top 12 bits of the word in bytes 2..3, a 12-bit R component in the top 12 bits of the word in bytes 4..5, and a 12-bit G component for the odd i coordinate in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed

format with a 2×1 compressed texel block.

- VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_420_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width and height that is a multiple of two.
- VK_FORMAT_G12X4_B12X4R12X4_2PLANE_420_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width and height that is a multiple of two.
- VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_422_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width that is a multiple of two.
- VK_FORMAT_G12X4_B12X4R12X4_2PLANE_422_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width that is a multiple of two.
- VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_444_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. Each

plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane.

- VK_FORMAT_G16B16G16R16_422_UNORM specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each *i* coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 16-bit G component for the even *i* coordinate in the word in bytes 0..1, a 16-bit B component in the word in bytes 2..3, a 16-bit G component for the odd *i* coordinate in the word in bytes 4..5, and a 16-bit R component in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- VK_FORMAT_B16G16R16G16_422_UNORM specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each *i* coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 16-bit B component in the word in bytes 0..1, a 16-bit G component for the even *i* coordinate in the word in bytes 2..3, a 16-bit R component in the word in bytes 4..5, and a 16-bit G component for the odd *i* coordinate in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
- VK_FORMAT_G16_B16_R16_3PLANE_420_UNORM specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width and height that is a multiple of two.
- VK_FORMAT_G16_B16R16_2PLANE_420_UNORM specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width and height that is a multiple of two.
- VK_FORMAT_G16_B16_R16_3PLANE_422_UNORM specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using

VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width that is a multiple of two.

- VK_FORMAT_G16_B16R16_2PLANE_422_UNORM specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width that is a multiple of two.
- VK_FORMAT_G16_B16_R16_3PLANE_444_UNORM specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane.
- VK_FORMAT_G8_B8R8_2PLANE_444_UNORM specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane.
- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, the bottom 6 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane.
- VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16 specifies an unsigned normalized *multi-planar format* that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, the bottom 4 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane.
- VK_FORMAT_G16_B16R16_2PLANE_444_UNORM specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in

the word in bytes 2..3. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane.

- VK_FORMAT_PVRTC1_2BPP_UNORM_BLOCK_IMG specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_PVRTC1_4BPP_UNORM_BLOCK_IMG specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_PVRTC2_2BPP_UNORM_BLOCK_IMG specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_PVRTC2_4BPP_UNORM_BLOCK_IMG specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
- VK_FORMAT_PVRTC1_2BPP_SRGB_BLOCK_IMG specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_PVRTC1_4BPP_SRGB_BLOCK_IMG specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_PVRTC2_2BPP_SRGB_BLOCK_IMG specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_PVRTC2_4BPP_SRGB_BLOCK_IMG specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.
- VK_FORMAT_R16G16_SFIXED5_NV specifies a two-component, 16-bit signed fixed-point format with linear encoding. The components are signed two's-complement integers where the most significant bit specifies the sign bit, the next 10 bits specify the integer value, and the last 5 bits represent the fractional value. The signed 16-bit values **can** be converted to floats in the range [-1024,1023.96875] by dividing the value by 32 (2^5).

48.1.1. Compatible Formats of Planes of Multi-Planar Formats

Individual planes of multi-planar formats are size-compatible with single-plane color formats if they occupy the same number of bits per texel block, and are compatible with those formats if they have the same block extent.

In the following table, individual planes of a *multi-planar* format are compatible with the format listed against the relevant plane index for that multi-planar format, and any format compatible with the listed single-plane format according to Format Compatibility Classes. These planes are also size-compatible with any format that is size-compatible with the listed single-plane format.

Table 70. Plane Format Compatibility Table

Plane	Compatible format for plane	Width relative to the width *w* of the plane with the largest dimensions	Height relative to the height *h* of the plane with the largest dimensions
VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8_UNORM	w/2	h/2
2	VK_FORMAT_R8_UNORM	w/2	h/2
VK_FORMAT_G8_B8R8_2PLANE_420_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8G8_UNORM	w/2	h/2
VK_FORMAT_G8_B8_R8_3PLANE_422_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8_UNORM	w/2	h
2	VK_FORMAT_R8_UNORM	w/2	h
VK_FORMAT_G8_B8R8_2PLANE_422_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8G8_UNORM	w/2	h
VK_FORMAT_G8_B8_R8_3PLANE_444_UNORM			
0	VK_FORMAT_R8_UNORM	w	h
1	VK_FORMAT_R8_UNORM	w	h
2	VK_FORMAT_R8_UNORM	w	h
VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16

48.1.2. Multi-planar Format Image Aspect

When using VkImageAspectFlagBits to select a plane of a multi-planar format, the following are the valid options:

- Two planes
  - VK_IMAGE_ASPECT_PLANE_0_BIT
  - VK_IMAGE_ASPECT_PLANE_1_BIT
- Three planes
  - VK_IMAGE_ASPECT_PLANE_0_BIT
  - VK_IMAGE_ASPECT_PLANE_1_BIT
  - VK_IMAGE_ASPECT_PLANE_2_BIT

48.1.3. Packed Formats

For the purposes of address alignment when accessing buffer memory containing vertex attribute or texel data, the following formats are considered *packed* - components of the texels or attributes are stored in bitfields packed into one or more 8-, 16-, or 32-bit fundamental data type.

- Packed into 8-bit data types:
  - VK_FORMAT_R4G4_UNORM_PACK8
- Packed into 16-bit data types:
  - VK_FORMAT_R4G4B4A4_UNORM_PACK16
  - VK_FORMAT_B4G4R4A4_UNORM_PACK16
  - VK_FORMAT_R5G6B5_UNORM_PACK16
  - VK_FORMAT_B5G6R5_UNORM_PACK16
  - VK_FORMAT_R5G5B5A1_UNORM_PACK16
  - VK_FORMAT_B5G5R5A1_UNORM_PACK16
  - VK_FORMAT_A1R5G5B5_UNORM_PACK16
  - VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR
  - VK_FORMAT_R10X6_UNORM_PACK16
  - VK_FORMAT_R10X6G10X6_UNORM_2PACK16
  - VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16
  - VK_FORMAT_G10X6B10X6G10X6R10X6_422_UNORM_4PACK16
  - VK_FORMAT_B10X6G10X6R10X6G10X6_422_UNORM_4PACK16
  - VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16
  - VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PACK16
  - VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_422_UNORM_3PACK16
  - VK_FORMAT_G10X6_B10X6R10X6_2PLANE_422_UNORM_3PACK16
  - VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_444_UNORM_3PACK16
  - VK_FORMAT_R12X4_UNORM_PACK16
  - VK_FORMAT_R12X4G12X4_UNORM_2PACK16
  - VK_FORMAT_R12X4G12X4B12X4A12X4_UNORM_4PACK16
  - VK_FORMAT_G12X4B12X4G12X4R12X4_422_UNORM_4PACK16
  - VK_FORMAT_B12X4G12X4R12X4G12X4_422_UNORM_4PACK16
  - VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_420_UNORM_3PACK16
  - VK_FORMAT_G12X4_B12X4R12X4_2PLANE_420_UNORM_3PACK16
  - VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_422_UNORM_3PACK16
  - VK_FORMAT_G12X4_B12X4R12X4_2PLANE_422_UNORM_3PACK16
  - VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_444_UNORM_3PACK16

- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16
- VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16
- VK_FORMAT_A4R4G4B4_UNORM_PACK16
- VK_FORMAT_A4B4G4R4_UNORM_PACK16

- Packed into 32-bit data types:
  - VK_FORMAT_A8B8G8R8_UNORM_PACK32
  - VK_FORMAT_A8B8G8R8_SNORM_PACK32
  - VK_FORMAT_A8B8G8R8_USCALED_PACK32
  - VK_FORMAT_A8B8G8R8_SSCALED_PACK32
  - VK_FORMAT_A8B8G8R8_UINT_PACK32
  - VK_FORMAT_A8B8G8R8_SINT_PACK32
  - VK_FORMAT_A8B8G8R8_SRGB_PACK32
  - VK_FORMAT_A2R10G10B10_UNORM_PACK32
  - VK_FORMAT_A2R10G10B10_SNORM_PACK32
  - VK_FORMAT_A2R10G10B10_USCALED_PACK32
  - VK_FORMAT_A2R10G10B10_SSCALED_PACK32

  - VK_FORMAT_E5B9G9R9_UFLOAT_PACK32
  - VK_FORMAT_X8_D24_UNORM_PACK32

48.1.4. Identification of Formats

A “format” is represented by a single enum value. The name of a format is usually built up by using the following pattern:

```
VK_FORMAT_{component-format|compression-scheme}_{numeric-format}
```

The component-format indicates either the size of the R, G, B, and A components (if they are present) in the case of a color format, or the size of the depth (D) and stencil (S) components (if they

are present) in the case of a depth/stencil format (see below). An X indicates a component that is unused, but **may** be present for padding.

Table 71. Interpretation of Numeric Format

Numeric format	Type-Declaration instructions	Numeric type	Description
`UNORM`	OpTypeFloat	floating-point	The components are unsigned normalized values in the range [0,1]
`SNORM`	OpTypeFloat	floating-point	The components are signed normalized values in the range [-1,1]
`USCALED`	OpTypeFloat	floating-point	The components are unsigned integer values that get converted to floating-point in the range [0,2^n-1]
`SSCALED`	OpTypeFloat	floating-point	The components are signed integer values that get converted to floating-point in the range [-2^{n-1},2^{n-1}-1]
`UINT`	OpTypeInt	unsigned integer	The components are unsigned integer values in the range [0,2^n-1]
`SINT`	OpTypeInt	signed integer	The components are signed integer values in the range [-2^{n-1},2^{n-1}-1]
`UFLOAT`	OpTypeFloat	floating-point	The components are unsigned floating-point numbers (used by packed, shared exponent, and some compressed formats)
`SFLOAT`	OpTypeFloat	floating-point	The components are signed floating-point numbers
`SRGB`	OpTypeFloat	floating-point	The R, G, and B components are unsigned normalized values that represent values using sRGB nonlinear encoding, while the A component (if one exists) is a regular unsigned normalized value
`SFIXED5`	OpTypeInt	scaled signed integer	The components are signed fractional integer values that get converted to floating-point in the range [-1024,1023.96875]
n is the number of bits in the component.			

The suffix `_PACKnn` indicates that the format is packed into an underlying type with `nn` bits. The suffix `_mPACKnn` is a short-hand that indicates that the format has `m` groups of components (which may or may not be stored in separate *planes*) that are each packed into an underlying type with `nn` bits.

The suffix `_BLOCK` indicates that the format is a block-compressed format, with the representation of multiple pixels encoded interdependently within a region.

Table 72. Interpretation of Compression Scheme

Compression scheme	Description
`BC`	Block Compression. See Block-Compressed Image Formats.

Compression scheme	Description
ETC2	Ericsson Texture Compression. See ETC Compressed Image Formats.
EAC	ETC2 Alpha Compression. See ETC Compressed Image Formats.
ASTC	Adaptive Scalable Texture Compression (LDR Profile). See ASTC Compressed Image Formats.

For *multi-planar* images, the components in separate *planes* are separated by underscores, and the number of planes is indicated by the addition of a _2PLANE or _3PLANE suffix. Similarly, the separate aspects of depth-stencil formats are separated by underscores, although these are not considered separate planes. Formats are suffixed by _422 to indicate that planes other than the first are reduced in size by a factor of two horizontally or that the R and B values appear at half the horizontal frequency of the G values, _420 to indicate that planes other than the first are reduced in size by a factor of two both horizontally and vertically, and _444 for consistency to indicate that all three planes of a three-planar image are the same size.

NOTE	No common format has a single plane containing both R and B components but does not store these components at reduced horizontal resolution.

48.1.5. Representation and Texel Block Size

Color formats **must** be represented in memory in exactly the form indicated by the format's name. This means that promoting one format to another with more bits per component and/or additional components **must** not occur for color formats. Depth/stencil formats have more relaxed requirements as discussed below.

Each format has a *texel block size*, the number of bytes used to store one *texel block* (a single addressable element of an uncompressed image, or a single compressed block of a compressed image). The texel block size for each format is shown in the Compatible formats table.

The representation of non-packed formats is that the first component specified in the name of the format is in the lowest memory addresses and the last component specified is in the highest memory addresses. See Byte mappings for non-packed/compressed color formats. The in-memory ordering of bytes within a component is determined by the host endianness.

Table 73. Byte Mappings for Non-Packed/Compressed Color Formats

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	← Byte
R																VK_FORMAT_R8_*
R	G															VK_FORMAT_R8G8_*

B	G	R														VK_FORMAT_B8G8R8_*
R	G	B	A													VK_FORMAT_R8G8B8A8_*
B	G	R	A													VK_FORMAT_B8G8R8A8_*
A																VK_FORMAT_A8_UNORM_KHR

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	← Byte
G_0	B	G_1	R													VK_FORMAT_G8B8G8R8_422_UNORM
B	G_0	R	G_1													VK_FORMAT_B8G8R8G8_422_UNORM
R																VK_FORMAT_R16_*
R		G														VK_FORMAT_R16G16_*
R		G		B												VK_FORMAT_R16G16B16_*
R		G		B		A										VK_FORMAT_R16G16B16A16_*
G_0		B		G_1		R										VK_FORMAT_G10X6B10X6G10X6R10X6_4PACK16_422_UNORM VK_FORMAT_G12X4B12X4G12X4R12X4_4PACK16_422_UNORM VK_FORMAT_G16B16G16R16_UNORM
B		G_0		R		G_1										VK_FORMAT_B10X6G10X6R10X6G10X6_4PACK16_422_UNORM VK_FORMAT_B12X4G12X4R12X4G12X4_4PACK16_422_UNORM VK_FORMAT_B16G16R16G16_422_UNORM
R																VK_FORMAT_R32_*
R				G												VK_FORMAT_R32G32_*
R				G				B								VK_FORMAT_R32G32B32_*
R				G				B				A				VK_FORMAT_R32G32B32A32_*
R																VK_FORMAT_R64_*
R								G								VK_FORMAT_R64G64_*
VK_FORMAT_R64G64B64_* **as** VK_FORMAT_R64G64_* **but with B in bytes 16-23**																
VK_FORMAT_R64G64B64A64_* **as** VK_FORMAT_R64G64B64_* **but with A in bytes 24-31**																

Packed formats store multiple components within one underlying type. The bit representation is that the first component specified in the name of the format is in the most-significant bits and the last component specified is in the least-significant bits of the underlying type. The in-memory ordering of bytes comprising the underlying type is determined by the host endianness.

48.1.6. Depth/Stencil Formats

Depth/stencil formats are considered opaque and need not be stored in the exact number of bits per texel or component ordering indicated by the format enum. However, implementations **must** not substitute a different depth or stencil precision than is described in the format (e.g. D16 **must** not be implemented as D24 or D32).

48.1.7. Format Compatibility Classes

Uncompressed color formats are *compatible* with each other if they occupy the same number of bits per texel block as long as neither or both are alpha formats (e.g., VK_FORMAT_A8_UNORM_KHR) . Compressed color formats are compatible with each other if the only difference between them is the numeric format of the uncompressed pixels. Each depth/stencil format is only compatible with itself. In the following table, all the formats in the same row are compatible. Each format has a defined *texel block extent* specifying how many texels each texel block represents in each dimension.

Table 77. Compatible Formats

Class, Texel Block Size, Texel Block Extent, # Texels/Block	**Formats**
8-bit Block size 1 byte 1x1x1 block extent 1 texel/block	VK_FORMAT_R4G4_UNORM_PACK8, VK_FORMAT_R8_UNORM, VK_FORMAT_R8_SNORM, VK_FORMAT_R8_USCALED, VK_FORMAT_R8_SSCALED, VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R8_SRGB

Size Compatibility

Color formats with the same texel block size are considered *size-compatible* as long as neither or both are alpha formats (e.g., VK_FORMAT_A8_UNORM_KHR). If two size-compatible formats have different block extents (i.e. for compressed formats), then an image with size A × B × C in one format with a block extent of a × b × c can be represented as an image with size X × Y × Z in the other format with block extent x × y × z at the ratio between the block extents for each format, where

$$\lceil A/a \rceil = \lceil X/x \rceil$$

$$\lceil B/b \rceil = \lceil Y/y \rceil$$

$$\lceil C/c \rceil = \lceil Z/z \rceil$$

NOTE For example, a 7x3 image in the VK_FORMAT_ASTC_8x5_UNORM_BLOCK format can be represented as a 1x1 VK_FORMAT_R64G64_UINT image.

Images created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag can have size-compatible views created from them to enable access via different size-compatible formats. Image views created in this way will be sized to match the expectations of the block extents noted above.

Copy operations are able to copy between size-compatible formats in different resources to enable manipulation of data in different formats. The extent used in these copy operations always matches the source image, and is resized to the expectations of the block extents noted above for the destination image.

48.2. Format Properties

To query supported format features which are properties of the physical device, call:

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFormatProperties(
    VkPhysicalDevice                            physicalDevice,
    VkFormat                                    format,
    VkFormatProperties*                         pFormatProperties);
```

- `physicalDevice` is the physical device from which to query the format properties.
- `format` is the format whose properties are queried.
- `pFormatProperties` is a pointer to a VkFormatProperties structure in which physical device properties for `format` are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceFormatProperties-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-vkGetPhysicalDeviceFormatProperties-pFormatProperties-parameter
  `pFormatProperties` **must** be a valid pointer to a VkFormatProperties structure

The `VkFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkFormatProperties {
    VkFormatFeatureFlags    linearTilingFeatures;
    VkFormatFeatureFlags    optimalTilingFeatures;
    VkFormatFeatureFlags    bufferFeatures;
} VkFormatProperties;
```

- `linearTilingFeatures` is a bitmask of VkFormatFeatureFlagBits specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_LINEAR`.
- `optimalTilingFeatures` is a bitmask of VkFormatFeatureFlagBits specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_OPTIMAL`.
- `bufferFeatures` is a bitmask of VkFormatFeatureFlagBits specifying features supported by buffers.

NOTE	If no format feature flags are supported, the format itself is not supported, and images of that format cannot be created.

If `format` is a block-compressed format, then `bufferFeatures` **must** not support any features for the format.

If `format` is not a multi-plane format then `linearTilingFeatures` and `optimalTilingFeatures` **must** not

contain VK_FORMAT_FEATURE_DISJOINT_BIT.

Bits which **can** be set in the VkFormatProperties features linearTilingFeatures, optimalTilingFeatures, VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures, and bufferFeatures are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFormatFeatureFlagBits {
    VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT = 0x00000001,

    VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT_KHR =
VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT_KHR =
VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT,
  // Provided by VK_KHR_sampler_ycbcr_conversion

VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT_KH
R =
VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT,
  // Provided by VK_KHR_sampler_ycbcr_conversion

VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT_KH
R =
VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT,
  // Provided by VK_KHR_sampler_ycbcr_conversion

VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEA
BLE_BIT_KHR =
VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEA
BLE_BIT,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_FORMAT_FEATURE_DISJOINT_BIT_KHR = VK_FORMAT_FEATURE_DISJOINT_BIT,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT_KHR =
VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT,
} VkFormatFeatureFlagBits;
```

These values all have the same meaning as the equivalently named values for VkFormatFeatureFlags2 and **may** be set in `linearTilingFeatures`, `optimalTilingFeatures`, and VkDrmFormatModifierPropertiesEXT::`drmFormatModifierTilingFeatures`, specifying that the features are supported by images or image views or sampler $Y'C_BC_R$ conversion objects created with the queried vkGetPhysicalDeviceFormatProperties::`format`:

- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` specifies that an image view **can** be sampled from.
- `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` specifies that an image view **can** be used as a storage image.
- `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT` specifies that an image view **can** be used as storage image that supports atomic operations.
- `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` specifies that an image view **can** be used as a framebuffer color attachment and as an input attachment.
- `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT` specifies that an image view **can** be used as a framebuffer color attachment that supports blending.
- `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT` specifies that an image view **can** be used as a framebuffer depth/stencil attachment and as an input attachment.
- `VK_FORMAT_FEATURE_BLIT_SRC_BIT` specifies that an image **can** be used as `srcImage` for the `vkCmdBlitImage2KHR` and `vkCmdBlitImage` commands.
- `VK_FORMAT_FEATURE_BLIT_DST_BIT` specifies that an image **can** be used as `dstImage` for the `vkCmdBlitImage2KHR` and `vkCmdBlitImage` commands.
- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` specifies that if `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` is also set, an image view **can** be used with a sampler that has either of `magFilter` or `minFilter` set to `VK_FILTER_LINEAR`, or `mipmapMode` set to `VK_SAMPLER_MIPMAP_MODE_LINEAR`. If `VK_FORMAT_FEATURE_BLIT_SRC_BIT` is also set, an image can be used as the `srcImage` to `vkCmdBlitImage2KHR` and `vkCmdBlitImage` with a `filter` of `VK_FILTER_LINEAR`. This bit **must** only be exposed for formats that also support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` or `VK_FORMAT_FEATURE_BLIT_SRC_BIT`.

  If the format being queried is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports linear filtering, and that linear filtering of the depth aspect is supported whether depth compare is enabled in the sampler or not. Where depth comparison is supported it **may** be linear filtered whether this bit is present or not, but where this bit is not present the filtered value **may** be computed in an implementation-dependent manner which differs from the normal rules of linear filtering. The resulting value **must** be in the range [0,1] and **should** be proportional to, or a weighted average of, the number of comparison passes or failures.

- `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` specifies that an image **can** be used as a source image for copy commands. If the application `apiVersion` is Vulkan 1.0 and `VK_KHR_maintenance1` is not supported, `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` is implied to be set when the format feature flag is not 0.
- `VK_FORMAT_FEATURE_TRANSFER_DST_BIT` specifies that an image **can** be used as a destination image for copy commands and clear commands. If the application `apiVersion` is Vulkan 1.0 and `VK_KHR_maintenance1` is not supported, `VK_FORMAT_FEATURE_TRANSFER_DST_BIT` is implied to be set

when the format feature flag is not 0.

- VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT specifies VkImage **can** be used as a sampled image with a min or max VkSamplerReductionMode. This bit **must** only be exposed for formats that also support the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.
- VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT specifies that VkImage **can** be used with a sampler that has either of magFilter or minFilter set to VK_FILTER_CUBIC_EXT, or be the source image for a blit with filter set to VK_FILTER_CUBIC_EXT. This bit **must** only be exposed for formats that also support the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT. If the format being queried is a depth/stencil format, this only specifies that the depth aspect is cubic filterable.
- VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT specifies that an application **can** define a sampler $Y'C_BC_R$ conversion using this format as a source, and that an image of this format **can** be used with a VkSamplerYcbcrConversionCreateInfo xChromaOffset and/or yChromaOffset of VK_CHROMA_LOCATION_MIDPOINT. Otherwise both xChromaOffset and yChromaOffset **must** be VK_CHROMA_LOCATION_COSITED_EVEN. If a format does not incorporate chroma downsampling (it is not a “422” or “420” format) but the implementation supports sampler $Y'C_BC_R$ conversion for this format, the implementation **must** set VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT.
- VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT specifies that an application **can** define a sampler $Y'C_BC_R$ conversion using this format as a source, and that an image of this format **can** be used with a VkSamplerYcbcrConversionCreateInfo xChromaOffset and/or yChromaOffset of VK_CHROMA_LOCATION_COSITED_EVEN. Otherwise both xChromaOffset and yChromaOffset **must** be VK_CHROMA_LOCATION_MIDPOINT. If neither VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT nor VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT is set, the application **must** not define a sampler $Y'C_BC_R$ conversion using this format as a source.
- VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT specifies that an application **can** define a sampler $Y'C_BC_R$ conversion using this format as a source with chromaFilter set to VK_FILTER_LINEAR.
- VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT specifies that the format can have different chroma, min, and mag filters.
- VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT specifies that reconstruction is explicit, as described in Chroma Reconstruction. If this bit is not present, reconstruction is implicit by default.
- VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT specifies that reconstruction **can** be forcibly made explicit by setting VkSamplerYcbcrConversionCreateInfo::forceExplicitReconstruction to VK_TRUE. If the format being queried supports VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT it **must** also support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT.
- VK_FORMAT_FEATURE_DISJOINT_BIT specifies that a multi-planar image **can** have the VK_IMAGE_CREATE_DISJOINT_BIT set during image creation. An implementation **must** not set VK_FORMAT_FEATURE_DISJOINT_BIT for *single-plane formats*.
- VK_FORMAT_FEATURE_FRAGMENT_DENSITY_MAP_BIT_EXT specifies that an image view **can** be used as a fragment density map attachment.

- VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies that an image view **can** be used as a fragment shading rate attachment. An implementation **must** not set this feature for formats with a numeric format other than UINT, or set it as a buffer feature.
- VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR specifies that an image view with this format **can** be used as a decode output picture in video decode operations.
- VK_FORMAT_FEATURE_VIDEO_DECODE_DPB_BIT_KHR specifies that an image view with this format **can** be used as an output reconstructed picture or an input reference picture in video decode operations.
- VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR specifies that an image view with this format **can** be used as an encode input picture in video encode operations.
- VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR specifies that an image view with this format **can** be used as an output reconstructed picture or an input reference picture in video encode operations.

NOTE

Specific video profiles **may** have additional restrictions on the format and other image creation parameters corresponding to image views used by video coding operations that **can** be enumerated using the vkGetPhysicalDeviceVideoFormatPropertiesKHR command.

The following bits **may** be set in bufferFeatures, specifying that the features are supported by buffers or buffer views created with the queried vkGetPhysicalDeviceFormatProperties::format:

- VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT specifies that the format **can** be used to create a buffer view that **can** be bound to a VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER descriptor.
- VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT specifies that the format **can** be used to create a buffer view that **can** be bound to a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor.
- VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT specifies that atomic operations are supported on VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER with this format.
- VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT specifies that the format **can** be used as a vertex attribute format (VkVertexInputAttributeDescription::format).
- VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR specifies that the format **can** be used as the vertex format when creating an acceleration structure (VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat). This format **can** also be used as the vertex format in host memory when doing host acceleration structure builds.

NOTE

VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT and VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT are only intended to be advertised for single-component formats, since SPIR-V atomic operations require a scalar type.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFormatFeatureFlags;
```

VkFormatFeatureFlags is a bitmask type for setting a mask of zero or more VkFormatFeatureFlagBits.

To query supported format features which are properties of the physical device, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceFormatProperties2(
    VkPhysicalDevice                            physicalDevice,
    VkFormat                                    format,
    VkFormatProperties2*                        pFormatProperties);
```

or the equivalent command

```
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceFormatProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    VkFormat                                    format,
    VkFormatProperties2*                        pFormatProperties);
```

- `physicalDevice` is the physical device from which to query the format properties.
- `format` is the format whose properties are queried.
- `pFormatProperties` is a pointer to a VkFormatProperties2 structure in which physical device properties for `format` are returned.

`vkGetPhysicalDeviceFormatProperties2` behaves similarly to vkGetPhysicalDeviceFormatProperties, with the ability to return extended information in a `pNext` chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties2-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceFormatProperties2-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-vkGetPhysicalDeviceFormatProperties2-pFormatProperties-parameter
  `pFormatProperties` **must** be a valid pointer to a VkFormatProperties2 structure

The `VkFormatProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkFormatProperties2 {
    VkStructureType       sType;
    void*                 pNext;
    VkFormatProperties    formatProperties;
} VkFormatProperties2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkFormatProperties2 VkFormatProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `formatProperties` is a VkFormatProperties structure describing features supported by the requested format.

Valid Usage (Implicit)

- VUID-VkFormatProperties2-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_2`
- VUID-VkFormatProperties2-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkDrmFormatModifierPropertiesList2EXT, VkDrmFormatModifierPropertiesListEXT, VkFormatProperties3, or VkSubpassResolvePerformanceQueryEXT
- VUID-VkFormatProperties2-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique

To obtain the list of Linux DRM format modifiers compatible with a VkFormat, add a VkDrmFormatModifierPropertiesListEXT structure to the `pNext` chain of VkFormatProperties2.

The VkDrmFormatModifierPropertiesListEXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesListEXT {
    VkStructureType                      sType;
    void*                                pNext;
    uint32_t                             drmFormatModifierCount;
    VkDrmFormatModifierPropertiesEXT*    pDrmFormatModifierProperties;
} VkDrmFormatModifierPropertiesListEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifierCount` is an inout parameter related to the number of modifiers compatible with the `format`, as described below.
- `pDrmFormatModifierProperties` is either `NULL` or a pointer to an array of VkDrmFormatModifierPropertiesEXT structures.

If `pDrmFormatModifierProperties` is `NULL`, then the function returns in `drmFormatModifierCount` the number of modifiers compatible with the queried `format`. Otherwise, the application **must** set `drmFormatModifierCount` to the length of the array `pDrmFormatModifierProperties`; the function will

write at most drmFormatModifierCount elements to the array, and will return in drmFormatModifierCount the number of elements written.

Among the elements in array pDrmFormatModifierProperties, each returned drmFormatModifier **must** be unique.

Valid Usage (Implicit)

- VUID-VkDrmFormatModifierPropertiesListEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_EXT

The VkDrmFormatModifierPropertiesEXT structure describes properties of a VkFormat when that format is combined with a Linux DRM format modifier. These properties, like those of VkFormatProperties2, are independent of any particular image.

The VkDrmFormatModifierPropertiesEXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesEXT {
    uint64_t                drmFormatModifier;
    uint32_t                drmFormatModifierPlaneCount;
    VkFormatFeatureFlags    drmFormatModifierTilingFeatures;
} VkDrmFormatModifierPropertiesEXT;
```

- drmFormatModifier is a *Linux DRM format modifier*.
- drmFormatModifierPlaneCount is the number of *memory planes* in any image created with format and drmFormatModifier. An image's *memory planecount* is distinct from its *format planecount*, as explained below.
- drmFormatModifierTilingFeatures is a bitmask of VkFormatFeatureFlagBits that are supported by any image created with format and drmFormatModifier.

The returned drmFormatModifierTilingFeatures **must** contain at least one bit.

The implementation **must** not return DRM_FORMAT_MOD_INVALID in drmFormatModifier.

An image's *memory planecount* (as returned by drmFormatModifierPlaneCount) is distinct from its *format planecount* (in the sense of multi-planar $Y'C_BC_R$ formats). In VkImageAspectFlags, each VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT represents a *memory plane* and each VK_IMAGE_ASPECT_PLANE_i_BIT a *format plane*.

An image's set of *format planes* is an ordered partition of the image's **content** into separable groups of format components. The ordered partition is encoded in the name of each VkFormat. For example, VK_FORMAT_G8_B8R8_2PLANE_420_UNORM contains two *format planes*; the first plane contains the green component and the second plane contains the blue component and red component. If the format name does not contain PLANE, then the format contains a single plane; for example, VK_FORMAT_R8G8B8A8_UNORM. Some commands, such as vkCmdCopyBufferToImage, do not operate on all format components in the image, but instead operate only on the *format planes* explicitly chosen

by the application and operate on each *format plane* independently.

An image's set of *memory planes* is an ordered partition of the image's **memory** rather than the image's **content**. Each *memory plane* is a contiguous range of memory. The union of an image's *memory planes* is not necessarily contiguous.

If an image is linear, then the partition is the same for *memory planes* and for *format planes*. Therefore, if the returned `drmFormatModifier` is `DRM_FORMAT_MOD_LINEAR`, then `drmFormatModifierPlaneCount` **must** equal the *format planecount*, and `drmFormatModifierTilingFeatures` **must** be identical to the VkFormatProperties2 ::`linearTilingFeatures` returned in the same `pNext` chain.

If an image is non-linear, then the partition of the image's **memory** into *memory planes* is implementation-specific and **may** be unrelated to the partition of the image's **content** into *format planes*. For example, consider an image whose `format` is `VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM`, `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, whose `drmFormatModifier` is not `DRM_FORMAT_MOD_LINEAR`, and `flags` lacks `VK_IMAGE_CREATE_DISJOINT_BIT`. The image has 3 *format planes*, and commands such vkCmdCopyBufferToImage act on each *format plane* independently as if the data of each *format plane* were separable from the data of the other planes. In a straightforward implementation, the implementation **may** store the image's content in 3 adjacent *memory planes* where each *memory plane* corresponds exactly to a *format plane*. However, the implementation **may** also store the image's content in a single *memory plane* where all format components are combined using an implementation-private block-compressed format; or the implementation **may** store the image's content in a collection of 7 adjacent *memory planes* using an implementation-private sharding technique. Because the image is non-linear and non-disjoint, the implementation has much freedom when choosing the image's placement in memory.

The *memory planecount* applies to function parameters and structures only when the API specifies an explicit requirement on `drmFormatModifierPlaneCount`. In all other cases, the *memory planecount* is ignored.

The list of Linux DRM format modifiers compatible with a VkFormat **can** be obtained by adding a VkDrmFormatModifierPropertiesList2EXT structure to the `pNext` chain of VkFormatProperties2.

The VkDrmFormatModifierPropertiesList2EXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier with VK_KHR_format_feature_flags2 or
VK_VERSION_1_3
typedef struct VkDrmFormatModifierPropertiesList2EXT {
    VkStructureType                        sType;
    void*                                  pNext;
    uint32_t                               drmFormatModifierCount;
    VkDrmFormatModifierProperties2EXT*     pDrmFormatModifierProperties;
} VkDrmFormatModifierPropertiesList2EXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifierCount` is an inout parameter related to the number of modifiers compatible

with the format, as described below.

- pDrmFormatModifierProperties is either NULL or a pointer to an array of VkDrmFormatModifierProperties2EXT structures.

If pDrmFormatModifierProperties is NULL, the number of modifiers compatible with the queried format is returned in drmFormatModifierCount. Otherwise, the application **must** set drmFormatModifierCount to the length of the array pDrmFormatModifierProperties; the function will write at most drmFormatModifierCount elements to the array, and will return in drmFormatModifierCount the number of elements written.

Among the elements in array pDrmFormatModifierProperties, each returned drmFormatModifier **must** be unique.

Among the elements in array pDrmFormatModifierProperties, the bits reported in drmFormatModifierTilingFeatures **must** include the bits reported in the corresponding element of VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties.

Valid Usage (Implicit)

- VUID-VkDrmFormatModifierPropertiesList2EXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_2_EXT

The VkDrmFormatModifierProperties2EXT structure describes properties of a VkFormat when that format is combined with a Linux DRM format modifier. These properties, like those of VkFormatProperties2, are independent of any particular image.

The VkDrmFormatModifierPropertiesEXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier with VK_KHR_format_feature_flags2 or
VK_VERSION_1_3
typedef struct VkDrmFormatModifierProperties2EXT {
    uint64_t                drmFormatModifier;
    uint32_t                drmFormatModifierPlaneCount;
    VkFormatFeatureFlags2   drmFormatModifierTilingFeatures;
} VkDrmFormatModifierProperties2EXT;
```

- drmFormatModifier is a *Linux DRM format modifier*.
- drmFormatModifierPlaneCount is the number of *memory planes* in any image created with format and drmFormatModifier. An image's *memory planecount* is distinct from its *format planecount*, as explained below.
- drmFormatModifierTilingFeatures is a bitmask of VkFormatFeatureFlagBits2 that are supported by any image created with format and drmFormatModifier.

To query supported format extended features which are properties of the physical device, add VkFormatProperties3 structure to the pNext chain of VkFormatProperties2.

The VkFormatProperties3 structure is defined as:

```
typedef struct VkFormatProperties3 {
    VkStructureType          sType;
    void*                    pNext;
    VkFormatFeatureFlags2    linearTilingFeatures;
    VkFormatFeatureFlags2    optimalTilingFeatures;
    VkFormatFeatureFlags2    bufferFeatures;
} VkFormatProperties3;
```

or the equivalent

```
// Provided by VK_KHR_format_feature_flags2
typedef VkFormatProperties3 VkFormatProperties3KHR;
```

- `linearTilingFeatures` is a bitmask of VkFormatFeatureFlagBits2 specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_LINEAR`.
- `optimalTilingFeatures` is a bitmask of VkFormatFeatureFlagBits2 specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_OPTIMAL`.
- `bufferFeatures` is a bitmask of VkFormatFeatureFlagBits2 specifying features supported by buffers.

The bits reported in `linearTilingFeatures`, `optimalTilingFeatures` and `bufferFeatures` **must** include the bits reported in the corresponding fields of `VkFormatProperties2`::`formatProperties`.

Valid Usage (Implicit)

- VUID-VkFormatProperties3-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_3`

Bits which **can** be set in the VkFormatProperties3 features `linearTilingFeatures`, `optimalTilingFeatures`, and `bufferFeatures` are:

```
// Flag bits for VkFormatFeatureFlagBits2
typedef VkFlags64 VkFormatFeatureFlagBits2;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT =
0x00000001ULL;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT_KHR =
0x00000001ULL;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_STORAGE_IMAGE_BIT =
0x00000002ULL;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_STORAGE_IMAGE_BIT_KHR =
0x00000002ULL;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_STORAGE_IMAGE_ATOMIC_BIT =
0x00000004ULL;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_STORAGE_IMAGE_ATOMIC_BIT_KHR
= 0x00000004ULL;
```

```
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_UNIFORM_TEXEL_BUFFER_BIT =
0x00000008ULL;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR
= 0x00000008ULL;

typedef VkFormatFeatureFlagBits2 VkFormatFeatureFlagBits2KHR;
```

The following bits **may** be set in `linearTilingFeatures` and `optimalTilingFeatures`, specifying that the features are supported by images or image views or sampler $Y'C_BC_R$ conversion objects created with the queried vkGetPhysicalDeviceFormatProperties2::`format`:

- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT` specifies that an image view **can** be sampled from.
- `VK_FORMAT_FEATURE_2_STORAGE_IMAGE_BIT` specifies that an image view **can** be used as a storage image.
- `VK_FORMAT_FEATURE_2_STORAGE_IMAGE_ATOMIC_BIT` specifies that an image view **can** be used as storage image that supports atomic operations.
- `VK_FORMAT_FEATURE_2_COLOR_ATTACHMENT_BIT` specifies that an image view **can** be used as a framebuffer color attachment and as an input attachment.
- `VK_FORMAT_FEATURE_2_COLOR_ATTACHMENT_BLEND_BIT` specifies that an image view **can** be used as a framebuffer color attachment that supports blending.
- `VK_FORMAT_FEATURE_2_DEPTH_STENCIL_ATTACHMENT_BIT` specifies that an image view **can** be used as a framebuffer depth/stencil attachment and as an input attachment.
- `VK_FORMAT_FEATURE_2_BLIT_SRC_BIT` specifies that an image **can** be used as the `srcImage` for vkCmdBlitImage2KHR and vkCmdBlitImage.
- `VK_FORMAT_FEATURE_2_BLIT_DST_BIT` specifies that an image **can** be used as the `dstImage` for vkCmdBlitImage2KHR and vkCmdBlitImage.
- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_LINEAR_BIT` specifies that if `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT` is also set, an image view **can** be used with a sampler that has either of `magFilter` or `minFilter` set to `VK_FILTER_LINEAR`, or `mipmapMode` set to `VK_SAMPLER_MIPMAP_MODE_LINEAR`. If `VK_FORMAT_FEATURE_2_BLIT_SRC_BIT` is also set, an image can be

used as the srcImage for vkCmdBlitImage2KHR and vkCmdBlitImage with a filter of VK_FILTER_LINEAR. This bit **must** only be exposed for formats that also support the VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT or VK_FORMAT_FEATURE_2_BLIT_SRC_BIT.

If the format being queried is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports linear filtering. Where depth comparison is supported it **may** be linear filtered whether this bit is present or not, but where this bit is not present the filtered value **may** be computed in an implementation-dependent manner which differs from the normal rules of linear filtering. The resulting value **must** be in the range [0,1] and **should** be proportional to, or a weighted average of, the number of comparison passes or failures.

- VK_FORMAT_FEATURE_2_TRANSFER_SRC_BIT specifies that an image **can** be used as a source image for copy commands.
- VK_FORMAT_FEATURE_2_TRANSFER_DST_BIT specifies that an image **can** be used as a destination image for copy commands and clear commands.
- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_MINMAX_BIT specifies VkImage **can** be used as a sampled image with a min or max VkSamplerReductionMode. This bit **must** only be exposed for formats that also support the VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_CUBIC_BIT specifies that VkImage **can** be used with a sampler that has either of magFilter or minFilter set to VK_FILTER_CUBIC_EXT, or be the source image for a blit with filter set to VK_FILTER_CUBIC_EXT. This bit **must** only be exposed for formats that also support the VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT. If the format being queried is a depth/stencil format, this only specifies that the depth aspect is cubic filterable.
- VK_FORMAT_FEATURE_2_MIDPOINT_CHROMA_SAMPLES_BIT specifies that an application **can** define a sampler $Y'C_BC_R$ conversion using this format as a source, and that an image of this format **can** be used with a VkSamplerYcbcrConversionCreateInfo xChromaOffset and/or yChromaOffset of VK_CHROMA_LOCATION_MIDPOINT. Otherwise both xChromaOffset and yChromaOffset **must** be VK_CHROMA_LOCATION_COSITED_EVEN. If a format does not incorporate chroma downsampling (it is not a “422” or “420” format) but the implementation supports sampler $Y'C_BC_R$ conversion for this format, the implementation **must** set VK_FORMAT_FEATURE_2_MIDPOINT_CHROMA_SAMPLES_BIT.
- VK_FORMAT_FEATURE_2_COSITED_CHROMA_SAMPLES_BIT specifies that an application **can** define a sampler $Y'C_BC_R$ conversion using this format as a source, and that an image of this format **can** be used with a VkSamplerYcbcrConversionCreateInfo xChromaOffset and/or yChromaOffset of VK_CHROMA_LOCATION_COSITED_EVEN. Otherwise both xChromaOffset and yChromaOffset **must** be VK_CHROMA_LOCATION_MIDPOINT. If neither VK_FORMAT_FEATURE_2_COSITED_CHROMA_SAMPLES_BIT nor VK_FORMAT_FEATURE_2_MIDPOINT_CHROMA_SAMPLES_BIT is set, the application **must** not define a sampler $Y'C_BC_R$ conversion using this format as a source.
- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT specifies that an application **can** define a sampler $Y'C_BC_R$ conversion using this format as a source with chromaFilter set to VK_FILTER_LINEAR.
- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT specifies that the format can have different chroma, min, and mag filters.
- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT specifies that reconstruction is explicit, as described in Chroma Reconstruction. If this bit is not

present, reconstruction is implicit by default.

- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT specifies that reconstruction **can** be forcibly made explicit by setting VkSamplerYcbcrConversionCreateInfo::forceExplicitReconstruction to VK_TRUE. If the format being queried supports VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT it **must** also support VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT.
- VK_FORMAT_FEATURE_2_DISJOINT_BIT specifies that a multi-planar image **can** have the VK_IMAGE_CREATE_DISJOINT_BIT set during image creation. An implementation **must** not set VK_FORMAT_FEATURE_2_DISJOINT_BIT for *single-plane formats*.
- VK_FORMAT_FEATURE_2_FRAGMENT_DENSITY_MAP_BIT_EXT specifies that an image view **can** be used as a fragment density map attachment.
- VK_FORMAT_FEATURE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies that an image view **can** be used as a fragment shading rate attachment. An implementation **must** not set this feature for formats with a numeric format other than UINT, or set it as a buffer feature.
- VK_FORMAT_FEATURE_2_VIDEO_DECODE_OUTPUT_BIT_KHR specifies that an image view with this format **can** be used as a decode output picture in video decode operations.
- VK_FORMAT_FEATURE_2_VIDEO_DECODE_DPB_BIT_KHR specifies that an image view with this format **can** be used as an output reconstructed picture or an input reference picture in video decode operations.
- VK_FORMAT_FEATURE_2_VIDEO_ENCODE_INPUT_BIT_KHR specifies that an image view with this format **can** be used as an encode input picture in video encode operations.
- VK_FORMAT_FEATURE_2_VIDEO_ENCODE_DPB_BIT_KHR specifies that an image view with this format **can** be used as an output reconstructed picture or an input reference picture in video encode operations.

> **NOTE** Specific video profiles **may** have additional restrictions on the format and other image creation parameters corresponding to image views used by video coding operations that **can** be enumerated using the vkGetPhysicalDeviceVideoFormatPropertiesKHR command.

- VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT specifies that image views or buffer views created with this format **can** be used as storage images or storage texel buffers respectively for read operations without specifying a format.
- VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT specifies that image views or buffer views created with this format **can** be used as storage images or storage texel buffers respectively for write operations without specifying a format.
- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT specifies that image views created with this format **can** be used for depth comparison performed by OpImage*Dref* instructions.
- VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV specifies that the format is supported as a renderable Linear Color Attachment. This bit will be set for renderable color formats in the

`linearTilingFeatures`. This **must** not be set in the `optimalTilingFeatures` or `bufferFeatures` members.

- `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM` specifies that image views created with this format **can** be used as the weight image input to weight image sampling operations.
- `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM` specifies that image views created with this format **can** be sampled in weight image sampling operations.
- `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM` specifies that image views created with this format **can** be used in block matching operations.
- `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM` specifies that image views created with this format **can** be sampled in box filter sampling operations.
- `VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT_EXT` specifies that an image **can** be created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT`.
- `VK_FORMAT_FEATURE_2_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR` specifies that an image view with this format **can** be used as a quantization delta map in video encode operations.
- `VK_FORMAT_FEATURE_2_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR` specifies that an image view with this format **can** be used as an emphasis map in video encode operations.

NOTE	Video encode quantization maps have additional restrictions specific to the video profile they are used with that **can** be enumerated using the vkGetPhysicalDeviceVideoFormatPropertiesKHR command.

The following bits **may** be set in `bufferFeatures`, specifying that the features are supported by buffers or buffer views created with the queried vkGetPhysicalDeviceFormatProperties2::`format`:

- `VK_FORMAT_FEATURE_2_UNIFORM_TEXEL_BUFFER_BIT` specifies that the format **can** be used to create a buffer view that **can** be bound to a `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` descriptor.
- `VK_FORMAT_FEATURE_2_STORAGE_TEXEL_BUFFER_BIT` specifies that the format **can** be used to create a buffer view that **can** be bound to a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor.
- `VK_FORMAT_FEATURE_2_STORAGE_TEXEL_BUFFER_ATOMIC_BIT` specifies that atomic operations are supported on `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` with this format.
- `VK_FORMAT_FEATURE_2_VERTEX_BUFFER_BIT` specifies that the format **can** be used as a vertex attribute format (`VkVertexInputAttributeDescription`::`format`).
- `VK_FORMAT_FEATURE_2_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR` specifies that the format **can** be used as the vertex format when creating an acceleration structure (`VkAccelerationStructureGeometryTrianglesDataKHR`::`vertexFormat`). This format **can** also be used as the vertex format in host memory when doing host acceleration structure builds.
- `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT` specifies that buffer views created with this format **can** be used as storage texel buffers for read operations without specifying a format.
- `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT` specifies that buffer views created with this format **can** be used as storage texel buffers for write operations without specifying a format.
- `VK_FORMAT_FEATURE_2_OPTICAL_FLOW_IMAGE_BIT_NV` specifies that an image view with this format

can be used as an input or reference to optical flow operations

- VK_FORMAT_FEATURE_2_OPTICAL_FLOW_VECTOR_BIT_NV specifies that an image view with this format **can** be used as a flow vector map (either as hint, output or global flow) for optical flow operations
- VK_FORMAT_FEATURE_2_OPTICAL_FLOW_COST_BIT_NV specifies that an image view with this format **can** be used as an output cost map for optical flow operations

```
typedef VkFlags64 VkFormatFeatureFlags2;
```

or the equivalent

```
// Provided by VK_KHR_format_feature_flags2
typedef VkFormatFeatureFlags2 VkFormatFeatureFlags2KHR;
```

VkFormatFeatureFlags2 is a bitmask type for setting a mask of zero or more VkFormatFeatureFlagBits2.

To query the performance characteristics of a subpass resolve operation for an attachment with a VkFormat, add a VkSubpassResolvePerformanceQueryEXT structure to the pNext chain of VkFormatProperties2.

The VkSubpassResolvePerformanceQueryEXT structure is defined as:

```
// Provided by VK_EXT_multisampled_render_to_single_sampled
typedef struct VkSubpassResolvePerformanceQueryEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           optimal;
} VkSubpassResolvePerformanceQueryEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- optimal specifies that a subpass resolve operation is optimally performed.

If optimal is VK_FALSE for a VkFormat, using a subpass resolve operation on a multisampled attachment with this format can incur additional costs, including additional memory bandwidth usage and a higher memory footprint. If an attachment with such a format is used in a multisampled-render-to-single-sampled subpass, the additional memory and memory bandwidth usage can nullify the benefits of using the VK_EXT_multisampled_render_to_single_sampled extension.

Valid Usage (Implicit)

- VUID-VkSubpassResolvePerformanceQueryEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SUBPASS_RESOLVE_PERFORMANCE_QUERY_EXT

48.2.1. Potential Format Features

Some valid usage conditions depend on the format features supported by a VkImage whose VkImageTiling is unknown. In such cases the exact VkFormatFeatureFlagBits supported by the VkImage cannot be determined, so the valid usage conditions are expressed in terms of the *potential format features* of the VkImage format.

The *potential format features* of a VkFormat are defined as follows:

- The union of VkFormatFeatureFlagBits and VkFormatFeatureFlagBits2, supported when the VkImageTiling is `VK_IMAGE_TILING_OPTIMAL`, `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, or `VK_IMAGE_TILING_LINEAR` if VkFormat is not `VK_FORMAT_UNDEFINED`
- VkAndroidHardwareBufferFormatPropertiesANDROID::`formatFeatures` and VkAndroidHardwareBufferFormatProperties2ANDROID::`formatFeatures` of a valid external format if VkFormat is `VK_FORMAT_UNDEFINED`
- VkScreenBufferFormatPropertiesQNX::`formatFeatures` of a valid external format if VkFormat is `VK_FORMAT_UNDEFINED`

48.3. Required Format Support

Implementations **must** support at least the following set of features on the listed formats. For images, these features **must** be supported for every VkImageType (including arrayed and cube variants) unless otherwise noted. These features are supported on existing formats without needing to advertise an extension or needing to explicitly enable them. Support for additional functionality beyond the requirements listed here is queried using the vkGetPhysicalDeviceFormatProperties command.

NOTE Unless otherwise excluded below, the required formats are supported for all VkImageCreateFlags values as long as those flag values are otherwise allowed.

The following tables show which feature bits **must** be supported for each format. Formats that are required to support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` **must** also support `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` and `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

Table 78. Key for Format Feature Tables

□	This feature **must** be supported on the named format
†	This feature **must** be supported on at least some of the named formats, with more information in the table where the symbol appears
‡	This feature **must** be supported with some caveats or preconditions, with more information in the table where the symbol appears
§	This feature **must** be supported with some caveats or preconditions, with more information in the table where the symbol appears

- VK_FORMAT_B8G8R8A8_SRGB
- VK_FORMAT_A8B8G8R8_UNORM_PACK32
- VK_FORMAT_A8B8G8R8_SNORM_PACK32
- VK_FORMAT_A8B8G8R8_SRGB_PACK32

If ETC compressed formats are supported, VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT **must** be supported for the following image view types:

- VK_IMAGE_VIEW_TYPE_2D
- VK_IMAGE_VIEW_TYPE_2D_ARRAY

for the following additional formats:

- VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK
- VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK
- VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK
- VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK
- VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK
- VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK

If cubic filtering is supported for any other formats, the following image view types **must** be supported for those formats:

- VK_IMAGE_VIEW_TYPE_2D
- VK_IMAGE_VIEW_TYPE_2D_ARRAY

To be used with VkImageView with subresourceRange.aspectMask equal to VK_IMAGE_ASPECT_COLOR_BIT, sampler $Y'C_BC_R$ conversion **must** be enabled for the following formats:

Table 92. Formats Requiring Sampler $Y'C_BC_R$ Conversion for VK_IMAGE_ASPECT_COLOR_BIT Image Views

Format	Planes	VK_FORMAT_FEATURE_DISJOINT_BIT	VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT	VK_FORMAT_FEATURE_TRANSFER_SRC_BIT	VK_FORMAT_FEATURE_TRANSFER_DST_BIT	VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT	VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT	VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT	VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT	VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT	VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT

VK_FORMAT_G16_B16R16_2PLANE_444_UNORM	2										
Format features marked † **must** be supported for optimalTilingFeatures with VkImageType VK_IMAGE_TYPE_2D if the VkPhysicalDevice supports the VkPhysicalDeviceSamplerYcbcrConversionFeatures feature.											
Formats marked ‡ do not require a sampler $Y'C_BC_R$ conversion for VK_IMAGE_ASPECT_COLOR_BIT image views if the VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT::formatRgba10x6WithoutYCbCrSampler feature is enabled.											

Implementations are not required to support the VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT VkImageCreateFlags for the above formats that require sampler $Y'C_BC_R$ conversion. To determine whether the implementation supports sparse image creation flags with these formats use vkGetPhysicalDeviceImageFormatProperties or vkGetPhysicalDeviceImageFormatProperties2.

VK_FORMAT_FEATURE_FRAGMENT_DENSITY_MAP_BIT_EXT **must** be supported for the following formats if the fragmentDensityMap feature is enabled:

- VK_FORMAT_R8G8_UNORM

VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR **must** be supported in bufferFeatures for the following formats if the accelerationStructure feature is supported:

- VK_FORMAT_R32G32_SFLOAT
- VK_FORMAT_R32G32B32_SFLOAT
- VK_FORMAT_R16G16_SFLOAT
- VK_FORMAT_R16G16B16A16_SFLOAT
- VK_FORMAT_R16G16_SNORM
- VK_FORMAT_R16G16B16A16_SNORM

VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR **must** be supported for the following formats if the attachmentFragmentShadingRate feature is supported:

- VK_FORMAT_R8_UINT

If the VK_EXT_host_image_copy extension is supported and VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT is supported in optimalTilingFeatures or linearTilingFeatures for a color format, VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT_EXT **must** also be supported in optimalTilingFeatures or linearTilingFeatures respectively.

48.3.1. Formats Without Shader Storage Format

The device-level features for using a storage image or a storage texel buffer with an image format of Unknown, shaderStorageImageReadWithoutFormat and shaderStorageImageWriteWithoutFormat, only apply to the following formats:

- VK_FORMAT_R8G8B8A8_UNORM
- VK_FORMAT_R8G8B8A8_SNORM
- VK_FORMAT_R8G8B8A8_UINT
- VK_FORMAT_R8G8B8A8_SINT
- VK_FORMAT_R32_UINT
- VK_FORMAT_R32_SINT
- VK_FORMAT_R32_SFLOAT
- VK_FORMAT_R32G32_UINT
- VK_FORMAT_R32G32_SINT
- VK_FORMAT_R32G32_SFLOAT
- VK_FORMAT_R32G32B32A32_UINT
- VK_FORMAT_R32G32B32A32_SINT
- VK_FORMAT_R32G32B32A32_SFLOAT
- VK_FORMAT_R16G16B16A16_UINT
- VK_FORMAT_R16G16B16A16_SINT
- VK_FORMAT_R16G16B16A16_SFLOAT
- VK_FORMAT_R16G16_SFLOAT
- VK_FORMAT_B10G11R11_UFLOAT_PACK32
- VK_FORMAT_R16_SFLOAT
- VK_FORMAT_R16G16B16A16_UNORM
- VK_FORMAT_A2B10G10R10_UNORM_PACK32
- VK_FORMAT_R16G16_UNORM
- VK_FORMAT_R8G8_UNORM
- VK_FORMAT_R16_UNORM
- VK_FORMAT_R8_UNORM
- VK_FORMAT_R16G16B16A16_SNORM

- VK_FORMAT_R16G16_SNORM
- VK_FORMAT_R8G8_SNORM
- VK_FORMAT_R16_SNORM
- VK_FORMAT_R8_SNORM
- VK_FORMAT_R16G16_SINT
- VK_FORMAT_R8G8_SINT
- VK_FORMAT_R16_SINT
- VK_FORMAT_R8_SINT
- VK_FORMAT_A2B10G10R10_UINT_PACK32
- VK_FORMAT_R16G16_UINT
- VK_FORMAT_R8G8_UINT
- VK_FORMAT_R16_UINT
- VK_FORMAT_R8_UINT
- VK_FORMAT_A8_UNORM_KHR

NOTE This list of formats is the union of required storage formats from Required Format Support section and formats listed in shaderStorageImageExtendedFormats.

An implementation that supports VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT for any format from the given list of formats and supports shaderStorageImageReadWithoutFormat **must** support VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT for that same format if Vulkan 1.3 or the VK_KHR_format_feature_flags2 extension is supported.

An implementation that supports VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT for any format from the given list of formats and supports shaderStorageImageWriteWithoutFormat **must** support VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT for that same format if Vulkan 1.3 or the VK_KHR_format_feature_flags2 extension is supported.

An implementation that does not support either of VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT or VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT for a format **must** not report support for VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT or VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT for that format if it is not listed in the SPIR-V and Vulkan Image Format Compatibility table.

NOTE Some older implementations do not follow this restriction. They report support for formats as storage images even though they do not support access without the Format qualifier and there is no matching Format token. Such images cannot be either read from or written to.

Drivers which pass Vulkan conformance test suite version 1.3.9.0, or any subsequent version will conform to the requirement above.

48.3.2. Depth Comparison Format Support

If Vulkan 1.3 or the VK_KHR_format_feature_flags2 extension is supported, a depth/stencil format with a depth component supporting VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT **must** support VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT.

48.3.3. Format Feature Dependent Usage Flags

Certain resource usage flags depend on support for the corresponding format feature flag for the format in question. The following tables list the VkBufferUsageFlagBits and VkImageUsageFlagBits that have such dependencies, and the format feature flags they depend on. Additional restrictions, including, but not limited to, further required format feature flags specific to the particular use of the resource **may** apply, as described in the respective sections of this specification.

Table 93. Format Feature Dependent Buffer Usage Flags

Buffer usage flag	Required format feature flag
VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT	VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT
VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT	VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT
VK_BUFFER_USAGE_VERTEX_BUFFER_BIT	VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT

Table 94. Format Feature Dependent Image Usage Flags

Image usage flag	Required format feature flag
VK_IMAGE_USAGE_SAMPLED_BIT	VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT
VK_IMAGE_USAGE_STORAGE_BIT	VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT
VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT	VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT
VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT	VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT	VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR	VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR	VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR
VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR	VK_FORMAT_FEATURE_VIDEO_DECODE_DPB_BIT_KHR
VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR	VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR
VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR	VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR
VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR	VK_FORMAT_FEATURE_2_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR
VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR	VK_FORMAT_FEATURE_2_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR

Chapter 49. Additional Capabilities

This chapter describes additional capabilities beyond the minimum capabilities described in the Limits and Formats chapters, including:

- Additional Image Capabilities
- Additional Buffer Capabilities
- Optional Semaphore Capabilities
- Optional Fence Capabilities
- Timestamp Calibration Capabilities

49.1. Additional Image Capabilities

Additional image capabilities, such as larger dimensions or additional sample counts for certain image types, or additional capabilities for *linear* tiling format images, are described in this section.

To query additional capabilities specific to image types, call:

```
// Provided by VK_VERSION_1_0
VkResult vkGetPhysicalDeviceImageFormatProperties(
    VkPhysicalDevice                            physicalDevice,
    VkFormat                                    format,
    VkImageType                                 type,
    VkImageTiling                               tiling,
    VkImageUsageFlags                           usage,
    VkImageCreateFlags                          flags,
    VkImageFormatProperties*                    pImageFormatProperties);
```

- `physicalDevice` is the physical device from which to query the image capabilities.
- `format` is a VkFormat value specifying the image format, corresponding to VkImageCreateInfo::`format`.
- `type` is a VkImageType value specifying the image type, corresponding to VkImageCreateInfo::`imageType`.
- `tiling` is a VkImageTiling value specifying the image tiling, corresponding to VkImageCreateInfo::`tiling`.
- `usage` is a bitmask of VkImageUsageFlagBits specifying the intended usage of the image, corresponding to VkImageCreateInfo::`usage`.
- `flags` is a bitmask of VkImageCreateFlagBits specifying additional parameters of the image, corresponding to VkImageCreateInfo::`flags`.
- `pImageFormatProperties` is a pointer to a VkImageFormatProperties structure in which capabilities are returned.

The `format`, `type`, `tiling`, `usage`, and `flags` parameters correspond to parameters that would be

consumed by vkCreateImage (as members of VkImageCreateInfo).

If format is not a supported image format, or if the combination of format, type, tiling, usage, and flags is not supported for images, then vkGetPhysicalDeviceImageFormatProperties returns VK_ERROR_FORMAT_NOT_SUPPORTED.

The limitations on an image format that are reported by vkGetPhysicalDeviceImageFormatProperties have the following property: if usage1 and usage2 of type VkImageUsageFlags are such that the bits set in usage1 are a subset of the bits set in usage2, and flags1 and flags2 of type VkImageCreateFlags are such that the bits set in flags1 are a subset of the bits set in flags2, then the limitations for usage1 and flags1 **must** be no more strict than the limitations for usage2 and flags2, for all values of format, type, and tiling.

If the VK_EXT_host_image_copy extension is supported, usage includes VK_IMAGE_USAGE_SAMPLED_BIT, and flags does not include either of VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, then the result of calls to vkGetPhysicalDeviceImageFormatProperties with identical parameters except for the inclusion of VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT in usage **must** be identical.

Valid Usage

- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-02248
  tiling **must** not be VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT. (Use vkGetPhysicalDeviceImageFormatProperties2 instead)

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties-physicalDevice-parameter
  physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceImageFormatProperties-format-parameter
  format **must** be a valid VkFormat value
- VUID-vkGetPhysicalDeviceImageFormatProperties-type-parameter
  type **must** be a valid VkImageType value
- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-parameter
  tiling **must** be a valid VkImageTiling value
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-parameter
  usage **must** be a valid combination of VkImageUsageFlagBits values
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-requiredbitmask
  usage **must** not be 0
- VUID-vkGetPhysicalDeviceImageFormatProperties-flags-parameter
  flags **must** be a valid combination of VkImageCreateFlagBits values
- VUID-vkGetPhysicalDeviceImageFormatProperties-pImageFormatProperties-parameter
  pImageFormatProperties **must** be a valid pointer to a VkImageFormatProperties structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_FORMAT_NOT_SUPPORTED

The VkImageFormatProperties structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageFormatProperties {
    VkExtent3D            maxExtent;
    uint32_t              maxMipLevels;
    uint32_t              maxArrayLayers;
    VkSampleCountFlags    sampleCounts;
    VkDeviceSize          maxResourceSize;
} VkImageFormatProperties;
```

- maxExtent are the maximum image dimensions. See the Allowed Extent Values section below for how these values are constrained by type.
- maxMipLevels is the maximum number of mipmap levels. maxMipLevels **must** be equal to the number of levels in the complete mipmap chain based on the maxExtent.width, maxExtent.height, and maxExtent.depth, except when one of the following conditions is true, in which case it **may** instead be 1:
  - vkGetPhysicalDeviceImageFormatProperties::tiling was VK_IMAGE_TILING_LINEAR
  - VkPhysicalDeviceImageFormatInfo2::tiling was VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT
  - the VkPhysicalDeviceImageFormatInfo2::pNext chain included a VkPhysicalDeviceExternalImageFormatInfo structure with a handle type included in the handleTypes member for which mipmap image support is not required
  - image format is one of the formats that require a sampler $Y'C_BC_R$ conversion
  - flags contains VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT
- maxArrayLayers is the maximum number of array layers. maxArrayLayers **must** be no less than VkPhysicalDeviceLimits::maxImageArrayLayers, except when one of the following conditions is true, in which case it **may** instead be 1:
  - tiling is VK_IMAGE_TILING_LINEAR
  - tiling is VK_IMAGE_TILING_OPTIMAL and type is VK_IMAGE_TYPE_3D
  - format is one of the formats that require a sampler $Y'C_BC_R$ conversion
- If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then maxArrayLayers **must** not be 0.

- `sampleCounts` is a bitmask of VkSampleCountFlagBits specifying all the supported sample counts for this image as described below.
- `maxResourceSize` is an upper bound on the total image size in bytes, inclusive of all image subresources. Implementations **may** have an address space limit on total size of a resource, which is advertised by this property. `maxResourceSize` **must** be at least 2^{31}.

NOTE	There is no mechanism to query the size of an image before creating it, to compare that size against `maxResourceSize`. If an application attempts to create an image that exceeds this limit, the creation will fail and vkCreateImage will return `VK_ERROR_OUT_OF_DEVICE_MEMORY`. While the advertised limit **must** be at least 2^{31}, it **may** not be possible to create an image that approaches that size, particularly for `VK_IMAGE_TYPE_1D`.

If the combination of parameters to `vkGetPhysicalDeviceImageFormatProperties` is not supported by the implementation for use in vkCreateImage, then all members of `VkImageFormatProperties` will be filled with zero.

NOTE	Filling `VkImageFormatProperties` with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility.

To determine the image capabilities compatible with an external memory handle type, call:

```
// Provided by VK_NV_external_memory_capabilities
VkResult vkGetPhysicalDeviceExternalImageFormatPropertiesNV(
    VkPhysicalDevice                            physicalDevice,
    VkFormat                                    format,
    VkImageType                                 type,
    VkImageTiling                               tiling,
    VkImageUsageFlags                           usage,
    VkImageCreateFlags                          flags,
    VkExternalMemoryHandleTypeFlagsNV           externalHandleType,
    VkExternalImageFormatPropertiesNV*          pExternalImageFormatProperties);
```

- `physicalDevice` is the physical device from which to query the image capabilities
- `format` is the image format, corresponding to VkImageCreateInfo::`format`.
- `type` is the image type, corresponding to VkImageCreateInfo::`imageType`.
- `tiling` is the image tiling, corresponding to VkImageCreateInfo::`tiling`.
- `usage` is the intended usage of the image, corresponding to VkImageCreateInfo::`usage`.
- `flags` is a bitmask describing additional parameters of the image, corresponding to VkImageCreateInfo::`flags`.
- `externalHandleType` is either one of the bits from VkExternalMemoryHandleTypeFlagBitsNV, or 0.
- `pExternalImageFormatProperties` is a pointer to a VkExternalImageFormatPropertiesNV structure

in which capabilities are returned.

If `externalHandleType` is 0, `pExternalImageFormatProperties->imageFormatProperties` will return the same values as a call to vkGetPhysicalDeviceImageFormatProperties, and the other members of `pExternalImageFormatProperties` will all be 0. Otherwise, they are filled in as described for VkExternalImageFormatPropertiesNV.

Valid Usage

- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-externalHandleType-07721
  `externalHandleType` **must** not have more than one bit set

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-type-parameter
  `type` **must** be a valid VkImageType value
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-tiling-parameter
  `tiling` **must** be a valid VkImageTiling value
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-usage-parameter
  `usage` **must** be a valid combination of VkImageUsageFlagBits values
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-usage-requiredbitmask
  `usage` **must** not be `0`
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-flags-parameter
  `flags` **must** be a valid combination of VkImageCreateFlagBits values
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-externalHandleType-parameter
  `externalHandleType` **must** be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values
- VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-pExternalImageFormatProperties-parameter
  `pExternalImageFormatProperties` **must** be a valid pointer to a VkExternalImageFormatPropertiesNV structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_FORMAT_NOT_SUPPORTED

The VkExternalImageFormatPropertiesNV structure is defined as:

```
// Provided by VK_NV_external_memory_capabilities
typedef struct VkExternalImageFormatPropertiesNV {
    VkImageFormatProperties             imageFormatProperties;
    VkExternalMemoryFeatureFlagsNV      externalMemoryFeatures;
    VkExternalMemoryHandleTypeFlagsNV   exportFromImportedHandleTypes;
    VkExternalMemoryHandleTypeFlagsNV   compatibleHandleTypes;
} VkExternalImageFormatPropertiesNV;
```

- imageFormatProperties will be filled in as when calling vkGetPhysicalDeviceImageFormatProperties, but the values returned **may** vary depending on the external handle type requested.
- externalMemoryFeatures is a bitmask of VkExternalMemoryFeatureFlagBitsNV, indicating properties of the external memory handle type (vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType) being queried, or 0 if the external memory handle type is 0.
- exportFromImportedHandleTypes is a bitmask of VkExternalMemoryHandleTypeFlagBitsNV containing a bit set for every external handle type that **may** be used to create memory from which the handles of the type specified in vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType **can** be exported, or 0 if the external memory handle type is 0.
- compatibleHandleTypes is a bitmask of VkExternalMemoryHandleTypeFlagBitsNV containing a bit set for every external handle type that **may** be specified simultaneously with the handle type specified by vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType when calling vkAllocateMemory, or 0 if the external memory handle type is 0. compatibleHandleTypes will always contain vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType

Bits which **can** be set in VkExternalImageFormatPropertiesNV::externalMemoryFeatures, indicating properties of the external memory handle type, are:

```
// Provided by VK_NV_external_memory_capabilities
typedef enum VkExternalMemoryFeatureFlagBitsNV {
    VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT_NV = 0x00000001,
    VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT_NV = 0x00000002,
    VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT_NV = 0x00000004,
} VkExternalMemoryFeatureFlagBitsNV;
```

- VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT_NV specifies that external memory of the

specified type **must** be created as a dedicated allocation when used in the manner specified.

- VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT_NV specifies that the implementation supports exporting handles of the specified type.
- VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT_NV specifies that the implementation supports importing handles of the specified type.

```
// Provided by VK_NV_external_memory_capabilities
typedef VkFlags VkExternalMemoryFeatureFlagsNV;
```

VkExternalMemoryFeatureFlagsNV is a bitmask type for setting a mask of zero or more VkExternalMemoryFeatureFlagBitsNV.

To query additional capabilities specific to image types, call:

```
// Provided by VK_VERSION_1_1
VkResult vkGetPhysicalDeviceImageFormatProperties2(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceImageFormatInfo2*     pImageFormatInfo,
    VkImageFormatProperties2*                   pImageFormatProperties);
```

or the equivalent command

```
// Provided by VK_KHR_get_physical_device_properties2
VkResult vkGetPhysicalDeviceImageFormatProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceImageFormatInfo2*     pImageFormatInfo,
    VkImageFormatProperties2*                   pImageFormatProperties);
```

- physicalDevice is the physical device from which to query the image capabilities.
- pImageFormatInfo is a pointer to a VkPhysicalDeviceImageFormatInfo2 structure describing the parameters that would be consumed by vkCreateImage.
- pImageFormatProperties is a pointer to a VkImageFormatProperties2 structure in which capabilities are returned.

vkGetPhysicalDeviceImageFormatProperties2 behaves similarly to vkGetPhysicalDeviceImageFormatProperties, with the ability to return extended information in a pNext chain of output structures.

If the pNext chain of pImageFormatInfo includes a VkVideoProfileListInfoKHR structure with a profileCount member greater than 0, then this command returns format capabilities specific to image types used in conjunction with the specified video profiles. In this case, this command will return one of the video-profile-specific error codes if any of the profiles specified via VkVideoProfileListInfoKHR::pProfiles are not supported. Furthermore, if VkPhysicalDeviceImageFormatInfo2::usage includes any image usage flag not supported by the specified video profiles, then this command returns VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR.

Valid Usage

- VUID-vkGetPhysicalDeviceImageFormatProperties2-pNext-01868
  If the `pNext` chain of `pImageFormatProperties` includes a VkAndroidHardwareBufferUsageANDROID structure, the `pNext` chain of `pImageFormatInfo` **must** include a VkPhysicalDeviceExternalImageFormatInfo structure with `handleType` set to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`
- VUID-vkGetPhysicalDeviceImageFormatProperties2-pNext-09004
  If the `pNext` chain of `pImageFormatProperties` includes a VkHostImageCopyDevicePerformanceQueryEXT structure, `pImageFormatInfo->usage` **must** contain `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties2-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceImageFormatProperties2-pImageFormatInfo-parameter
  `pImageFormatInfo` **must** be a valid pointer to a valid VkPhysicalDeviceImageFormatInfo2 structure
- VUID-vkGetPhysicalDeviceImageFormatProperties2-pImageFormatProperties-parameter
  `pImageFormatProperties` **must** be a valid pointer to a VkImageFormatProperties2 structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_FORMAT_NOT_SUPPORTED`
- `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR`

The `VkPhysicalDeviceImageFormatInfo2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceImageFormatInfo2 {
    VkStructureType       sType;
    const void*           pNext;
    VkFormat              format;
    VkImageType           type;
    VkImageTiling         tiling;
    VkImageUsageFlags     usage;
    VkImageCreateFlags    flags;
} VkPhysicalDeviceImageFormatInfo2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceImageFormatInfo2 VkPhysicalDeviceImageFormatInfo2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure. The `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` is used to provide additional image parameters to `vkGetPhysicalDeviceImageFormatProperties2`.
- `format` is a VkFormat value indicating the image format, corresponding to VkImageCreateInfo::`format`.
- `type` is a VkImageType value indicating the image type, corresponding to VkImageCreateInfo::`imageType`.
- `tiling` is a VkImageTiling value indicating the image tiling, corresponding to VkImageCreateInfo::`tiling`.
- `usage` is a bitmask of VkImageUsageFlagBits indicating the intended usage of the image, corresponding to VkImageCreateInfo::`usage`.
- `flags` is a bitmask of VkImageCreateFlagBits indicating additional parameters of the image, corresponding to VkImageCreateInfo::`flags`.

The members of `VkPhysicalDeviceImageFormatInfo2` correspond to the arguments to vkGetPhysicalDeviceImageFormatProperties, with `sType` and `pNext` added for extensibility.

Valid Usage

- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-02249
  `tiling` **must** be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` if and only if the `pNext` chain includes VkPhysicalDeviceImageDrmFormatModifierInfoEXT
- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-02313
  If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `pNext` chain **must** include a VkImageFormatListCreateInfo structure with non-zero `viewFormatCount`

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageFormatInfo2-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_FORMAT_INFO_2`
- VUID-VkPhysicalDeviceImageFormatInfo2-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkImageCompressionControlEXT, VkImageFormatListCreateInfo, VkImageStencilUsageCreateInfo, VkOpticalFlowImageFormatInfoNV, VkPhysicalDeviceExternalImageFormatInfo, VkPhysicalDeviceImageDrmFormatModifierInfoEXT, VkPhysicalDeviceImageViewImageFormatInfoEXT, or VkVideoProfileListInfoKHR
- VUID-VkPhysicalDeviceImageFormatInfo2-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkPhysicalDeviceImageFormatInfo2-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-VkPhysicalDeviceImageFormatInfo2-type-parameter
  `type` **must** be a valid VkImageType value
- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-parameter
  `tiling` **must** be a valid VkImageTiling value
- VUID-VkPhysicalDeviceImageFormatInfo2-usage-parameter
  `usage` **must** be a valid combination of VkImageUsageFlagBits values
- VUID-VkPhysicalDeviceImageFormatInfo2-usage-requiredbitmask
  `usage` **must** not be `0`
- VUID-VkPhysicalDeviceImageFormatInfo2-flags-parameter
  `flags` **must** be a valid combination of VkImageCreateFlagBits values

The `VkImageFormatProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageFormatProperties2 {
    VkStructureType             sType;
    void*                       pNext;
    VkImageFormatProperties     imageFormatProperties;
} VkImageFormatProperties2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkImageFormatProperties2 VkImageFormatProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure. The `pNext` chain of

VkImageFormatProperties2 is used to allow the specification of additional capabilities to be returned from vkGetPhysicalDeviceImageFormatProperties2.

- imageFormatProperties is a VkImageFormatProperties structure in which capabilities are returned.

If the combination of parameters to vkGetPhysicalDeviceImageFormatProperties2 is not supported by the implementation for use in vkCreateImage, then all members of imageFormatProperties will be filled with zero.

NOTE

Filling imageFormatProperties with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility. This exception only applies to imageFormatProperties, not sType, pNext, or any structures chained from pNext.

Valid Usage (Implicit)

- VUID-VkImageFormatProperties2-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_FORMAT_PROPERTIES_2
- VUID-VkImageFormatProperties2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkAndroidHardwareBufferUsageANDROID, VkExternalImageFormatProperties, VkFilterCubicImageViewImageFormatPropertiesEXT, VkHostImageCopyDevicePerformanceQueryEXT, VkImageCompressionPropertiesEXT, VkSamplerYcbcrConversionImageFormatProperties, or VkTextureLODGatherFormatPropertiesAMD
- VUID-VkImageFormatProperties2-sType-unique
  The sType value of each struct in the pNext chain **must** be unique

To determine if texture gather functions that take explicit LOD and/or bias argument values **can** be used with a given image format, add a VkTextureLODGatherFormatPropertiesAMD structure to the pNext chain of the VkImageFormatProperties2 structure in a call to vkGetPhysicalDeviceImageFormatProperties2.

The VkTextureLODGatherFormatPropertiesAMD structure is defined as:

```
// Provided by VK_AMD_texture_gather_bias_lod
typedef struct VkTextureLODGatherFormatPropertiesAMD {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           supportsTextureGatherLODBiasAMD;
} VkTextureLODGatherFormatPropertiesAMD;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.

- `supportsTextureGatherLODBiasAMD` tells if the image format can be used with texture gather bias/LOD functions, as introduced by the `VK_AMD_texture_gather_bias_lod` extension. This field is set by the implementation. An application-specified value is ignored.

Valid Usage (Implicit)

- VUID-VkTextureLODGatherFormatPropertiesAMD-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_TEXTURE_LOD_GATHER_FORMAT_PROPERTIES_AMD`

To determine the image capabilities compatible with an external memory handle type, add a VkPhysicalDeviceExternalImageFormatInfo structure to the `pNext` chain of the VkPhysicalDeviceImageFormatInfo2 structure and a `VkExternalImageFormatProperties` structure to the `pNext` chain of the VkImageFormatProperties2 structure.

The `VkPhysicalDeviceExternalImageFormatInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalImageFormatInfo {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalMemoryHandleTypeFlagBits    handleType;
} VkPhysicalDeviceExternalImageFormatInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkPhysicalDeviceExternalImageFormatInfo
VkPhysicalDeviceExternalImageFormatInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the memory handle type that will be used with the memory associated with the image.

If `handleType` is 0, vkGetPhysicalDeviceImageFormatProperties2 will behave as if VkPhysicalDeviceExternalImageFormatInfo was not present, and VkExternalImageFormatProperties will be ignored.

If `handleType` is not compatible with the `format`, `type`, `tiling`, `usage`, and `flags` specified in VkPhysicalDeviceImageFormatInfo2, then vkGetPhysicalDeviceImageFormatProperties2 returns `VK_ERROR_FORMAT_NOT_SUPPORTED`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalImageFormatInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_IMAGE_FORMAT_INFO`

- VUID-VkPhysicalDeviceExternalImageFormatInfo-handleType-parameter
  If `handleType` is not `0`, `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value

Possible values of VkPhysicalDeviceExternalImageFormatInfo::`handleType`, specifying an external memory handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalMemoryHandleTypeFlagBits {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT = 0x00000008,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT = 0x00000010,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT = 0x00000020,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT = 0x00000040,
  // Provided by VK_EXT_external_memory_dma_buf
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT = 0x00000200,
  // Provided by VK_ANDROID_external_memory_android_hardware_buffer
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID = 0x00000400,
  // Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT = 0x00000080,
  // Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT = 0x00000100,
  // Provided by VK_FUCHSIA_external_memory
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA = 0x00000800,
  // Provided by VK_NV_external_memory_rdma
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV = 0x00001000,
  // Provided by VK_QNX_external_memory_screen_buffer
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX = 0x00004000,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT_KHR =
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT,
} VkExternalMemoryHandleTypeFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryHandleTypeFlagBits VkExternalMemoryHandleTypeFlagBitsKHR;
```

- VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls dup, dup2, close, and the non-standard system call dup3. Additionally, it **must** be transportable over a socket using an SCM_RIGHTS control message. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the functions DuplicateHandle, CloseHandle, CompareObjectHandles, GetHandleInformation, and SetHandleInformation. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying memory resource represented by its Vulkan memory object, and will therefore become invalid when all Vulkan memory objects associated with it are destroyed.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT specifies an NT handle returned by IDXGIResource1::CreateSharedHandle referring to a Direct3D 10 or 11 texture resource. It owns a reference to the memory used by the Direct3D resource.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT specifies a global share handle returned by IDXGIResource::GetSharedHandle referring to a Direct3D 10 or 11 texture resource. It does not own a reference to the underlying Direct3D resource, and will therefore become invalid when all Vulkan memory objects and Direct3D resources associated with it are destroyed.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT specifies an NT handle returned by ID3D12Device::CreateSharedHandle referring to a Direct3D 12 heap resource. It owns a reference to the resources used by the Direct3D heap.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT specifies an NT handle returned by ID3D12Device::CreateSharedHandle referring to a Direct3D 12 committed resource. It owns a reference to the memory used by the Direct3D resource.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT specifies a host pointer returned by a host memory allocation command. It does not own a reference to the underlying memory resource, and will therefore become invalid if the host memory is freed.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT specifies a host pointer to *host mapped foreign memory*. It does not own a reference to the underlying memory resource, and will therefore become invalid if the foreign memory is unmapped or otherwise becomes no longer available.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT is a file descriptor for a Linux dma_buf. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID specifies an AHardwareBuffer object defined by the Android NDK. See Android Hardware Buffers for more details of this handle type.

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA` is a Zircon handle to a virtual memory object.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV` is a handle to an allocation accessible by remote devices. It owns a reference to the underlying memory resource represented by its Vulkan memory object.
- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX` specifies a `_screen_buffer` object defined by the QNX SDP. See QNX Screen Buffer for more details of this handle type.

Some external memory handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

Table 95. External Memory Handle Types Compatibility

Handle type	VkPhysicalDeviceIDProperties::driverUUID	VkPhysicalDeviceIDProperties::deviceUUID
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT	Must match	Must match
VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV	No restriction	No restriction
VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX	No restriction	No restriction

NOTE The above table does not restrict the drivers and devices with which VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT and VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT **may** be shared, as these handle types inherently mean memory that does not come from the same device, as they import memory from the host or a foreign device, respectively.

NOTE Even though the above table does not restrict the drivers and devices with which VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT **may** be shared, query mechanisms exist in the Vulkan API that prevent the import of incompatible dma-bufs (such as vkGetMemoryFdPropertiesKHR) and that prevent incompatible usage of dma-bufs

(such as VkPhysicalDeviceExternalBufferInfo and VkPhysicalDeviceExternalImageFormatInfo).

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryHandleTypeFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryHandleTypeFlags VkExternalMemoryHandleTypeFlagsKHR;
```

VkExternalMemoryHandleTypeFlags is a bitmask type for setting a mask of zero or more VkExternalMemoryHandleTypeFlagBits.

The VkExternalImageFormatProperties structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalImageFormatProperties {
    VkStructureType               sType;
    void*                         pNext;
    VkExternalMemoryProperties    externalMemoryProperties;
} VkExternalImageFormatProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalImageFormatProperties VkExternalImageFormatPropertiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- externalMemoryProperties is a VkExternalMemoryProperties structure specifying various capabilities of the external handle type when used with the specified image creation parameters.

Valid Usage (Implicit)

- VUID-VkExternalImageFormatProperties-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXTERNAL_IMAGE_FORMAT_PROPERTIES

The VkExternalMemoryProperties structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryProperties {
    VkExternalMemoryFeatureFlags       externalMemoryFeatures;
    VkExternalMemoryHandleTypeFlags    exportFromImportedHandleTypes;
    VkExternalMemoryHandleTypeFlags    compatibleHandleTypes;
} VkExternalMemoryProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryProperties VkExternalMemoryPropertiesKHR;
```

- `externalMemoryFeatures` is a bitmask of VkExternalMemoryFeatureFlagBits specifying the features of `handleType`.
- `exportFromImportedHandleTypes` is a bitmask of VkExternalMemoryHandleTypeFlagBits specifying which types of imported handle `handleType` **can** be exported from.
- `compatibleHandleTypes` is a bitmask of VkExternalMemoryHandleTypeFlagBits specifying handle types which **can** be specified at the same time as `handleType` when creating an image compatible with external memory.

`compatibleHandleTypes` **must** include at least `handleType`. Inclusion of a handle type in `compatibleHandleTypes` does not imply the values returned in VkImageFormatProperties2 will be the same when VkPhysicalDeviceExternalImageFormatInfo::`handleType` is set to that type. The application is responsible for querying the capabilities of all handle types intended for concurrent use in a single image and intersecting them to obtain the compatible set of capabilities.

Bits which **may** be set in VkExternalMemoryProperties::`externalMemoryFeatures`, specifying features of an external memory handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalMemoryFeatureFlagBits {
    VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT = 0x00000001,
    VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT = 0x00000002,
    VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT = 0x00000004,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT_KHR =
VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT_KHR =
VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT,
  // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT_KHR =
VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT,
} VkExternalMemoryFeatureFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryFeatureFlagBits VkExternalMemoryFeatureFlagBitsKHR;
```

- VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT specifies that images or buffers created with the specified parameters and handle type **must** use the mechanisms defined by VkMemoryDedicatedRequirements and VkMemoryDedicatedAllocateInfo to create (or import) a dedicated allocation for the image or buffer.
- VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT specifies that handles of this type **can** be exported from Vulkan memory objects.
- VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT specifies that handles of this type **can** be imported as Vulkan memory objects.

Because their semantics in external APIs roughly align with that of an image or buffer with a dedicated allocation in Vulkan, implementations are **required** to report VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT for the following external handle types:

- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID for images only
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX for images only

Implementations **must** not report VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT for buffers with external handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID. Implementations **must** not report VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT for buffers with external handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX. Implementations **must** not report VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT for images or buffers with external handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryFeatureFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryFeatureFlags VkExternalMemoryFeatureFlagsKHR;
```

VkExternalMemoryFeatureFlags is a bitmask type for setting a mask of zero or more VkExternalMemoryFeatureFlagBits.

To query the image capabilities that are compatible with a Linux DRM format modifier, set VkPhysicalDeviceImageFormatInfo2::tiling to VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT and add a VkPhysicalDeviceImageDrmFormatModifierInfoEXT structure to the pNext chain of

VkPhysicalDeviceImageFormatInfo2.

The VkPhysicalDeviceImageDrmFormatModifierInfoEXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkPhysicalDeviceImageDrmFormatModifierInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           drmFormatModifier;
    VkSharingMode      sharingMode;
    uint32_t           queueFamilyIndexCount;
    const uint32_t*    pQueueFamilyIndices;
} VkPhysicalDeviceImageDrmFormatModifierInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- drmFormatModifier is the image's *Linux DRM format modifier*, corresponding to VkImageDrmFormatModifierExplicitCreateInfoEXT::modifier or to VkImageDrmFormatModifierListCreateInfoEXT::pModifiers.
- sharingMode specifies how the image will be accessed by multiple queue families.
- queueFamilyIndexCount is the number of entries in the pQueueFamilyIndices array.
- pQueueFamilyIndices is a pointer to an array of queue families that will access the image. It is ignored if sharingMode is not VK_SHARING_MODE_CONCURRENT.

If the drmFormatModifier is incompatible with the parameters specified in VkPhysicalDeviceImageFormatInfo2 and its pNext chain, then vkGetPhysicalDeviceImageFormatProperties2 returns VK_ERROR_FORMAT_NOT_SUPPORTED. The implementation **must** support the query of any drmFormatModifier, including unknown and invalid modifier values.

Valid Usage

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02314
  If sharingMode is VK_SHARING_MODE_CONCURRENT, then pQueueFamilyIndices **must** be a valid pointer to an array of queueFamilyIndexCount uint32_t values
- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02315
  If sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount **must** be greater than 1
- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02316
  If sharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices **must** be unique and **must** be less than the pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_DRM_FORMAT_MODIFIER_INFO_EXT`
- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-parameter
  `sharingMode` **must** be a valid VkSharingMode value

To determine the number of combined image samplers required to support a multi-planar format, add VkSamplerYcbcrConversionImageFormatProperties to the `pNext` chain of the VkImageFormatProperties2 structure in a call to `vkGetPhysicalDeviceImageFormatProperties2`.

The `VkSamplerYcbcrConversionImageFormatProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionImageFormatProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           combinedImageSamplerDescriptorCount;
} VkSamplerYcbcrConversionImageFormatProperties;
```

or the equivalent

```
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionImageFormatProperties
VkSamplerYcbcrConversionImageFormatPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `combinedImageSamplerDescriptorCount` is the number of combined image sampler descriptors that the implementation uses to access the format.

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionImageFormatProperties-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_IMAGE_FORMAT_PROPERTIES`

`combinedImageSamplerDescriptorCount` is a number between 1 and the number of planes in the format. A descriptor set layout binding with immutable $Y'C_BC_R$ conversion samplers will have a maximum `combinedImageSamplerDescriptorCount` which is the maximum across all formats supported by its samplers of the `combinedImageSamplerDescriptorCount` for each format. Descriptor sets with that layout will internally use that maximum `combinedImageSamplerDescriptorCount` descriptors for each descriptor in the binding. This expanded number of descriptors will be consumed from the descriptor pool when a descriptor set is allocated, and counts towards the

maxDescriptorSetSamplers, maxDescriptorSetSampledImages, maxPerStageDescriptorSamplers, and maxPerStageDescriptorSampledImages limits.

NOTE

All descriptors in a binding use the same maximum combinedImageSamplerDescriptorCount descriptors to allow implementations to use a uniform stride for dynamic indexing of the descriptors in the binding.

For example, consider a descriptor set layout binding with two descriptors and immutable samplers for multi-planar formats that have VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount values of 2 and 3 respectively. There are two descriptors in the binding and the maximum combinedImageSamplerDescriptorCount is 3, so descriptor sets with this layout consume 6 descriptors from the descriptor pool. To create a descriptor pool that allows allocating four descriptor sets with this layout, descriptorCount must be at least 24.

Instead of querying all the potential formats that the application might use in the descriptor layout, the application **can** use the VkPhysicalDeviceMaintenance6PropertiesKHR::maxCombinedImageSamplerDescriptorCount property to determine the maximum descriptor size that will accommodate any and all formats that require a sampler $Y'C_BC_R$ conversion supported by the implementation.

To obtain optimal Android hardware buffer usage flags for specific image creation parameters, add a VkAndroidHardwareBufferUsageANDROID structure to the pNext chain of a VkImageFormatProperties2 structure passed to vkGetPhysicalDeviceImageFormatProperties2. This structure is defined as:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkAndroidHardwareBufferUsageANDROID {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           androidHardwareBufferUsage;
} VkAndroidHardwareBufferUsageANDROID;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- androidHardwareBufferUsage returns the Android hardware buffer usage flags.

The androidHardwareBufferUsage field **must** include Android hardware buffer usage flags listed in the AHardwareBuffer Usage Equivalence table when the corresponding Vulkan image usage or image creation flags are included in the usage or flags fields of VkPhysicalDeviceImageFormatInfo2. It **must** include at least one GPU usage flag (AHARDWAREBUFFER_USAGE_GPU_*), even if none of the corresponding Vulkan usages or flags are requested.

NOTE

Requiring at least one GPU usage flag ensures that Android hardware buffer memory will be allocated in a memory pool accessible to the Vulkan implementation, and that specializing the memory layout based on usage flags does

not prevent it from being compatible with Vulkan. Implementations **may** avoid unnecessary restrictions caused by this requirement by using vendor usage flags to indicate that only the Vulkan uses indicated in VkImageFormatProperties2 are required.

Valid Usage (Implicit)

- VUID-VkAndroidHardwareBufferUsageANDROID-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_USAGE_ANDROID`

To query if using `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` has a negative impact on device performance when accessing an image, add `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` to VkPhysicalDeviceImageFormatInfo2::`usage`, and add a `VkHostImageCopyDevicePerformanceQueryEXT` structure to the `pNext` chain of a VkImageFormatProperties2 structure passed to vkGetPhysicalDeviceImageFormatProperties2. This structure is defined as:

```
// Provided by VK_EXT_host_image_copy
typedef struct VkHostImageCopyDevicePerformanceQueryEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           optimalDeviceAccess;
    VkBool32           identicalMemoryLayout;
} VkHostImageCopyDevicePerformanceQueryEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `optimalDeviceAccess` returns `VK_TRUE` if use of host image copy has no adverse effect on device access performance, compared to an image that is created with exact same creation parameters, and bound to the same VkDeviceMemory, except that `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` is replaced with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` and `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.
- `identicalMemoryLayout` returns `VK_TRUE` if use of host image copy has no impact on memory layout compared to an image that is created with exact same creation parameters, and bound to the same VkDeviceMemory, except that `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` is replaced with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` and `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.

The implementation **may** return `VK_FALSE` in `optimalDeviceAccess` if `identicalMemoryLayout` is `VK_FALSE`. If `identicalMemoryLayout` is `VK_TRUE`, `optimalDeviceAccess` **must** be `VK_TRUE`.

The implementation **may** return `VK_TRUE` in `optimalDeviceAccess` while `identicalMemoryLayout` is `VK_FALSE`. In this situation, any device performance impact **should** not be measurable.

If VkPhysicalDeviceImageFormatInfo2::`format` is a block-compressed format and vkGetPhysicalDeviceImageFormatProperties2 returns `VK_SUCCESS`, the implementation **must** return `VK_TRUE` in `optimalDeviceAccess`.

NOTE Applications can make use of `optimalDeviceAccess` to determine their resource

copying strategy. If a resource is expected to be accessed more on device than on the host, and the implementation considers the resource sub-optimally accessed, it is likely better to use device copies instead.

NOTE Layout not being identical yet still considered optimal for device access could happen if the implementation has different memory layout patterns, some of which are easier to access on the host.

NOTE The most practical reason for `optimalDeviceAccess` to be `VK_FALSE` is that host image access may disable framebuffer compression where it would otherwise have been enabled. This represents far more efficient host image access since no compression algorithm is required to read or write to the image, but it would impact device access performance. Some implementations may only set `optimalDeviceAccess` to `VK_FALSE` if certain conditions are met, such as specific image usage flags or creation flags.

Valid Usage (Implicit)

- VUID-VkHostImageCopyDevicePerformanceQueryEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_HOST_IMAGE_COPY_DEVICE_PERFORMANCE_QUERY_EXT`

To determine if cubic filtering can be used with a given image format and a given image view type add a VkPhysicalDeviceImageViewImageFormatInfoEXT structure to the `pNext` chain of the VkPhysicalDeviceImageFormatInfo2 structure, and a VkFilterCubicImageViewImageFormatPropertiesEXT structure to the `pNext` chain of the VkImageFormatProperties2 structure.

The `VkPhysicalDeviceImageViewImageFormatInfoEXT` structure is defined as:

```
// Provided by VK_EXT_filter_cubic
typedef struct VkPhysicalDeviceImageViewImageFormatInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    VkImageViewType    imageViewType;
} VkPhysicalDeviceImageViewImageFormatInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageViewType` is a VkImageViewType value specifying the type of the image view.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_VIEW_IMAGE_FORMAT_INFO_EXT`

- VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-imageViewType-parameter
  `imageViewType` **must** be a valid VkImageViewType value

The `VkFilterCubicImageViewImageFormatPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_filter_cubic
typedef struct VkFilterCubicImageViewImageFormatPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           filterCubic;
    VkBool32           filterCubicMinmax;
} VkFilterCubicImageViewImageFormatPropertiesEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `filterCubic` tells if image format, image type and image view type **can** be used with cubic filtering. This field is set by the implementation. An application-specified value is ignored.
- `filterCubicMinmax` tells if image format, image type and image view type **can** be used with cubic filtering and minmax filtering. This field is set by the implementation. An application-specified value is ignored.

Valid Usage (Implicit)

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_FILTER_CUBIC_IMAGE_VIEW_IMAGE_FORMAT_PROPERTIES_EXT`

Valid Usage

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-pNext-02627
  If the `pNext` chain of the VkImageFormatProperties2 structure includes a VkFilterCubicImageViewImageFormatPropertiesEXT structure, the `pNext` chain of the VkPhysicalDeviceImageFormatInfo2 structure **must** include a VkPhysicalDeviceImageViewImageFormatInfoEXT structure with an `imageViewType` that is compatible with `imageType`

49.1.1. Supported Sample Counts

`vkGetPhysicalDeviceImageFormatProperties` returns a bitmask of VkSampleCountFlagBits in `sampleCounts` specifying the supported sample counts for the image parameters.

`sampleCounts` will be `VK_SAMPLE_COUNT_1_BIT` if at least one of the following conditions is true:

- `tiling` is `VK_IMAGE_TILING_LINEAR`
- `type` is not `VK_IMAGE_TYPE_2D`

- `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`
- Neither the `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` flag nor the `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT` flag in `VkFormatProperties::optimalTilingFeatures` returned by vkGetPhysicalDeviceFormatProperties is set
- VkPhysicalDeviceExternalImageFormatInfo::`handleType` is an external handle type for which multisampled image support is not required.
- `format` is one of the formats that require a sampler $Y'C_BC_R$ conversion
- `usage` contains `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `usage` contains `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`

Otherwise, the bits set in `sampleCounts` will be the sample counts supported for the specified values of `usage` and `format`. For each bit set in `usage`, the supported sample counts relate to the limits in `VkPhysicalDeviceLimits` as follows:

- If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` and `format` is a floating- or fixed-point color format, a superset of `VkPhysicalDeviceLimits::framebufferColorSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and `format` includes a depth component, a superset of `VkPhysicalDeviceLimits::framebufferDepthSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and `format` includes a stencil component, a superset of `VkPhysicalDeviceLimits::framebufferStencilSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_SAMPLED_BIT`, and `format` includes a color component, a superset of `VkPhysicalDeviceLimits::sampledImageColorSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_SAMPLED_BIT`, and `format` includes a depth component, a superset of `VkPhysicalDeviceLimits::sampledImageDepthSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_SAMPLED_BIT`, and `format` is an integer format, a superset of `VkPhysicalDeviceLimits::sampledImageIntegerSampleCounts`
- If `usage` includes `VK_IMAGE_USAGE_STORAGE_BIT`, a superset of `VkPhysicalDeviceLimits::storageImageSampleCounts`

If multiple bits are set in `usage`, `sampleCounts` will be the intersection of the per-usage values described above.

If none of the bits described above are set in `usage`, then there is no corresponding limit in `VkPhysicalDeviceLimits`. In this case, `sampleCounts` **must** include at least `VK_SAMPLE_COUNT_1_BIT`.

49.1.2. Allowed Extent Values Based on Image Type

Implementations **may** support extent values larger than the required minimum/maximum values for certain types of images. VkImageFormatProperties::`maxExtent` for each type is subject to the constraints below.

NOTE

Implementations **must** support images with dimensions up to the required minimum/maximum values for all types of images. It follows that the query for additional capabilities **must** return extent values that are at least as large as the

required values.

For VK_IMAGE_TYPE_1D:

- maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimension1D
- maxExtent.height = 1
- maxExtent.depth = 1

For VK_IMAGE_TYPE_2D when flags does not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT:

- maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimension2D
- maxExtent.height ≥ VkPhysicalDeviceLimits::maxImageDimension2D
- maxExtent.depth = 1

For VK_IMAGE_TYPE_2D when flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT:

- maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimensionCube
- maxExtent.height ≥ VkPhysicalDeviceLimits::maxImageDimensionCube
- maxExtent.depth = 1

For VK_IMAGE_TYPE_3D:

- maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimension3D
- maxExtent.height ≥ VkPhysicalDeviceLimits::maxImageDimension3D
- maxExtent.depth ≥ VkPhysicalDeviceLimits::maxImageDimension3D

49.2. Additional Buffer Capabilities

To query the external handle types supported by buffers, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalBufferProperties(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceExternalBufferInfo*   pExternalBufferInfo,
    VkExternalBufferProperties*                 pExternalBufferProperties);
```

or the equivalent command

```
// Provided by VK_KHR_external_memory_capabilities
void vkGetPhysicalDeviceExternalBufferPropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceExternalBufferInfo*   pExternalBufferInfo,
    VkExternalBufferProperties*                 pExternalBufferProperties);
```

- physicalDevice is the physical device from which to query the buffer capabilities.

- `pExternalBufferInfo` is a pointer to a VkPhysicalDeviceExternalBufferInfo structure describing the parameters that would be consumed by vkCreateBuffer.
- `pExternalBufferProperties` is a pointer to a VkExternalBufferProperties structure in which capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalBufferProperties-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferInfo-parameter
  `pExternalBufferInfo` **must** be a valid pointer to a valid VkPhysicalDeviceExternalBufferInfo structure
- VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferProperties-parameter
  `pExternalBufferProperties` **must** be a valid pointer to a VkExternalBufferProperties structure

The `VkPhysicalDeviceExternalBufferInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalBufferInfo {
    VkStructureType                       sType;
    const void*                           pNext;
    VkBufferCreateFlags                   flags;
    VkBufferUsageFlags                    usage;
    VkExternalMemoryHandleTypeFlagBits    handleType;
} VkPhysicalDeviceExternalBufferInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkPhysicalDeviceExternalBufferInfo VkPhysicalDeviceExternalBufferInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkBufferCreateFlagBits describing additional parameters of the buffer, corresponding to VkBufferCreateInfo::`flags`.
- `usage` is a bitmask of VkBufferUsageFlagBits describing the intended usage of the buffer, corresponding to VkBufferCreateInfo::`usage`.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the memory handle type that will be used with the memory associated with the buffer.

Only usage flags representable in VkBufferUsageFlagBits are returned in this structure's `usage`. If

the pNext chain includes a VkBufferUsageFlags2CreateInfoKHR structure, all usage flags of the buffer are returned in VkBufferUsageFlags2CreateInfoKHR::usage.

Valid Usage

- VUID-VkPhysicalDeviceExternalBufferInfo-None-09499
  If the pNext chain does not include a VkBufferUsageFlags2CreateInfoKHR structure, usage **must** be a valid combination of VkBufferUsageFlagBits values
- VUID-VkPhysicalDeviceExternalBufferInfo-None-09500
  If the pNext chain does not include a VkBufferUsageFlags2CreateInfoKHR structure, usage **must** not be 0

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalBufferInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_BUFFER_INFO
- VUID-VkPhysicalDeviceExternalBufferInfo-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkBufferUsageFlags2CreateInfoKHR
- VUID-VkPhysicalDeviceExternalBufferInfo-sType-unique
  The sType value of each struct in the pNext chain **must** be unique
- VUID-VkPhysicalDeviceExternalBufferInfo-flags-parameter
  flags **must** be a valid combination of VkBufferCreateFlagBits values
- VUID-VkPhysicalDeviceExternalBufferInfo-handleType-parameter
  handleType **must** be a valid VkExternalMemoryHandleTypeFlagBits value

The VkExternalBufferProperties structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalBufferProperties {
    VkStructureType                 sType;
    void*                           pNext;
    VkExternalMemoryProperties      externalMemoryProperties;
} VkExternalBufferProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalBufferProperties VkExternalBufferPropertiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- externalMemoryProperties is a VkExternalMemoryProperties structure specifying various

capabilities of the external handle type when used with the specified buffer creation parameters.

Valid Usage (Implicit)

- VUID-VkExternalBufferProperties-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_BUFFER_PROPERTIES`
- VUID-VkExternalBufferProperties-pNext-pNext
  `pNext` **must** be `NULL`

49.3. Optional Semaphore Capabilities

Semaphores **may** support import and export of their payload to external handles. To query the external handle types supported by semaphores, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalSemaphoreProperties(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceExternalSemaphoreInfo* pExternalSemaphoreInfo,
    VkExternalSemaphoreProperties*              pExternalSemaphoreProperties);
```

or the equivalent command

```
// Provided by VK_KHR_external_semaphore_capabilities
void vkGetPhysicalDeviceExternalSemaphorePropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceExternalSemaphoreInfo* pExternalSemaphoreInfo,
    VkExternalSemaphoreProperties*              pExternalSemaphoreProperties);
```

- `physicalDevice` is the physical device from which to query the semaphore capabilities.
- `pExternalSemaphoreInfo` is a pointer to a VkPhysicalDeviceExternalSemaphoreInfo structure describing the parameters that would be consumed by vkCreateSemaphore.
- `pExternalSemaphoreProperties` is a pointer to a VkExternalSemaphoreProperties structure in which capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreInfo-parameter
  `pExternalSemaphoreInfo` **must** be a valid pointer to a valid VkPhysicalDeviceExternalSemaphoreInfo structure

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreProperties-parameter
  pExternalSemaphoreProperties **must** be a valid pointer to a VkExternalSemaphoreProperties structure

The VkPhysicalDeviceExternalSemaphoreInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalSemaphoreInfo {
    VkStructureType                          sType;
    const void*                              pNext;
    VkExternalSemaphoreHandleTypeFlagBits    handleType;
} VkPhysicalDeviceExternalSemaphoreInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkPhysicalDeviceExternalSemaphoreInfo
VkPhysicalDeviceExternalSemaphoreInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleType is a VkExternalSemaphoreHandleTypeFlagBits value specifying the external semaphore handle type for which capabilities will be returned.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SEMAPHORE_INFO
- VUID-VkPhysicalDeviceExternalSemaphoreInfo-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkSemaphoreTypeCreateInfo
- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-unique
  The sType value of each struct in the pNext chain **must** be unique
- VUID-VkPhysicalDeviceExternalSemaphoreInfo-handleType-parameter
  handleType **must** be a valid VkExternalSemaphoreHandleTypeFlagBits value

Bits which **may** be set in VkPhysicalDeviceExternalSemaphoreInfo::handleType, specifying an external semaphore handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreHandleTypeFlagBits {
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT = 0x00000008,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT = 0x00000010,
  // Provided by VK_FUCHSIA_external_semaphore
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA = 0x00000080,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D11_FENCE_BIT =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT,
  // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT,
  // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT,
  // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
  // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT,
  // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT,
} VkExternalSemaphoreHandleTypeFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreHandleTypeFlagBits
VkExternalSemaphoreHandleTypeFlagBitsKHR;
```

- VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls dup, dup2, close, and the non-standard system call dup3. Additionally, it **must** be transportable over a socket using an SCM_RIGHTS control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.
- VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the functions DuplicateHandle, CloseHandle, CompareObjectHandles, GetHandleInformation, and SetHandleInformation. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.
- VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive

represented by its Vulkan semaphore object, and will therefore become invalid when all Vulkan semaphore objects associated with it are destroyed.

- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` specifies an NT handle returned by `ID3D12Device`::`CreateSharedHandle` referring to a Direct3D 12 fence, or `ID3D11Device5`::`CreateFence` referring to a Direct3D 11 fence. It owns a reference to the underlying synchronization primitive associated with the Direct3D fence.
- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D11_FENCE_BIT` is an alias of `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` with the same meaning. It is provided for convenience and code clarity when interacting with D3D11 fences.
- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` specifies a POSIX file descriptor handle to a Linux Sync File or Android Fence object. It can be used with any native API accepting a valid sync file or fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type **must** accept any type of sync or fence FD supported by the native system they are running on.
- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA` specifies a handle to a Zircon event object. It can be used with any native API that accepts a Zircon event handle. Zircon event handles are created with `ZX_RIGHTS_BASIC` and `ZX_RIGHTS_SIGNAL` rights. Vulkan on Fuchsia uses only the ZX_EVENT_SIGNALED bit when signaling or waiting.

NOTE

Handles of type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` generated by the implementation may represent either Linux Sync Files or Android Fences at the implementation's discretion. Applications **should** only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.

Some external semaphore handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

Table 96. External Semaphore Handle Types Compatibility

Handle type	VkPhysicalDeviceIDProperties::driverUUID	VkPhysicalDeviceIDProperties::deviceUUID
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT	Must match	Must match
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT	No restriction	No restriction
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA	No restriction	No restriction

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalSemaphoreHandleTypeFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreHandleTypeFlags VkExternalSemaphoreHandleTypeFlagsKHR;
```

VkExternalSemaphoreHandleTypeFlags is a bitmask type for setting a mask of zero or more VkExternalSemaphoreHandleTypeFlagBits.

The VkExternalSemaphoreProperties structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalSemaphoreProperties {
    VkStructureType                       sType;
    void*                                 pNext;
    VkExternalSemaphoreHandleTypeFlags    exportFromImportedHandleTypes;
    VkExternalSemaphoreHandleTypeFlags    compatibleHandleTypes;
    VkExternalSemaphoreFeatureFlags       externalSemaphoreFeatures;
} VkExternalSemaphoreProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreProperties VkExternalSemaphorePropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `exportFromImportedHandleTypes` is a bitmask of VkExternalSemaphoreHandleTypeFlagBits specifying which types of imported handle `handleType` **can** be exported from.
- `compatibleHandleTypes` is a bitmask of VkExternalSemaphoreHandleTypeFlagBits specifying handle types which **can** be specified at the same time as `handleType` when creating a semaphore.
- `externalSemaphoreFeatures` is a bitmask of VkExternalSemaphoreFeatureFlagBits describing the features of `handleType`.

If `handleType` is not supported by the implementation, then VkExternalSemaphoreProperties ::`externalSemaphoreFeatures` will be zero.

Valid Usage (Implicit)

- VUID-VkExternalSemaphoreProperties-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_SEMAPHORE_PROPERTIES`
- VUID-VkExternalSemaphoreProperties-pNext-pNext
  `pNext` **must** be `NULL`

Bits which **may** be set in VkExternalSemaphoreProperties::`externalSemaphoreFeatures`, specifying the features of an external semaphore handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreFeatureFlagBits {
    VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT = 0x00000002,
  // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT,
  // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT_KHR =
VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT,
} VkExternalSemaphoreFeatureFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreFeatureFlagBits VkExternalSemaphoreFeatureFlagBitsKHR;
```

- `VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT` specifies that handles of this type **can** be exported from Vulkan semaphore objects.
- `VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT` specifies that handles of this type **can** be imported as Vulkan semaphore objects.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalSemaphoreFeatureFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreFeatureFlags VkExternalSemaphoreFeatureFlagsKHR;
```

VkExternalSemaphoreFeatureFlags is a bitmask type for setting a mask of zero or more VkExternalSemaphoreFeatureFlagBits.

49.4. Optional Fence Capabilities

Fences **may** support import and export of their payload to external handles. To query the external handle types supported by fences, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalFenceProperties(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceExternalFenceInfo*    pExternalFenceInfo,
    VkExternalFenceProperties*                  pExternalFenceProperties);
```

or the equivalent command

```
// Provided by VK_KHR_external_fence_capabilities
void vkGetPhysicalDeviceExternalFencePropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    const VkPhysicalDeviceExternalFenceInfo*    pExternalFenceInfo,
    VkExternalFenceProperties*                  pExternalFenceProperties);
```

- physicalDevice is the physical device from which to query the fence capabilities.
- pExternalFenceInfo is a pointer to a VkPhysicalDeviceExternalFenceInfo structure describing the parameters that would be consumed by vkCreateFence.
- pExternalFenceProperties is a pointer to a VkExternalFenceProperties structure in which capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalFenceProperties-physicalDevice-parameter physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceExternalFenceProperties-pExternalFenceInfo-parameter pExternalFenceInfo **must** be a valid pointer to a valid VkPhysicalDeviceExternalFenceInfo structure

- VUID-vkGetPhysicalDeviceExternalFenceProperties-pExternalFenceProperties-parameter
  `pExternalFenceProperties` **must** be a valid pointer to a VkExternalFenceProperties structure

The `VkPhysicalDeviceExternalFenceInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalFenceInfo {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalFenceHandleTypeFlagBits     handleType;
} VkPhysicalDeviceExternalFenceInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkPhysicalDeviceExternalFenceInfo VkPhysicalDeviceExternalFenceInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a VkExternalFenceHandleTypeFlagBits value specifying an external fence handle type for which capabilities will be returned.

NOTE

Handles of type `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` generated by the implementation may represent either Linux Sync Files or Android Fences at the implementation's discretion. Applications **should** only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalFenceInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_FENCE_INFO`
- VUID-VkPhysicalDeviceExternalFenceInfo-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPhysicalDeviceExternalFenceInfo-handleType-parameter
  `handleType` **must** be a valid VkExternalFenceHandleTypeFlagBits value

Bits which **may** be set in

- VkPhysicalDeviceExternalFenceInfo::`handleType`
- VkExternalFenceProperties::`exportFromImportedHandleTypes`

- VkExternalFenceProperties::compatibleHandleTypes

indicate external fence handle types, and are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalFenceHandleTypeFlagBits {
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT = 0x00000008,
  // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT_KHR =
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT,
  // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR =
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT,
  // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR =
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
  // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT_KHR =
VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT,
} VkExternalFenceHandleTypeFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceHandleTypeFlagBits VkExternalFenceHandleTypeFlagBitsKHR;
```

- VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls dup, dup2, close, and the non-standard system call dup3. Additionally, it **must** be transportable over a socket using an SCM_RIGHTS control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.
- VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the functions DuplicateHandle, CloseHandle, CompareObjectHandles, GetHandleInformation, and SetHandleInformation. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.
- VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive represented by its Vulkan fence object, and will therefore become invalid when all Vulkan fence objects associated with it are destroyed.
- VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT specifies a POSIX file descriptor handle to a Linux Sync File or Android Fence. It can be used with any native API accepting a valid sync file or

fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type **must** accept any type of sync or fence FD supported by the native system they are running on.

Some external fence handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

Table 97. External Fence Handle Types Compatibility

Handle type	VkPhysicalDeviceIDProperties::driverUUID	VkPhysicalDeviceIDProperties::deviceUUID
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Must match	Must match
VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT	No restriction	No restriction

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalFenceHandleTypeFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceHandleTypeFlags VkExternalFenceHandleTypeFlagsKHR;
```

VkExternalFenceHandleTypeFlags is a bitmask type for setting a mask of zero or more VkExternalFenceHandleTypeFlagBits.

The VkExternalFenceProperties structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalFenceProperties {
    VkStructureType                 sType;
    void*                           pNext;
    VkExternalFenceHandleTypeFlags  exportFromImportedHandleTypes;
    VkExternalFenceHandleTypeFlags  compatibleHandleTypes;
    VkExternalFenceFeatureFlags     externalFenceFeatures;
} VkExternalFenceProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceProperties VkExternalFencePropertiesKHR;
```

- exportFromImportedHandleTypes is a bitmask of VkExternalFenceHandleTypeFlagBits indicating which types of imported handle handleType **can** be exported from.

- `compatibleHandleTypes` is a bitmask of VkExternalFenceHandleTypeFlagBits specifying handle types which **can** be specified at the same time as `handleType` when creating a fence.
- `externalFenceFeatures` is a bitmask of VkExternalFenceFeatureFlagBits indicating the features of `handleType`.

If `handleType` is not supported by the implementation, then VkExternalFenceProperties ::`externalFenceFeatures` will be zero.

Valid Usage (Implicit)

- VUID-VkExternalFenceProperties-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_FENCE_PROPERTIES`
- VUID-VkExternalFenceProperties-pNext-pNext
  `pNext` **must** be `NULL`

Bits which **may** be set in VkExternalFenceProperties::`externalFenceFeatures`, indicating features of a fence external handle type, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkExternalFenceFeatureFlagBits {
    VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT = 0x00000002,
  // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT_KHR =
VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT,
  // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT_KHR =
VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT,
} VkExternalFenceFeatureFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceFeatureFlagBits VkExternalFenceFeatureFlagBitsKHR;
```

- `VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT` specifies handles of this type **can** be exported from Vulkan fence objects.
- `VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT` specifies handles of this type **can** be imported to Vulkan fence objects.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalFenceFeatureFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceFeatureFlags VkExternalFenceFeatureFlagsKHR;
```

VkExternalFenceFeatureFlags is a bitmask type for setting a mask of zero or more VkExternalFenceFeatureFlagBits.

49.5. Timestamp Calibration Capabilities

To query the set of time domains for which a physical device supports timestamp calibration, call:

```
// Provided by VK_KHR_calibrated_timestamps
VkResult vkGetPhysicalDeviceCalibrateableTimeDomainsKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pTimeDomainCount,
    VkTimeDomainKHR*                            pTimeDomains);
```

or the equivalent command

```
// Provided by VK_EXT_calibrated_timestamps
VkResult vkGetPhysicalDeviceCalibrateableTimeDomainsEXT(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pTimeDomainCount,
    VkTimeDomainKHR*                            pTimeDomains);
```

- physicalDevice is the physical device from which to query the set of calibrateable time domains.
- pTimeDomainCount is a pointer to an integer related to the number of calibrateable time domains available or queried, as described below.
- pTimeDomains is either NULL or a pointer to an array of VkTimeDomainKHR values, indicating the supported calibrateable time domains.

If pTimeDomains is NULL, then the number of calibrateable time domains supported for the given physicalDevice is returned in pTimeDomainCount. Otherwise, pTimeDomainCount **must** point to a variable set by the application to the number of elements in the pTimeDomains array, and on return the variable is overwritten with the number of values actually written to pTimeDomains. If the value of pTimeDomainCount is less than the number of calibrateable time domains supported, at most pTimeDomainCount values will be written to pTimeDomains, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available time domains were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsKHR-physicalDevice-parameter physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsKHR-pTimeDomainCount-parameter

pTimeDomainCount **must** be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsKHR-pTimeDomains-parameter
  If the value referenced by pTimeDomainCount is not 0, and pTimeDomains is not NULL, pTimeDomains **must** be a valid pointer to an array of pTimeDomainCount VkTimeDomainKHR values

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Chapter 50. Debugging

To aid developers in tracking down errors in the application's use of Vulkan, particularly in combination with an external debugger or profiler, *debugging extensions* may be available.

The VkObjectType enumeration defines values, each of which corresponds to a specific Vulkan handle type. These values **can** be used to associate debug information with a particular type of object through one or more extensions.

```
// Provided by VK_VERSION_1_0
typedef enum VkObjectType {
    VK_OBJECT_TYPE_UNKNOWN = 0,
    VK_OBJECT_TYPE_INSTANCE = 1,
    VK_OBJECT_TYPE_PHYSICAL_DEVICE = 2,
    VK_OBJECT_TYPE_DEVICE = 3,
    VK_OBJECT_TYPE_QUEUE = 4,
    VK_OBJECT_TYPE_SEMAPHORE = 5,
    VK_OBJECT_TYPE_COMMAND_BUFFER = 6,
    VK_OBJECT_TYPE_FENCE = 7,
    VK_OBJECT_TYPE_DEVICE_MEMORY = 8,
    VK_OBJECT_TYPE_BUFFER = 9,
    VK_OBJECT_TYPE_IMAGE = 10,
    VK_OBJECT_TYPE_EVENT = 11,
    VK_OBJECT_TYPE_QUERY_POOL = 12,
    VK_OBJECT_TYPE_BUFFER_VIEW = 13,
    VK_OBJECT_TYPE_IMAGE_VIEW = 14,
    VK_OBJECT_TYPE_SHADER_MODULE = 15,
    VK_OBJECT_TYPE_PIPELINE_CACHE = 16,
    VK_OBJECT_TYPE_PIPELINE_LAYOUT = 17,
    VK_OBJECT_TYPE_RENDER_PASS = 18,
    VK_OBJECT_TYPE_PIPELINE = 19,
    VK_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT = 20,
    VK_OBJECT_TYPE_SAMPLER = 21,
    VK_OBJECT_TYPE_DESCRIPTOR_POOL = 22,
    VK_OBJECT_TYPE_DESCRIPTOR_SET = 23,
    VK_OBJECT_TYPE_FRAMEBUFFER = 24,
    VK_OBJECT_TYPE_COMMAND_POOL = 25,
  // Provided by VK_VERSION_1_1
    VK_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION = 1000156000,
  // Provided by VK_VERSION_1_1
    VK_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE = 1000085000,
    VK_OBJECT_TYPE_PRIVATE_DATA_SLOT = 1000295000,
  // Provided by VK_KHR_surface
    VK_OBJECT_TYPE_SURFACE_KHR = 1000000000,
  // Provided by VK_KHR_swapchain
    VK_OBJECT_TYPE_SWAPCHAIN_KHR = 1000001000,
  // Provided by VK_KHR_display
    VK_OBJECT_TYPE_DISPLAY_KHR = 1000002000,
  // Provided by VK_KHR_display
    VK_OBJECT_TYPE_DISPLAY_MODE_KHR = 1000002001,
```

```
  // Provided by VK_EXT_debug_report
    VK_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT = 1000011000,
  // Provided by VK_KHR_video_queue
    VK_OBJECT_TYPE_VIDEO_SESSION_KHR = 1000023000,
  // Provided by VK_KHR_video_queue
    VK_OBJECT_TYPE_VIDEO_SESSION_PARAMETERS_KHR = 1000023001,
  // Provided by VK_NVX_binary_import
    VK_OBJECT_TYPE_CU_MODULE_NVX = 1000029000,
  // Provided by VK_NVX_binary_import
    VK_OBJECT_TYPE_CU_FUNCTION_NVX = 1000029001,
  // Provided by VK_EXT_debug_utils
    VK_OBJECT_TYPE_DEBUG_UTILS_MESSENGER_EXT = 1000128000,
  // Provided by VK_KHR_acceleration_structure
    VK_OBJECT_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
  // Provided by VK_EXT_validation_cache
    VK_OBJECT_TYPE_VALIDATION_CACHE_EXT = 1000160000,
  // Provided by VK_NV_ray_tracing
    VK_OBJECT_TYPE_ACCELERATION_STRUCTURE_NV = 1000165000,
  // Provided by VK_INTEL_performance_query
    VK_OBJECT_TYPE_PERFORMANCE_CONFIGURATION_INTEL = 1000210000,
  // Provided by VK_KHR_deferred_host_operations
    VK_OBJECT_TYPE_DEFERRED_OPERATION_KHR = 1000268000,
  // Provided by VK_NV_device_generated_commands
    VK_OBJECT_TYPE_INDIRECT_COMMANDS_LAYOUT_NV = 1000277000,
  // Provided by VK_NV_cuda_kernel_launch
    VK_OBJECT_TYPE_CUDA_MODULE_NV = 1000307000,
  // Provided by VK_NV_cuda_kernel_launch
    VK_OBJECT_TYPE_CUDA_FUNCTION_NV = 1000307001,
  // Provided by VK_FUCHSIA_buffer_collection
    VK_OBJECT_TYPE_BUFFER_COLLECTION_FUCHSIA = 1000366000,
  // Provided by VK_EXT_opacity_micromap
    VK_OBJECT_TYPE_MICROMAP_EXT = 1000396000,
  // Provided by VK_NV_optical_flow
    VK_OBJECT_TYPE_OPTICAL_FLOW_SESSION_NV = 1000464000,
  // Provided by VK_EXT_shader_object
    VK_OBJECT_TYPE_SHADER_EXT = 1000482000,
  // Provided by VK_KHR_pipeline_binary
    VK_OBJECT_TYPE_PIPELINE_BINARY_KHR = 1000483000,
  // Provided by VK_EXT_device_generated_commands
    VK_OBJECT_TYPE_INDIRECT_COMMANDS_LAYOUT_EXT = 1000572000,
  // Provided by VK_EXT_device_generated_commands
    VK_OBJECT_TYPE_INDIRECT_EXECUTION_SET_EXT = 1000572001,
  // Provided by VK_KHR_descriptor_update_template
    VK_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_KHR =
VK_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_KHR =
VK_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION,
  // Provided by VK_EXT_private_data
    VK_OBJECT_TYPE_PRIVATE_DATA_SLOT_EXT = VK_OBJECT_TYPE_PRIVATE_DATA_SLOT,
```

```
} VkObjectType;
```

Table 98. `VkObjectType` and Vulkan Handle Relationship

VkObjectType	Vulkan Handle Type
VK_OBJECT_TYPE_UNKNOWN	Unknown/Undefined Handle
VK_OBJECT_TYPE_INSTANCE	VkInstance
VK_OBJECT_TYPE_PHYSICAL_DEVICE	VkPhysicalDevice
VK_OBJECT_TYPE_DEVICE	VkDevice
VK_OBJECT_TYPE_QUEUE	VkQueue
VK_OBJECT_TYPE_SEMAPHORE	VkSemaphore
VK_OBJECT_TYPE_COMMAND_BUFFER	VkCommandBuffer
VK_OBJECT_TYPE_FENCE	VkFence
VK_OBJECT_TYPE_DEVICE_MEMORY	VkDeviceMemory
VK_OBJECT_TYPE_BUFFER	VkBuffer
VK_OBJECT_TYPE_IMAGE	VkImage
VK_OBJECT_TYPE_EVENT	VkEvent
VK_OBJECT_TYPE_QUERY_POOL	VkQueryPool

VK_OBJECT_TYPE_MICROMAP_EXT	VkMicromapEXT
VK_OBJECT_TYPE_OPTICAL_FLOW_SESSION_NV	VkOpticalFlowSessionNV
VK_OBJECT_TYPE_SHADER_EXT	VkShaderEXT

If this Specification was generated with any such extensions included, they will be described in the remainder of this chapter.

50.1. Debug Utilities

Vulkan provides flexible debugging utilities for debugging an application.

The Object Debug Annotation section describes how to associate either a name or binary data with a specific Vulkan object.

The Queue Labels section describes how to annotate and group the work submitted to a queue.

The Command Buffer Labels section describes how to associate logical elements of the scene with commands in a VkCommandBuffer.

The Debug Messengers section describes how to create debug messenger objects associated with an application supplied callback to capture debug messages from a variety of Vulkan components.

50.1.1. Object Debug Annotation

It can be useful for an application to provide its own content relative to a specific Vulkan object.

The following commands allow application developers to associate application-defined information with Vulkan objects. These commands are device-level commands but they **may** reference instance-level objects (such as VkInstance) and physical device-level objects (such as VkPhysicalDevice) with a few restrictions: * The data for the corresponding object **may** still be available after the VkDevice used in the corresponding API call to set it is destroyed, but access to this data is not guaranteed and should be avoided. * Subsequent calls to change the data of the same object across multiple VkDevice objects, **may** result in the data being changed to the most recent version for all VkDevice objects and not just the VkDevice used in the most recent API call.

Object Naming

An object can be given an application-defined name by calling:

```
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectNameEXT(
    VkDevice                                    device,
    const VkDebugUtilsObjectNameInfoEXT*        pNameInfo);
```

- device is the device that is associated with the named object passed in via objectHandle.
- pNameInfo is a pointer to a VkDebugUtilsObjectNameInfoEXT structure specifying parameters of the name to set on the object.

Valid Usage

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02587
  pNameInfo->objectType **must** not be VK_OBJECT_TYPE_UNKNOWN
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02588
  pNameInfo->objectHandle **must** not be VK_NULL_HANDLE
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07872
  If pNameInfo->objectHandle is the valid handle of an instance-level object, the VkDevice identified by device **must** be a descendent of the same VkInstance as the object identified by pNameInfo->objectHandle
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07873
  If pNameInfo->objectHandle is the valid handle of a physical-device-level object, the VkDevice identified by device **must** be a descendant of the same VkPhysicalDevice as the object identified by pNameInfo->objectHandle
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07874
  If pNameInfo->objectHandle is the valid handle of a device-level object, that object **must** be a descendent of the VkDevice identified by device

Valid Usage (Implicit)

- VUID-vkSetDebugUtilsObjectNameEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-parameter
  `pNameInfo` **must** be a valid pointer to a valid VkDebugUtilsObjectNameInfoEXT structure

Host Synchronization

- Host access to `pNameInfo->objectHandle` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDebugUtilsObjectNameInfoEXT` structure is defined as:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsObjectNameInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkObjectType       objectType;
    uint64_t           objectHandle;
    const char*        pObjectName;
} VkDebugUtilsObjectNameInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `objectType` is a VkObjectType specifying the type of the object to be named.
- `objectHandle` is the object to be named.
- `pObjectName` is either `NULL` or a null-terminated UTF-8 string specifying the name to apply to `objectHandle`.

Applications **may** change the name associated with an object simply by calling `vkSetDebugUtilsObjectNameEXT` again with a new string. If `pObjectName` is either `NULL` or an empty string, then any previously set name is removed.

The graphicsPipelineLibrary feature allows the specification of pipelines without the creation of VkShaderModule objects beforehand. In order to continue to allow naming these shaders independently, VkDebugUtilsObjectNameInfoEXT **can** be included in the pNext chain of VkPipelineShaderStageCreateInfo, which associates a static name with that particular shader.

Valid Usage

- VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02589
  If objectType is VK_OBJECT_TYPE_UNKNOWN, objectHandle **must** not be VK_NULL_HANDLE
- VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02590
  If objectType is not VK_OBJECT_TYPE_UNKNOWN, objectHandle **must** be VK_NULL_HANDLE or a valid Vulkan handle of the type associated with objectType as defined in the VkObjectType and Vulkan Handle Relationship table

Valid Usage (Implicit)

- VUID-VkDebugUtilsObjectNameInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT
- VUID-VkDebugUtilsObjectNameInfoEXT-objectType-parameter
  objectType **must** be a valid VkObjectType value
- VUID-VkDebugUtilsObjectNameInfoEXT-pObjectName-parameter
  If pObjectName is not NULL, pObjectName **must** be a null-terminated UTF-8 string

Object Data Association

In addition to setting a name for an object, debugging and validation layers **may** have uses for additional binary data on a per-object basis that have no other place in the Vulkan API.

For example, a VkShaderModule could have additional debugging data attached to it to aid in offline shader tracing.

Additional data can be attached to an object by calling vkSetDebugUtilsObjectTagEXT as defined below.

```
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectTagEXT(
    VkDevice                                    device,
    const VkDebugUtilsObjectTagInfoEXT*         pTagInfo);
```

- device is the device that created the object.
- pTagInfo is a pointer to a VkDebugUtilsObjectTagInfoEXT structure specifying parameters of the tag to attach to the object.

Valid Usage

- VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07875
  If `pNameInfo->objectHandle` is the valid handle of an instance-level object, the VkDevice identified by `device` **must** be a descendent of the same VkInstance as the object identified by `pNameInfo->objectHandle`
- VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07876
  If `pNameInfo->objectHandle` is the valid handle of a physical-device-level object, the VkDevice identified by `device` **must** be a descendant of the same VkPhysicalDevice as the object identified by `pNameInfo->objectHandle`
- VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07877
  If `pNameInfo->objectHandle` is the valid handle of a device-level object, that object **must** be a descendent of the VkDevice identified by `device`

Valid Usage (Implicit)

- VUID-vkSetDebugUtilsObjectTagEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkSetDebugUtilsObjectTagEXT-pTagInfo-parameter
  `pTagInfo` **must** be a valid pointer to a valid VkDebugUtilsObjectTagInfoEXT structure

Host Synchronization

- Host access to `pTagInfo->objectHandle` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDebugUtilsObjectTagInfoEXT` structure is defined as:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsObjectTagInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkObjectType       objectType;
    uint64_t           objectHandle;
    uint64_t           tagName;
    size_t             tagSize;
    const void*        pTag;
} VkDebugUtilsObjectTagInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `objectType` is a VkObjectType specifying the type of the object to be named.
- `objectHandle` is the object to be tagged.
- `tagName` is a numerical identifier of the tag.
- `tagSize` is the number of bytes of data to attach to the object.
- `pTag` is a pointer to an array of `tagSize` bytes containing the data to be associated with the object.

The `tagName` parameter gives a name or identifier to the type of data being tagged. This can be used by debugging layers to easily filter for only data that can be used by that implementation.

Valid Usage

- VUID-VkDebugUtilsObjectTagInfoEXT-objectType-01908
  `objectType` **must** not be `VK_OBJECT_TYPE_UNKNOWN`
- VUID-VkDebugUtilsObjectTagInfoEXT-objectHandle-01910
  `objectHandle` **must** be a valid Vulkan handle of the type associated with `objectType` as defined in the `VkObjectType` and Vulkan Handle Relationship table

Valid Usage (Implicit)

- VUID-VkDebugUtilsObjectTagInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_TAG_INFO_EXT`
- VUID-VkDebugUtilsObjectTagInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDebugUtilsObjectTagInfoEXT-objectType-parameter
  `objectType` **must** be a valid VkObjectType value
- VUID-VkDebugUtilsObjectTagInfoEXT-pTag-parameter
  `pTag` **must** be a valid pointer to an array of `tagSize` bytes
- VUID-VkDebugUtilsObjectTagInfoEXT-tagSize-arraylength
  `tagSize` **must** be greater than `0`

50.1.2. Queue Labels

All Vulkan work is submitted using queues. It is possible for an application to use multiple queues, each containing multiple command buffers, when performing work. It can be useful to identify which queue, or even where in a queue, something has occurred.

To begin identifying a region using a debug label inside a queue, you may use the vkQueueBeginDebugUtilsLabelEXT command.

Then, when the region of interest has passed, you may end the label region using vkQueueEndDebugUtilsLabelEXT.

Additionally, a single debug label may be inserted at any time using vkQueueInsertDebugUtilsLabelEXT.

A queue debug label region is opened by calling:

```
// Provided by VK_EXT_debug_utils
void vkQueueBeginDebugUtilsLabelEXT(
    VkQueue                                     queue,
    const VkDebugUtilsLabelEXT*                 pLabelInfo);
```

- `queue` is the queue in which to start a debug label region.
- `pLabelInfo` is a pointer to a VkDebugUtilsLabelEXT structure specifying parameters of the label region to open.

Valid Usage (Implicit)

- VUID-vkQueueBeginDebugUtilsLabelEXT-queue-parameter
  `queue` **must** be a valid VkQueue handle
- VUID-vkQueueBeginDebugUtilsLabelEXT-pLabelInfo-parameter
  `pLabelInfo` **must** be a valid pointer to a valid VkDebugUtilsLabelEXT structure

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

The `VkDebugUtilsLabelEXT` structure is defined as:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsLabelEXT {
    VkStructureType    sType;
    const void*        pNext;
    const char*        pLabelName;
    float              color[4];
} VkDebugUtilsLabelEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pLabelName` is a pointer to a null-terminated UTF-8 string containing the name of the label.
- `color` is an optional RGBA color value that can be associated with the label. A particular implementation **may** choose to ignore this color value. The values contain RGBA values in order, in the range 0.0 to 1.0. If all elements in `color` are 0.0, then it is ignored.

Valid Usage (Implicit)

- VUID-VkDebugUtilsLabelEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT`
- VUID-VkDebugUtilsLabelEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDebugUtilsLabelEXT-pLabelName-parameter
  `pLabelName` **must** be a null-terminated UTF-8 string

A queue debug label region is closed by calling:

```
// Provided by VK_EXT_debug_utils
void vkQueueEndDebugUtilsLabelEXT(
    VkQueue                                     queue);
```

- `queue` is the queue in which a debug label region should be closed.

The calls to vkQueueBeginDebugUtilsLabelEXT and vkQueueEndDebugUtilsLabelEXT **must** be matched and balanced.

Valid Usage

- VUID-vkQueueEndDebugUtilsLabelEXT-None-01911
  There **must** be an outstanding `vkQueueBeginDebugUtilsLabelEXT` command prior to the `vkQueueEndDebugUtilsLabelEXT` on the queue

Valid Usage (Implicit)

- VUID-vkQueueEndDebugUtilsLabelEXT-queue-parameter
  `queue` **must** be a valid VkQueue handle

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

A single label can be inserted into a queue by calling:

```
// Provided by VK_EXT_debug_utils
void vkQueueInsertDebugUtilsLabelEXT(
    VkQueue                                     queue,
    const VkDebugUtilsLabelEXT*                 pLabelInfo);
```

- `queue` is the queue into which a debug label will be inserted.
- `pLabelInfo` is a pointer to a VkDebugUtilsLabelEXT structure specifying parameters of the label to insert.

Valid Usage (Implicit)

- VUID-vkQueueInsertDebugUtilsLabelEXT-queue-parameter
  `queue` **must** be a valid VkQueue handle
- VUID-vkQueueInsertDebugUtilsLabelEXT-pLabelInfo-parameter
  `pLabelInfo` **must** be a valid pointer to a valid VkDebugUtilsLabelEXT structure

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

50.1.3. Command Buffer Labels

Typical Vulkan applications will submit many command buffers in each frame, with each command buffer containing a large number of individual commands. Being able to logically annotate regions of command buffers that belong together as well as hierarchically subdivide the

frame is important to a developer's ability to navigate the commands viewed holistically.

To identify the beginning of a debug label region in a command buffer, vkCmdBeginDebugUtilsLabelEXT **can** be used as defined below.

To indicate the end of a debug label region in a command buffer, vkCmdEndDebugUtilsLabelEXT **can** be used.

To insert a single command buffer debug label inside of a command buffer, vkCmdInsertDebugUtilsLabelEXT **can** be used as defined below.

A command buffer debug label region can be opened by calling:

```
// Provided by VK_EXT_debug_utils
void vkCmdBeginDebugUtilsLabelEXT(
    VkCommandBuffer                             commandBuffer,
    const VkDebugUtilsLabelEXT*                 pLabelInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pLabelInfo` is a pointer to a VkDebugUtilsLabelEXT structure specifying parameters of the label region to open.

Valid Usage (Implicit)

- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBeginDebugUtilsLabelEXT-pLabelInfo-parameter
  `pLabelInfo` **must** be a valid pointer to a valid VkDebugUtilsLabelEXT structure
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- VUID-vkCmdBeginDebugUtilsLabelEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics Compute	Action State

A command buffer label region can be closed by calling:

```
// Provided by VK_EXT_debug_utils
void vkCmdEndDebugUtilsLabelEXT(
    VkCommandBuffer                             commandBuffer);
```

- `commandBuffer` is the command buffer into which the command is recorded.

An application **may** open a debug label region in one command buffer and close it in another, or otherwise split debug label regions across multiple command buffers or multiple queue submissions. When viewed from the linear series of submissions to a single queue, the calls to vkCmdBeginDebugUtilsLabelEXT and vkCmdEndDebugUtilsLabelEXT **must** be matched and balanced.

There **can** be problems reporting command buffer debug labels during the recording process because command buffers **may** be recorded out of sequence with the resulting execution order. Since the recording order **may** be different, a solitary command buffer **may** have an inconsistent view of the debug label regions by itself. Therefore, if an issue occurs during the recording of a command buffer, and the environment requires returning debug labels, the implementation **may** return only those labels it is aware of. This is true even if the implementation is aware of only the debug labels within the command buffer being actively recorded.

Valid Usage

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01912
  There **must** be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command prior to the `vkCmdEndDebugUtilsLabelEXT` on the queue that `commandBuffer` is submitted to
- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01913
  If `commandBuffer` is a secondary command buffer, there **must** be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`

Valid Usage (Implicit)

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- VUID-vkCmdEndDebugUtilsLabelEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics Compute	Action State

A single debug label can be inserted into a command buffer by calling:

```
// Provided by VK_EXT_debug_utils
void vkCmdInsertDebugUtilsLabelEXT(
    VkCommandBuffer                             commandBuffer,
    const VkDebugUtilsLabelEXT*                 pLabelInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a VkDebugUtilsLabelEXT structure specifying parameters of the label to insert.

Valid Usage (Implicit)

- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdInsertDebugUtilsLabelEXT-pLabelInfo-parameter
  `pLabelInfo` **must** be a valid pointer to a valid VkDebugUtilsLabelEXT structure
- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- VUID-vkCmdInsertDebugUtilsLabelEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics Compute	Action

50.1.4. Debug Messengers

Vulkan allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application-defined behavior. A primary producer of callback messages are the validation layers. An application **can** register callbacks even when no validation layers are enabled, but they will only be called for the Vulkan loader and, if implemented, other layer and driver events.

A `VkDebugUtilsMessengerEXT` is a messenger object which handles passing along debug messages to a provided debug callback.

```
// Provided by VK_EXT_debug_utils
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDebugUtilsMessengerEXT)
```

The debug messenger will provide detailed feedback on the application's use of Vulkan when events of interest occur. When an event of interest does occur, the debug messenger will submit a debug message to the debug callback that was provided during its creation. Additionally, the debug messenger is responsible with filtering out debug messages that the callback is not interested in and will only provide desired debug messages.

A debug messenger triggers a debug callback with a debug message when an event of interest occurs. To create a debug messenger which will trigger a debug callback, call:

```
// Provided by VK_EXT_debug_utils
VkResult vkCreateDebugUtilsMessengerEXT(
    VkInstance                                  instance,
    const VkDebugUtilsMessengerCreateInfoEXT*   pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDebugUtilsMessengerEXT*                   pMessenger);
```

- `instance` is the instance the messenger will be used with.
- `pCreateInfo` is a pointer to a VkDebugUtilsMessengerCreateInfoEXT structure containing the callback pointer, as well as defining conditions under which this messenger will trigger the callback.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pMessenger` is a pointer to a VkDebugUtilsMessengerEXT handle in which the created object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDebugUtilsMessengerEXT-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkCreateDebugUtilsMessengerEXT-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkDebugUtilsMessengerCreateInfoEXT structure
- VUID-vkCreateDebugUtilsMessengerEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateDebugUtilsMessengerEXT-pMessenger-parameter
  `pMessenger` **must** be a valid pointer to a VkDebugUtilsMessengerEXT handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The application **must** ensure that vkCreateDebugUtilsMessengerEXT is not executed in parallel with any Vulkan command that is also called with `instance` or child of `instance` as the dispatchable argument.

The definition of `VkDebugUtilsMessengerCreateInfoEXT` is:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsMessengerCreateInfoEXT {
    VkStructureType                         sType;
    const void*                             pNext;
    VkDebugUtilsMessengerCreateFlagsEXT     flags;
    VkDebugUtilsMessageSeverityFlagsEXT     messageSeverity;
    VkDebugUtilsMessageTypeFlagsEXT         messageType;
    PFN_vkDebugUtilsMessengerCallbackEXT    pfnUserCallback;
    void*                                   pUserData;
} VkDebugUtilsMessengerCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is `0` and is reserved for future use.
- `messageSeverity` is a bitmask of VkDebugUtilsMessageSeverityFlagBitsEXT specifying which severity of event(s) will cause this callback to be called.
- `messageType` is a bitmask of VkDebugUtilsMessageTypeFlagBitsEXT specifying which type of event(s) will cause this callback to be called.
- `pfnUserCallback` is the application callback function to call.
- `pUserData` is user data to be passed to the callback.

For each `VkDebugUtilsMessengerEXT` that is created the `VkDebugUtilsMessengerCreateInfoEXT::messageSeverity` and `VkDebugUtilsMessengerCreateInfoEXT::messageType` determine when that `VkDebugUtilsMessengerCreateInfoEXT::pfnUserCallback` is called. The process to determine if the user's `pfnUserCallback` is triggered when an event occurs is as follows:

1. The implementation will perform a bitwise AND of the event's VkDebugUtilsMessageSeverityFlagBitsEXT with the `messageSeverity` provided during creation of the VkDebugUtilsMessengerEXT object.
    a. If the value is 0, the message is skipped.
2. The implementation will perform bitwise AND of the event's VkDebugUtilsMessageTypeFlagBitsEXT with the `messageType` provided during the creation of the VkDebugUtilsMessengerEXT object.
    a. If the value is 0, the message is skipped.
3. The callback will trigger a debug message for the current event

The callback will come directly from the component that detected the event, unless some other layer intercepts the calls for its own purposes (filter them in a different way, log to a system error log, etc.).

An application **can** receive multiple callbacks if multiple `VkDebugUtilsMessengerEXT` objects are created. A callback will always be executed in the same thread as the originating Vulkan call.

A callback **can** be called from multiple threads simultaneously (if the application is making Vulkan

calls from multiple threads).

Valid Usage (Implicit)

- VUID-VkDebugUtilsMessengerCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageSeverity-parameter
  `messageSeverity` **must** be a valid combination of VkDebugUtilsMessageSeverityFlagBitsEXT values
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageSeverity-requiredbitmask
  `messageSeverity` **must** not be `0`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageType-parameter
  `messageType` **must** be a valid combination of VkDebugUtilsMessageTypeFlagBitsEXT values
- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageType-requiredbitmask
  `messageType` **must** not be `0`
- VUID-VkDebugUtilsMessengerCreateInfoEXT-pfnUserCallback-parameter
  `pfnUserCallback` **must** be a valid PFN_vkDebugUtilsMessengerCallbackEXT value

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessengerCreateFlagsEXT;
```

`VkDebugUtilsMessengerCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which **can** be set in VkDebugUtilsMessengerCreateInfoEXT::`messageSeverity`, specifying event severities which cause a debug messenger to call the callback, are:

```
// Provided by VK_EXT_debug_utils
typedef enum VkDebugUtilsMessageSeverityFlagBitsEXT {
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_VERBOSE_BIT_EXT = 0x00000001,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_INFO_BIT_EXT = 0x00000010,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT = 0x00000100,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT = 0x00001000,
} VkDebugUtilsMessageSeverityFlagBitsEXT;
```

- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_VERBOSE_BIT_EXT` specifies the most verbose output indicating all diagnostic messages from the Vulkan loader, layers, and drivers should be captured.
- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_INFO_BIT_EXT` specifies an informational message such as resource details that may be handy when debugging an application.
- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT` specifies use of Vulkan that **may** expose an

application bug. Such cases may not be immediately harmful, such as a fragment shader outputting to a location with no attachment. Other cases **may** point to behavior that is almost certainly bad when unintended such as using an image whose memory has not been filled. In general if you see a warning but you know that the behavior is intended/desired, then simply ignore the warning.

- VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT specifies that the application has violated a valid usage condition of the specification.

NOTE

The values of VkDebugUtilsMessageSeverityFlagBitsEXT are sorted based on severity. The higher the flag value, the more severe the message. This allows for simple boolean operation comparisons when looking at VkDebugUtilsMessageSeverityFlagBitsEXT values.

For example:

```
    if (messageSeverity >=
VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT) {
        // Do something for warnings and errors
    }
```

In addition, space has been left between the enums to allow for later addition of new severities in between the existing values.

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessageSeverityFlagsEXT;
```

VkDebugUtilsMessageSeverityFlagsEXT is a bitmask type for setting a mask of zero or more VkDebugUtilsMessageSeverityFlagBitsEXT.

Bits which **can** be set in VkDebugUtilsMessengerCreateInfoEXT::messageType, specifying event types which cause a debug messenger to call the callback, are:

```
// Provided by VK_EXT_debug_utils
typedef enum VkDebugUtilsMessageTypeFlagBitsEXT {
    VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT = 0x00000001,
    VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT = 0x00000002,
    VK_DEBUG_UTILS_MESSAGE_TYPE_PERFORMANCE_BIT_EXT = 0x00000004,
  // Provided by VK_EXT_device_address_binding_report
    VK_DEBUG_UTILS_MESSAGE_TYPE_DEVICE_ADDRESS_BINDING_BIT_EXT = 0x00000008,
} VkDebugUtilsMessageTypeFlagBitsEXT;
```

- VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT specifies that some general event has occurred. This is typically a non-specification, non-performance event.
- VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT specifies that something has occurred during validation against the Vulkan specification that may indicate invalid behavior.

- VK_DEBUG_UTILS_MESSAGE_TYPE_PERFORMANCE_BIT_EXT specifies a potentially non-optimal use of Vulkan, e.g. using vkCmdClearColorImage when setting VkAttachmentDescription::loadOp to VK_ATTACHMENT_LOAD_OP_CLEAR would have worked.
- VK_DEBUG_UTILS_MESSAGE_TYPE_DEVICE_ADDRESS_BINDING_BIT_EXT specifies that the implementation has modified the set of GPU-visible virtual addresses associated with a Vulkan object.

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessageTypeFlagsEXT;
```

VkDebugUtilsMessageTypeFlagsEXT is a bitmask type for setting a mask of zero or more VkDebugUtilsMessageTypeFlagBitsEXT.

The prototype for the VkDebugUtilsMessengerCreateInfoEXT::pfnUserCallback function implemented by the application is:

```
// Provided by VK_EXT_debug_utils
typedef VkBool32 (VKAPI_PTR *PFN_vkDebugUtilsMessengerCallbackEXT)(
    VkDebugUtilsMessageSeverityFlagBitsEXT           messageSeverity,
    VkDebugUtilsMessageTypeFlagsEXT                  messageTypes,
    const VkDebugUtilsMessengerCallbackDataEXT*      pCallbackData,
    void*                                            pUserData);
```

- messageSeverity specifies the VkDebugUtilsMessageSeverityFlagBitsEXT that triggered this callback.
- messageTypes is a bitmask of VkDebugUtilsMessageTypeFlagBitsEXT specifying which type of event(s) triggered this callback.
- pCallbackData contains all the callback related data in the VkDebugUtilsMessengerCallbackDataEXT structure.
- pUserData is the user data provided when the VkDebugUtilsMessengerEXT was created.

The callback returns a VkBool32, which is interpreted in a layer-specified manner. The application **should** always return VK_FALSE. The VK_TRUE value is reserved for use in layer development.

Valid Usage

- VUID-PFN_vkDebugUtilsMessengerCallbackEXT-None-04769
  The callback **must** not make calls to any Vulkan commands

The definition of VkDebugUtilsMessengerCallbackDataEXT is:

```
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsMessengerCallbackDataEXT {
    VkStructureType                                 sType;
    const void*                                     pNext;
    VkDebugUtilsMessengerCallbackDataFlagsEXT       flags;
    const char*                                     pMessageIdName;
    int32_t                                         messageIdNumber;
    const char*                                     pMessage;
    uint32_t                                        queueLabelCount;
    const VkDebugUtilsLabelEXT*                     pQueueLabels;
    uint32_t                                        cmdBufLabelCount;
    const VkDebugUtilsLabelEXT*                     pCmdBufLabels;
    uint32_t                                        objectCount;
    const VkDebugUtilsObjectNameInfoEXT*            pObjects;
} VkDebugUtilsMessengerCallbackDataEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is `0` and is reserved for future use.
- `pMessageIdName` is `NULL` or a null-terminated UTF-8 string that identifies the particular message ID that is associated with the provided message. If the message corresponds to a validation layer message, then this string may contain the portion of the Vulkan specification that is believed to have been violated.
- `messageIdNumber` is the ID number of the triggering message. If the message corresponds to a validation layer message, then this number is related to the internal number associated with the message being triggered.
- `pMessage` is `NULL` if `messageTypes` is equal to `VK_DEBUG_UTILS_MESSAGE_TYPE_DEVICE_ADDRESS_BINDING_BIT_EXT`, or a null-terminated UTF-8 string detailing the trigger conditions.
- `queueLabelCount` is a count of items contained in the `pQueueLabels` array.
- `pQueueLabels` is `NULL` or a pointer to an array of VkDebugUtilsLabelEXT active in the current `VkQueue` at the time the callback was triggered. Refer to Queue Labels for more information.
- `cmdBufLabelCount` is a count of items contained in the `pCmdBufLabels` array.
- `pCmdBufLabels` is `NULL` or a pointer to an array of VkDebugUtilsLabelEXT active in the current `VkCommandBuffer` at the time the callback was triggered. Refer to Command Buffer Labels for more information.
- `objectCount` is a count of items contained in the `pObjects` array.
- `pObjects` is a pointer to an array of VkDebugUtilsObjectNameInfoEXT objects related to the detected issue. The array is roughly in order or importance, but the 0th element is always guaranteed to be the most important object for this message.

NOTE This structure should only be considered valid during the lifetime of the triggered callback.

Since adding queue and command buffer labels behaves like pushing and popping onto a stack, the order of both `pQueueLabels` and `pCmdBufLabels` is based on the order the labels were defined. The result is that the first label in either `pQueueLabels` or `pCmdBufLabels` will be the first defined (and therefore the oldest) while the last label in each list will be the most recent.

NOTE

`pQueueLabels` will only be non-`NULL` if one of the objects in `pObjects` can be related directly to a defined `VkQueue` which has had one or more labels associated with it.

Likewise, `pCmdBufLabels` will only be non-`NULL` if one of the objects in `pObjects` can be related directly to a defined `VkCommandBuffer` which has had one or more labels associated with it. Additionally, while command buffer labels allow for beginning and ending across different command buffers, the debug messaging framework **cannot** guarantee that labels in `pCmdBufLables` will contain those defined outside of the associated command buffer. This is partially due to the fact that the association of one command buffer with another may not have been defined at the time the debug message is triggered.

Valid Usage (Implicit)

- VUID-VkDebugUtilsMessengerCallbackDataEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CALLBACK_DATA_EXT`
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkDeviceAddressBindingCallbackDataEXT
- VUID-VkDebugUtilsMessengerCallbackDataEXT-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkDebugUtilsMessengerCallbackDataEXT-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pMessageIdName-parameter
  If `pMessageIdName` is not `NULL`, `pMessageIdName` **must** be a null-terminated UTF-8 string
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pMessage-parameter
  If `pMessage` is not `NULL`, `pMessage` **must** be a null-terminated UTF-8 string
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pQueueLabels-parameter
  If `queueLabelCount` is not `0`, `pQueueLabels` **must** be a valid pointer to an array of `queueLabelCount` valid VkDebugUtilsLabelEXT structures
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pCmdBufLabels-parameter
  If `cmdBufLabelCount` is not `0`, `pCmdBufLabels` **must** be a valid pointer to an array of `cmdBufLabelCount` valid VkDebugUtilsLabelEXT structures
- VUID-VkDebugUtilsMessengerCallbackDataEXT-pObjects-parameter
  If `objectCount` is not `0`, `pObjects` **must** be a valid pointer to an array of `objectCount` valid VkDebugUtilsObjectNameInfoEXT structures

```
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessengerCallbackDataFlagsEXT;
```

VkDebugUtilsMessengerCallbackDataFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

The definition of VkDeviceAddressBindingCallbackDataEXT is:

```
// Provided by VK_EXT_device_address_binding_report
typedef struct VkDeviceAddressBindingCallbackDataEXT {
    VkStructureType                   sType;
    void*                             pNext;
    VkDeviceAddressBindingFlagsEXT    flags;
    VkDeviceAddress                   baseAddress;
    VkDeviceSize                      size;
    VkDeviceAddressBindingTypeEXT     bindingType;
} VkDeviceAddressBindingCallbackDataEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkDeviceAddressBindingFlagBitsEXT specifying additional information about the binding event that caused the callback to be called.
- baseAddress is a GPU-accessible virtual address identifying the start of a region of the virtual address space associated with a Vulkan object, as identified by the pObjects member of VkDebugUtilsMessengerCallbackDataEXT.
- size is the size in bytes of a region of GPU-accessible virtual address space.
- bindingType is a VkDeviceAddressBindingTypeEXT specifying the type of binding event that caused the callback to be called.

If the reportAddressBinding feature is enabled and the implementation binds or unbinds a region of virtual address space associated with a Vulkan object, the implementation **must** submit a debug message with the following properties:

- messageSeverity equal to VK_DEBUG_UTILS_MESSAGE_SEVERITY_INFO_BIT_EXT
- messageTypes equal to VK_DEBUG_UTILS_MESSAGE_TYPE_DEVICE_ADDRESS_BINDING_BIT_EXT
- VkDebugUtilsMessengerCallbackDataEXT::pObjects **must** identify the associated Vulkan object
- VkDeviceAddressBindingCallbackDataEXT **must** be included in the pNext chain of VkDebugUtilsMessengerCallbackDataEXT

These debug messages **must** be emitted both for GPU virtual address space regions that are explicitly bound to a Vulkan object via the vkBind*Memory/vkBind*Memory2 functions, and for those that are implicitly generated via memory allocation or importing external memory.

An implementation **may** report binding events associated with a Vulkan object via

VkDebugUtilsMessengerEXT prior to the object becoming visible to an application via other Vulkan commands. For example, object creation functions **may** report binding events that occur during an objects creation. In such cases, VkDeviceAddressBindingCallbackDataEXT::flags **must** include VK_DEVICE_ADDRESS_BINDING_INTERNAL_OBJECT_BIT_EXT.

Object handles reported in this manner are not valid object handles, and **must** not be used as an input parameter to any Vulkan command.

Any valid object handle returned by an object creation function **must** match the handle specified via any previously reported binding events associated with the object's creation.

Valid Usage (Implicit)

- VUID-VkDeviceAddressBindingCallbackDataEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DEVICE_ADDRESS_BINDING_CALLBACK_DATA_EXT
- VUID-VkDeviceAddressBindingCallbackDataEXT-flags-parameter
  flags **must** be a valid combination of VkDeviceAddressBindingFlagBitsEXT values
- VUID-VkDeviceAddressBindingCallbackDataEXT-bindingType-parameter
  bindingType **must** be a valid VkDeviceAddressBindingTypeEXT value

Bits which **can** be set in VkDeviceAddressBindingCallbackDataEXT::flags specifying additional information about a binding event are:

```
// Provided by VK_EXT_device_address_binding_report
typedef enum VkDeviceAddressBindingFlagBitsEXT {
    VK_DEVICE_ADDRESS_BINDING_INTERNAL_OBJECT_BIT_EXT = 0x00000001,
} VkDeviceAddressBindingFlagBitsEXT;
```

- VK_DEVICE_ADDRESS_BINDING_INTERNAL_OBJECT_BIT_EXT specifies that VkDeviceAddressBindingCallbackDataEXT describes a Vulkan object that has not been made visible to the application via a Vulkan command.

```
// Provided by VK_EXT_device_address_binding_report
typedef VkFlags VkDeviceAddressBindingFlagsEXT;
```

VkDeviceAddressBindingFlagsEXT is a bitmask type for setting a mask of zero or more VkDeviceAddressBindingFlagBitsEXT.

The VkDeviceAddressBindingTypeEXT enum is defined as:

```
// Provided by VK_EXT_device_address_binding_report
typedef enum VkDeviceAddressBindingTypeEXT {
    VK_DEVICE_ADDRESS_BINDING_TYPE_BIND_EXT = 0,
    VK_DEVICE_ADDRESS_BINDING_TYPE_UNBIND_EXT = 1,
} VkDeviceAddressBindingTypeEXT;
```

- VK_DEVICE_ADDRESS_BINDING_TYPE_BIND_EXT specifies that a new GPU-accessible virtual address range has been bound.
- VK_DEVICE_ADDRESS_BINDING_TYPE_UNBIND_EXT specifies that a GPU-accessible virtual address range has been unbound.

To intentionally submit a debug message, call:

```
// Provided by VK_EXT_debug_utils
void vkSubmitDebugUtilsMessageEXT(
    VkInstance                                  instance,
    VkDebugUtilsMessageSeverityFlagBitsEXT      messageSeverity,
    VkDebugUtilsMessageTypeFlagsEXT             messageTypes,
    const VkDebugUtilsMessengerCallbackDataEXT* pCallbackData);
```

- instance is the debug stream's VkInstance.
- messageSeverity is a VkDebugUtilsMessageSeverityFlagBitsEXT value specifying the severity of this event/message.
- messageTypes is a bitmask of VkDebugUtilsMessageTypeFlagBitsEXT specifying which type of event(s) to identify with this message.
- pCallbackData contains all the callback related data in the VkDebugUtilsMessengerCallbackDataEXT structure.

The call will propagate through the layers and generate callback(s) as indicated by the message's flags. The parameters are passed on to the callback in addition to the pUserData value that was defined at the time the messenger was registered.

Valid Usage

- VUID-vkSubmitDebugUtilsMessageEXT-objectType-02591
  The objectType member of each element of pCallbackData->pObjects **must** not be VK_OBJECT_TYPE_UNKNOWN

Valid Usage (Implicit)

- VUID-vkSubmitDebugUtilsMessageEXT-instance-parameter
  instance **must** be a valid VkInstance handle
- VUID-vkSubmitDebugUtilsMessageEXT-messageSeverity-parameter

`messageSeverity` **must** be a valid VkDebugUtilsMessageSeverityFlagBitsEXT value

- VUID-vkSubmitDebugUtilsMessageEXT-messageTypes-parameter
  `messageTypes` **must** be a valid combination of VkDebugUtilsMessageTypeFlagBitsEXT values
- VUID-vkSubmitDebugUtilsMessageEXT-messageTypes-requiredbitmask
  `messageTypes` **must** not be `0`
- VUID-vkSubmitDebugUtilsMessageEXT-pCallbackData-parameter
  `pCallbackData` **must** be a valid pointer to a valid VkDebugUtilsMessengerCallbackDataEXT structure

To destroy a `VkDebugUtilsMessengerEXT` object, call:

```
// Provided by VK_EXT_debug_utils
void vkDestroyDebugUtilsMessengerEXT(
    VkInstance                                  instance,
    VkDebugUtilsMessengerEXT                    messenger,
    const VkAllocationCallbacks*                pAllocator);
```

- `instance` is the instance where the callback was created.
- `messenger` is the VkDebugUtilsMessengerEXT object to destroy. `messenger` is an externally synchronized object and **must** not be used on more than one thread at a time. This means that `vkDestroyDebugUtilsMessengerEXT` **must** not be called when a callback is active.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-01915
  If `VkAllocationCallbacks` were provided when `messenger` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-01916
  If no `VkAllocationCallbacks` were provided when `messenger` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyDebugUtilsMessengerEXT-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-parameter
  If `messenger` is not VK_NULL_HANDLE, `messenger` **must** be a valid VkDebugUtilsMessengerEXT handle
- VUID-vkDestroyDebugUtilsMessengerEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid

VkAllocationCallbacks structure

- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-parent
  If `messenger` is a valid handle, it **must** have been created, allocated, or retrieved from `instance`

Host Synchronization

- Host access to `messenger` **must** be externally synchronized

The application **must** ensure that vkDestroyDebugUtilsMessengerEXT is not executed in parallel with any Vulkan command that is also called with `instance` or child of `instance` as the dispatchable argument.

50.2. Debug Markers

Debug markers provide a flexible way for debugging and validation layers to receive annotation and debug information.

The Object Annotation section describes how to associate a name or binary data with a Vulkan object.

The Command Buffer Markers section describes how to associate logical elements of the scene with commands in the command buffer.

50.2.1. Object Annotation

The commands in this section allow application developers to associate application-defined information with Vulkan objects at will.

An object can be given an application-defined name by calling:

```
// Provided by VK_EXT_debug_marker
VkResult vkDebugMarkerSetObjectNameEXT(
    VkDevice                                    device,
    const VkDebugMarkerObjectNameInfoEXT*       pNameInfo);
```

- `device` is the device that created the object.
- `pNameInfo` is a pointer to a VkDebugMarkerObjectNameInfoEXT structure specifying the parameters of the name to set on the object.

Valid Usage (Implicit)

- VUID-vkDebugMarkerSetObjectNameEXT-device-parameter
  `device` **must** be a valid VkDevice handle

- VUID-vkDebugMarkerSetObjectNameEXT-pNameInfo-parameter
  `pNameInfo` **must** be a valid pointer to a valid VkDebugMarkerObjectNameInfoEXT structure

Host Synchronization

- Host access to `pNameInfo->object` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDebugMarkerObjectNameInfoEXT` structure is defined as:

```
// Provided by VK_EXT_debug_marker
typedef struct VkDebugMarkerObjectNameInfoEXT {
    VkStructureType               sType;
    const void*                   pNext;
    VkDebugReportObjectTypeEXT    objectType;
    uint64_t                      object;
    const char*                   pObjectName;
} VkDebugMarkerObjectNameInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `objectType` is a VkDebugReportObjectTypeEXT specifying the type of the object to be named.
- `object` is the object to be named.
- `pObjectName` is a null-terminated UTF-8 string specifying the name to apply to `object`.

Applications **may** change the name associated with an object simply by calling `vkDebugMarkerSetObjectNameEXT` again with a new string. To remove a previously set name, `pObjectName` **should** be an empty string.

Valid Usage

- VUID-VkDebugMarkerObjectNameInfoEXT-objectType-01490
  `objectType` **must** not be `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT`

- VUID-VkDebugMarkerObjectNameInfoEXT-object-01491
  `object` **must** not be VK_NULL_HANDLE
- VUID-VkDebugMarkerObjectNameInfoEXT-object-01492
  `object` **must** be a Vulkan object of the type associated with `objectType` as defined in `VkDebugReportObjectTypeEXT` and Vulkan Handle Relationship

Valid Usage (Implicit)

- VUID-VkDebugMarkerObjectNameInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_NAME_INFO_EXT`
- VUID-VkDebugMarkerObjectNameInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDebugMarkerObjectNameInfoEXT-objectType-parameter
  `objectType` **must** be a valid VkDebugReportObjectTypeEXT value
- VUID-VkDebugMarkerObjectNameInfoEXT-pObjectName-parameter
  `pObjectName` **must** be a null-terminated UTF-8 string

In addition to setting a name for an object, debugging and validation layers may have uses for additional binary data on a per-object basis that has no other place in the Vulkan API. For example, a `VkShaderModule` could have additional debugging data attached to it to aid in offline shader tracing. To attach data to an object, call:

```
// Provided by VK_EXT_debug_marker
VkResult vkDebugMarkerSetObjectTagEXT(
    VkDevice                                    device,
    const VkDebugMarkerObjectTagInfoEXT*        pTagInfo);
```

- `device` is the device that created the object.
- `pTagInfo` is a pointer to a VkDebugMarkerObjectTagInfoEXT structure specifying the parameters of the tag to attach to the object.

Valid Usage (Implicit)

- VUID-vkDebugMarkerSetObjectTagEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDebugMarkerSetObjectTagEXT-pTagInfo-parameter
  `pTagInfo` **must** be a valid pointer to a valid VkDebugMarkerObjectTagInfoEXT structure

Host Synchronization

- Host access to `pTagInfo->object` **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDebugMarkerObjectTagInfoEXT structure is defined as:

```
// Provided by VK_EXT_debug_marker
typedef struct VkDebugMarkerObjectTagInfoEXT {
    VkStructureType               sType;
    const void*                   pNext;
    VkDebugReportObjectTypeEXT    objectType;
    uint64_t                      object;
    uint64_t                      tagName;
    size_t                        tagSize;
    const void*                   pTag;
} VkDebugMarkerObjectTagInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- objectType is a VkDebugReportObjectTypeEXT specifying the type of the object to be named.
- object is the object to be tagged.
- tagName is a numerical identifier of the tag.
- tagSize is the number of bytes of data to attach to the object.
- pTag is a pointer to an array of tagSize bytes containing the data to be associated with the object.

The tagName parameter gives a name or identifier to the type of data being tagged. This can be used by debugging layers to easily filter for only data that can be used by that implementation.

Valid Usage

- VUID-VkDebugMarkerObjectTagInfoEXT-objectType-01493
  objectType **must** not be VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT
- VUID-VkDebugMarkerObjectTagInfoEXT-object-01494
  object **must** not be VK_NULL_HANDLE
- VUID-VkDebugMarkerObjectTagInfoEXT-object-01495
  object **must** be a Vulkan object of the type associated with objectType as defined in VkDebugReportObjectTypeEXT and Vulkan Handle Relationship

Valid Usage (Implicit)

- VUID-VkDebugMarkerObjectTagInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_TAG_INFO_EXT`
- VUID-VkDebugMarkerObjectTagInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDebugMarkerObjectTagInfoEXT-objectType-parameter
  `objectType` **must** be a valid VkDebugReportObjectTypeEXT value
- VUID-VkDebugMarkerObjectTagInfoEXT-pTag-parameter
  `pTag` **must** be a valid pointer to an array of `tagSize` bytes
- VUID-VkDebugMarkerObjectTagInfoEXT-tagSize-arraylength
  `tagSize` **must** be greater than `0`

50.2.2. Command Buffer Markers

Typical Vulkan applications will submit many command buffers in each frame, with each command buffer containing a large number of individual commands. Being able to logically annotate regions of command buffers that belong together as well as hierarchically subdivide the frame is important to a developer's ability to navigate the commands viewed holistically.

The marker commands `vkCmdDebugMarkerBeginEXT` and `vkCmdDebugMarkerEndEXT` define regions of a series of commands that are grouped together, and they can be nested to create a hierarchy. The `vkCmdDebugMarkerInsertEXT` command allows insertion of a single label within a command buffer.

A marker region can be opened by calling:

```
// Provided by VK_EXT_debug_marker
void vkCmdDebugMarkerBeginEXT(
    VkCommandBuffer                             commandBuffer,
    const VkDebugMarkerMarkerInfoEXT*           pMarkerInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pMarkerInfo` is a pointer to a VkDebugMarkerMarkerInfoEXT structure specifying the parameters of the marker region to open.

Valid Usage (Implicit)

- VUID-vkCmdDebugMarkerBeginEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdDebugMarkerBeginEXT-pMarkerInfo-parameter
  `pMarkerInfo` **must** be a valid pointer to a valid VkDebugMarkerMarkerInfoEXT structure
- VUID-vkCmdDebugMarkerBeginEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdDebugMarkerBeginEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- VUID-vkCmdDebugMarkerBeginEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics Compute	Action

The `VkDebugMarkerMarkerInfoEXT` structure is defined as:

```
// Provided by VK_EXT_debug_marker
typedef struct VkDebugMarkerMarkerInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    const char*        pMarkerName;
    float              color[4];
} VkDebugMarkerMarkerInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pMarkerName` is a pointer to a null-terminated UTF-8 string containing the name of the marker.
- `color` is an **optional** RGBA color value that can be associated with the marker. A particular implementation **may** choose to ignore this color value. The values contain RGBA values in order, in the range 0.0 to 1.0. If all elements in `color` are 0.0, then it is ignored.

Valid Usage (Implicit)

- VUID-VkDebugMarkerMarkerInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT`
- VUID-VkDebugMarkerMarkerInfoEXT-pNext-pNext

`pNext` **must** be `NULL`

- VUID-VkDebugMarkerMarkerInfoEXT-pMarkerName-parameter
  `pMarkerName` **must** be a null-terminated UTF-8 string

A marker region can be closed by calling:

```
// Provided by VK_EXT_debug_marker
void vkCmdDebugMarkerEndEXT(
    VkCommandBuffer                             commandBuffer);
```

- `commandBuffer` is the command buffer into which the command is recorded.

An application **may** open a marker region in one command buffer and close it in another, or otherwise split marker regions across multiple command buffers or multiple queue submissions. When viewed from the linear series of submissions to a single queue, the calls to `vkCmdDebugMarkerBeginEXT` and `vkCmdDebugMarkerEndEXT` **must** be matched and balanced.

Valid Usage

- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-01239
  There **must** be an outstanding vkCmdDebugMarkerBeginEXT command prior to the `vkCmdDebugMarkerEndEXT` on the queue that `commandBuffer` is submitted to
- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-01240
  If `commandBuffer` is a secondary command buffer, there **must** be an outstanding vkCmdDebugMarkerBeginEXT command recorded to `commandBuffer` that has not previously been ended by a call to vkCmdDebugMarkerEndEXT

Valid Usage (Implicit)

- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdDebugMarkerEndEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- VUID-vkCmdDebugMarkerEndEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics Compute	Action

A single marker label can be inserted into a command buffer by calling:

```
// Provided by VK_EXT_debug_marker
void vkCmdDebugMarkerInsertEXT(
    VkCommandBuffer                             commandBuffer,
    const VkDebugMarkerMarkerInfoEXT*           pMarkerInfo);
```

- commandBuffer is the command buffer into which the command is recorded.
- pMarkerInfo is a pointer to a VkDebugMarkerMarkerInfoEXT structure specifying the parameters of the marker to insert.

Valid Usage (Implicit)

- VUID-vkCmdDebugMarkerInsertEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdDebugMarkerInsertEXT-pMarkerInfo-parameter
  pMarkerInfo **must** be a valid pointer to a valid VkDebugMarkerMarkerInfoEXT structure
- VUID-vkCmdDebugMarkerInsertEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdDebugMarkerInsertEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics, or compute operations
- VUID-vkCmdDebugMarkerInsertEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics Compute	Action

50.3. Debug Report Callbacks

Debug report callbacks are represented by `VkDebugReportCallbackEXT` handles:

```
// Provided by VK_EXT_debug_report
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDebugReportCallbackEXT)
```

Debug report callbacks give more detailed feedback on the application's use of Vulkan when events of interest occur.

To register a debug report callback, an application uses vkCreateDebugReportCallbackEXT.

```
// Provided by VK_EXT_debug_report
VkResult vkCreateDebugReportCallbackEXT(
    VkInstance                                  instance,
    const VkDebugReportCallbackCreateInfoEXT*   pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDebugReportCallbackEXT*                   pCallback);
```

- `instance` is the instance the callback will be logged on.
- `pCreateInfo` is a pointer to a VkDebugReportCallbackCreateInfoEXT structure defining the conditions under which this callback will be called.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pCallback` is a pointer to a VkDebugReportCallbackEXT handle in which the created object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDebugReportCallbackEXT-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkCreateDebugReportCallbackEXT-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkDebugReportCallbackCreateInfoEXT structure
- VUID-vkCreateDebugReportCallbackEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid

VkAllocationCallbacks structure

- VUID-vkCreateDebugReportCallbackEXT-pCallback-parameter
  `pCallback` **must** be a valid pointer to a VkDebugReportCallbackEXT handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The definition of VkDebugReportCallbackCreateInfoEXT is:

```
// Provided by VK_EXT_debug_report
typedef struct VkDebugReportCallbackCreateInfoEXT {
    VkStructureType                 sType;
    const void*                     pNext;
    VkDebugReportFlagsEXT           flags;
    PFN_vkDebugReportCallbackEXT    pfnCallback;
    void*                           pUserData;
} VkDebugReportCallbackCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkDebugReportFlagBitsEXT specifying which event(s) will cause this callback to be called.
- `pfnCallback` is the application callback function to call.
- `pUserData` is user data to be passed to the callback.

For each `VkDebugReportCallbackEXT` that is created the `VkDebugReportCallbackCreateInfoEXT`::`flags` determine when that `VkDebugReportCallbackCreateInfoEXT`::`pfnCallback` is called. When an event happens, the implementation will do a bitwise AND of the event's VkDebugReportFlagBitsEXT flags to each `VkDebugReportCallbackEXT` object's flags. For each non-zero result the corresponding callback will be called. The callback will come directly from the component that detected the event, unless some other layer intercepts the calls for its own purposes (filter them in a different way, log to a system error log, etc.).

An application **may** receive multiple callbacks if multiple `VkDebugReportCallbackEXT` objects were created. A callback will always be executed in the same thread as the originating Vulkan call.

A callback may be called from multiple threads simultaneously (if the application is making Vulkan calls from multiple threads).

Valid Usage (Implicit)

- VUID-VkDebugReportCallbackCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT`
- VUID-VkDebugReportCallbackCreateInfoEXT-flags-parameter
  `flags` **must** be a valid combination of VkDebugReportFlagBitsEXT values
- VUID-VkDebugReportCallbackCreateInfoEXT-pfnCallback-parameter
  `pfnCallback` **must** be a valid PFN_vkDebugReportCallbackEXT value

Bits which **can** be set in VkDebugReportCallbackCreateInfoEXT::`flags`, specifying events which cause a debug report, are:

```
// Provided by VK_EXT_debug_report
typedef enum VkDebugReportFlagBitsEXT {
    VK_DEBUG_REPORT_INFORMATION_BIT_EXT = 0x00000001,
    VK_DEBUG_REPORT_WARNING_BIT_EXT = 0x00000002,
    VK_DEBUG_REPORT_PERFORMANCE_WARNING_BIT_EXT = 0x00000004,
    VK_DEBUG_REPORT_ERROR_BIT_EXT = 0x00000008,
    VK_DEBUG_REPORT_DEBUG_BIT_EXT = 0x00000010,
} VkDebugReportFlagBitsEXT;
```

- `VK_DEBUG_REPORT_ERROR_BIT_EXT` specifies that the application has violated a valid usage condition of the specification.
- `VK_DEBUG_REPORT_WARNING_BIT_EXT` specifies use of Vulkan that **may** expose an application bug. Such cases may not be immediately harmful, such as a fragment shader outputting to a location with no attachment. Other cases **may** point to behavior that is almost certainly bad when unintended such as using an image whose memory has not been filled. In general if you see a warning but you know that the behavior is intended/desired, then simply ignore the warning.
- `VK_DEBUG_REPORT_PERFORMANCE_WARNING_BIT_EXT` specifies a potentially non-optimal use of Vulkan, e.g. using vkCmdClearColorImage when setting VkAttachmentDescription::`loadOp` to `VK_ATTACHMENT_LOAD_OP_CLEAR` would have worked.
- `VK_DEBUG_REPORT_INFORMATION_BIT_EXT` specifies an informational message such as resource details that may be handy when debugging an application.
- `VK_DEBUG_REPORT_DEBUG_BIT_EXT` specifies diagnostic information from the implementation and layers.

```
// Provided by VK_EXT_debug_report
typedef VkFlags VkDebugReportFlagsEXT;
```

`VkDebugReportFlagsEXT` is a bitmask type for setting a mask of zero or more VkDebugReportFlagBitsEXT.

The prototype for the VkDebugReportCallbackCreateInfoEXT::`pfnCallback` function implemented by

the application is:

```
// Provided by VK_EXT_debug_report
typedef VkBool32 (VKAPI_PTR *PFN_vkDebugReportCallbackEXT)(
    VkDebugReportFlagsEXT                       flags,
    VkDebugReportObjectTypeEXT                  objectType,
    uint64_t                                    object,
    size_t                                      location,
    int32_t                                     messageCode,
    const char*                                 pLayerPrefix,
    const char*                                 pMessage,
    void*                                       pUserData);
```

- `flags` specifies the VkDebugReportFlagBitsEXT that triggered this callback.
- `objectType` is a VkDebugReportObjectTypeEXT value specifying the type of object being used or created at the time the event was triggered.
- `object` is the object where the issue was detected. If `objectType` is `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT`, `object` is undefined.
- `location` is a component (layer, driver, loader) defined value specifying the *location* of the trigger. This is an **optional** value.
- `messageCode` is a layer-defined value indicating what test triggered this callback.
- `pLayerPrefix` is a null-terminated UTF-8 string that is an abbreviation of the name of the component making the callback. `pLayerPrefix` is only valid for the duration of the callback.
- `pMessage` is a null-terminated UTF-8 string detailing the trigger conditions. `pMessage` is only valid for the duration of the callback.
- `pUserData` is the user data given when the VkDebugReportCallbackEXT was created.

The callback **must** not call `vkDestroyDebugReportCallbackEXT`.

The callback returns a VkBool32, which is interpreted in a layer-specified manner. The application **should** always return `VK_FALSE`. The `VK_TRUE` value is reserved for use in layer development.

`object` **must** be a Vulkan object or VK_NULL_HANDLE. If `objectType` is not `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT` and `object` is not VK_NULL_HANDLE, `object` **must** be a Vulkan object of the corresponding type associated with `objectType` as defined in `VkDebugReportObjectTypeEXT` and Vulkan Handle Relationship.

Possible values passed to the `objectType` parameter of the callback function specified by VkDebugReportCallbackCreateInfoEXT::`pfnCallback`, specifying the type of object handle being reported, are:

```
// Provided by VK_EXT_debug_marker, VK_EXT_debug_report
typedef enum VkDebugReportObjectTypeEXT {
    VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT = 0,
    VK_DEBUG_REPORT_OBJECT_TYPE_INSTANCE_EXT = 1,
    VK_DEBUG_REPORT_OBJECT_TYPE_PHYSICAL_DEVICE_EXT = 2,
```

```
    VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_EXT = 3,
    VK_DEBUG_REPORT_OBJECT_TYPE_QUEUE_EXT = 4,
    VK_DEBUG_REPORT_OBJECT_TYPE_SEMAPHORE_EXT = 5,
    VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_BUFFER_EXT = 6,
    VK_DEBUG_REPORT_OBJECT_TYPE_FENCE_EXT = 7,
    VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_MEMORY_EXT = 8,
    VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_EXT = 9,
    VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_EXT = 10,
    VK_DEBUG_REPORT_OBJECT_TYPE_EVENT_EXT = 11,
    VK_DEBUG_REPORT_OBJECT_TYPE_QUERY_POOL_EXT = 12,
    VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_VIEW_EXT = 13,
    VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_VIEW_EXT = 14,
    VK_DEBUG_REPORT_OBJECT_TYPE_SHADER_MODULE_EXT = 15,
    VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_CACHE_EXT = 16,
    VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_LAYOUT_EXT = 17,
    VK_DEBUG_REPORT_OBJECT_TYPE_RENDER_PASS_EXT = 18,
    VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_EXT = 19,
    VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT_EXT = 20,
    VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_EXT = 21,
    VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_POOL_EXT = 22,
    VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_EXT = 23,
    VK_DEBUG_REPORT_OBJECT_TYPE_FRAMEBUFFER_EXT = 24,
    VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_POOL_EXT = 25,
    VK_DEBUG_REPORT_OBJECT_TYPE_SURFACE_KHR_EXT = 26,
    VK_DEBUG_REPORT_OBJECT_TYPE_SWAPCHAIN_KHR_EXT = 27,
    VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT_EXT = 28,
    VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_KHR_EXT = 29,
    VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_MODE_KHR_EXT = 30,
    VK_DEBUG_REPORT_OBJECT_TYPE_VALIDATION_CACHE_EXT_EXT = 33,
  // Provided by VK_VERSION_1_1 with VK_EXT_debug_report,
VK_KHR_sampler_ycbcr_conversion with VK_EXT_debug_report
    VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_EXT = 1000156000,
  // Provided by VK_VERSION_1_1 with VK_EXT_debug_report
    VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_EXT = 1000085000,
  // Provided by VK_EXT_debug_report with VK_NVX_binary_import
    VK_DEBUG_REPORT_OBJECT_TYPE_CU_MODULE_NVX_EXT = 1000029000,
  // Provided by VK_EXT_debug_report with VK_NVX_binary_import
    VK_DEBUG_REPORT_OBJECT_TYPE_CU_FUNCTION_NVX_EXT = 1000029001,
  // Provided by VK_KHR_acceleration_structure with VK_EXT_debug_report
    VK_DEBUG_REPORT_OBJECT_TYPE_ACCELERATION_STRUCTURE_KHR_EXT = 1000150000,
  // Provided by VK_EXT_debug_report with VK_NV_ray_tracing
    VK_DEBUG_REPORT_OBJECT_TYPE_ACCELERATION_STRUCTURE_NV_EXT = 1000165000,
  // Provided by VK_EXT_debug_report with VK_NV_cuda_kernel_launch
    VK_DEBUG_REPORT_OBJECT_TYPE_CUDA_MODULE_NV_EXT = 1000307000,
  // Provided by VK_EXT_debug_report with VK_NV_cuda_kernel_launch
    VK_DEBUG_REPORT_OBJECT_TYPE_CUDA_FUNCTION_NV_EXT = 1000307001,
  // Provided by VK_EXT_debug_report with VK_FUCHSIA_buffer_collection
    VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_COLLECTION_FUCHSIA_EXT = 1000366000,
  // VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_EXT is a deprecated alias
    VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_EXT =
VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT_EXT,
```

```
  // VK_DEBUG_REPORT_OBJECT_TYPE_VALIDATION_CACHE_EXT is a deprecated alias
    VK_DEBUG_REPORT_OBJECT_TYPE_VALIDATION_CACHE_EXT =
VK_DEBUG_REPORT_OBJECT_TYPE_VALIDATION_CACHE_EXT_EXT,
  // Provided by VK_KHR_descriptor_update_template with VK_EXT_debug_report
    VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_KHR_EXT =
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_EXT,
  // Provided by VK_KHR_sampler_ycbcr_conversion with VK_EXT_debug_report
    VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_KHR_EXT =
VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_EXT,
} VkDebugReportObjectTypeEXT;
```

Table 99. VkDebugReportObjectTypeEXT and Vulkan Handle Relationship

VkDebugReportObjectTypeEXT	Vulkan Handle Type
VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT	Unknown/Undefined Handle
VK_DEBUG_REPORT_OBJECT_TYPE_INSTANCE_EXT	VkInstance
VK_DEBUG_REPORT_OBJECT_TYPE_PHYSICAL_DEVICE_EXT	VkPhysicalDevice
VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_EXT	VkDevice
VK_DEBUG_REPORT_OBJECT_TYPE_QUEUE_EXT	VkQueue
VK_DEBUG_REPORT_OBJECT_TYPE_SEMAPHORE_EXT	VkSemaphore
VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_BUFFER_EXT	VkCommandBuffer
VK_DEBUG_REPORT_OBJECT_TYPE_FENCE_EXT	VkFence
VK_DEBUG_REPORT_OBJECT_TYPE_DEVICE_MEMORY_EXT	VkDeviceMemory
VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_EXT	VkBuffer
VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_EXT	VkImage
VK_DEBUG_REPORT_OBJECT_TYPE_EVENT_EXT	VkEvent
VK_DEBUG_REPORT_OBJECT_TYPE_QUERY_POOL_EXT	VkQueryPool
VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_VIEW_EXT	VkBufferView
VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_VIEW_EXT	VkImageView
VK_DEBUG_REPORT_OBJECT_TYPE_SHADER_MODULE_EXT	VkShaderModule
VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_CACHE_EXT	VkPipelineCache
VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_LAYOUT_EXT	VkPipelineLayout
VK_DEBUG_REPORT_OBJECT_TYPE_RENDER_PASS_EXT	VkRenderPass
VK_DEBUG_REPORT_OBJECT_TYPE_PIPELINE_EXT	VkPipeline
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT_EXT	VkDescriptorSetLayout

VkDebugReportObjectTypeEXT	Vulkan Handle Type
VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_EXT	VkSampler
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_POOL_EXT	VkDescriptorPool
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_SET_EXT	VkDescriptorSet
VK_DEBUG_REPORT_OBJECT_TYPE_FRAMEBUFFER_EXT	VkFramebuffer
VK_DEBUG_REPORT_OBJECT_TYPE_COMMAND_POOL_EXT	VkCommandPool
VK_DEBUG_REPORT_OBJECT_TYPE_SURFACE_KHR_EXT	VkSurfaceKHR
VK_DEBUG_REPORT_OBJECT_TYPE_SWAPCHAIN_KHR_EXT	VkSwapchainKHR
VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT_EXT	VkDebugReportCallbackEXT
VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_KHR_EXT	VkDisplayKHR
VK_DEBUG_REPORT_OBJECT_TYPE_DISPLAY_MODE_KHR_EXT	VkDisplayModeKHR
VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_EXT	VkDescriptorUpdateTemplate

NOTE The primary expected use of VK_ERROR_VALIDATION_FAILED_EXT is for validation layer testing. It is not expected that an application would see this error code during normal use of the validation layers.

To inject its own messages into the debug stream, call:

```
// Provided by VK_EXT_debug_report
void vkDebugReportMessageEXT(
    VkInstance                                  instance,
    VkDebugReportFlagsEXT                       flags,
    VkDebugReportObjectTypeEXT                  objectType,
    uint64_t                                    object,
    size_t                                      location,
    int32_t                                     messageCode,
    const char*                                 pLayerPrefix,
    const char*                                 pMessage);
```

- instance is the debug stream's VkInstance.
- flags specifies the VkDebugReportFlagBitsEXT classification of this event/message.
- objectType is a VkDebugReportObjectTypeEXT specifying the type of object being used or created at the time the event was triggered.
- object is the object where the issue was detected. object **can** be VK_NULL_HANDLE if there is no object associated with the event.
- location is an application-defined value.

- `messageCode` is an application-defined value.
- `pLayerPrefix` is the abbreviation of the component making this event/message.
- `pMessage` is a null-terminated UTF-8 string detailing the trigger conditions.

The call will propagate through the layers and generate callback(s) as indicated by the message's flags. The parameters are passed on to the callback in addition to the `pUserData` value that was defined at the time the callback was registered.

Valid Usage

- VUID-vkDebugReportMessageEXT-object-01241
  `object` **must** be a Vulkan object or VK_NULL_HANDLE
- VUID-vkDebugReportMessageEXT-objectType-01498
  If `objectType` is not `VK_DEBUG_REPORT_OBJECT_TYPE_UNKNOWN_EXT` and `object` is not VK_NULL_HANDLE, `object` **must** be a Vulkan object of the corresponding type associated with `objectType` as defined in `VkDebugReportObjectTypeEXT` and Vulkan Handle Relationship

Valid Usage (Implicit)

- VUID-vkDebugReportMessageEXT-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkDebugReportMessageEXT-flags-parameter
  `flags` **must** be a valid combination of VkDebugReportFlagBitsEXT values
- VUID-vkDebugReportMessageEXT-flags-requiredbitmask
  `flags` **must** not be `0`
- VUID-vkDebugReportMessageEXT-objectType-parameter
  `objectType` **must** be a valid VkDebugReportObjectTypeEXT value
- VUID-vkDebugReportMessageEXT-pLayerPrefix-parameter
  `pLayerPrefix` **must** be a null-terminated UTF-8 string
- VUID-vkDebugReportMessageEXT-pMessage-parameter
  `pMessage` **must** be a null-terminated UTF-8 string

To destroy a `VkDebugReportCallbackEXT` object, call:

```
// Provided by VK_EXT_debug_report
void vkDestroyDebugReportCallbackEXT(
    VkInstance                                  instance,
    VkDebugReportCallbackEXT                    callback,
    const VkAllocationCallbacks*                pAllocator);
```

- `instance` is the instance where the callback was created.
- `callback` is the VkDebugReportCallbackEXT object to destroy. `callback` is an externally

synchronized object and **must** not be used on more than one thread at a time. This means that `vkDestroyDebugReportCallbackEXT` **must** not be called when a callback is active.

- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyDebugReportCallbackEXT-instance-01242
  If `VkAllocationCallbacks` were provided when `callback` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDebugReportCallbackEXT-instance-01243
  If no `VkAllocationCallbacks` were provided when `callback` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyDebugReportCallbackEXT-instance-parameter
  `instance` **must** be a valid VkInstance handle
- VUID-vkDestroyDebugReportCallbackEXT-callback-parameter
  If `callback` is not VK_NULL_HANDLE, `callback` **must** be a valid VkDebugReportCallbackEXT handle
- VUID-vkDestroyDebugReportCallbackEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyDebugReportCallbackEXT-callback-parent
  If `callback` is a valid handle, it **must** have been created, allocated, or retrieved from `instance`

Host Synchronization

- Host access to `callback` **must** be externally synchronized

50.4. Device Loss Debugging

50.4.1. Device Diagnostic Checkpoints

Device execution progress **can** be tracked for the purposes of debugging a device loss by annotating the command stream with application-defined diagnostic checkpoints.

Device diagnostic checkpoints are inserted into the command stream by calling vkCmdSetCheckpointNV.

```
// Provided by VK_NV_device_diagnostic_checkpoints
void vkCmdSetCheckpointNV(
    VkCommandBuffer                             commandBuffer,
    const void*                                 pCheckpointMarker);
```

- `commandBuffer` is the command buffer that will receive the marker
- `pCheckpointMarker` is an opaque application-provided value that will be associated with the checkpoint.

Valid Usage (Implicit)

- VUID-vkCmdSetCheckpointNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetCheckpointNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetCheckpointNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, or transfer operations
- VUID-vkCmdSetCheckpointNV-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics Compute Transfer	Action

Note that `pCheckpointMarker` is treated as an opaque value. It does not need to be a valid pointer and will not be dereferenced by the implementation.

If the device encounters an error during execution, the implementation will return a `VK_ERROR_DEVICE_LOST` error to the application at some point during host execution. When this happens, the application **can** call vkGetQueueCheckpointData2NV to retrieve information on the

most recent diagnostic checkpoints that were executed by the device.

```
// Provided by VK_NV_device_diagnostic_checkpoints with VK_VERSION_1_3 or
VK_KHR_synchronization2
void vkGetQueueCheckpointData2NV(
    VkQueue                                     queue,
    uint32_t*                                   pCheckpointDataCount,
    VkCheckpointData2NV*                        pCheckpointData);
```

- `queue` is the VkQueue object the caller would like to retrieve checkpoint data for
- `pCheckpointDataCount` is a pointer to an integer related to the number of checkpoint markers available or queried, as described below.
- `pCheckpointData` is either `NULL` or a pointer to an array of `VkCheckpointData2NV` structures.

If `pCheckpointData` is `NULL`, then the number of checkpoint markers available is returned in `pCheckpointDataCount`. Otherwise, `pCheckpointDataCount` **must** point to a variable set by the application to the number of elements in the `pCheckpointData` array, and on return the variable is overwritten with the number of structures actually written to `pCheckpointData`.

If `pCheckpointDataCount` is less than the number of checkpoint markers available, at most `pCheckpointDataCount` structures will be written.

Valid Usage

- VUID-vkGetQueueCheckpointData2NV-queue-03892
  The device that `queue` belongs to **must** be in the lost state

Valid Usage (Implicit)

- VUID-vkGetQueueCheckpointData2NV-queue-parameter
  `queue` **must** be a valid VkQueue handle
- VUID-vkGetQueueCheckpointData2NV-pCheckpointDataCount-parameter
  `pCheckpointDataCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetQueueCheckpointData2NV-pCheckpointData-parameter
  If the value referenced by `pCheckpointDataCount` is not `0`, and `pCheckpointData` is not `NULL`, `pCheckpointData` **must** be a valid pointer to an array of `pCheckpointDataCount` VkCheckpointData2NV structures

The VkCheckpointData2NV structure is defined as:

```
// Provided by VK_NV_device_diagnostic_checkpoints with VK_VERSION_1_3 or
VK_KHR_synchronization2
typedef struct VkCheckpointData2NV {
    VkStructureType          sType;
    void*                    pNext;
    VkPipelineStageFlags2    stage;
    void*                    pCheckpointMarker;
} VkCheckpointData2NV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stage` indicates a single pipeline stage which the checkpoint marker data refers to.
- `pCheckpointMarker` contains the value of the last checkpoint marker executed in the stage that `stage` refers to.

Valid Usage (Implicit)

- VUID-VkCheckpointData2NV-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_CHECKPOINT_DATA_2_NV`
- VUID-VkCheckpointData2NV-pNext-pNext
  `pNext` **must** be `NULL`

The stages at which a checkpoint marker **can** be executed are implementation-defined and **can** be queried by calling vkGetPhysicalDeviceQueueFamilyProperties2.

If the device encounters an error during execution, the implementation will return a `VK_ERROR_DEVICE_LOST` error to the application at a certain point during host execution. When this happens, the application **can** call vkGetQueueCheckpointDataNV to retrieve information on the most recent diagnostic checkpoints that were executed by the device.

```
// Provided by VK_NV_device_diagnostic_checkpoints
void vkGetQueueCheckpointDataNV(
    VkQueue                                     queue,
    uint32_t*                                   pCheckpointDataCount,
    VkCheckpointDataNV*                         pCheckpointData);
```

- `queue` is the VkQueue object the caller would like to retrieve checkpoint data for
- `pCheckpointDataCount` is a pointer to an integer related to the number of checkpoint markers available or queried, as described below.
- `pCheckpointData` is either `NULL` or a pointer to an array of `VkCheckpointDataNV` structures.

If `pCheckpointData` is `NULL`, then the number of checkpoint markers available is returned in `pCheckpointDataCount`.

Otherwise, `pCheckpointDataCount` **must** point to a variable set by the application to the number of elements in the `pCheckpointData` array, and on return the variable is overwritten with the number of structures actually written to `pCheckpointData`.

If `pCheckpointDataCount` is less than the number of checkpoint markers available, at most `pCheckpointDataCount` structures will be written.

Valid Usage

- VUID-vkGetQueueCheckpointDataNV-queue-02025
  The device that `queue` belongs to **must** be in the lost state

Valid Usage (Implicit)

- VUID-vkGetQueueCheckpointDataNV-queue-parameter
  `queue` **must** be a valid VkQueue handle
- VUID-vkGetQueueCheckpointDataNV-pCheckpointDataCount-parameter
  `pCheckpointDataCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetQueueCheckpointDataNV-pCheckpointData-parameter
  If the value referenced by `pCheckpointDataCount` is not `0`, and `pCheckpointData` is not `NULL`, `pCheckpointData` **must** be a valid pointer to an array of `pCheckpointDataCount` VkCheckpointDataNV structures

The VkCheckpointDataNV structure is defined as:

```
// Provided by VK_NV_device_diagnostic_checkpoints
typedef struct VkCheckpointDataNV {
    VkStructureType            sType;
    void*                      pNext;
    VkPipelineStageFlagBits    stage;
    void*                      pCheckpointMarker;
} VkCheckpointDataNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stage` is a `VkPipelineStageFlagBits` value specifying which pipeline stage the checkpoint marker data refers to.
- `pCheckpointMarker` contains the value of the last checkpoint marker executed in the stage that `stage` refers to.

The stages at which a checkpoint marker **can** be executed are implementation-defined and **can** be queried by calling vkGetPhysicalDeviceQueueFamilyProperties2.

Valid Usage (Implicit)

- VUID-VkCheckpointDataNV-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_CHECKPOINT_DATA_NV`
- VUID-VkCheckpointDataNV-pNext-pNext
  `pNext` **must** be `NULL`

50.4.2. Device Fault Diagnosis

To retrieve diagnostic information about faults that **may** have caused device loss, call:

```
// Provided by VK_EXT_device_fault
VkResult vkGetDeviceFaultInfoEXT(
    VkDevice                                    device,
    VkDeviceFaultCountsEXT*                     pFaultCounts,
    VkDeviceFaultInfoEXT*                       pFaultInfo);
```

- `device` is the logical device from which to query the diagnostic fault information.
- `pFaultCounts` is a pointer to a VkDeviceFaultCountsEXT structure in which counts for structures describing additional fault information are returned.
- `pFaultInfo` is `NULL` or a pointer to a VkDeviceFaultInfoEXT structure in which fault information is returned.

If `pFaultInfo` is `NULL`, then the counts of corresponding additional fault information structures available are returned in the `addressInfoCount` and `vendorInfoCount` members of `pFaultCounts`. Additionally, the size of any vendor-specific binary crash dump is returned in the `vendorBinarySize` member of `pFaultCounts`.

If `pFaultInfo` is not `NULL`, `pFaultCounts` **must** point to a VkDeviceFaultCountsEXT structure with each structure count or size member (`addressInfoCount`, `vendorInfoCount`, `vendorBinarySize`) set by the application to the number of elements in the corresponding output array member of `pFaultInfo` (`pAddressInfos` and `pVendorInfos`), or to the size of the output buffer in bytes (`pVendorBinaryData`). On return, each structure count member is overwritten with the number of structures actually written to the corresponding output array member of `pFaultInfo`. Similarly, `vendorBinarySize` is overwritten with the number of bytes actually written to the `pVendorBinaryData` member of `pFaultInfo`.

If the vendor-specific crash dumps feature is not enabled, then implementations **must** set `pFaultCounts`->vendorBinarySize to zero and **must** not modify `pFaultInfo`->pVendorBinaryData.

If any `pFaultCounts` structure count member is less than the number of corresponding fault properties available, at most structure count (`addressInfoCount`, `vendorInfoCount`) elements will be written to the associated `pFaultInfo` output array. Similarly, if `vendorBinarySize` is less than the size in bytes of the available crash dump data, at most `vendorBinarySize` elements will be written to `pVendorBinaryData`.

If `pFaultInfo` is `NULL`, then subsequent calls to vkGetDeviceFaultInfoEXT for the same `device` **must**

return identical values in the addressInfoCount, vendorInfoCount and vendorBinarySize members of pFaultCounts.

If pFaultInfo is not NULL, then subsequent calls to vkGetDeviceFaultInfoEXT for the same device **must** return identical values in the output members of pFaultInfo (pAddressInfos, pVendorInfos, pVendorBinaryData), up to the limits described by the structure count and buffer size members of pFaultCounts (addressInfoCount, vendorInfoCount, vendorBinarySize). If the sizes of the output members of pFaultInfo increase for a subsequent call to vkGetDeviceFaultInfoEXT, then supplementary information **may** be returned in the additional available space.

If any pFaultCounts structure count member is smaller than the number of corresponding fault properties available, or if pFaultCounts->vendorBinarySize is smaller than the size in bytes of the generated binary crash dump data, VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

If pFaultCounts->vendorBinarySize is less than what is necessary to store the binary crash dump header, nothing will be written to pFaultInfo->pVendorBinaryData and zero will be written to pFaultCounts->vendorBinarySize.

Valid Usage

- VUID-vkGetDeviceFaultInfoEXT-device-07336
  device **must** be in the *lost* state
- VUID-vkGetDeviceFaultInfoEXT-pFaultCounts-07337
  If the value referenced by pFaultCounts->addressInfoCount is not 0, and pFaultInfo->pAddressInfos is not NULL, pFaultInfo->pAddressInfos **must** be a valid pointer to an array of pFaultCounts->addressInfoCount VkDeviceFaultAddressInfoEXT structures
- VUID-vkGetDeviceFaultInfoEXT-pFaultCounts-07338
  If the value referenced by pFaultCounts->vendorInfoCount is not 0, and pFaultInfo->pVendorInfos is not NULL, pFaultInfo->pVendorInfos **must** be a valid pointer to an array of pFaultCounts->vendorInfoCount VkDeviceFaultVendorInfoEXT structures
- VUID-vkGetDeviceFaultInfoEXT-pFaultCounts-07339
  If the value referenced by pFaultCounts->vendorBinarySize is not 0, and pFaultInfo->pVendorBinaryData is not NULL, pFaultInfo->pVendorBinaryData **must** be a valid pointer to an array of pFaultCounts->vendorBinarySize bytes

Valid Usage (Implicit)

- VUID-vkGetDeviceFaultInfoEXT-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetDeviceFaultInfoEXT-pFaultCounts-parameter
  pFaultCounts **must** be a valid pointer to a VkDeviceFaultCountsEXT structure
- VUID-vkGetDeviceFaultInfoEXT-pFaultInfo-parameter
  If pFaultInfo is not NULL, pFaultInfo **must** be a valid pointer to a VkDeviceFaultInfoEXT structure

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY

The VkDeviceFaultCountsEXT structure is defined as:

```
// Provided by VK_EXT_device_fault
typedef struct VkDeviceFaultCountsEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           addressInfoCount;
    uint32_t           vendorInfoCount;
    VkDeviceSize       vendorBinarySize;
} VkDeviceFaultCountsEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- addressInfoCount is the number of VkDeviceFaultAddressInfoEXT structures describing either memory accesses which **may** have caused a page fault, or the addresses of active instructions at the time of the fault.
- vendorInfoCount is the number of VkDeviceFaultVendorInfoEXT structures describing vendor-specific fault information.
- vendorBinarySize is the size in bytes of a vendor-specific binary crash dump, which may provide additional information when imported into external tools.

Valid Usage (Implicit)

- VUID-VkDeviceFaultCountsEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DEVICE_FAULT_COUNTS_EXT
- VUID-VkDeviceFaultCountsEXT-pNext-pNext
  pNext **must** be NULL

The VkDeviceFaultInfoEXT structure is defined as:

```
// Provided by VK_EXT_device_fault
typedef struct VkDeviceFaultInfoEXT {
    VkStructureType                 sType;
    void*                           pNext;
    char                            description[VK_MAX_DESCRIPTION_SIZE];
    VkDeviceFaultAddressInfoEXT*    pAddressInfos;
    VkDeviceFaultVendorInfoEXT*     pVendorInfos;
    void*                           pVendorBinaryData;
} VkDeviceFaultInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `description` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a human readable description of the fault.
- `pAddressInfos` is `NULL` or a pointer to an array of VkDeviceFaultAddressInfoEXT structures describing either memory accesses which **may** have caused a page fault, or describing active instruction pointers at the time of the fault. If not `NULL`, each element of `pAddressInfos` describes the a bounded region of GPU virtual address space containing either the GPU virtual address accessed, or the value of an active instruction pointer.
- `pVendorInfos` is `NULL` or a pointer to an array of VkDeviceFaultVendorInfoEXT structures describing vendor-specific fault information.
- `pVendorBinaryData` is `NULL` or a pointer to `vendorBinarySize` number of bytes of data, which will be populated with a vendor-specific binary crash dump, as described in Vendor Binary Crash Dumps.

An implementation **should** populate as many members of VkDeviceFaultInfoEXT as possible, given the information available at the time of the fault and the constraints of the implementation itself.

Due to hardware limitations, `pAddressInfos` describes ranges of GPU virtual address space, rather than precise addresses. The precise memory address accessed or the precise value of the instruction pointer **must** lie within the region described.

NOTE

Each element of `pAddressInfos` describes either:

- A memory access which may have triggered a page fault and may have contributed to device loss
- The value of an active instruction pointer at the time a fault occurred. This value may be indicative of the active pipeline or shader at the time of device loss

Comparison of the GPU virtual addresses described by `pAddressInfos` to GPU virtual address ranges reported by the `VK_EXT_device_address_binding_report` extension may allow applications to correlate between these addresses and Vulkan objects. Applications should be aware that these addresses may also correspond to resources internal to an implementation, which will not be reported via the `VK_EXT_device_address_binding_report` extension.

Valid Usage (Implicit)

- VUID-VkDeviceFaultInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_FAULT_INFO_EXT`
- VUID-VkDeviceFaultInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`

The `VkDeviceFaultAddressInfoEXT` structure is defined as:

```
// Provided by VK_EXT_device_fault
typedef struct VkDeviceFaultAddressInfoEXT {
    VkDeviceFaultAddressTypeEXT    addressType;
    VkDeviceAddress                reportedAddress;
    VkDeviceSize                   addressPrecision;
} VkDeviceFaultAddressInfoEXT;
```

- `addressType` is either the type of memory operation that triggered a page fault, or the type of association between an instruction pointer and a fault.
- `reportedAddress` is the GPU virtual address recorded by the device.
- `addressPrecision` is a power of two value that specifies how precisely the device can report the address.

The combination of `reportedAddress` and `addressPrecision` allow the possible range of addresses to be calculated, such that:

```
lower_address = (pInfo->reportedAddress & ~(pInfo->addressPrecision-1))
upper_address = (pInfo->reportedAddress |  (pInfo->addressPrecision-1))
```

NOTE

It is valid for the `reportedAddress` to contain a more precise address than indicated by `addressPrecision`. In this case, the value of `reportedAddress` should be treated as an additional hint as to the value of the address that triggered the page fault, or to the value of an instruction pointer.

Valid Usage (Implicit)

- VUID-VkDeviceFaultAddressInfoEXT-addressType-parameter
  `addressType` **must** be a valid VkDeviceFaultAddressTypeEXT value

Possible values of VkDeviceFaultAddressInfoEXT::`addressType` are:

```
// Provided by VK_EXT_device_fault
typedef enum VkDeviceFaultAddressTypeEXT {
    VK_DEVICE_FAULT_ADDRESS_TYPE_NONE_EXT = 0,
    VK_DEVICE_FAULT_ADDRESS_TYPE_READ_INVALID_EXT = 1,
    VK_DEVICE_FAULT_ADDRESS_TYPE_WRITE_INVALID_EXT = 2,
    VK_DEVICE_FAULT_ADDRESS_TYPE_EXECUTE_INVALID_EXT = 3,
    VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_UNKNOWN_EXT = 4,
    VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_INVALID_EXT = 5,
    VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_FAULT_EXT = 6,
} VkDeviceFaultAddressTypeEXT;
```

- VK_DEVICE_FAULT_ADDRESS_TYPE_NONE_EXT specifies that VkDeviceFaultAddressInfoEXT does not describe a page fault, or an instruction address.
- VK_DEVICE_FAULT_ADDRESS_TYPE_READ_INVALID_EXT specifies that VkDeviceFaultAddressInfoEXT describes a page fault triggered by an invalid read operation.
- VK_DEVICE_FAULT_ADDRESS_TYPE_WRITE_INVALID_EXT specifies that VkDeviceFaultAddressInfoEXT describes a page fault triggered by an invalid write operation.
- VK_DEVICE_FAULT_ADDRESS_TYPE_EXECUTE_INVALID_EXT describes a page fault triggered by an attempt to execute non-executable memory.
- VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_UNKNOWN_EXT specifies an instruction pointer value at the time the fault occurred. This may or may not be related to a fault.
- VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_INVALID_EXT specifies an instruction pointer value associated with an invalid instruction fault.
- VK_DEVICE_FAULT_ADDRESS_TYPE_INSTRUCTION_POINTER_FAULT_EXT specifies an instruction pointer value associated with a fault.

NOTE	The instruction pointer values recorded may not identify the specific instruction(s) that triggered the fault. The relationship between the instruction pointer reported and triggering instruction will be vendor-specific.

The VkDeviceFaultVendorInfoEXT structure is defined as:

```
// Provided by VK_EXT_device_fault
typedef struct VkDeviceFaultVendorInfoEXT {
    char        description[VK_MAX_DESCRIPTION_SIZE];
    uint64_t    vendorFaultCode;
    uint64_t    vendorFaultData;
} VkDeviceFaultVendorInfoEXT;
```

- description is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description of the fault.
- vendorFaultCode is the vendor-specific fault code for this fault.
- vendorFaultData is the vendor-specific fault data associated with this fault.

Vendor Binary Crash Dumps

Applications **can** store the vendor-specific binary crash dump data retrieved by calling vkGetDeviceFaultInfoEXT for later analysis using external tools.

However, the format of this data **may** depend on the vendor ID, device ID, driver version, and other details of the device. To enable external applications to identify the original device from which a crash dump was generated, the initial bytes written to VkDeviceFaultInfoEXT::pVendorBinaryData **must** begin with a valid crash dump header.

Version one of the crash dump header is defined as:

```
// Provided by VK_EXT_device_fault
typedef struct VkDeviceFaultVendorBinaryHeaderVersionOneEXT {
    uint32_t                                    headerSize;
    VkDeviceFaultVendorBinaryHeaderVersionEXT    headerVersion;
    uint32_t                                    vendorID;
    uint32_t                                    deviceID;
    uint32_t                                    driverVersion;
    uint8_t                                     pipelineCacheUUID[VK_UUID_SIZE];
    uint32_t                                    applicationNameOffset;
    uint32_t                                    applicationVersion;
    uint32_t                                    engineNameOffset;
    uint32_t                                    engineVersion;
    uint32_t                                    apiVersion;
} VkDeviceFaultVendorBinaryHeaderVersionOneEXT;
```

- headerSize is the length in bytes of the crash dump header.
- headerVersion is a VkDeviceFaultVendorBinaryHeaderVersionEXT enum value specifying the version of the header. A consumer of the crash dump **should** use the header version to interpret the remainder of the header.
- vendorID is the VkPhysicalDeviceProperties::vendorID of the implementation.
- deviceID is the VkPhysicalDeviceProperties::deviceID of the implementation.
- driverVersion is the VkPhysicalDeviceProperties::driverVersion of the implementation.
- pipelineCacheUUID is an array of VK_UUID_SIZE uint8_t values matching the VkPhysicalDeviceProperties::pipelineCacheUUID property of the implementation.
- applicationNameOffset is zero, or an offset from the base address of the crash dump header to a null-terminated UTF-8 string containing the name of the application. If applicationNameOffset is non-zero, this string **must** match the application name specified via VkApplicationInfo ::pApplicationName during instance creation.
- applicationVersion **must** be zero or the value specified by VkApplicationInfo ::applicationVersion during instance creation.
- engineNameOffset is zero, or an offset from the base address of the crash dump header to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application. If engineNameOffset is non-zero, this string **must** match the engine name specified

via VkApplicationInfo::pEngineName during instance creation.

- engineVersion **must** be zero or the value specified by VkApplicationInfo::engineVersion during instance creation.
- apiVersion **must** be zero or the value specified by VkApplicationInfo::apiVersion during instance creation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 56 bytes. If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values at the correct offsets.

Valid Usage

- VUID-VkDeviceFaultVendorBinaryHeaderVersionOneEXT-headerSize-07340
  headerSize **must** be 56
- VUID-VkDeviceFaultVendorBinaryHeaderVersionOneEXT-headerVersion-07341
  headerVersion **must** be VK_DEVICE_FAULT_VENDOR_BINARY_HEADER_VERSION_ONE_EXT

Valid Usage (Implicit)

- VUID-VkDeviceFaultVendorBinaryHeaderVersionOneEXT-headerVersion-parameter
  headerVersion **must** be a valid VkDeviceFaultVendorBinaryHeaderVersionEXT value

Possible values of the headerVersion value of the crash dump header are:

```
// Provided by VK_EXT_device_fault
typedef enum VkDeviceFaultVendorBinaryHeaderVersionEXT {
    VK_DEVICE_FAULT_VENDOR_BINARY_HEADER_VERSION_ONE_EXT = 1,
} VkDeviceFaultVendorBinaryHeaderVersionEXT;
```

- VK_DEVICE_FAULT_VENDOR_BINARY_HEADER_VERSION_ONE_EXT specifies version one of the binary crash dump header.

50.5. Active Tooling Information

Information about tools providing debugging, profiling, or similar services, active for a given physical device, can be obtained by calling:

```
// Provided by VK_EXT_tooling_info
VkResult vkGetPhysicalDeviceToolPropertiesEXT(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pToolCount,
    VkPhysicalDeviceToolProperties*             pToolProperties);
```

- `physicalDevice` is the handle to the physical device to query for active tools.
- `pToolCount` is a pointer to an integer describing the number of tools active on `physicalDevice`.
- `pToolProperties` is either `NULL` or a pointer to an array of VkPhysicalDeviceToolProperties structures.

If `pToolProperties` is `NULL`, then the number of tools currently active on `physicalDevice` is returned in `pToolCount`. Otherwise, `pToolCount` **must** point to a variable set by the application to the number of elements in the `pToolProperties` array, and on return the variable is overwritten with the number of structures actually written to `pToolProperties`. If `pToolCount` is less than the number of currently active tools, at most `pToolCount` structures will be written.

The count and properties of active tools **may** change in response to events outside the scope of the specification. An application **should** assume these properties might change at any given time.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceToolProperties-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceToolProperties-pToolCount-parameter
  `pToolCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceToolProperties-pToolProperties-parameter
  If the value referenced by `pToolCount` is not `0`, and `pToolProperties` is not `NULL`, `pToolProperties` **must** be a valid pointer to an array of `pToolCount` VkPhysicalDeviceToolProperties structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The VkPhysicalDeviceToolProperties structure is defined as:

```
typedef struct VkPhysicalDeviceToolProperties {
    VkStructureType       sType;
    void*                 pNext;
    char                  name[VK_MAX_EXTENSION_NAME_SIZE];
    char                  version[VK_MAX_EXTENSION_NAME_SIZE];
    VkToolPurposeFlags    purposes;
    char                  description[VK_MAX_DESCRIPTION_SIZE];
    char                  layer[VK_MAX_EXTENSION_NAME_SIZE];
} VkPhysicalDeviceToolProperties;
```

or the equivalent

```
// Provided by VK_EXT_tooling_info
typedef VkPhysicalDeviceToolProperties VkPhysicalDeviceToolPropertiesEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `name` is a null-terminated UTF-8 string containing the name of the tool.
- `version` is a null-terminated UTF-8 string containing the version of the tool.
- `purposes` is a bitmask of VkToolPurposeFlagBits which is populated with purposes supported by the tool.
- `description` is a null-terminated UTF-8 string containing a description of the tool.
- `layer` is a null-terminated UTF-8 string containing the name of the layer implementing the tool, if the tool is implemented in a layer - otherwise it **may** be an empty string.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceToolProperties-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TOOL_PROPERTIES`
- VUID-VkPhysicalDeviceToolProperties-pNext-pNext
  `pNext` **must** be `NULL`

Bits which **can** be set in VkPhysicalDeviceToolProperties::`purposes`, specifying the purposes of an active tool, are:

```
typedef enum VkToolPurposeFlagBits {
    VK_TOOL_PURPOSE_VALIDATION_BIT = 0x00000001,
    VK_TOOL_PURPOSE_PROFILING_BIT = 0x00000002,
    VK_TOOL_PURPOSE_TRACING_BIT = 0x00000004,
    VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT = 0x00000008,
    VK_TOOL_PURPOSE_MODIFYING_FEATURES_BIT = 0x00000010,
  // Provided by VK_EXT_debug_report with VK_EXT_tooling_info, VK_EXT_debug_utils with
VK_EXT_tooling_info
    VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT = 0x00000020,
  // Provided by VK_EXT_debug_marker with VK_EXT_tooling_info, VK_EXT_debug_utils with
VK_EXT_tooling_info
    VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT = 0x00000040,
    VK_TOOL_PURPOSE_VALIDATION_BIT_EXT = VK_TOOL_PURPOSE_VALIDATION_BIT,
    VK_TOOL_PURPOSE_PROFILING_BIT_EXT = VK_TOOL_PURPOSE_PROFILING_BIT,
    VK_TOOL_PURPOSE_TRACING_BIT_EXT = VK_TOOL_PURPOSE_TRACING_BIT,
    VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT_EXT =
VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT,
    VK_TOOL_PURPOSE_MODIFYING_FEATURES_BIT_EXT =
VK_TOOL_PURPOSE_MODIFYING_FEATURES_BIT,
} VkToolPurposeFlagBits;
```

or the equivalent

```
// Provided by VK_EXT_tooling_info
typedef VkToolPurposeFlagBits VkToolPurposeFlagBitsEXT;
```

- VK_TOOL_PURPOSE_VALIDATION_BIT specifies that the tool provides validation of API usage.
- VK_TOOL_PURPOSE_PROFILING_BIT specifies that the tool provides profiling of API usage.
- VK_TOOL_PURPOSE_TRACING_BIT specifies that the tool is capturing data about the application's API usage, including anything from simple logging to capturing data for later replay.
- VK_TOOL_PURPOSE_ADDITIONAL_FEATURES_BIT specifies that the tool provides additional API features/extensions on top of the underlying implementation.
- VK_TOOL_PURPOSE_MODIFYING_FEATURES_BIT specifies that the tool modifies the API features/limits/extensions presented to the application.
- VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT specifies that the tool reports additional information to the application via callbacks specified by vkCreateDebugReportCallbackEXT or vkCreateDebugUtilsMessengerEXT
- VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT specifies that the tool consumes debug markers or object debug annotation, queue labels, or command buffer labels

```
typedef VkFlags VkToolPurposeFlags;
```

or the equivalent

```
// Provided by VK_EXT_tooling_info
typedef VkToolPurposeFlags VkToolPurposeFlagsEXT;
```

VkToolPurposeFlags is a bitmask type for setting a mask of zero or more VkToolPurposeFlagBits.

50.6. Frame Boundary

The VkFrameBoundaryEXT structure is defined as:

```
// Provided by VK_EXT_frame_boundary
typedef struct VkFrameBoundaryEXT {
    VkStructureType            sType;
    const void*                pNext;
    VkFrameBoundaryFlagsEXT    flags;
    uint64_t                   frameID;
    uint32_t                   imageCount;
    const VkImage*             pImages;
    uint32_t                   bufferCount;
    const VkBuffer*            pBuffers;
    uint64_t                   tagName;
    size_t                     tagSize;
    const void*                pTag;
} VkFrameBoundaryEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkFrameBoundaryFlagBitsEXT that can flag the last submission of a frame identifier.
- frameID is the frame identifier.
- imageCount is the number of images that store frame results.
- pImages is a pointer to an array of VkImage objects with imageCount entries.
- bufferCount is the number of buffers the store the frame results.
- pBuffers is a pointer to an array of VkBuffer objects with bufferCount entries.
- tagName is a numerical identifier for tag data.
- tagSize is the number of bytes of tag data.
- pTag is a pointer to an array of tagSize bytes containing tag data.

The application **can** associate frame boundary information to a queue submission call by adding a VkFrameBoundaryEXT structure to the pNext chain of queue submission, VkPresentInfoKHR, or VkBindSparseInfo.

NOTE	The frame identifier is used to associate one or more queue submissions to a frame. It is meant to be unique within a frame lifetime, i.e. it is possible (though not

> recommended) to reuse frame identifiers, as long as any two frames that may have overlapping queue submissions (as in the example above) use different frame identifiers.
>
> Since the concept of frame is application-dependent, there is no way to validate the use of frame identifier. It is good practice to use a monotonically increasing counter as the frame identifier and not reuse identifiers between frames.

The `pImages` and `pBuffers` arrays contain a list of images and buffers which store the "end result" of the frame. As the concept of frame is application-dependent, not all frames **may** produce their results in images or buffers, yet this is a sufficiently common case to be handled by `VkFrameBoundaryEXT`. Note that no extra information, such as image layout is being provided, since the images are meant to be used by tools which would already be tracking this required information. Having the possibility of passing a list of end-result images makes `VkFrameBoundaryEXT` as expressive as vkQueuePresentKHR, which is often the default frame boundary delimiter.

The application **can** also associate arbitrary extra information via tag data using `tagName`, `tagSize` and `pTag`. This extra information is typically tool-specific.

Valid Usage (Implicit)

- VUID-VkFrameBoundaryEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_FRAME_BOUNDARY_EXT`
- VUID-VkFrameBoundaryEXT-flags-parameter
  `flags` **must** be a valid combination of VkFrameBoundaryFlagBitsEXT values
- VUID-VkFrameBoundaryEXT-pImages-parameter
  If `imageCount` is not `0`, and `pImages` is not `NULL`, `pImages` **must** be a valid pointer to an array of `imageCount` valid VkImage handles
- VUID-VkFrameBoundaryEXT-pBuffers-parameter
  If `bufferCount` is not `0`, and `pBuffers` is not `NULL`, `pBuffers` **must** be a valid pointer to an array of `bufferCount` valid VkBuffer handles
- VUID-VkFrameBoundaryEXT-pTag-parameter
  If `tagSize` is not `0`, and `pTag` is not `NULL`, `pTag` **must** be a valid pointer to an array of `tagSize` bytes
- VUID-VkFrameBoundaryEXT-commonparent
  Both of the elements of `pBuffers`, and the elements of `pImages` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

The bit which **can** be set in VkFrameBoundaryEXT::`flags` is:

```
// Provided by VK_EXT_frame_boundary
typedef enum VkFrameBoundaryFlagBitsEXT {
    VK_FRAME_BOUNDARY_FRAME_END_BIT_EXT = 0x00000001,
} VkFrameBoundaryFlagBitsEXT;
```

- VK_FRAME_BOUNDARY_FRAME_END_BIT_EXT specifies that this queue submission is the last one for this frame, i.e. once this queue submission has terminated, then the work for this frame is completed.

Note that in the presence of timeline semaphores, the last queue submission might not be the last one to be submitted, as timeline semaphores allow for wait-before-signal submissions. In the context of frame boundary, the queue submission that should be done flagged as the last one is the one that is meant to be executed last, even if it **may** not be the last one to be submitted.

```
// Provided by VK_EXT_frame_boundary
typedef VkFlags VkFrameBoundaryFlagsEXT;
```

VkFrameBoundaryFlagsEXT is a bitmask type for setting a mask of zero or more VkFrameBoundaryFlagBitsEXT.

Appendix A: Vulkan Environment for SPIR-V

Shaders for Vulkan are defined by the Khronos SPIR-V Specification as well as the Khronos SPIR-V Extended Instructions for GLSL Specification. This appendix defines additional SPIR-V requirements applying to Vulkan shaders.

Versions and Formats

A Vulkan 1.1 implementation **must** support the 1.0, 1.1, 1.2, and 1.3 versions of SPIR-V and the 1.0 version of the SPIR-V Extended Instructions for GLSL. If the `VK_KHR_spirv_1_4` extension is enabled, the implementation **must** additionally support the 1.4 version of SPIR-V.

A SPIR-V module passed into vkCreateShaderModule is interpreted as a series of 32-bit words in host endianness, with literal strings packed as described in section 2.2 of the SPIR-V Specification. The first few words of the SPIR-V module **must** be a magic number and a SPIR-V version number, as described in section 2.3 of the SPIR-V Specification.

Capabilities

The table below lists the set of SPIR-V capabilities that **may** be supported in Vulkan implementations. The application **must** not use any of these capabilities in SPIR-V passed to vkCreateShaderModule unless one of the following conditions is met for the VkDevice specified in the `device` parameter of vkCreateShaderModule:

- The corresponding field in the table is blank.
- Any corresponding Vulkan feature is enabled.
- Any corresponding Vulkan extension is enabled.
- Any corresponding Vulkan property is supported.
- The corresponding core version is supported (as returned by VkPhysicalDeviceProperties ::`apiVersion`).

Table 100. List of SPIR-V Capabilities and Corresponding Vulkan Features, Extensions, or Core Version

SPIR-V `OpCapability`	**Vulkan feature, extension, or core version**
`Matrix`	VK_VERSION_1_0
`Shader`	VK_VERSION_1_0
`InputAttachment`	VK_VERSION_1_0
`Sampled1D`	VK_VERSION_1_0

SPIR-V `OpCapability` **Vulkan feature, extension, or core version**
`Image1D` VK_VERSION_1_0
`SampledBuffer` VK_VERSION_1_0
`ImageBuffer` VK_VERSION_1_0
`ImageQuery` VK_VERSION_1_0
`DerivativeControl` VK_VERSION_1_0
`Geometry` `VkPhysicalDeviceFeatures::geometryShader`
`Tessellation` `VkPhysicalDeviceFeatures::tessellationShader`
`Float64` `VkPhysicalDeviceFeatures::shaderFloat64`
`Int64` `VkPhysicalDeviceFeatures::shaderInt64`

`Int64Atomics`

The application **must** not pass a SPIR-V module containing any of the following to vkCreateShaderModule:

- any `OpCapability` not listed above,
- an unsupported capability, or
- a capability which corresponds to a Vulkan feature or extension which has not been enabled.

SPIR-V Extensions

The following table lists SPIR-V extensions that implementations **may** support. The application **must** not pass a SPIR-V module to vkCreateShaderModule that uses the following SPIR-V extensions unless one of the following conditions is met for the VkDevice specified in the `device` parameter of vkCreateShaderModule:

- Any corresponding Vulkan extension is enabled.
- The corresponding core version is supported (as returned by VkPhysicalDeviceProperties::`apiVersion`).

Table 101. List of SPIR-V Extensions and Corresponding Vulkan Extensions or Core Version

SPIR-V `OpExtension` **Vulkan extension or core version**
`SPV_KHR_variable_pointers` VK_VERSION_1_1 VK_KHR_variable_pointers

Validation Rules Within a Module

A SPIR-V module passed to vkCreateShaderModule **must** conform to the following rules:

Standalone SPIR-V Validation

The following rules **can** be validated with only the SPIR-V module itself. They do not depend on knowledge of the implementation and its capabilities or knowledge of runtime information, such as enabled features.

Valid Usage

- VUID-StandaloneSpirv-None-04633
  Every entry point **must** have no return value and accept no arguments
- VUID-StandaloneSpirv-None-04634

The static function-call graph for an entry point **must** not contain cycles; that is, static recursion is not allowed

- VUID-StandaloneSpirv-None-04635
  The `Logical` or `PhysicalStorageBuffer64` addressing model **must** be selected
- VUID-StandaloneSpirv-None-04636
  `Scope` for execution **must** be limited to `Workgroup` or `Subgroup`
- VUID-StandaloneSpirv-None-04637
  If the `Scope` for execution is `Workgroup`, then it **must** only be used in the task, mesh, tessellation control, or compute `Execution Model`
- VUID-StandaloneSpirv-None-04638
  `Scope` for memory **must** be limited to `Device`, `QueueFamily`, `Workgroup`, `ShaderCallKHR`, `Subgroup`, or `Invocation`
- VUID-StandaloneSpirv-ExecutionModel-07320
  If the `Execution Model` is `TessellationControl`, and the `MemoryModel` is `GLSL450`, the `Scope` for memory **must** not be `Workgroup`
- VUID-StandaloneSpirv-None-07321
  If the `Scope` for memory is `Workgroup`, then it **must** only be used in the task, mesh, tessellation control, or compute `Execution Model`
- VUID-StandaloneSpirv-None-04640
  If the `Scope` for memory is `ShaderCallKHR`, then it **must** only be used in ray generation, intersection, closest hit, any-hit, miss, and callable `Execution Model`
- VUID-StandaloneSpirv-None-04641
  If the `Scope` for memory is `Invocation`, then memory semantics **must** be `None`
- VUID-StandaloneSpirv-None-04642
  `Scope` for group operations **must** be limited to `Subgroup`
- VUID-StandaloneSpirv-SubgroupVoteKHR-07951
  If none of the `SubgroupVoteKHR`, `GroupNonUniform`, or `SubgroupBallotKHR` capabilities are declared, `Scope` for memory **must** not be `Subgroup`
- VUID-StandaloneSpirv-None-04643
  `Storage Class` **must** be limited to `UniformConstant`, `Input`, `Uniform`, `Output`, `Workgroup`, `Private`, `Function`, `PushConstant`, `Image`, `StorageBuffer`, `RayPayloadKHR`, `IncomingRayPayloadKHR`, `HitAttributeKHR`, `CallableDataKHR`, `IncomingCallableDataKHR`, `ShaderRecordBufferKHR`, `PhysicalStorageBuffer`, or `TileImageEXT`
- VUID-StandaloneSpirv-None-04644
  If the `Storage Class` is `Output`, then it **must** not be used in the `GlCompute`, `RayGenerationKHR`, `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, `MissKHR`, or `CallableKHR Execution Model`
- VUID-StandaloneSpirv-None-04645
  If the `Storage Class` is `Workgroup`, then it **must** only be used in the task, mesh, or compute `Execution Model`
- VUID-StandaloneSpirv-None-08720
  If the `Storage Class` is `TileImageEXT`, then it **must** only be used in the fragment execution model

- VUID-StandaloneSpirv-OpAtomicStore-04730
  `OpAtomicStore` **must** not use `Acquire`, `AcquireRelease`, or `SequentiallyConsistent` memory semantics
- VUID-StandaloneSpirv-OpAtomicLoad-04731
  `OpAtomicLoad` **must** not use `Release`, `AcquireRelease`, or `SequentiallyConsistent` memory semantics
- VUID-StandaloneSpirv-OpMemoryBarrier-04732
  `OpMemoryBarrier` **must** use one of `Acquire`, `Release`, `AcquireRelease`, or `SequentiallyConsistent` memory semantics
- VUID-StandaloneSpirv-OpMemoryBarrier-04733
  `OpMemoryBarrier` **must** include at least one `Storage Class`
- VUID-StandaloneSpirv-OpControlBarrier-04650
  If the semantics for `OpControlBarrier` includes one of `Acquire`, `Release`, `AcquireRelease`, or `SequentiallyConsistent` memory semantics, then it **must** include at least one `Storage Class`
- VUID-StandaloneSpirv-OpVariable-04651
  Any `OpVariable` with an `Initializer` operand **must** have `Output`, `Private`, `Function`, or `Workgroup` as its `Storage Class` operand
- VUID-StandaloneSpirv-OpVariable-04734
  Any `OpVariable` with an `Initializer` operand and `Workgroup` as its `Storage Class` operand **must** use `OpConstantNull` as the initializer
- VUID-StandaloneSpirv-OpReadClockKHR-04652
  `Scope` for `OpReadClockKHR` **must** be limited to `Subgroup` or `Device`
- VUID-StandaloneSpirv-OriginLowerLeft-04653
  The `OriginLowerLeft Execution Mode` **must** not be used; fragment entry points **must** declare `OriginUpperLeft`
- VUID-StandaloneSpirv-PixelCenterInteger-04654
  The `PixelCenterInteger Execution Mode` **must** not be used (pixels are always centered at half-integer coordinates)
- VUID-StandaloneSpirv-UniformConstant-04655
  Any variable in the `UniformConstant Storage Class` **must** be typed as either `OpTypeImage`, `OpTypeSampler`, `OpTypeSampledImage`, `OpTypeAccelerationStructureKHR`, or an array of one of these types
- VUID-StandaloneSpirv-Uniform-06807
  Any variable in the `Uniform` or `StorageBuffer Storage Class` **must** be typed as `OpTypeStruct` or an array of this type
- VUID-StandaloneSpirv-PushConstant-06808
  Any variable in the `PushConstant Storage Class` **must** be typed as `OpTypeStruct`
- VUID-StandaloneSpirv-OpTypeImage-04656
  `OpTypeImage` **must** declare a scalar 32-bit float, 64-bit integer, or 32-bit integer type for the “Sampled Type” (`RelaxedPrecision` **can** be applied to a sampling instruction and to the variable holding the result of a sampling instruction)
- VUID-StandaloneSpirv-OpTypeImage-04657

OpTypeImage **must** have a “Sampled” operand of 1 (sampled image) or 2 (storage image)

- VUID-StandaloneSpirv-OpTypeSampledImage-06671
  OpTypeSampledImage **must** have a OpTypeImage with a “Sampled” operand of 1 (sampled image)
- VUID-StandaloneSpirv-Image-04965
  The SPIR-V Type of the Image Format operand of an OpTypeImage **must** match the Sampled Type, as defined in Image Format and Type Matching
- VUID-StandaloneSpirv-OpImageTexelPointer-04658
  If an OpImageTexelPointer is used in an atomic operation, the image type of the image parameter to OpImageTexelPointer **must** have an image format of R64i, R64ui, R32f, R32i, or R32ui
- VUID-StandaloneSpirv-OpImageQuerySizeLod-04659
  OpImageQuerySizeLod, OpImageQueryLod, and OpImageQueryLevels **must** only consume an “Image” operand whose type has its “Sampled” operand set to 1
- VUID-StandaloneSpirv-OpTypeImage-09638
  An OpTypeImage **must** not have a “Dim” operand of Rect
- VUID-StandaloneSpirv-OpTypeImage-06214
  An OpTypeImage with a “Dim” operand of SubpassData **must** have an “Arrayed” operand of 0 (non-arrayed) and a “Sampled” operand of 2 (storage image)
- VUID-StandaloneSpirv-SubpassData-04660
  The (u,v) coordinates used for a SubpassData **must** be the <id> of a constant vector (0,0)
- VUID-StandaloneSpirv-OpTypeImage-06924
  Objects of types OpTypeImage, OpTypeSampler, OpTypeSampledImage, OpTypeAccelerationStructureKHR, and arrays of these types **must** not be stored to or modified
- VUID-StandaloneSpirv-Uniform-06925
  Any variable in the Uniform Storage Class decorated as Block **must** not be stored to or modified
- VUID-StandaloneSpirv-Offset-04663
  Image operand Offset **must** only be used with OpImage*Gather instructions
- VUID-StandaloneSpirv-Offset-04865
  Any image instruction which uses an Offset, ConstOffset, or ConstOffsets image operand, **must** only consume a “Sampled Image” operand whose type has its “Sampled” operand set to 1
- VUID-StandaloneSpirv-OpImageGather-04664
  The “Component” operand of OpImageGather, and OpImageSparseGather **must** be the <id> of a constant instruction
- VUID-StandaloneSpirv-OpImage-04777
  OpImage*Dref* instructions **must** not consume an image whose Dim is 3D
- VUID-StandaloneSpirv-None-04667
  Structure types **must** not contain opaque types
- VUID-StandaloneSpirv-BuiltIn-04668

Any BuiltIn decoration not listed in Built-In Variables **must** not be used

- VUID-StandaloneSpirv-OpEntryPoint-09658
  For a given OpEntryPoint, any BuiltIn decoration **must** not be used more than once by the Input interface
- VUID-StandaloneSpirv-OpEntryPoint-09659
  For a given OpEntryPoint, any BuiltIn decoration **must** not be used more than once by the Output interface
- VUID-StandaloneSpirv-Location-06672
  The Location or Component decorations **must** only be used with the Input, Output, RayPayloadKHR, IncomingRayPayloadKHR, HitAttributeKHR, HitObjectAttributeNV, CallableDataKHR, IncomingCallableDataKHR, or ShaderRecordBufferKHR storage classes
- VUID-StandaloneSpirv-Location-04915
  The Location or Component decorations **must** not be used with BuiltIn
- VUID-StandaloneSpirv-Location-04916
  The Location decorations **must** be used on user-defined variables
- VUID-StandaloneSpirv-Location-04917
  If a user-defined variable is not a pointer to a Block decorated OpTypeStruct, then the OpVariable **must** have a Location decoration
- VUID-StandaloneSpirv-Location-04918
  If a user-defined variable has a Location decoration, and the variable is a pointer to a OpTypeStruct, then the members of that structure **must** not have Location decorations
- VUID-StandaloneSpirv-Location-04919
  If a user-defined variable does not have a Location decoration, and the variable is a pointer to a Block decorated OpTypeStruct, then each member of the struct **must** have a Location decoration
- VUID-StandaloneSpirv-Component-04920
  The Component decoration value **must** not be greater than 3
- VUID-StandaloneSpirv-Component-04921
  If the Component decoration is used on an OpVariable that has a OpTypeVector type with a Component Type with a Width that is less than or equal to 32, the sum of its Component Count and the Component decoration value **must** be less than or equal to 4
- VUID-StandaloneSpirv-Component-04922
  If the Component decoration is used on an OpVariable that has a OpTypeVector type with a Component Type with a Width that is equal to 64, the sum of two times its Component Count and the Component decoration value **must** be less than or equal to 4
- VUID-StandaloneSpirv-Component-04923
  The Component decorations value **must** not be 1 or 3 for scalar or two-component 64-bit data types
- VUID-StandaloneSpirv-Component-04924
  The Component decorations **must** not be used with any type that is not a scalar or vector, or an array of such a type
- VUID-StandaloneSpirv-Component-07703

The Component decorations **must** not be used for a 64-bit vector type with more than two components

- VUID-StandaloneSpirv-Input-09557
  The pointers of any Input or Output Interface user-defined variables **must** not contain any PhysicalStorageBuffer Storage Class pointers
- VUID-StandaloneSpirv-GLSLShared-04669
  The GLSLShared and GLSLPacked decorations **must** not be used
- VUID-StandaloneSpirv-Flat-04670
  The Flat, NoPerspective, Sample, and Centroid decorations **must** only be used on variables with the Output or Input Storage Class
- VUID-StandaloneSpirv-Flat-06201
  The Flat, NoPerspective, Sample, and Centroid decorations **must** not be used on variables with the Output storage class in a fragment shader
- VUID-StandaloneSpirv-Flat-06202
  The Flat, NoPerspective, Sample, and Centroid decorations **must** not be used on variables with the Input storage class in a vertex shader
- VUID-StandaloneSpirv-PerVertexKHR-06777
  The PerVertexKHR decoration **must** only be used on variables with the Input Storage Class in a fragment shader
- VUID-StandaloneSpirv-Flat-04744
  Any variable with integer or double-precision floating-point type and with Input Storage Class in a fragment shader, **must** be decorated Flat
- VUID-StandaloneSpirv-ViewportRelativeNV-04672
  The ViewportRelativeNV decoration **must** only be used on a variable decorated with Layer in the vertex, tessellation evaluation, or geometry shader stages
- VUID-StandaloneSpirv-ViewportRelativeNV-04673
  The ViewportRelativeNV decoration **must** not be used unless a variable decorated with one of ViewportIndex or ViewportMaskNV is also statically used by the same OpEntryPoint
- VUID-StandaloneSpirv-ViewportMaskNV-04674
  The ViewportMaskNV and ViewportIndex decorations **must** not both be statically used by one or more OpEntryPoint's that form the pre-rasterization shader stages of a graphics pipeline
- VUID-StandaloneSpirv-FPRoundingMode-04675
  Rounding modes other than round-to-nearest-even and round-towards-zero **must** not be used for the FPRoundingMode decoration
- VUID-StandaloneSpirv-Invariant-04677
  Variables decorated with Invariant and variables with structure types that have any members decorated with Invariant **must** be in the Output or Input Storage Class, Invariant used on an Input Storage Class variable or structure member has no effect
- VUID-StandaloneSpirv-VulkanMemoryModel-04678
  If the VulkanMemoryModel capability is not declared, the Volatile decoration **must** be used on any variable declaration that includes one of the SMIDNV, WarpIDNV, SubgroupSize, SubgroupLocalInvocationId, SubgroupEqMask, SubgroupGeMask, SubgroupGtMask, SubgroupLeMask, or SubgroupLtMask BuiltIn decorations when used in the ray generation, closest hit, miss,

intersection, or callable shaders, or with the RayTmaxKHR Builtin decoration when used in an intersection shader

- VUID-StandaloneSpirv-VulkanMemoryModel-04679
  If the VulkanMemoryModel capability is declared, the OpLoad instruction **must** use the Volatile memory semantics when it accesses into any variable that includes one of the SMIDNV, WarpIDNV, SubgroupSize, SubgroupLocalInvocationId, SubgroupEqMask, SubgroupGeMask, SubgroupGtMask, SubgroupLeMask, or SubgroupLtMask BuiltIn decorations when used in the ray generation, closest hit, miss, intersection, or callable shaders, or with the RayTmaxKHR Builtin decoration when used in an intersection shader
- VUID-StandaloneSpirv-OpTypeRuntimeArray-04680
  OpTypeRuntimeArray **must** only be used for:
  - the last member of a Block-decorated OpTypeStruct in StorageBuffer or PhysicalStorageBuffer storage Storage Class
  - BufferBlock-decorated OpTypeStruct in the Uniform storage Storage Class
  - the outermost dimension of an arrayed variable in the StorageBuffer, Uniform, or UniformConstant storage Storage Class
  - variables in the NodePayloadAMDX storage Storage Class when the CoalescingAMDX Execution Mode is specified
- VUID-StandaloneSpirv-Function-04681
  A type *T* that is an array sized with a specialization constant **must** neither be, nor be contained in, the type *T2* of a variable *V*, unless either: a) *T* is equal to *T2*, b) *V* is declared in the Function, or Private Storage Class, c) *V* is a non-Block variable in the Workgroup Storage Class, or d) *V* is an interface variable with an additional level of arrayness, as described in interface matching, and *T* is the member type of the array type *T2*
- VUID-StandaloneSpirv-OpControlBarrier-04682
  If OpControlBarrier is used in ray generation, intersection, any-hit, closest hit, miss, fragment, vertex, tessellation evaluation, or geometry shaders, the execution Scope **must** be Subgroup
- VUID-StandaloneSpirv-LocalSize-06426
  For each compute shader entry point, either a LocalSize or LocalSizeId Execution Mode, or an object decorated with the WorkgroupSize decoration **must** be specified
- VUID-StandaloneSpirv-DerivativeGroupQuadsNV-04684
  For compute shaders using the DerivativeGroupQuadsNV execution mode, the first two dimensions of the local workgroup size **must** be a multiple of two
- VUID-StandaloneSpirv-DerivativeGroupLinearNV-04778
  For compute shaders using the DerivativeGroupLinearNV execution mode, the product of the dimensions of the local workgroup size **must** be a multiple of four
- VUID-StandaloneSpirv-DerivativeGroupQuadsKHR-10151
  For compute, mesh, or task shaders using the DerivativeGroupQuadsKHR execution mode, the first two dimensions of the local workgroup size **must** be a multiple of two
- VUID-StandaloneSpirv-DerivativeGroupLinearKHR-10152
  For compute, mesh, or task shaders using the DerivativeGroupLinearKHR execution mode, the product of the dimensions of the local workgroup size **must** be a multiple of four

- VUID-StandaloneSpirv-OpGroupNonUniformBallotBitCount-04685
  If `OpGroupNonUniformBallotBitCount` is used, the group operation **must** be limited to `Reduce`, `InclusiveScan`, or `ExclusiveScan`
- VUID-StandaloneSpirv-None-04686
  The *Pointer* operand of all atomic instructions **must** have a `Storage Class` limited to `Uniform`, `Workgroup`, `Image`, `StorageBuffer`, `PhysicalStorageBuffer`, or `TaskPayloadWorkgroupEXT`
- VUID-StandaloneSpirv-Offset-04687
  Output variables or block members decorated with `Offset` that have a 64-bit type, or a composite type containing a 64-bit type, **must** specify an `Offset` value aligned to a 8 byte boundary
- VUID-StandaloneSpirv-Offset-04689
  The size of any output block containing any member decorated with `Offset` that is a 64-bit type **must** be a multiple of 8
- VUID-StandaloneSpirv-Offset-04690
  The first member of an output block specifying a `Offset` decoration **must** specify a `Offset` value that is aligned to an 8 byte boundary if that block contains any member decorated with `Offset` and is a 64-bit type
- VUID-StandaloneSpirv-Offset-04691
  Output variables or block members decorated with `Offset` that have a 32-bit type, or a composite type contains a 32-bit type, **must** specify an `Offset` value aligned to a 4 byte boundary
- VUID-StandaloneSpirv-Offset-04692
  Output variables, blocks or block members decorated with `Offset` **must** only contain base types that have components that are either 32-bit or 64-bit in size
- VUID-StandaloneSpirv-Offset-04716
  Only variables or block members in the output interface decorated with `Offset` **can** be captured for transform feedback, and those variables or block members **must** also be decorated with `XfbBuffer` and `XfbStride`, or inherit `XfbBuffer` and `XfbStride` decorations from a block containing them
- VUID-StandaloneSpirv-XfbBuffer-04693
  All variables or block members in the output interface of the entry point being compiled decorated with a specific `XfbBuffer` value **must** all be decorated with identical `XfbStride` values
- VUID-StandaloneSpirv-Stream-04694
  If any variables or block members in the output interface of the entry point being compiled are decorated with `Stream`, then all variables belonging to the same `XfbBuffer` **must** specify the same `Stream` value
- VUID-StandaloneSpirv-XfbBuffer-04696
  For any two variables or block members in the output interface of the entry point being compiled with the same `XfbBuffer` value, the ranges determined by the `Offset` decoration and the size of the type **must** not overlap
- VUID-StandaloneSpirv-XfbBuffer-04697
  All block members in the output interface of the entry point being compiled that are in

the same block and have a declared or inherited `XfbBuffer` decoration **must** specify the same `XfbBuffer` value

- VUID-StandaloneSpirv-RayPayloadKHR-04698
  `RayPayloadKHR Storage Class` **must** only be used in ray generation, closest hit or miss shaders
- VUID-StandaloneSpirv-IncomingRayPayloadKHR-04699
  `IncomingRayPayloadKHR Storage Class` **must** only be used in closest hit, any-hit, or miss shaders
- VUID-StandaloneSpirv-IncomingRayPayloadKHR-04700
  There **must** be at most one variable with the `IncomingRayPayloadKHR Storage Class` in the input interface of an entry point
- VUID-StandaloneSpirv-HitAttributeKHR-04701
  `HitAttributeKHR Storage Class` **must** only be used in intersection, any-hit, or closest hit shaders
- VUID-StandaloneSpirv-HitAttributeKHR-04702
  There **must** be at most one variable with the `HitAttributeKHR Storage Class` in the input interface of an entry point
- VUID-StandaloneSpirv-HitAttributeKHR-04703
  A variable with `HitAttributeKHR Storage Class` **must** only be written to in an intersection shader
- VUID-StandaloneSpirv-CallableDataKHR-04704
  `CallableDataKHR Storage Class` **must** only be used in ray generation, closest hit, miss, and callable shaders
- VUID-StandaloneSpirv-IncomingCallableDataKHR-04705
  `IncomingCallableDataKHR Storage Class` **must** only be used in callable shaders
- VUID-StandaloneSpirv-IncomingCallableDataKHR-04706
  There **must** be at most one variable with the `IncomingCallableDataKHR Storage Class` in the input interface of an entry point
- VUID-StandaloneSpirv-ShaderRecordBufferKHR-07119
  `ShaderRecordBufferKHR Storage Class` **must** only be used in ray generation, intersection, any-hit, closest hit, callable, or miss shaders
- VUID-StandaloneSpirv-Base-07650
  The `Base` operand of `OpPtrAccessChain` **must** have a storage class of `Workgroup`, `StorageBuffer`, or `PhysicalStorageBuffer`
- VUID-StandaloneSpirv-Base-07651
  If the `Base` operand of `OpPtrAccessChain` has a `Workgroup Storage Class`, then the `VariablePointers` capability **must** be declared
- VUID-StandaloneSpirv-Base-07652
  If the `Base` operand of `OpPtrAccessChain` has a `StorageBuffer Storage Class`, then the `VariablePointers` or `VariablePointersStorageBuffer` capability **must** be declared
- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04708
  If the `PhysicalStorageBuffer64` addressing model is enabled, all instructions that support

memory access operands and that use a physical pointer **must** include the `Aligned` operand

- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04709
  If the `PhysicalStorageBuffer64` addressing model is enabled, any access chain instruction that accesses into a `RowMajor` matrix **must** only be used as the `Pointer` operand to `OpLoad` or `OpStore`
- VUID-StandaloneSpirv-PhysicalStorageBuffer64-04710
  If the `PhysicalStorageBuffer64` addressing model is enabled, `OpConvertUToPtr` and `OpConvertPtrToU` **must** use an integer type whose `Width` is 64
- VUID-StandaloneSpirv-OpTypeForwardPointer-04711
  `OpTypeForwardPointer` **must** have a `Storage Class` of `PhysicalStorageBuffer`
- VUID-StandaloneSpirv-None-04745
  All block members in a variable with a `Storage Class` of `PushConstant` declared as an array **must** only be accessed by dynamically uniform indices
- VUID-StandaloneSpirv-OpVariable-06673
  There **must** not be more than one `OpVariable` in the `PushConstant Storage Class` listed in the `Interface` for each `OpEntryPoint`
- VUID-StandaloneSpirv-OpEntryPoint-06674
  Each `OpEntryPoint` **must** not statically use more than one `OpVariable` in the `PushConstant Storage Class`
- VUID-StandaloneSpirv-OpEntryPoint-08721
  Each `OpEntryPoint` **must** not have more than one `Input` variable assigned the same `Component` word inside a `Location` slot, either explicitly or implicitly
- VUID-StandaloneSpirv-OpEntryPoint-08722
  Each `OpEntryPoint` **must** not have more than one `Output` variable assigned the same `Component` word inside a `Location` slot, either explicitly or implicitly
- VUID-StandaloneSpirv-Result-04780
  The `Result Type` operand of any `OpImageRead` or `OpImageSparseRead` instruction **must** be a vector of four components
- VUID-StandaloneSpirv-Base-04781
  The `Base` operand of any `OpBitCount`, `OpBitReverse`, `OpBitFieldInsert`, `OpBitFieldSExtract`, or `OpBitFieldUExtract` instruction **must** be a 32-bit integer scalar or a vector of 32-bit integers
- VUID-StandaloneSpirv-PushConstant-06675
  Any variable in the `PushConstant` or `StorageBuffer` storage class **must** be decorated as `Block`
- VUID-StandaloneSpirv-Uniform-06676
  Any variable in the `Uniform Storage Class` **must** be decorated as `Block` or `BufferBlock`
- VUID-StandaloneSpirv-UniformConstant-06677
  Any variable in the `UniformConstant`, `StorageBuffer`, or `Uniform Storage Class` **must** be decorated with `DescriptorSet` and `Binding`
- VUID-StandaloneSpirv-InputAttachmentIndex-06678
  Variables decorated with `InputAttachmentIndex` **must** be in the `UniformConstant Storage`

Class

- VUID-StandaloneSpirv-DescriptorSet-06491
  If a variable is decorated by DescriptorSet or Binding, the Storage Class **must** correspond to an entry in Shader Resource and Storage Class Correspondence
- VUID-StandaloneSpirv-Input-06778
  Variables with a Storage Class of Input in a fragment shader stage that are decorated with PerVertexKHR **must** be declared as arrays
- VUID-StandaloneSpirv-MeshEXT-07102
  The module **must** not contain both an entry point that uses the TaskEXT or MeshEXT Execution Model and an entry point that uses the TaskNV or MeshNV Execution Model
- VUID-StandaloneSpirv-MeshEXT-07106
  In mesh shaders using the MeshEXT Execution Model OpSetMeshOutputsEXT **must** be called before any outputs are written
- VUID-StandaloneSpirv-MeshEXT-07107
  In mesh shaders using the MeshEXT Execution Model all variables declared as output **must** not be read from
- VUID-StandaloneSpirv-MeshEXT-07108
  In mesh shaders using the MeshEXT Execution Model for OpSetMeshOutputsEXT instructions, the “Vertex Count” and “Primitive Count” operands **must** not depend on ViewIndex
- VUID-StandaloneSpirv-MeshEXT-07109
  In mesh shaders using the MeshEXT Execution Model variables decorated with PrimitivePointIndicesEXT, PrimitiveLineIndicesEXT, or PrimitiveTriangleIndicesEXT declared as an array **must** not be accessed by indices that depend on ViewIndex
- VUID-StandaloneSpirv-MeshEXT-07110
  In mesh shaders using the MeshEXT Execution Model any values stored in variables decorated with PrimitivePointIndicesEXT, PrimitiveLineIndicesEXT, or PrimitiveTriangleIndicesEXT **must** not depend on ViewIndex
- VUID-StandaloneSpirv-MeshEXT-07111
  In mesh shaders using the MeshEXT Execution Model variables in workgroup or private Storage Class declared as or containing a composite type **must** not be accessed by indices that depend on ViewIndex
- VUID-StandaloneSpirv-MeshEXT-07330
  In mesh shaders using the MeshEXT Execution Model the OutputVertices Execution Mode **must** be greater than 0
- VUID-StandaloneSpirv-MeshEXT-07331
  In mesh shaders using the MeshEXT Execution Model the OutputPrimitivesEXT Execution Mode **must** be greater than 0
- VUID-StandaloneSpirv-Input-07290
  Variables with a Storage Class of Input or Output and a type of OpTypeBool **must** be decorated with the BuiltIn decoration
- VUID-StandaloneSpirv-TileImageEXT-08723
  The tile image variable declarations **must** obey the constraints on the TileImageEXT Storage Class and the Location decoration described in Fragment Tile Image Interface

- VUID-StandaloneSpirv-None-08724
  The `TileImageEXT` `Storage Class` **must** only be used for declaring tile image variables
- VUID-StandaloneSpirv-Pointer-08973
  The `Storage Class` of the `Pointer` operand to `OpCooperativeMatrixLoadKHR` or `OpCooperativeMatrixStoreKHR` **must** be limited to `Workgroup`, `StorageBuffer`, or `PhysicalStorageBuffer`
- VUID-StandaloneSpirv-UniformBufferArrayDynamicIndexing-10127
  If the `UniformBufferArrayDynamicIndexing` capability is not declared, and an instruction accesses memory through a uniform buffer, the uniform buffer through which that memory is accessed **must** be determined by constant integral expressions
- VUID-StandaloneSpirv-SampledImageArrayDynamicIndexing-10128
  If the `SampledImageArrayDynamicIndexing` capability is not declared, and an instruction accesses memory through a sampled image or sampler, the sampled image or sampler through which that memory is accessed **must** be determined by constant integral expressions
- VUID-StandaloneSpirv-StorageBufferArrayDynamicIndexing-10129
  If the `StorageBufferArrayDynamicIndexing` capability is not declared, and an instruction accesses memory through a storage buffer, the storage buffer through which that memory is accessed **must** be determined by constant integral expressions
- VUID-StandaloneSpirv-StorageImageArrayDynamicIndexing-10130
  If the `StorageImageArrayDynamicIndexing` capability is not declared, and an instruction accesses memory through a storage image, the storage image through which that memory is accessed **must** be determined by constant integral expressions
- VUID-StandaloneSpirv-InputAttachmentArrayDynamicIndexing-10131
  If the `InputAttachmentArrayDynamicIndexing` capability is not declared, and an instruction accesses memory through an input attachment, the input attachmnet through which that memory is accessed **must** be determined by constant integral expressions
- VUID-StandaloneSpirv-UniformTexelBufferArrayDynamicIndexing-10132
  If the `UniformTexelBufferArrayDynamicIndexing` capability is not declared, and an instruction accesses memory through a uniform texel buffer, the uniform texel buffer through which that memory is accessed **must** be determined by constant integral expressions
- VUID-StandaloneSpirv-StorageTexelBufferArrayDynamicIndexing-10133
  If the `StorageTexelBufferArrayDynamicIndexing` capability is not declared, and an instruction accesses memory through a storage texel buffer, the storage texel buffer through which that memory is accessed **must** be determined by constant integral expressions

Runtime SPIR-V Validation

The following rules **must** be validated at runtime. These rules depend on knowledge of the implementation and its capabilities and knowledge of runtime information, such as enabled features.

Valid Usage

- VUID-RuntimeSpirv-vulkanMemoryModel-06265
  If the `vulkanMemoryModel` feature is enabled and the `vulkanMemoryModelDeviceScope` feature is not enabled, `Device` memory scope **must** not be used
- VUID-RuntimeSpirv-vulkanMemoryModel-06266
  If the `vulkanMemoryModel` feature is not enabled, `QueueFamily` memory scope **must** not be used
- VUID-RuntimeSpirv-shaderSubgroupClock-06267
  If the `shaderSubgroupClock` feature is not enabled, the `Subgroup` scope **must** not be used for `OpReadClockKHR`
- VUID-RuntimeSpirv-shaderDeviceClock-06268
  If the `shaderDeviceClock` feature is not enabled, the `Device` scope **must** not be used for `OpReadClockKHR`
- VUID-RuntimeSpirv-None-09558
  If the `dynamicRenderingLocalRead` feature is not enabled, any variable created with a "Type" of `OpTypeImage` that has a "Dim" operand of `SubpassData` **must** be decorated with `InputAttachmentIndex`
- VUID-RuntimeSpirv-OpTypeImage-09644
  Any variable declared as an `OpTypeArray` where the `Element Type` is an `OpTypeImage` with a "Dim" operand of `SubpassData` **must** be decorated with `InputAttachmentIndex`
- VUID-RuntimeSpirv-shaderStorageImageWriteWithoutFormat-07956
  If the VK_KHR_format_feature_flags2 extension is not enabled, and the `shaderStorageImageWriteWithoutFormat` feature is not enabled, any variable created with a "Type" of `OpTypeImage` that has a "Sampled" operand of 2 and an "Image Format" operand of `Unknown` **must** be decorated with `NonWritable`
- VUID-RuntimeSpirv-shaderStorageImageReadWithoutFormat-07957
  If the VK_KHR_format_feature_flags2 extension is not enabled, and the `shaderStorageImageReadWithoutFormat` feature is not enabled, any variable created with a "Type" of `OpTypeImage` that has a "Sampled" operand of 2 and an "Image Format" operand of `Unknown` **must** be decorated with `NonReadable`
- VUID-RuntimeSpirv-OpImageWrite-07112
  `OpImageWrite` to any `Image` whose `Image Format` is not `Unknown` **must** have the `Texel` operand contain at least as many components as the corresponding VkFormat as given in the SPIR-V Image Format compatibility table
- VUID-RuntimeSpirv-Location-06272
  The sum of `Location` and the number of locations the variable it decorates consumes **must** be less than or equal to the value for the matching `Execution Model` defined in Shader Input and Output Locations
- VUID-RuntimeSpirv-Location-06428
  The maximum number of storage buffers, storage images, and output `Location` decorated color attachments written to in the `Fragment Execution Model` **must** be less than or equal to `maxFragmentCombinedOutputResources`

- VUID-RuntimeSpirv-UniformBufferArrayNonUniformIndexing-10134
  If the `UniformBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a uniform buffer, the uniform buffer through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup
- VUID-RuntimeSpirv-SampledImageArrayNonUniformIndexing-10135
  If the `SampledImageArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a sampled image or sampler, the sampled image or sampler through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup
- VUID-RuntimeSpirv-StorageBufferArrayNonUniformIndexing-10136
  If the `StorageBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage buffer, the storage buffer through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup
- VUID-RuntimeSpirv-StorageImageArrayNonUniformIndexing-10137
  If the `StorageImageArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage image, the storage image through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup
- VUID-RuntimeSpirv-InputAttachmentArrayNonUniformIndexing-10138
  If the `InputAttachmentArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through an input attachment, the input attachment through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup
- VUID-RuntimeSpirv-UniformTexelBufferArrayNonUniformIndexing-10139
  If the `UniformTexelBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a uniform texel buffer, the uniform texel buffer through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup
- VUID-RuntimeSpirv-StorageTexelBufferArrayNonUniformIndexing-10140
  If the `StorageTexelBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage texel buffer, the storage texel buffer through which that memory is accessed **must** be dynamically uniform within the invocation group or subgroup
- VUID-RuntimeSpirv-subgroupSize-10141
  If `subgroupSize` is 1, the `UniformBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a uniform buffer, the uniform buffer through which that memory is accessed **must** be dynamically uniform within the invocation group
- VUID-RuntimeSpirv-subgroupSize-10142
  If `subgroupSize` is 1, the `SampledImageArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a sampled image or sampler, the sampled image or sampler through which that memory is accessed **must** be dynamically uniform within the invocation group
- VUID-RuntimeSpirv-subgroupSize-10143

If `subgroupSize` is 1, the `StorageBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage buffer, the storage buffer through which that memory is accessed **must** be dynamically uniform within the invocation group

- VUID-RuntimeSpirv-subgroupSize-10144
  If `subgroupSize` is 1, the `StorageImageArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a storage image, the storage image through which that memory is accessed **must** be dynamically uniform within the invocation group
- VUID-RuntimeSpirv-subgroupSize-10145
  If `subgroupSize` is 1, the `InputAttachmentArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through an input attachment, the input attachment through which that memory is accessed **must** be dynamically uniform within the invocation group
- VUID-RuntimeSpirv-subgroupSize-10146
  If `subgroupSize` is 1, the `UniformTexelBufferArrayNonUniformIndexing` capability is not declared, and an instruction accesses memory through a uniform texel buffer, the uniform texel buffer through which that memory is accessed **must** be dynamically uniform within the invocation group
- VUID-RuntimeSpirv-subgroupSize-10147
  If `subgroupSize` is 1, the `StorageTexelBufferArrayNonUniformIndexing` capability is not is not declared, and an instruction accesses memory through a storage texel buffer, the storage texel buffer through which that memory is accessed **must** be dynamically uniform within the invocation group
- VUID-RuntimeSpirv-None-10148
  If an instruction accesses memory through any resource, `subgroupSize` is 1, and the resource through which that memory is accessed is not uniform within the invocation group, then the operand corresponding to that resource (e.g. the pointer or sampled image operand) **must** be decorated with `NonUniform`
- VUID-RuntimeSpirv-subgroupSize-10149
  If an instruction accesses memory through any resource, `subgroupSize` is greater than 1, and the resource through which that memory is accessed is not uniform within the invocation group, and not uniform within the subgroup, then the operand corresponding to that resource (e.g. the pointer or sampled image operand) **must** be decorated with `NonUniform`
- VUID-RuntimeSpirv-None-06275
  `shaderSubgroupExtendedTypes` **must** be enabled for group operations to use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types
- VUID-RuntimeSpirv-None-06278
  `shaderBufferInt64Atomics` **must** be enabled for 64-bit integer atomic operations to be supported on a *Pointer* with a `Storage Class` of `StorageBuffer` or `Uniform`
- VUID-RuntimeSpirv-None-06279
  `shaderSharedInt64Atomics` **must** be enabled for 64-bit integer atomic operations to be supported on a *Pointer* with a `Storage Class` of `Workgroup`

- VUID-RuntimeSpirv-None-06284
  shaderBufferFloat32Atomics, or shaderBufferFloat32AtomicAdd, or shaderBufferFloat64Atomics, or shaderBufferFloat64AtomicAdd, or shaderBufferFloat16Atomics, or shaderBufferFloat16AtomicAdd, or shaderBufferFloat16AtomicMinMax, or shaderBufferFloat32AtomicMinMax, or shaderBufferFloat64AtomicMinMax, or shaderFloat16VectorAtomics **must** be enabled for floating-point atomic operations to be supported on a *Pointer* with a Storage Class of StorageBuffer
- VUID-RuntimeSpirv-None-06285
  shaderSharedFloat32Atomics, or shaderSharedFloat32AtomicAdd, or shaderSharedFloat64Atomics, or shaderSharedFloat64AtomicAdd, or shaderSharedFloat16Atomics, or shaderSharedFloat16AtomicAdd, or shaderSharedFloat16AtomicMinMax, or shaderSharedFloat32AtomicMinMax, or shaderSharedFloat64AtomicMinMax, or shaderFloat16VectorAtomics, **must** be enabled for floating-point atomic operations to be supported on a *Pointer* with a Storage Class of Workgroup
- VUID-RuntimeSpirv-None-06286
  shaderImageFloat32Atomics, or shaderImageFloat32AtomicAdd, or shaderImageFloat32AtomicMinMax, **must** be enabled for 32-bit floating-point atomic operations to be supported on a *Pointer* with a Storage Class of Image
- VUID-RuntimeSpirv-None-06287
  sparseImageFloat32Atomics, or sparseImageFloat32AtomicAdd, or sparseImageFloat32AtomicMinMax, **must** be enabled for 32-bit floating-point atomics to be supported on sparse images
- VUID-RuntimeSpirv-None-06288
  shaderImageInt64Atomics **must** be enabled for 64-bit integer atomic operations to be supported on a *Pointer* with a Storage Class of Image
- VUID-RuntimeSpirv-denormBehaviorIndependence-06289
  If denormBehaviorIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY, then the entry point **must** use the same denormals Execution Mode for both 16-bit and 64-bit floating-point types
- VUID-RuntimeSpirv-denormBehaviorIndependence-06290
  If denormBehaviorIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE, then the entry point **must** use the same denormals Execution Mode for all floating-point types
- VUID-RuntimeSpirv-roundingModeIndependence-06291
  If roundingModeIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY, then the entry point **must** use the same rounding Execution Mode for both 16-bit and 64-bit floating-point types
- VUID-RuntimeSpirv-roundingModeIndependence-06292
  If roundingModeIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE, then the entry point **must** use the same rounding Execution Mode for all floating-point types
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat16-06293
  If shaderSignedZeroInfNanPreserveFloat16 is VK_FALSE, then SignedZeroInfNanPreserve for 16-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat32-06294
  If `shaderSignedZeroInfNanPreserveFloat32` is `VK_FALSE`, then `SignedZeroInfNanPreserve` for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat64-06295
  If `shaderSignedZeroInfNanPreserveFloat64` is `VK_FALSE`, then `SignedZeroInfNanPreserve` for 64-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormPreserveFloat16-06296
  If `shaderDenormPreserveFloat16` is `VK_FALSE`, then `DenormPreserve` for 16-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormPreserveFloat32-06297
  If `shaderDenormPreserveFloat32` is `VK_FALSE`, then `DenormPreserve` for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormPreserveFloat64-06298
  If `shaderDenormPreserveFloat64` is `VK_FALSE`, then `DenormPreserve` for 64-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat16-06299
  If `shaderDenormFlushToZeroFloat16` is `VK_FALSE`, then `DenormFlushToZero` for 16-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat32-06300
  If `shaderDenormFlushToZeroFloat32` is `VK_FALSE`, then `DenormFlushToZero` for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat64-06301
  If `shaderDenormFlushToZeroFloat64` is `VK_FALSE`, then `DenormFlushToZero` for 64-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTEFloat16-06302
  If `shaderRoundingModeRTEFloat16` is `VK_FALSE`, then `RoundingModeRTE` for 16-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTEFloat32-06303
  If `shaderRoundingModeRTEFloat32` is `VK_FALSE`, then `RoundingModeRTE` for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTEFloat64-06304
  If `shaderRoundingModeRTEFloat64` is `VK_FALSE`, then `RoundingModeRTE` for 64-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTZFloat16-06305
  If `shaderRoundingModeRTZFloat16` is `VK_FALSE`, then `RoundingModeRTZ` for 16-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTZFloat32-06306
  If `shaderRoundingModeRTZFloat32` is `VK_FALSE`, then `RoundingModeRTZ` for 32-bit floating-point type **must** not be used
- VUID-RuntimeSpirv-shaderRoundingModeRTZFloat64-06307
  If `shaderRoundingModeRTZFloat64` is `VK_FALSE`, then `RoundingModeRTZ` for 64-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat16-09559
  If shaderSignedZeroInfNanPreserveFloat16 is VK_FALSE then any FPFastMathDefault execution mode with a type of 16-bit float **must** include the NSZ, NotInf, and NotNaN flags
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat16-09560
  If shaderSignedZeroInfNanPreserveFloat16 is VK_FALSE then any FPFastMathMode decoration on an instruction with result type or any operand type that includes a 16-bit float **must** include the NSZ, NotInf, and NotNaN flags
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat32-09561
  If shaderSignedZeroInfNanPreserveFloat32 is VK_FALSE then any FPFastMathDefault execution mode with a type of 32-bit float **must** include the NSZ, NotInf, and NotNaN flags
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat32-09562
  If shaderSignedZeroInfNanPreserveFloat32 is VK_FALSE then any FPFastMathMode decoration on an instruction with result type or any operand type that includes a 32-bit float **must** include the NSZ, NotInf, and NotNaN flags
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat64-09563
  If shaderSignedZeroInfNanPreserveFloat64 is VK_FALSE then any FPFastMathDefault execution mode with a type of 64-bit float **must** include the NSZ, NotInf, and NotNaN flags
- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat64-09564
  If shaderSignedZeroInfNanPreserveFloat64 is VK_FALSE then any FPFastMathMode decoration on an instruction with result type or any operand type that includes a 64-bit float **must** include the NSZ, NotInf, and NotNaN flags
- VUID-RuntimeSpirv-Offset-06308
  The Offset plus size of the type of each variable, in the output interface of the entry point being compiled, decorated with XfbBuffer **must** not be greater than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize
- VUID-RuntimeSpirv-XfbBuffer-06309
  For any given XfbBuffer value, define the buffer data size to be smallest number of bytes such that, for all outputs decorated with the same XfbBuffer value, the size of the output interface variable plus the Offset is less than or equal to the buffer data size. For a given Stream, the sum of all the buffer data sizes for all buffers writing to that stream the **must** not exceed VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize
- VUID-RuntimeSpirv-OpEmitStreamVertex-06310
  The Stream value to OpEmitStreamVertex and OpEndStreamPrimitive **must** be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams
- VUID-RuntimeSpirv-transformFeedbackStreamsLinesTriangles-06311
  If the geometry shader emits to more than one vertex stream and VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles is VK_FALSE, then Execution Mode **must** be OutputPoints
- VUID-RuntimeSpirv-Stream-06312
  The stream number value to Stream **must** be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams
- VUID-RuntimeSpirv-XfbStride-06313

The XFB Stride value to `XfbStride` **must** be less than or equal to VkPhysicalDeviceTransformFeedbackPropertiesEXT::`maxTransformFeedbackBufferDataStride`

- VUID-RuntimeSpirv-PhysicalStorageBuffer64-06314
  If the `PhysicalStorageBuffer64` addressing model is enabled any load or store through a physical pointer type **must** be aligned to a multiple of the size of the largest scalar type in the pointed-to type
- VUID-RuntimeSpirv-PhysicalStorageBuffer64-06315
  If the `PhysicalStorageBuffer64` addressing model is enabled the pointer value of a memory access instruction **must** be at least as aligned as specified by the `Aligned` memory access operand
- VUID-RuntimeSpirv-OpTypeCooperativeMatrixNV-06316
  For `OpTypeCooperativeMatrixNV`, the component type, scope, number of rows, and number of columns **must** match one of the matrices in any of the supported VkCooperativeMatrixPropertiesNV
- VUID-RuntimeSpirv-OpTypeCooperativeMatrixMulAddNV-10059
  For `OpTypeCooperativeMatrixMulAddNV`, the operands **must** match a supported VkCooperativeMatrixPropertiesNV, such that:
  - The type of `A` **must** have `Rows` match VkCooperativeMatrixPropertiesNV::`MSize`, `Columns` match VkCooperativeMatrixPropertiesNV::`KSize`, and `ComponentType` match VkCooperativeMatrixPropertiesNV::`AType`.
  - The type of `B` **must** have `Rows` match VkCooperativeMatrixPropertiesNV::`KSize`, `Columns` match VkCooperativeMatrixPropertiesNV::`NSize`, and `ComponentType` match VkCooperativeMatrixPropertiesNV::`BType`.
  - The type of `C` **must** have `Rows` match VkCooperativeMatrixPropertiesNV::`MSize`, `Columns` match VkCooperativeMatrixPropertiesNV::`NSize`, and `ComponentType` match VkCooperativeMatrixPropertiesNV::`CType`.
  - The type of `Result` **must** have `Rows` match VkCooperativeMatrixPropertiesNV::`MSize`, `Columns` match VkCooperativeMatrixPropertiesNV::`NSize`, and `ComponentType` match VkCooperativeMatrixPropertiesNV::`DType`.
  - The scope of all cooperative matrix operands **must** be VkScopeNV::`VK_SCOPE_SUBGROUP_NV`.
  - If `ComponentType` of `A`, `B`, `C`, or `Result` is a signed integral type, the `Signedness` operand of the `OpTypeInt` must be 1.
  - If `ComponentType` of `A`, `B`, `C`, or `Result` is an unsigned integral type, the `Signedness` operand of the `OpTypeInt` must be 0
- VUID-RuntimeSpirv-OpTypeCooperativeMatrixNV-06322
  `OpTypeCooperativeMatrixNV` and `OpCooperativeMatrix*` instructions **must** not be used in shader stages not included in VkPhysicalDeviceCooperativeMatrixPropertiesNV::`cooperativeMatrixSupportedStages`
- VUID-RuntimeSpirv-OpTypeCooperativeMatrixKHR-10163
  For `OpTypeCooperativeMatrixKHR`, if the `cooperativeMatrixFlexibleDimensions` feature is not enabled, the component type, scope, number of rows, and number of columns **must**

match one of the matrices in any of the supported VkCooperativeMatrixPropertiesKHR, where

  - for Use of MatrixA, the number of rows must match VkCooperativeMatrixPropertiesKHR::MSize and the number of columns must match VkCooperativeMatrixPropertiesKHR::KSize and the type **must** match VkCooperativeMatrixPropertiesKHR::AType
  - for Use of MatrixB, the number of rows must match VkCooperativeMatrixPropertiesKHR::KSize and the number of columns must match VkCooperativeMatrixPropertiesKHR::NSize and the type **must** match VkCooperativeMatrixPropertiesKHR::BType
  - for Use of MatrixAccumulator, the number of rows must match VkCooperativeMatrixPropertiesKHR::MSize and the number of columns must match VkCooperativeMatrixPropertiesKHR::NSize and the type **must** match VkCooperativeMatrixPropertiesKHR::CType or VkCooperativeMatrixPropertiesKHR::ResultType

- VUID-RuntimeSpirv-OpCooperativeMatrixMulAddKHR-10060
  For OpCooperativeMatrixMulAddKHR, if the cooperativeMatrixFlexibleDimensions feature is not enabled, the operands **must** match a supported VkCooperativeMatrixPropertiesKHR, such that:

  - The type of A **must** have Rows match VkCooperativeMatrixPropertiesKHR::MSize, Columns match VkCooperativeMatrixPropertiesKHR::KSize, Use be MatrixAKHR, and ComponentType match VkCooperativeMatrixPropertiesKHR::AType.
  - The type of B **must** have Rows match VkCooperativeMatrixPropertiesKHR::KSize, Columns match VkCooperativeMatrixPropertiesKHR::NSize, Use be MatrixBKHR, and ComponentType match VkCooperativeMatrixPropertiesKHR::BType.
  - The type of C **must** have Rows match VkCooperativeMatrixPropertiesKHR::MSize, Columns match VkCooperativeMatrixPropertiesKHR::NSize, Use be MatrixAccumulatorKHR, and ComponentType match VkCooperativeMatrixPropertiesKHR::CType.
  - The type of Result **must** have Rows match VkCooperativeMatrixPropertiesKHR::MSize, Columns match VkCooperativeMatrixPropertiesKHR::NSize, Use be MatrixAccumulatorKHR, and ComponentType match VkCooperativeMatrixPropertiesKHR::ResultType.
  - If and only if VkCooperativeMatrixPropertiesKHR::AType is a signed integer type, MatrixASignedComponents **must** be used.
  - If and only if VkCooperativeMatrixPropertiesKHR::BType is a signed integer type, MatrixBSignedComponents **must** be used.
  - If and only if VkCooperativeMatrixPropertiesKHR::CType is a signed integer type, MatrixCSignedComponents **must** be used.
  - If and only if VkCooperativeMatrixPropertiesKHR::ResultType is a signed integer type, MatrixResultSignedComponents **must** be used.
  - If and only if VkCooperativeMatrixPropertiesKHR::saturatingAccumulation is VK_TRUE, SaturatingAccumulationKHR **must** be used.

- If and only if VkCooperativeMatrixPropertiesKHR::saturatingAccumulation is VK_FALSE, SaturatingAccumulationKHR **must** not be used.
- The scope of all cooperative matrix operands **must** match VkCooperativeMatrixPropertiesKHR::scope.

- VUID-RuntimeSpirv-cooperativeMatrixWorkgroupScope-10164
  If the cooperativeMatrixWorkgroupScope feature is not enabled, the scope of all OpTypeCooperativeMatrixKHR **must** not be VkScopeKHR::VK_SCOPE_WORKGROUP_KHR
- VUID-RuntimeSpirv-cooperativeMatrixFlexibleDimensions-10165
  For OpTypeCooperativeMatrixKHR, if the cooperativeMatrixFlexibleDimensions feature is enabled, the component type, scope, number of rows, and number of columns **must** match either one of the matrices in one of the supported VkCooperativeMatrixPropertiesKHR as described above, or one of the supported VkCooperativeMatrixFlexibleDimensionsPropertiesNV, where
  - for MatrixA, the number of rows must be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity and the number of columns must be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::KGranularity and the type **must** match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::AType
  - for MatrixB, the number of rows must be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::KGranularity and the number of columns must be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity and the type **must** match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::BType
  - for MatrixAccumulator, the number of rows must be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity and the number of columns must be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity and the type **must** match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::CType or VkCooperativeMatrixFlexibleDimensionsPropertiesNV::ResultType
  - if the scope is VK_SCOPE_WORKGROUP_KHR, the number of invocations in the local workgroup **must** match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::workgroupInvocations
- VUID-RuntimeSpirv-cooperativeMatrixFlexibleDimensions-10166
  For OpCooperativeMatrixMulAddKHR, if the cooperativeMatrixFlexibleDimensions feature is enabled, the operands **must** match either one of the supported VkCooperativeMatrixPropertiesKHR as described above, or one of the supported VkCooperativeMatrixFlexibleDimensionsPropertiesNV, such that:
  - The type of A **must** have Rows be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity, Columns be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::KGranularity, Use be MatrixAKHR, and ComponentType match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::AType.
  - The type of B **must** have Rows be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::KGranularity, Columns be a

multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity, Use be MatrixBKHR, and ComponentType match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::BType.

- The type of C **must** have Rows be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity, Columns be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity, Use be MatrixAccumulatorKHR, and ComponentType match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::CType.
- The type of Result **must** have Rows be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity, Columns be a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity, Use be MatrixAccumulatorKHR, and ComponentType match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::ResultType.
- If and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::AType is a signed integer type, MatrixASignedComponents **must** be used.
- If and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::BType is a signed integer type, MatrixBSignedComponents **must** be used.
- If and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::CType is a signed integer type, MatrixCSignedComponents **must** be used.
- If and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::ResultType is a signed integer type, MatrixResultSignedComponents **must** be used.
- If and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::saturatingAccumulation is VK_TRUE, SaturatingAccumulationKHR **must** be used.
- If and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::saturatingAccumulation is VK_FALSE, SaturatingAccumulationKHR **must** not be used.
- The scope of all cooperative matrix operands **must** match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::scope.
- If the scope is VK_SCOPE_WORKGROUP_KHR, the number of invocations in the local workgroup **must** match VkCooperativeMatrixFlexibleDimensionsPropertiesNV::workgroupInvocations

- VUID-RuntimeSpirv-cooperativeMatrixFlexibleDimensionsMaxDimension-10167
  All OpTypeCooperativeMatrixKHR dimensions **must** be less than or equal to cooperativeMatrixFlexibleDimensionsMaxDimension
- VUID-RuntimeSpirv-maxComputeSharedMemorySize-10168
  If the module uses OpTypeCooperativeMatrixKHR with Scope equal to Workgroup, the sum of size in bytes for variables and padding in the Workgroup Storage Class in the GLCompute Execution Model **must** be less than or equal to maxComputeSharedMemorySize minus cooperativeMatrixWorkgroupScopeReservedSharedMemory
- VUID-RuntimeSpirv-cooperativeMatrixSupportedStages-08985
  OpTypeCooperativeMatrixKHR and OpCooperativeMatrix* instructions **must** not be used in shader stages not included in VkPhysicalDeviceCooperativeMatrixPropertiesKHR::cooperativeMatrixSupportedStages

- VUID-RuntimeSpirv-DescriptorSet-06323
  DescriptorSet and Binding decorations **must** obey the constraints on Storage Class, type, and descriptor type described in DescriptorSet and Binding Assignment
- VUID-RuntimeSpirv-OpCooperativeMatrixLoadNV-06324
  For OpCooperativeMatrixLoadNV and OpCooperativeMatrixStoreNV instructions, the Pointer and Stride operands **must** be aligned to at least the lesser of 16 bytes or the natural alignment of a row or column (depending on ColumnMajor) of the matrix (where the natural alignment is the number of columns/rows multiplied by the component size)
- VUID-RuntimeSpirv-MeshNV-07113
  For mesh shaders using the MeshNV Execution Model the OutputVertices OpExecutionMode **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV ::maxMeshOutputVertices
- VUID-RuntimeSpirv-MeshNV-07114
  For mesh shaders using the MeshNV Execution Model the OutputPrimitivesNV OpExecutionMode **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV ::maxMeshOutputPrimitives
- VUID-RuntimeSpirv-MeshEXT-07115
  For mesh shaders using the MeshEXT Execution Model the OutputVertices OpExecutionMode **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxMeshOutputVertices
- VUID-RuntimeSpirv-MeshEXT-07332
  For mesh shaders using the MeshEXT Execution Model the “Vertex Count” operand of OpSetMeshOutputsEXT **must** be less than or equal to OutputVertices OpExecutionMode
- VUID-RuntimeSpirv-MeshEXT-07116
  For mesh shaders using the MeshEXT Execution Model the OutputPrimitivesEXT OpExecutionMode **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputPrimitives
- VUID-RuntimeSpirv-MeshEXT-07333
  For mesh shaders using the MeshEXT Execution Model the “Primitive Count” operand of OpSetMeshOutputsEXT **must** be less than or equal to OutputPrimitivesEXT OpExecutionMode
- VUID-RuntimeSpirv-TaskEXT-07117
  In task shaders using the TaskEXT Execution Model OpEmitMeshTasksEXT **must** be called exactly once under dynamically uniform conditions
- VUID-RuntimeSpirv-MeshEXT-07118
  In mesh shaders using the MeshEXT Execution Model OpSetMeshOutputsEXT **must** be called at most once under dynamically uniform conditions
- VUID-RuntimeSpirv-TaskEXT-07291
  In task shaders using the TaskEXT Execution Model the x size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxTaskWorkGroupSize[0]
- VUID-RuntimeSpirv-TaskEXT-07292
  In task shaders using the TaskEXT Execution Model the y size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT

::maxTaskWorkGroupSize[1]

- VUID-RuntimeSpirv-TaskEXT-07293
  In task shaders using the TaskEXT Execution Model the z size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxTaskWorkGroupSize[2]
- VUID-RuntimeSpirv-TaskEXT-07294
  In task shaders using the TaskEXT Execution Model the product of x size, y size, and z size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupInvocations
- VUID-RuntimeSpirv-MeshEXT-07295
  For mesh shaders using the MeshEXT Execution Model the x size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxMeshWorkGroupSize[0]
- VUID-RuntimeSpirv-MeshEXT-07296
  For mesh shaders using the MeshEXT Execution Model the y size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxMeshWorkGroupSize[1]
- VUID-RuntimeSpirv-MeshEXT-07297
  For mesh shaders using the MeshEXT Execution Model the z size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT ::maxMeshWorkGroupSize[2]
- VUID-RuntimeSpirv-MeshEXT-07298
  For mesh shaders using the MeshEXT Execution Model the product of x size, y size, and z size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupInvocations
- VUID-RuntimeSpirv-TaskEXT-07299
  In task shaders using the TaskEXT Execution Model the value of the “Group Count X” operand of OpEmitMeshTasksEXT **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[0]
- VUID-RuntimeSpirv-TaskEXT-07300
  In task shaders using the TaskEXT Execution Model the value of the “Group Count Y” operand of OpEmitMeshTasksEXT **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[1]
- VUID-RuntimeSpirv-TaskEXT-07301
  In task shaders using the TaskEXT Execution Model the value of the “Group Count Z” operand of OpEmitMeshTasksEXT **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[2]
- VUID-RuntimeSpirv-TaskEXT-07302
  In task shaders using the TaskEXT Execution Model the product of the “Group Count” operands of OpEmitMeshTasksEXT **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupTotalCount
- VUID-RuntimeSpirv-maxMeshSharedMemorySize-08754
  The sum of size in bytes for variables and padding in the Workgroup Storage Class in the

MeshEXT Execution Model **must** be less than or equal to maxMeshSharedMemorySize

- VUID-RuntimeSpirv-maxMeshPayloadAndSharedMemorySize-08755
  The sum of size in bytes for variables and padding in the TaskPayloadWorkgroupEXT or Workgroup Storage Class in the MeshEXT Execution Model **must** be less than or equal to maxMeshPayloadAndSharedMemorySize
- VUID-RuntimeSpirv-maxMeshOutputMemorySize-08756
  The sum of size in bytes for variables in the Output Storage Class in the MeshEXT Execution Model **must** be less than or equal to maxMeshOutputMemorySize according to the formula in Mesh Shader Output
- VUID-RuntimeSpirv-maxMeshPayloadAndOutputMemorySize-08757
  The sum of size in bytes for variables and in the TaskPayloadWorkgroupEXT or Output Storage Class in the MeshEXT Execution Model **must** be less than or equal to maxMeshPayloadAndOutputMemorySize according to the formula in Mesh Shader Output
- VUID-RuntimeSpirv-maxTaskPayloadSize-08758
  The sum of size in bytes for variables and in the TaskPayloadWorkgroupEXT Storage Class in the TaskEXT Execution Model **must** be less than or equal to maxTaskPayloadSize
- VUID-RuntimeSpirv-maxTaskSharedMemorySize-08759
  The sum of size in bytes for variables and padding in the Workgroup Storage Class in the TaskEXT Execution Model **must** be less than or equal to maxTaskSharedMemorySize
- VUID-RuntimeSpirv-maxTaskPayloadAndSharedMemorySize-08760
  The sum of size in bytes for variables and padding in the TaskPayloadWorkgroupEXT or Workgroup Storage Class in the TaskEXT Execution Model **must** be less than or equal to maxTaskPayloadAndSharedMemorySize
- VUID-RuntimeSpirv-OpCooperativeMatrixLoadKHR-08986
  For OpCooperativeMatrixLoadKHR and OpCooperativeMatrixStoreKHR instructions, the Pointer and Stride operands **must** be aligned to at least the lesser of 16 bytes or the natural alignment of a row or column (depending on ColumnMajor) of the matrix (where the natural alignment is the number of columns/rows multiplied by the component size)
- VUID-RuntimeSpirv-shaderSampleRateInterpolationFunctions-06325
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::shaderSampleRateInterpolationFunctions is VK_FALSE, then GLSL.std.450 fragment interpolation functions are not supported by the implementation and OpCapability **must** not be InterpolationFunction
- VUID-RuntimeSpirv-tessellationShader-06326
  If the tessellationShader feature is enabled, and the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines is VK_FALSE, then OpExecutionMode **must** not be IsoLines
- VUID-RuntimeSpirv-tessellationShader-06327
  If the tessellationShader feature is enabled, and the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode is VK_FALSE, then OpExecutionMode **must** not be PointMode
- VUID-RuntimeSpirv-storageBuffer8BitAccess-06328
  If storageBuffer8BitAccess is VK_FALSE, then objects containing an 8-bit integer element

must not have `Storage Class` of `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer`

- VUID-RuntimeSpirv-uniformAndStorageBuffer8BitAccess-06329
  If `uniformAndStorageBuffer8BitAccess` is `VK_FALSE`, then objects in the `Uniform Storage Class` with the `Block` decoration **must** not have an 8-bit integer member
- VUID-RuntimeSpirv-storagePushConstant8-06330
  If `storagePushConstant8` is `VK_FALSE`, then objects containing an 8-bit integer element **must** not have `Storage Class` of `PushConstant`
- VUID-RuntimeSpirv-storageBuffer16BitAccess-06331
  If `storageBuffer16BitAccess` is `VK_FALSE`, then objects containing 16-bit integer or 16-bit floating-point elements **must** not have `Storage Class` of `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer`
- VUID-RuntimeSpirv-uniformAndStorageBuffer16BitAccess-06332
  If `uniformAndStorageBuffer16BitAccess` is `VK_FALSE`, then objects in the `Uniform Storage Class` with the `Block` decoration **must** not have 16-bit integer or 16-bit floating-point members
- VUID-RuntimeSpirv-storagePushConstant16-06333
  If `storagePushConstant16` is `VK_FALSE`, then objects containing 16-bit integer or 16-bit floating-point elements **must** not have `Storage Class` of `PushConstant`
- VUID-RuntimeSpirv-storageInputOutput16-06334
  If `storageInputOutput16` is `VK_FALSE`, then objects containing 16-bit integer or 16-bit floating-point elements **must** not have `Storage Class` of `Input` or `Output`
- VUID-RuntimeSpirv-None-06337
  `shaderBufferFloat16Atomics`, or `shaderBufferFloat16AtomicAdd`, or `shaderBufferFloat16AtomicMinMax`, or `shaderSharedFloat16Atomics`, or `shaderSharedFloat16AtomicAdd`, or `shaderSharedFloat16AtomicMinMax` **must** be enabled for 16-bit floating-point atomic operations
- VUID-RuntimeSpirv-None-06338
  `shaderBufferFloat32Atomics`, or `shaderBufferFloat32AtomicAdd`, or `shaderSharedFloat32Atomics`, or `shaderSharedFloat32AtomicAdd`, or `shaderImageFloat32Atomics`, or `shaderImageFloat32AtomicAdd` or `shaderBufferFloat32AtomicMinMax`, or `shaderSharedFloat32AtomicMinMax`, or `shaderImageFloat32AtomicMinMax` **must** be enabled for 32-bit floating-point atomic operations
- VUID-RuntimeSpirv-None-06339
  `shaderBufferFloat64Atomics`, or `shaderBufferFloat64AtomicAdd`, or `shaderSharedFloat64Atomics`, or `shaderSharedFloat64AtomicAdd`, or `shaderBufferFloat64AtomicMinMax`, or `shaderSharedFloat64AtomicMinMax`, **must** be enabled for 64-bit floating-point atomic operations
- VUID-RuntimeSpirv-shaderFloat16VectorAtomics-09581
  `shaderFloat16VectorAtomics`, **must** be enabled for 16-bit floating-point, 2- and 4-component vector atomic operations to be supported
- VUID-RuntimeSpirv-NonWritable-06340
  If the `fragmentStoresAndAtomics` feature is not enabled, then all storage image, storage

texel buffer, and storage buffer variables in the fragment stage **must** be decorated with the `NonWritable` decoration

- VUID-RuntimeSpirv-NonWritable-06341
  If the `vertexPipelineStoresAndAtomics` feature is not enabled, then all storage image, storage texel buffer, and storage buffer variables in the vertex, tessellation, and geometry stages **must** be decorated with the `NonWritable` decoration
- VUID-RuntimeSpirv-None-06342
  If `subgroupQuadOperationsInAllStages` is `VK_FALSE`, then quad subgroup operations **must** not be used except for in fragment and compute stages
- VUID-RuntimeSpirv-None-06343
  Group operations with subgroup scope **must** not be used if the shader stage is not in `subgroupSupportedStages`
- VUID-RuntimeSpirv-Offset-06344
  The first element of the `Offset` operand of `InterpolateAtOffset` **must** be greater than or equal to:
  $frag_{width}$ × `minInterpolationOffset`
  where $frag_{width}$ is the width of the current fragment in pixels
- VUID-RuntimeSpirv-Offset-06345
  The first element of the `Offset` operand of `InterpolateAtOffset` **must** be less than or equal to
  $frag_{width}$ × (`maxInterpolationOffset` + ULP) - ULP
  where $frag_{width}$ is the width of the current fragment in pixels and ULP = 1 / 2^`subPixelInterpolationOffsetBits`^
- VUID-RuntimeSpirv-Offset-06346
  The second element of the `Offset` operand of `InterpolateAtOffset` **must** be greater than or equal to
  $frag_{height}$ × `minInterpolationOffset`
  where $frag_{height}$ is the height of the current fragment in pixels
- VUID-RuntimeSpirv-Offset-06347
  The second element of the `Offset` operand of `InterpolateAtOffset` **must** be less than or equal to
  $frag_{height}$ × (`maxInterpolationOffset` + ULP) - ULP
  where $frag_{height}$ is the height of the current fragment in pixels and ULP = 1 / 2^`subPixelInterpolationOffsetBits`^
- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06348
  For `OpRayQueryInitializeKHR` instructions, all components of the `RayOrigin` and `RayDirection` operands **must** be finite floating-point values
- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06349
  For `OpRayQueryInitializeKHR` instructions, the `RayTmin` and `RayTmax` operands **must** be non-negative floating-point values
- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06350
  For `OpRayQueryInitializeKHR` instructions, the `RayTmin` operand **must** be less than or equal to the `RayTmax` operand

- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06351
  For OpRayQueryInitializeKHR instructions, RayOrigin, RayDirection, RayTmin, and RayTmax operands **must** not contain NaNs
- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06352
  For OpRayQueryInitializeKHR instructions, Acceleration Structure **must** be an acceleration structure built as a top-level acceleration structure
- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06889
  For OpRayQueryInitializeKHR instructions, the Rayflags operand **must** not contain both SkipTrianglesKHR and SkipAABBsKHR
- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06890
  For OpRayQueryInitializeKHR instructions, the Rayflags operand **must** not contain more than one of SkipTrianglesKHR, CullBackFacingTrianglesKHR, and CullFrontFacingTrianglesKHR
- VUID-RuntimeSpirv-OpRayQueryInitializeKHR-06891
  For OpRayQueryInitializeKHR instructions, the Rayflags operand **must** not contain more than one of OpaqueKHR, NoOpaqueKHR, CullOpaqueKHR, and CullNoOpaqueKHR
- VUID-RuntimeSpirv-OpRayQueryGenerateIntersectionKHR-06353
  For OpRayQueryGenerateIntersectionKHR instructions, Hit T **must** satisfy the condition RayTmin ≤ Hit T ≤ RayTmax, where RayTmin is equal to the value returned by OpRayQueryGetRayTMinKHR with the same ray query object, and RayTmax is equal to the value of OpRayQueryGetIntersectionTKHR for the current committed intersection with the same ray query object
- VUID-RuntimeSpirv-OpRayQueryGenerateIntersectionKHR-06354
  For OpRayQueryGenerateIntersectionKHR instructions, Acceleration Structure **must** not be built with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV in flags
- VUID-RuntimeSpirv-flags-08761
  For OpRayQueryGetIntersectionTriangleVertexPositionsKHR instructions, Acceleration Structure **must** have been built with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR in flags
- VUID-RuntimeSpirv-OpTraceRayKHR-06355
  For OpTraceRayKHR instructions, all components of the RayOrigin and RayDirection operands **must** be finite floating-point values
- VUID-RuntimeSpirv-OpTraceRayKHR-06356
  For OpTraceRayKHR instructions, the RayTmin and RayTmax operands **must** be non-negative floating-point values
- VUID-RuntimeSpirv-OpTraceRayKHR-06552
  For OpTraceRayKHR instructions, the Rayflags operand **must** not contain both SkipTrianglesKHR and SkipAABBsKHR
- VUID-RuntimeSpirv-OpTraceRayKHR-06892
  For OpTraceRayKHR instructions, the Rayflags operand **must** not contain more than one of SkipTrianglesKHR, CullBackFacingTrianglesKHR, and CullFrontFacingTrianglesKHR
- VUID-RuntimeSpirv-OpTraceRayKHR-06893
  For OpTraceRayKHR instructions, the Rayflags operand **must** not contain more than one of

OpaqueKHR, NoOpaqueKHR, CullOpaqueKHR, and CullNoOpaqueKHR

- VUID-RuntimeSpirv-OpTraceRayKHR-06553
  For OpTraceRayKHR instructions, if the Rayflags operand contains SkipTrianglesKHR, the pipeline **must** not have been created with VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR set
- VUID-RuntimeSpirv-OpTraceRayKHR-06554
  For OpTraceRayKHR instructions, if the Rayflags operand contains SkipAABBsKHR, the pipeline **must** not have been created with VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR set
- VUID-RuntimeSpirv-OpTraceRayKHR-06357
  For OpTraceRayKHR instructions, the RayTmin operand **must** be less than or equal to the RayTmax operand
- VUID-RuntimeSpirv-OpTraceRayKHR-06358
  For OpTraceRayKHR instructions, RayOrigin, RayDirection, RayTmin, and RayTmax operands **must** not contain NaNs
- VUID-RuntimeSpirv-OpTraceRayKHR-06359
  For OpTraceRayKHR instructions, Acceleration Structure **must** be an acceleration structure built as a top-level acceleration structure
- VUID-RuntimeSpirv-OpReportIntersectionKHR-06998
  The value of the “Hit Kind” operand of OpReportIntersectionKHR **must** be in the range [0,127]
- VUID-RuntimeSpirv-OpTraceRayKHR-06360
  For OpTraceRayKHR instructions, if Acceleration Structure was built with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV in flags, the pipeline **must** have been created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV set
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06361
  For OpTraceRayMotionNV instructions, all components of the RayOrigin and RayDirection operands **must** be finite floating-point values
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06362
  For OpTraceRayMotionNV instructions, the RayTmin and RayTmax operands **must** be non-negative floating-point values
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06363
  For OpTraceRayMotionNV instructions, the RayTmin operand **must** be less than or equal to the RayTmax operand
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06364
  For OpTraceRayMotionNV instructions, RayOrigin, RayDirection, RayTmin, and RayTmax operands **must** not contain NaNs
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06365
  For OpTraceRayMotionNV instructions, Acceleration Structure **must** be an acceleration structure built as a top-level acceleration structure with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV in flags
- VUID-RuntimeSpirv-OpTraceRayMotionNV-06366
  For OpTraceRayMotionNV instructions the time operand **must** be between 0.0 and 1.0

- VUID-RuntimeSpirv-OpTraceRayMotionNV-06367
  For OpTraceRayMotionNV instructions the pipeline **must** have been created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV set
- VUID-RuntimeSpirv-OpHitObjectTraceRayMotionNV-07704
  For OpHitObjectTraceRayMotionNV instructions, if Acceleration Structure was built with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV in flags, the pipeline **must** have been created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV set
- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07705
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, all components of the RayOrigin and RayDirection operands **must** be finite floating-point values
- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07706
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the RayTmin and RayTmax operands **must** be non-negative floating-point values
- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07707
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the RayTmin operand **must** be less than or equal to the RayTmax operand
- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07708
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, RayOrigin, RayDirection, RayTmin, and RayTmax operands **must** not contain NaNs
- VUID-RuntimeSpirv-OpHitObjectTraceRayMotionNV-07709
  For OpHitObjectTraceRayMotionNV instructions, Acceleration Structure **must** be an acceleration structure built as a top-level acceleration structure with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV in flags
- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07710
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions the time operand **must** be between 0.0 and 1.0
- VUID-RuntimeSpirv-OpHitObjectTraceRayMotionNV-07711
  For OpHitObjectTraceRayMotionNV instructions the pipeline **must** have been created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV set
- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07712
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the Rayflags operand **must** not contain both SkipTrianglesKHR and SkipAABBsKHR
- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07713
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the Rayflags operand **must** not contain more than one of SkipTrianglesKHR, CullBackFacingTrianglesKHR, and CullFrontFacingTrianglesKHR
- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07714
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, the Rayflags operand **must** not contain more than one of OpaqueKHR, NoOpaqueKHR, CullOpaqueKHR, and CullNoOpaqueKHR
- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07715
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, if the Rayflags operand contains SkipTrianglesKHR, the pipeline **must** not have been created with

VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR set

- VUID-RuntimeSpirv-OpHitObjectTraceRayNV-07716
  For OpHitObjectTraceRayNV and OpHitObjectTraceRayMotionNV instructions, if the Rayflags operand contains SkipAABBsKHR, the pipeline **must** not have been created with VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR set
- VUID-RuntimeSpirv-x-06429
  In compute shaders using the GLCompute Execution Model the x size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceLimits ::maxComputeWorkGroupSize[0]
- VUID-RuntimeSpirv-y-06430
  In compute shaders using the GLCompute Execution Model the y size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceLimits ::maxComputeWorkGroupSize[1]
- VUID-RuntimeSpirv-z-06431
  In compute shaders using the GLCompute Execution Model the z size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceLimits ::maxComputeWorkGroupSize[2]
- VUID-RuntimeSpirv-x-06432
  In compute shaders using the GLCompute Execution Model the product of x size, y size, and z size in LocalSize or LocalSizeId **must** be less than or equal to VkPhysicalDeviceLimits ::maxComputeWorkGroupInvocations
- VUID-RuntimeSpirv-LocalSizeId-06434
  If Execution Mode LocalSizeId is used, maintenance4 **must** be enabled
- VUID-RuntimeSpirv-maintenance4-06817
  If the maintenance4 feature is not enabled, any OpTypeVector output interface variables **must** not have a higher Component Count than a matching OpTypeVector input interface variable
- VUID-RuntimeSpirv-OpEntryPoint-08743
  Any user-defined variables shared between the OpEntryPoint of two shader stages, and declared with Input as its Storage Class for the subsequent shader stage, **must** have all Location slots and Component words declared in the preceding shader stage's OpEntryPoint with Output as the Storage Class
- VUID-RuntimeSpirv-OpEntryPoint-07754
  Any user-defined variables between the OpEntryPoint of two shader stages **must** have the same type and width for each Component
- VUID-RuntimeSpirv-OpVariable-08746
  Any OpVariable, Block-decorated OpTypeStruct, or Block-decorated OpTypeStruct members shared between the OpEntryPoint of two shader stages **must** have matching decorations as defined in interface matching
- VUID-RuntimeSpirv-Workgroup-06530
  The sum of size in bytes for variables and padding in the Workgroup Storage Class in the GLCompute Execution Model **must** be less than or equal to maxComputeSharedMemorySize
- VUID-RuntimeSpirv-shaderZeroInitializeWorkgroupMemory-06372

If the shaderZeroInitializeWorkgroupMemory feature is not enabled, any OpVariable with Workgroup as its Storage Class **must** not have an Initializer operand

- VUID-RuntimeSpirv-OpImage-06376
  If an OpImage*Gather operation has an image operand of Offset, ConstOffset, or ConstOffsets the offset value **must** be greater than or equal to minTexelGatherOffset
- VUID-RuntimeSpirv-OpImage-06377
  If an OpImage*Gather operation has an image operand of Offset, ConstOffset, or ConstOffsets the offset value **must** be less than or equal to maxTexelGatherOffset
- VUID-RuntimeSpirv-OpImageSample-06435
  If an OpImageSample* or OpImageFetch* operation has an image operand of ConstOffset then the offset value **must** be greater than or equal to minTexelOffset
- VUID-RuntimeSpirv-OpImageSample-06436
  If an OpImageSample* or OpImageFetch* operation has an image operand of ConstOffset then the offset value **must** be less than or equal to maxTexelOffset
- VUID-RuntimeSpirv-samples-08725
  If an OpTypeImage has an MS operand 0, its bound image **must** have been created with VkImageCreateInfo::samples as VK_SAMPLE_COUNT_1_BIT
- VUID-RuntimeSpirv-samples-08726
  If an OpTypeImage has an MS operand 1, its bound image **must** not have been created with VkImageCreateInfo::samples as VK_SAMPLE_COUNT_1_BIT
- VUID-RuntimeSpirv-SampleRateShading-06378
  If the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then the SPIR-V fragment shader Capability SampleRateShading **must** not be enabled
- VUID-RuntimeSpirv-SubgroupUniformControlFlowKHR-06379
  The Execution Mode SubgroupUniformControlFlowKHR **must** not be applied to an entry point unless the shaderSubgroupUniformControlFlow feature is enabled, the corresponding shader stage bit is set in subgroupSupportedStages, and the entry point does not execute any *invocation repack instructions*
- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06767
  If the shaderEarlyAndLateFragmentTests feature is not enabled, the EarlyAndLateFragmentTestsEXT Execution Mode **must** not be used
- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06768
  If the shaderEarlyAndLateFragmentTests feature is not enabled, the StencilRefUnchangedFrontEXT Execution Mode **must** not be used
- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06769
  If the shaderEarlyAndLateFragmentTests feature is not enabled, the StencilRefUnchangedBackEXT Execution Mode **must** not be used
- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06770
  If the shaderEarlyAndLateFragmentTests feature is not enabled, the StencilRefGreaterFrontEXT Execution Mode **must** not be used
- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06771
  If the shaderEarlyAndLateFragmentTests feature is not enabled, the StencilRefGreaterBackEXT Execution Mode **must** not be used

- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06772
  If the `shaderEarlyAndLateFragmentTests` feature is not enabled, the `StencilRefLessFrontEXT` `Execution Mode` **must** not be used
- VUID-RuntimeSpirv-shaderEarlyAndLateFragmentTests-06773
  If the `shaderEarlyAndLateFragmentTests` feature is not enabled, the `StencilRefLessBackEXT` `Execution Mode` **must** not be used
- VUID-RuntimeSpirv-OpImageWeightedSampleQCOM-06979
  If an `OpImageWeightedSampleQCOM` operation is used, then the `Texture Sampled Image` and `Weight Image` parameters **must** both be *dynamically uniform* for the quad
- VUID-RuntimeSpirv-OpImageWeightedSampleQCOM-06980
  If an `OpImageWeightedSampleQCOM` operation is used, then the `Weight Image` parameter **must** be of `Storage Class` `UniformConstant` and type `OpTypeImage` with `Depth`=0, `Dim`=`2D`, `Arrayed`=1, `MS`=0, and `Sampled`=1
- VUID-RuntimeSpirv-OpImageWeightedSampleQCOM-06981
  If an `OpImageWeightedSampleQCOM` operation is used, then the `Weight Image` parameter **must** be decorated with `WeightTextureQCOM`
- VUID-RuntimeSpirv-OpImageBlockMatchSADQCOM-06982
  If an `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` operation is used, then the `target sampled image`, `reference sampled image`, and `Block Size` parameters **must** both be *dynamically uniform* for the quad
- VUID-RuntimeSpirv-OpImageBlockMatchSSDQCOM-06983
  If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then `target sampled image` and `reference sampled image` parameters **must** be of storage class `UniformConstant` and type `OpTypeImage` with `Depth`=0, `Dim`=`2D`, `Arrayed`=0, `MS`=0, and `Sampled`=1
- VUID-RuntimeSpirv-OpImageBlockMatchSSDQCOM-06984
  If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then the `target sampled image` and `reference sampled image` parameters **must** be decorated with `BlockMatchTextureQCOM`
- VUID-RuntimeSpirv-OpImageBlockMatchSSDQCOM-06985
  If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then `target sampled image` and `reference sampled image` parameters **must** have been created using an identical sampler object
- VUID-RuntimeSpirv-OpImageBlockMatchSSDQCOM-06986
  If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then `target sampled image` and `reference sampled image` parameters **must** have been created with a sampler object with `unnormalizedCoordinates` equal to `VK_TRUE`
- VUID-RuntimeSpirv-OpImageBlockMatchSSDQCOM-06987
  If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then `target sampled image` and `reference sampled image` parameters **must** have been created with a sampler object with `unnormalizedCoordinates` equal to `VK_TRUE`
- VUID-RuntimeSpirv-OpImageBlockMatchSSDQCOM-06988
  If an `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` operation is used, then `Block Size` less than or equal to `maxBlockMatchRegion`

- VUID-RuntimeSpirv-OpImageBoxFilterQCOM-06989
  If an OpImageBoxFilterQCOM operation is used, then Box Size.y **must** be equal to or greater than 1.0 and less than or equal to maxBoxFilterBlockSize.height
- VUID-RuntimeSpirv-OpImageBoxFilterQCOM-06990
  If an OpImageBoxFilterQCOM operation is used, then Sampled Texture Image and Box Size parameters **must** be *dynamically uniform*
- VUID-RuntimeSpirv-OpEntryPoint-08727
  Each OpEntryPoint **must** not have more than one variable decorated with InputAttachmentIndex per image aspect of the attachment image bound to it, either explicitly or implicitly as described by input attachment interface
- VUID-RuntimeSpirv-shaderTileImageColorReadAccess-08728
  If the shaderTileImageColorReadAccess feature is not enabled, OpColorAttachmentReadEXT operation **must** not be used
- VUID-RuntimeSpirv-shaderTileImageDepthReadAccess-08729
  If the shaderTileImageDepthReadAccess feature is not enabled, OpDepthAttachmentReadEXT operation **must** not be used
- VUID-RuntimeSpirv-shaderTileImageStencilReadAccess-08730
  If the shaderTileImageStencilReadAccess feature is not enabled, OpStencilAttachmentReadEXT operation **must** not be used
- VUID-RuntimeSpirv-minSampleShading-08731
  If sample shading is enabled and minSampleShading is 1.0, the sample operand of any OpColorAttachmentReadEXT, OpDepthAttachmentReadEXT, or OpStencilAttachmentReadEXT operation **must** evaluate to the value of the coverage index for any given fragment invocation
- VUID-RuntimeSpirv-minSampleShading-08732
  If sample shading is enabled and any of the OpColorAttachmentReadEXT, OpDepthAttachmentReadEXT, or OpStencilAttachmentReadEXT operations are used, then minSampleShading **must** be 1.0
- VUID-RuntimeSpirv-MeshEXT-09218
  In mesh shaders using the MeshEXT or MeshNV Execution Model and the OutputPoints Execution Mode, if the maintenance5 feature is not enabled, and if the number of output points is greater than 0, a PointSize decorated variable **must** be written to for each output point
- VUID-RuntimeSpirv-maintenance5-09190
  If the maintenance5 feature is enabled and a PointSize decorated variable is written to, all execution paths **must** write to a PointSize decorated variable
- VUID-RuntimeSpirv-ShaderEnqueueAMDX-09191
  The ShaderEnqueueAMDX capability **must** only be used in shaders with the GLCompute or MeshEXT execution model
- VUID-RuntimeSpirv-NodePayloadAMDX-09192
  Variables in the NodePayloadAMDX storage class **must** only be declared in the GLCompute or MeshEXT execution model
- VUID-RuntimeSpirv-maxExecutionGraphShaderPayloadSize-09193

Variables declared in the NodePayloadAMDX storage class **must** not be larger than the maxExecutionGraphShaderPayloadSize limit

- VUID-RuntimeSpirv-maxExecutionGraphShaderPayloadSize-09194
  Variables declared in the NodeOutputPayloadAMDX storage class **must** not be larger than the maxExecutionGraphShaderPayloadSize limit
- VUID-RuntimeSpirv-maxExecutionGraphShaderPayloadSize-09195
  For a given entry point, the sum of the size of any variable in the NodePayloadAMDX storage class, and the combined size of all statically initialized variables in the NodeOutputPayloadAMDX storage class **must** not be greater than maxExecutionGraphShaderPayloadSize
- VUID-RuntimeSpirv-maxExecutionGraphShaderPayloadCount-09196
  Shaders **must** not statically initialize more than maxExecutionGraphShaderPayloadCount variables in the NodeOutputPayloadAMDX storage class
- VUID-RuntimeSpirv-maxExecutionGraphShaderOutputNodes-09197
  Shaders **must** not include more than maxExecutionGraphShaderOutputNodes instances of OpInitializeNodePayloadsAMDX
- VUID-RuntimeSpirv-OpImageBlockMatchWindow-09219
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM operation is used, then the target sampled image, reference sampled image, and Block Size parameters **must** both be *dynamically uniform* for the quad
- VUID-RuntimeSpirv-OpImageBlockMatchWindow-09220
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM operation is used, then target sampled image and reference sampled image parameters **must** be of storage class UniformConstant and type OpTypeImage with Depth=0, Dim=2D, Arrayed=0, MS=0, and Sampled=1
- VUID-RuntimeSpirv-OpImageBlockMatchWindow-09221
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM operation is used, then the target sampled image and reference sampled image parameters **must** be decorated with BlockMatchTextureQCOM
- VUID-RuntimeSpirv-OpImageBlockMatchWindow-09222
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM operation is used, then target sampled image and reference sampled image parameters **must** have been created using an identical sampler object
- VUID-RuntimeSpirv-OpImageBlockMatchWindow-09223
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM operation is used, then target sampled image and reference sampled image parameters **must** have been created with a sampler object with unnormalizedCoordinates equal to VK_TRUE
- VUID-RuntimeSpirv-OpImageBlockMatchWindow-09224
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM operation is used, then target sampled image and reference sampled image parameters **must** have been created with sampler object with unnormalizedCoordinates equal to VK_TRUE
- VUID-RuntimeSpirv-maxBlockMatchRegion-09225
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM operation is used, then Block Size less than or equal to maxBlockMatchRegion

- VUID-RuntimeSpirv-pNext-09226
  If a OpImageBlockMatchWindow*QCOM operation is used, then target sampled image **must** have been created using asampler object that included VkSamplerBlockMatchWindowCreateInfoQCOM in the pNext chain
- VUID-RuntimeSpirv-MaximallyReconvergesKHR-09565
  The execution mode MaximallyReconvergesKHR **must** not be applied to an entry point unless the entry point does not execute any *invocation repack instructions*
- VUID-RuntimeSpirv-shaderSubgroupRotateClustered-09566
  If shaderSubgroupRotateClustered is VK_FALSE, then the ClusterSize operand to OpGroupNonUniformRotateKHR **must** not be used
- VUID-RuntimeSpirv-protectedNoFault-09645
  If protectedNoFault is not supported, the Storage Class of the PhysicalStorageBuffer **must** not be used if the buffer being accessed is protected
- VUID-RuntimeSpirv-meshAndTaskShaderDerivatives-10153
  If meshAndTaskShaderDerivatives is VK_FALSE, the DerivativeGroupLinearKHR and DerivativeGroupQuadsKHR execution modes **must** not be used in the MeshEXT, MeshNV, TaskEXT, or TaskNV Execution Model

Precision and Operation of SPIR-V Instructions

The following rules apply to half, single, and double-precision floating-point instructions:

- Positive and negative infinities and positive and negative zeros are generated as dictated by IEEE 754, but subject to the precisions allowed in the table below.
- Signaling NaNs are not required to be generated and exceptions are never raised. Signaling NaN **may** be converted to quiet NaNs values by any floating-point instruction.
- The set of operations OpPhi, OpSelect, OpFunctionCall, OpReturnValue, OpVectorExtractDynamic, OpVectorInsertDynamic, OpVectorShuffle, OpCompositeConstruct, OpCompositeExtract, OpCompositeInsert, OpTranspose, OpCopyObject, OpCopyLogical, OpCopyMemory, OpGroupNonUniformBroadcast, OpGroupNonUniformBroadcastFirst, OpGroupNonUniformShuffle, OpGroupNonUniformShuffleXor, OpGroupNonUniformShuffleUp, OpGroupNonUniformShuffleDown, OpGroupNonUniformQuadBroadcast, OpGroupNonUniformQuadSwap, OpSubgroupReadInvocationKHR, OpSubgroupFirstInvocationKHR, OpGroupNonUniformRotateKHR, OpCooperativeMatrixLoadKHR, OpCooperativeMatrixStoreKHR, OpCooperativeMatrixLoadNV, OpCooperativeMatrixStoreNV, OpCooperativeMatrixLoadTensorNV, OpCooperativeMatrixStoreTensorNV, OpAtomicLoad, OpAtomicStore, OpAtomicExchange, OpStore, and OpLoad are referred to as *bit-preserving operations*.
- The floating-point environment used for an instruction can be determined as follows:
  - If the SPIR-V specifies it explicitly using the FPFastMath decoration or FPFastMathDefault Execution Mode then that is used.
  - If the environment is not specified in the SPIR-V then it is determined as follows:
    - If the operation is not decorated NoContraction then the flags AllowContract, AllowReassoc, AllowRecip, and AllowTransform are assumed.
    - If any of the following conditions are true then the flags NSZ, NotInf, and NotNaN are

assumed:

    - The entry point does not use the Execution Mode SignedZeroInfNanPreserve with a bit-width corresponding to one of the operands or to the result type.
    - The operation is not a bit-preserving operation and is not one of OpFConvert, OpFNegate, OpFAdd, OpFSub, OpFMul, OpFDiv, OpIsNan, or OpIsInf.
    - The operation is an OpLoad from the Input Storage Class in the fragment shader stage.

- All bit-preserving operations and the following instructions **must** not flush denormalized values: OpConstant, OpConstantComposite, OpSpecConstant, OpSpecConstantComposite, and OpBitcast.
- Denormalized values are supported.
    - By default, any half, single, or double-precision denormalized value input into a shader or potentially generated by any instruction (except those listed above) or any extended instructions for GLSL in a shader **may** be flushed to zero.
    - If the entry point is declared with the DenormFlushToZero Execution Mode then for the affected instructions the denormalized result **must** be flushed to zero and the denormalized operands **may** be flushed to zero. Denormalized values obtained via unpacking an integer into a vector of values with smaller bit width and interpreting those values as floating-point numbers **must** be flushed to zero.
    - The following core SPIR-V instructions **must** respect the DenormFlushToZero Execution Mode: OpSpecConstantOp (with opcode OpFConvert), OpFConvert, OpFNegate, OpFAdd, OpFSub, OpFMul, OpFDiv, OpFRem, OpFMod, OpVectorTimesScalar, OpMatrixTimesScalar, OpVectorTimesMatrix, OpMatrixTimesVector, OpMatrixTimesMatrix, OpOuterProduct, OpDot; and the following extended instructions for GLSL: Round, RoundEven, Trunc, FAbs, Floor, Ceil, Fract, Radians, Degrees, Sin, Cos, Tan, Asin, Acos, Atan, Sinh, Cosh, Tanh, Asinh, Acosh, Atanh, Atan2, Pow, Exp, Log, Exp2, Log2, Sqrt, InverseSqrt, Determinant, MatrixInverse, Modf, ModfStruct, FMin, FMax, FClamp, FMix, Step, SmoothStep, Fma, UnpackHalf2x16, Length, Distance, Cross, Normalize, FaceForward, Reflect, Refract, NMin, NMax, and NClamp.
    - The following core SPIR-V instructions **must** respect the DenormPreserve Execution Mode: OpSpecConstantOp, OpFConvert, OpFNegate, OpFAdd, OpFSub, OpFMul, OpVectorTimesScalar, OpMatrixTimesScalar, OpVectorTimesMatrix, OpMatrixTimesVector, OpMatrixTimesMatrix, OpOuterProduct, OpDot, OpFOrdEqual, OpFUnordEqual, OpFOrdNotEqual, OpFUnordNotEqual, OpFOrdLessThan, OpFUnordLessThan, OpFOrdGreaterThan, OpFUnordGreaterThan, OpFOrdLessThanEqual, OpFUnordLessThanEqual, OpFOrdGreaterThanEqual, OpFUnordGreaterThanEqual, OpSubgroupAllEqualKHR, OpGroupNonUniformAllEqual; and the following extended instructions for GLSL: FAbs, FSign, Radians, Degrees, FMin, FMax, FClamp, FMix, Fma, PackHalf2x16, PackDouble2x32, UnpackHalf2x16, UnpackDouble2x32, NMin, NMax, and NClamp.

The precision of double-precision instructions is at least that of single precision.

The precision of individual operations is defined in Precision of Individual Operations. Subject to the constraints below, however, implementations **may** reorder or combine operations, resulting in expressions exhibiting different precisions than might be expected from the constituent operations.

Evaluation of Expressions

Implementations **may** rearrange floating-point operations using any of the mathematical properties governing the expressions in precise arithmetic, even where the floating- point operations do not share these properties. This includes, but is not limited to, associativity and distributivity, and **may** involve a different number of rounding steps than would occur if the operations were not rearranged. In shaders that use the `SignedZeroInfNanPreserve Execution Mode` the values **must** be preserved if they are generated after any rearrangement but the `Execution Mode` does not change which rearrangements are valid. This rearrangement **can** be prevented for particular operations by using the `NoContraction` decoration.

For example, in the absence of the `NoContraction` decoration implementations are allowed to implement a + b - a and $\frac{a \times b}{a}$ as b. The `SignedZeroInfNanPreserve` does not prevent these transformations, even though they may overflow to infinity or NaN when evaluated in floating-point.

NOTE

If the `NoContraction` decoration is applied then operations may not be rearranged, so, for example, a + a - a must account for possible overflow to infinity. If infinities are not preserved then the expression may be replaced with a, since the replacement is exact when overflow does not occur and infinities may be replaced with undefined values. If both `NoContraction` and `SignedZeroInfNanPreserve` are used then the result must be infinity for sufficiently large a.

Precision of Individual Operations

The precision of individual operations is defined either in terms of rounding (correctly rounded), as an error bound in ULP, or as inherited from a formula as follows:

Correct Result

Operations that are described as returning the “correct result” will return the infinitely precise result which, due to the nature of the operation, will not need rounding.

Correctly Rounded

Operations described as “correctly rounded” will return the infinitely precise result, x, rounded so as to be representable in floating-point. If the entry point is declared with the `RoundingModeRTE` or the `RoundingModeRTZ Execution Mode` then this is done according to IEEE 754 “roundTiesToEven” or “roundTowardZero” rounding directions, respectively. Otherwise, they are rounded with implementation-defined rounding mode.

Correctly Rounded with Implementation-Defined Rounding Mode

Operations described as “correctly rounded with implementation-defined rounding mode” will return the infinitely precise result, x, rounded so as to be representable in floating-point. If x is exactly representable then x will be returned. Otherwise, either the floating-point value closest to and no less than x or the value closest to and no greater than x will be returned. Which value is chosen is implementation-defined.

ULP

Where an error bound of n ULP (units in the last place) is given, for an operation with infinitely

precise result x the value returned **must** be in the range [x - n × ulp(x), x + n × ulp(x)]. The function ulp(x) is defined as follows:

> If there exist non-equal, finite floating-point numbers a and b such that a ≤ x ≤ b then ulp(x) is the minimum possible distance between such numbers, $ulp(x) = \min_{a,\ b}|b - a|$. If such numbers do not exist then ulp(x) is defined to be the difference between the two non-equal, finite floating-point numbers nearest to x.

Where the range of allowed return values includes any value of magnitude larger than that of the largest representable finite floating-point number, operations **may**, additionally, return either an infinity of the appropriate sign or the finite number with the largest magnitude of the appropriate sign. If the infinitely precise result of the operation is not mathematically defined then the value returned is undefined.

Inherited From ...

Where an operation's precision is described as being inherited from a formula, the result returned **must** be at least as accurate as the result of computing an approximation to x using a formula equivalent to the given formula applied to the supplied inputs. Specifically, the formula given may be transformed using the mathematical associativity, commutativity and distributivity of the operators involved to yield an equivalent formula. The SPIR-V precision rules, when applied to each such formula and the given input values, define a range of permitted values. If NaN is one of the permitted values then the operation may return any result, otherwise let the largest permitted value in any of the ranges be F_{max} and the smallest be F_{min}. The operation **must** return a value in the range [x - E, x + E] where $E = \max(|x - F_{min}|, |x - F_{max}|)$. If the entry point is declared with the `DenormFlushToZero` execution mode, then any intermediate denormal value(s) while evaluating the formula **may** be flushed to zero. Denormal final results **must** be flushed to zero. If the entry point is declared with the `DenormPreserve` `Execution Mode`, then denormals **must** be preserved throughout the formula.

For half- (16 bit) and single- (32 bit) precision instructions, precisions are **required** to be at least as follows:

Table 102. Precision of Core SPIR-V Instructions

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
`OpFNegate`	Correct result.	
`OpFAdd`	Correctly rounded.	
`OpFSub`	Correctly rounded.	
`OpFMul`, `OpVectorTimesScalar`, `OpMatrixTimesScalar`	Correctly rounded.	
`OpMatrixTimesVector`	Inherited from $\sum_{j=0}^{n-1} M_{ij} \times v_j$.	
`OpVectorTimesMatrix`	Inherited from $\sum_{j=0}^{n-1} v_j \times M_{ji}$.	
`OpMatrixTimesMatrix`	Inherited from $\sum_{k=0}^{n-1} M_{ik} \times N_{kj}$.	

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
OpOuterProduct	Correctly rounded.	
OpDot(x, y)	Inherited from $\sum_{i=0}^{n-1} x_i \times y_i$.	
OpIsNan, OpIsInf	Correct result.	
OpFOrdEqual, OpFUnordEqual	Correct result.	
OpFOrdNotEqual, OpFUnordNotEqual	Correct result.	
OpFOrdLessThan, OpFUnordLessThan	Correct result.	
OpFOrdGreaterThan, OpFUnordGreaterThan	Correct result.	
OpFOrdLessThanEqual, OpFUnordLessThanEqual	Correct result.	
OpFOrdGreaterThanEqual, OpFUnordGreaterThanEqual	Correct result.	
OpSubgroupAllEqualKHR	Correct result.	
OpGroupNonUniformAllEqual	Correct result.	
OpFDiv(x,y)	2.5 ULP for $\|y\| = 0$ or $\|y\|$ in the range $[2^{-126}, 2^{126}]$.	2.5 ULP for $\|y\| = 0$ or $\|y\|$ in the range $[2^{-14}, 2^{14}]$.
OpFRem(x,y)	Inherited from x - y × trunc(x/y).	
OpFMod(x,y)	Inherited from x - y × floor(x/y).	
OpQuantizeToF16	Correctly rounded with implementation defined rounding mode.	
conversions between types	Correctly rounded.	

NOTE The OpFRem and OpFMod instructions use cheap approximations of remainder, and the error can be large due to the discontinuity in trunc() and floor(). This can produce mathematically unexpected results in some cases, such as FMod(x,x) computing x rather than 0, and can also cause the result to have a different sign than the infinitely precise result.

Table 103. Precision of GLSL.std.450 Instructions

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
fma()	Inherited from OpFMul followed by OpFAdd.	
exp(x), exp2(x)	$3 + 2 \times \|x\|$ ULP.	$1 + 2 \times \|x\|$ ULP.

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
log(), log2()	3 ULP outside the range $[0.5, 2.0]$. Absolute error $< 2^{-21}$ inside the range $[0.5, 2.0]$.	3 ULP outside the range $[0.5, 2.0]$. Absolute error $< 2^{-7}$ inside the range $[0.5, 2.0]$.
pow(x, y)	Inherited from exp2(y × log2(x)).	
sqrt()	Inherited from 1.0 / inversesqrt().	
inversesqrt()	2 ULP.	
radians(x)	Inherited from $x \times C_{\pi_180}$, where C_{π_180} is a correctly rounded approximation to $\frac{\pi}{180}$.	
degrees(x)	Inherited from $x \times C_{180_\pi}$, where C_{180_π} is a correctly rounded approximation to $\frac{180}{\pi}$.	
sin()	Absolute error $\leq 2^{-11}$ inside the range $[-\pi, \pi]$.	Absolute error $\leq 2^{-7}$ inside the range $[-\pi, \pi]$.
cos()	Absolute error $\leq 2^{-11}$ inside the range $[-\pi, \pi]$.	Absolute error $\leq 2^{-7}$ inside the range $[-\pi, \pi]$.
tan()	Inherited from $\frac{\sin()}{\cos()}$.	
asin(x)	Inherited from $\text{atan2}(x, sqrt(1.0 - x \times x))$.	
acos(x)	Inherited from $\text{atan2}(sqrt(1.0 - x \times x), x)$.	
atan(), atan2()	4096 ULP	5 ULP.
sinh(x)	Inherited from $(\exp(x) - \exp(-x)) \times 0.5$.	
cosh(x)	Inherited from $(\exp(x) + \exp(-x)) \times 0.5$.	
tanh()	Inherited from $\frac{\sinh()}{\cosh()}$.	
asinh(x)	Inherited from $\log(x + sqrt(x \times x + 1.0))$.	
acosh(x)	Inherited from $\log(x + sqrt(x \times x - 1.0))$.	
atanh(x)	Inherited from $\log(\frac{1.0 + x}{1.0 - x}) \times 0.5$.	
frexp()	Correct result.	
ldexp()	Correctly rounded.	
length(x)	Inherited from $sqrt(dot(x, x))$.	
distance(x, y)	Inherited from $length(x - y)$.	
cross()	Inherited from OpFSub(OpFMul, OpFMul).	
normalize(x)	Inherited from $x \times inversesqrt(dot(x, x))$.	
faceforward(N, I, NRef)	Inherited from dot(NRef, I) < 0.0 ? N : -N.	
reflect(x, y)	Inherited from x - 2.0 × dot(y, x) × y.	
refract(I, N, eta)	Inherited from k < 0.0 ? 0.0 : eta × I - (eta × dot(N, I) + sqrt(k)) × N, where k = 1 - eta × eta × (1.0 - dot(N, I) × dot(N, I)).	

Instruction	Single precision, unless decorated with RelaxedPrecision	Half precision
round	Correctly rounded.	
roundEven	Correctly rounded.	
trunc	Correctly rounded.	
fabs	Correct result.	
fsign	Correct result.	
floor	Correctly rounded.	
ceil	Correctly rounded.	
fract	Correctly rounded.	
modf	Correctly rounded.	
fmin	Correct result.	
fmax	Correct result.	
fclamp	Correct result.	
fmix(x, y, a)	Inherited from $x \times (1.0 - a) + y \times a$.	
step	Correctly rounded.	
smoothStep(edge0, edge1, x)	Inherited from $t \times t \times (3.0 - 2.0 \times t)$, where $t = clamp(\frac{x - edge0}{edge1 - edge0}, 0.0, 1.0)$.	
nmin	Correct result.	
nmax	Correct result.	
nclamp	Correct result.	
packHalf2x16	Correctly rounded with implementation defined rounding mode.	

GLSL.std.450 extended instructions specifically defined in terms of the above instructions inherit the above errors. GLSL.std.450 extended instructions not listed above and not defined in terms of the above have undefined precision.

For the OpSRem and OpSMod instructions, if either operand is negative the result is undefined.

NOTE While the OpSRem and OpSMod instructions are supported by the Vulkan environment, they require non-negative values and thus do not enable additional functionality beyond what OpUMod provides.

OpCooperativeMatrixMulAddNV performs its operations in an implementation-dependent order and internal precision.

OpCooperativeMatrixMulAddKHR performs its operations in an implementation-dependent order and internal precision.

Signedness of SPIR-V Image Accesses

SPIR-V associates a signedness with all integer image accesses. This is required in certain parts of the SPIR-V and the Vulkan image access pipeline to ensure defined results. The signedness is determined from a combination of the access instruction's `Image Operands` and the underlying image's `Sampled Type` as follows:

1. If the instruction's `Image Operands` contains the `SignExtend` operand then the access is signed.
2. If the instruction's `Image Operands` contains the `ZeroExtend` operand then the access is unsigned.
3. Otherwise, the image accesses signedness matches that of the `Sampled Type` of the `OpTypeImage` being accessed.

Image Format and Type Matching

When specifying the `Image Format` of an `OpTypeImage`, the converted bit width and type, as shown in the table below, **must** match the `Sampled Type`. The signedness **must** match the signedness of any access to the image.

NOTE

Formatted accesses are always converted from a shader readable type to the resource's format or vice versa via Format Conversion for reads and Texel Output Format Conversion for writes. As such, the bit width and format below do not necessarily match 1:1 with what might be expected for some formats.

For a given `Image Format`, the `Sampled Type` **must** be the type described in the *Type* column of the below table, with its `Literal Width` set to that in the *Bit Width* column. Every access that is made to the image **must** have a signedness equal to that in the *Signedness* column (where applicable).

Image Format	Type-Declaration instructions	Bit Width	Signedness
`Unknown`	Any	Any	Any

The *SPIR-V Type* is defined by an instruction in SPIR-V, declared with the Type-Declaration Instruction, Bit Width, and Signedness from above.

Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types

SPIR-V `Image Dim` values are compatible with VkImageView `viewType` values as defined below:

Table 104. SPIR-V and Vulkan ImageView Dimension Compatibility

SPIR-V Image Dim	Compatible Vulkan ImageView viewTypes
1D	`VK_IMAGE_VIEW_TYPE_1D`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`
2D	`VK_IMAGE_VIEW_TYPE_2D`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY`
3D	`VK_IMAGE_VIEW_TYPE_3D`
Cube	`VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

Compatibility Between SPIR-V Image Formats and Vulkan Formats

SPIR-V `Image Format` values are compatible with VkFormat values as defined below:

Table 105. SPIR-V and Vulkan Image Format Compatibility

SPIR-V Image Format	Compatible Vulkan Format
`Unknown`	Any
`R8`	`VK_FORMAT_R8_UNORM`
`R8Snorm`	`VK_FORMAT_R8_SNORM`

Ray Query Precision and Operation

The values returned by OpRayQueryGetIntersectionTriangleVertexPositionsKHR are transformed by the geometry transform, which is performed at standard floating-point precision, but without a specifically defined order of floating-point operations to perform the matrix multiplication.

Appendix B: Memory Model

NOTE This memory model describes synchronizations provided by all implementations; however, some of the synchronizations defined require extra features to be supported by the implementation. See VkPhysicalDeviceVulkanMemoryModelFeatures.

Agent

Operation is a general term for any task that is executed on the system.

NOTE An operation is by definition something that is executed. Thus if an instruction is skipped due to control flow, it does not constitute an operation.

Each operation is executed by a particular *agent*. Possible agents include each shader invocation, each host thread, and each fixed-function stage of the pipeline.

Memory Location

A *memory location* identifies unique storage for 8 bits of data. Memory operations access a *set of memory locations* consisting of one or more memory locations at a time, e.g. an operation accessing a 32-bit integer in memory would read/write a set of four memory locations. Memory operations that access whole aggregates **may** access any padding bytes between elements or members, but no padding bytes at the end of the aggregate. Two sets of memory locations *overlap* if the intersection of their sets of memory locations is non-empty. A memory operation **must** not affect memory at a memory location not within its set of memory locations.

Memory locations for buffers and images are explicitly allocated in VkDeviceMemory objects, and are implicitly allocated for SPIR-V variables in each shader invocation.

Variables with `Workgroup` storage class that point to a block-decorated type share a set of memory locations.

Allocation

The values stored in newly allocated memory locations are determined by a SPIR-V variable's initializer, if present, or else are undefined. At the time an allocation is created there have been no memory operations to any of its memory locations. The initialization is not considered to be a memory operation.

NOTE For tessellation control shader output variables, a consequence of initialization not being considered a memory operation is that some implementations may need to insert a barrier between the initialization of the output variables and any reads of those variables.

Memory Operation

For an operation A and memory location M:

- A *reads* M if and only if the data stored in M is an input to A.
- A *writes* M if and only if the data output from A is stored to M.
- A *accesses* M if and only if it either reads or writes (or both) M.

NOTE	A write whose value is the same as what was already in those memory locations is still considered to be a write and has all the same effects.

Reference

A *reference* is an object that a particular agent **can** use to access a set of memory locations. On the host, a reference is a host virtual address. On the device, a reference is:

- The descriptor that a variable is bound to, for variables in Image, Uniform, or StorageBuffer storage classes. If the variable is an array (or array of arrays, etc.) then each element of the array **may** be a unique reference.
- The address range for a buffer in `PhysicalStorageBuffer` storage class, where the base of the address range is queried with vkGetBufferDeviceAddressKHR and the length of the range is the size of the buffer.
- A single common reference for all variables with `Workgroup` storage class that point to a block-decorated type.
- The variable itself for non-block-decorated type variables in `Workgroup` storage class.
- The variable itself for variables in other storage classes.

Two memory accesses through distinct references **may** require availability and visibility operations as defined below.

Program-Order

A *dynamic instance* of an instruction is defined in SPIR-V (https://registry.khronos.org/spir-v/specs/unified1/SPIRV.html#DynamicInstance) as a way of referring to a particular execution of a static instruction. Program-order is an ordering on dynamic instances of instructions executed by a single shader invocation:

- (Basic block): If instructions A and B are in the same basic block, and A is listed in the module before B, then the n'th dynamic instance of A is program-ordered before the n'th dynamic instance of B.
- (Branch): The dynamic instance of a branch or switch instruction is program-ordered before the dynamic instance of the OpLabel instruction to which it transfers control.
- (Call entry): The dynamic instance of an `OpFunctionCall` instruction is program-ordered before the dynamic instances of the `OpFunctionParameter` instructions and the body of the called

function.

- (Call exit): The dynamic instance of the instruction following an `OpFunctionCall` instruction is program-ordered after the dynamic instance of the return instruction executed by the called function.
- (Transitive Closure): If dynamic instance A of any instruction is program-ordered before dynamic instance B of any instruction and B is program-ordered before dynamic instance C of any instruction then A is program-ordered before C.
- (Complete definition): No other dynamic instances are program-ordered.

For instructions executed on the host, the source language defines the program-order relation (e.g. as “sequenced-before”).

Shader Call Related

Shader-call-related is an equivalence relation on invocations defined as the symmetric and transitive closure of:

- A is shader-call-related to B if A is created by an shader call instruction executed by B.

Shader Call Order

Shader-call-order is a partial order on dynamic instances of instructions executed by invocations that are shader-call-related:

- (Program order): If dynamic instance A is program-ordered before B, then A is shader-call-ordered before B.
- (Shader call entry): If A is a dynamic instance of an shader call instruction and B is a dynamic instance executed by an invocation that is created by A, then A is shader-call-ordered before B.
- (Shader call exit): If A is a dynamic instance of an shader call instruction, B is the next dynamic instance executed by the same invocation, and C is a dynamic instance executed by an invocation that is created by A, then C is shader-call-ordered before B.
- (Transitive closure): If A is shader-call-ordered-before B and B is shader-call-ordered-before C, then A is shader-call-ordered-before C.
- (Complete definition): No other dynamic instances are shader-call-ordered.

Scope

Atomic and barrier instructions include scopes which identify sets of shader invocations that **must** obey the requested ordering and atomicity rules of the operation, as defined below.

The various scopes are described in detail in the Shaders chapter.

Atomic Operation

An *atomic operation* on the device is any SPIR-V operation whose name begins with `OpAtomic`. An atomic operation on the host is any operation performed with an std::atomic typed object.

Each atomic operation has a memory scope and a semantics. Informally, the scope determines which other agents it is atomic with respect to, and the semantics constrains its ordering against other memory accesses. Device atomic operations have explicit scopes and semantics. Each host atomic operation implicitly uses the `CrossDevice` scope, and uses a memory semantics equivalent to a C++ std::memory_order value of relaxed, acquire, release, acq_rel, or seq_cst.

Two atomic operations A and B are *potentially-mutually-ordered* if and only if all of the following are true:

- They access the same set of memory locations.
- They use the same reference.
- A is in the instance of B's memory scope.
- B is in the instance of A's memory scope.
- A and B are not the same operation (irreflexive).

Two atomic operations A and B are *mutually-ordered* if and only if they are potentially-mutually-ordered and any of the following are true:

- A and B are both device operations.
- A and B are both host operations.

NOTE	If two atomic operations are not mutually-ordered, and if their sets of memory locations overlap, then each **must** be synchronized against the other as if they were non-atomic operations.

Scoped Modification Order

For a given atomic write A, all atomic writes that are mutually-ordered with A occur in an order known as A's *scoped modification order*. A's scoped modification order relates no other operations.

NOTE	Invocations outside the instance of A's memory scope **may** observe the values at A's set of memory locations becoming visible to it in an order that disagrees with the scoped modification order.

NOTE	It is valid to have non-atomic operations or atomics in a different scope instance to the same set of memory locations, as long as they are synchronized against each other as if they were non-atomic (if they are not, it is treated as a data race). That means this definition of A's scoped modification order could include atomic operations that occur much later, after intervening non-atomics. That is a bit non-intuitive, but it helps to keep this definition simple and non-circular.

Memory Semantics

Non-atomic memory operations, by default, **may** be observed by one agent in a different order than they were written by another agent.

Atomics and some synchronization operations include *memory semantics*, which are flags that constrain the order in which other memory accesses (including non-atomic memory accesses and availability and visibility operations) performed by the same agent **can** be observed by other agents, or **can** observe accesses by other agents.

Device instructions that include semantics are `OpAtomic*`, `OpControlBarrier`, `OpMemoryBarrier`, and `OpMemoryNamedBarrier`. Host instructions that include semantics are some std::atomic methods and memory fences.

SPIR-V supports the following memory semantics:

- Relaxed: No constraints on order of other memory accesses.
- Acquire: A memory read with this semantic performs an *acquire operation*. A memory barrier with this semantic is an *acquire barrier*.
- Release: A memory write with this semantic performs a *release operation*. A memory barrier with this semantic is a *release barrier*.
- AcquireRelease: A memory read-modify-write operation with this semantic performs both an acquire operation and a release operation, and inherits the limitations on ordering from both of those operations. A memory barrier with this semantic is both a release and acquire barrier.

NOTE	SPIR-V does not support “consume” semantics on the device.

The memory semantics operand also includes *storage class semantics* which indicate which storage classes are constrained by the synchronization. SPIR-V storage class semantics include:

- UniformMemory
- WorkgroupMemory
- ImageMemory
- OutputMemory

Each SPIR-V memory operation accesses a single storage class. Semantics in synchronization operations can include a combination of storage classes.

The UniformMemory storage class semantic applies to accesses to memory in the PhysicalStorageBuffer, `ShaderRecordBufferKHR`, Uniform and StorageBuffer storage classes. The WorkgroupMemory storage class semantic applies to accesses to memory in the Workgroup storage class. The ImageMemory storage class semantic applies to accesses to memory in the Image storage class. The OutputMemory storage class semantic applies to accesses to memory in the Output storage class.

NOTE	Informally, these constraints limit how memory operations can be reordered, and these limits apply not only to the order of accesses as performed in the agent that

executes the instruction, but also to the order the effects of writes become visible to all other agents within the same instance of the instruction's memory scope.

NOTE Release and acquire operations in different threads **can** act as synchronization operations, to guarantee that writes that happened before the release are visible after the acquire. (This is not a formal definition, just an Informative forward reference.)

NOTE The OutputMemory storage class semantic is only useful in tessellation control shaders, which is the only execution model where output variables are shared between invocations.

The memory semantics operand **can** also include availability and visibility flags, which apply availability and visibility operations as described in availability and visibility. The availability/visibility flags are:

- MakeAvailable: Semantics **must** be Release or AcquireRelease. Performs an availability operation before the release operation or barrier.
- MakeVisible: Semantics **must** be Acquire or AcquireRelease. Performs a visibility operation after the acquire operation or barrier.

The specifics of these operations are defined in Availability and Visibility Semantics.

Host atomic operations **may** support a different list of memory semantics and synchronization operations, depending on the host architecture and source language.

Release Sequence

After an atomic operation A performs a release operation on a set of memory locations M, the *release sequence headed by A* is the longest continuous subsequence of A's scoped modification order that consists of:

- the atomic operation A as its first element
- atomic read-modify-write operations on M by any agent

NOTE The atomics in the last bullet **must** be mutually-ordered with A by virtue of being in A's scoped modification order.

NOTE This intentionally omits "atomic writes to M performed by the same agent that performed A", which is present in the corresponding C++ definition.

Synchronizes-With

Synchronizes-with is a relation between operations, where each operation is either an atomic operation or a memory barrier (aka fence on the host).

If A and B are atomic operations, then A synchronizes-with B if and only if all of the following are true:

- A performs a release operation
- B performs an acquire operation
- A and B are mutually-ordered
- B reads a value written by A or by an operation in the release sequence headed by A

`OpControlBarrier`, `OpMemoryBarrier`, and `OpMemoryNamedBarrier` are *memory barrier* instructions in SPIR-V.

If A is a release barrier and B is an atomic operation that performs an acquire operation, then A synchronizes-with B if and only if all of the following are true:

- there exists an atomic write X (with any memory semantics)
- A is program-ordered before X
- X and B are mutually-ordered
- B reads a value written by X or by an operation in the release sequence headed by X
    - If X is relaxed, it is still considered to head a hypothetical release sequence for this rule
- A and B are in the instance of each other's memory scopes
- X's storage class is in A's semantics.

If A is an atomic operation that performs a release operation and B is an acquire barrier, then A synchronizes-with B if and only if all of the following are true:

- there exists an atomic read X (with any memory semantics)
- X is program-ordered before B
- X and A are mutually-ordered
- X reads a value written by A or by an operation in the release sequence headed by A
- A and B are in the instance of each other's memory scopes
- X's storage class is in B's semantics.

If A is a release barrier and B is an acquire barrier, then A synchronizes-with B if all of the following are true:

- there exists an atomic write X (with any memory semantics)
- A is program-ordered before X
- there exists an atomic read Y (with any memory semantics)
- Y is program-ordered before B
- X and Y are mutually-ordered
- Y reads the value written by X or by an operation in the release sequence headed by X
    - If X is relaxed, it is still considered to head a hypothetical release sequence for this rule

- A and B are in the instance of each other's memory scopes
- X's and Y's storage class is in A's and B's semantics.
    - NOTE: X and Y **must** have the same storage class, because they are mutually ordered.

If A is a release barrier, B is an acquire barrier, and C is a control barrier (where A **can** equal C, and B **can** equal C), then A synchronizes-with B if all of the following are true:

- A is program-ordered before (or equals) C
- C is program-ordered before (or equals) B
- A and B are in the instance of each other's memory scopes
- A and B are in the instance of C's execution scope

> **NOTE** This is similar to the barrier-barrier synchronization above, but with a control barrier filling the role of the relaxed atomics.

Let F be an ordering of fragment shader invocations, such that invocation F_1 is ordered before invocation F_2 if and only if F_1 and F_2 overlap as described in Fragment Shader Interlock and F_1 executes the interlocked code before F_2.

If A is an `OpEndInvocationInterlockEXT` instruction and B is an `OpBeginInvocationInterlockEXT` instruction, then A synchronizes-with B if the agent that executes A is ordered before the agent that executes B in F. A and B are both considered to have `FragmentInterlock` memory scope and semantics of UniformMemory and ImageMemory, and A is considered to have Release semantics and B is considered to have Acquire semantics.

> **NOTE** `OpBeginInvocationInterlockEXT` and `OpBeginInvocationInterlockEXT` do not perform implicit availability or visibility operations. Usually, shaders using fragment shader interlock will declare the relevant resources as `coherent` to get implicit per-instruction availability and visibility operations.

If A is a release barrier and B is an acquire barrier, then A synchronizes-with B if all of the following are true:

- A is shader-call-ordered-before B
- A and B are in the instance of each other's memory scopes

No other release and acquire barriers synchronize-with each other.

System-Synchronizes-With

System-synchronizes-with is a relation between arbitrary operations on the device or host. Certain operations system-synchronize-with each other, which informally means the first operation occurs before the second and that the synchronization is performed without using application-visible memory accesses.

If there is an execution dependency between two operations A and B, then the operation in the first

synchronization scope system-synchronizes-with the operation in the second synchronization scope.

NOTE	This covers all Vulkan synchronization primitives, including device operations executing before a synchronization primitive is signaled, wait operations happening before subsequent device operations, signal operations happening before host operations that wait on them, and host operations happening before vkQueueSubmit. The list is spread throughout the synchronization chapter, and is not repeated here.

System-synchronizes-with implicitly includes all storage class semantics and has `CrossDevice` scope.

If A system-synchronizes-with B, we also say A is *system-synchronized-before* B and B is *system-synchronized-after* A.

Private vs. Non-Private

By default, non-atomic memory operations are treated as *private*, meaning such a memory operation is not intended to be used for communication with other agents. Memory operations with the NonPrivatePointer/NonPrivateTexel bit set are treated as *non-private*, and are intended to be used for communication with other agents.

More precisely, for private memory operations to be Location-Ordered between distinct agents requires using system-synchronizes-with rather than shader-based synchronization. Private memory operations still obey program-order.

Atomic operations are always considered non-private.

Inter-Thread-Happens-Before

Let SC be a non-empty set of storage class semantics. Then (using template syntax) operation A *inter-thread-happens-before*<SC> operation B if and only if any of the following is true:

- A system-synchronizes-with B
- A synchronizes-with B, and both A and B have all of SC in their semantics
- A is an operation on memory in a storage class in SC or that has all of SC in its semantics, B is a release barrier or release atomic with all of SC in its semantics, and A is program-ordered before B
- A is an acquire barrier or acquire atomic with all of SC in its semantics, B is an operation on memory in a storage class in SC or that has all of SC in its semantics, and A is program-ordered before B
- A and B are both host operations and A inter-thread-happens-before B as defined in the host language specification
- A inter-thread-happens-before<SC> some X and X inter-thread-happens-before<SC> B

Happens-Before

Operation A *happens-before* operation B if and only if any of the following is true:

- A is program-ordered before B
- A inter-thread-happens-before<SC> B for some set of storage classes SC

Happens-after is defined similarly.

NOTE	Unlike C++, happens-before is not always sufficient for a write to be visible to a read. Additional availability and visibility operations **may** be required for writes to be visible-to other memory accesses.

NOTE	Happens-before is not transitive, but each of program-order and inter-thread-happens-before<SC> are transitive. These can be thought of as covering the "single-threaded" case and the "multi-threaded" case, and it is not necessary (and not valid) to form chains between the two.

Availability and Visibility

Availability and *visibility* are states of a write operation, which (informally) track how far the write has permeated the system, i.e. which agents and references are able to observe the write. Availability state is per *memory domain*. Visibility state is per (agent,reference) pair. Availability and visibility states are per-memory location for each write.

Memory domains are named according to the agents whose memory accesses use the domain. Domains used by shader invocations are organized hierarchically into multiple smaller memory domains which correspond to the different scopes. Each memory domain is considered the *dual* of a scope, and vice versa. The memory domains defined in Vulkan include:

- *host* - accessible by host agents
- *device* - accessible by all device agents for a particular device
- *shader* - accessible by shader agents for a particular device, corresponding to the `Device` scope
- *queue family instance* - accessible by shader agents in a single queue family, corresponding to the `QueueFamily` scope.
- *fragment interlock instance* - accessible by fragment shader agents that overlap, corresponding to the `FragmentInterlock` scope.
- *shader call instance* - accessible by shader agents that are shader-call-related, corresponding to the `ShaderCallKHR` scope.
- *workgroup instance* - accessible by shader agents in the same workgroup, corresponding to the `Workgroup` scope.
- *subgroup instance* - accessible by shader agents in the same subgroup, corresponding to the `Subgroup` scope.

The memory domains are nested in the order listed above, except for shader call instance domain,

with memory domains later in the list nested in the domains earlier in the list. The shader call instance domain is at an implementation-dependent location in the list, and is nested according to that location. The shader call instance domain is not broader than the queue family instance domain.

NOTE

Memory domains do not correspond to storage classes or device-local and host-local VkDeviceMemory allocations, rather they indicate whether a write can be made visible only to agents in the same subgroup, same workgroup, overlapping fragment shader invocation, shader-call-related ray tracing invocation, in any shader invocation, or anywhere on the device, or host. The shader, queue family instance, fragment interlock instance, shader call instance, workgroup instance, and subgroup instance domains are only used for shader-based availability/visibility operations, in other cases writes can be made available from/visible to the shader via the device domain.

Availability operations, *visibility operations*, and *memory domain operations* alter the state of the write operations that happen-before them, and which are included in their *source scope* to be available or visible to their *destination scope*.

- For an availability operation, the source scope is a set of (agent,reference,memory location) tuples, and the destination scope is a set of memory domains.
- For a memory domain operation, the source scope is a memory domain and the destination scope is a memory domain.
- For a visibility operation, the source scope is a set of memory domains and the destination scope is a set of (agent,reference,memory location) tuples.

How the scopes are determined depends on the specific operation. Availability and memory domain operations expand the set of memory domains to which the write is available. Visibility operations expand the set of (agent,reference,memory location) tuples to which the write is visible.

Recall that availability and visibility states are per-memory location, and let W be a write operation to one or more locations performed by agent A via reference R. Let L be one of the locations written. (W,L) (the write W to L), is initially not available to any memory domain and only visible to (A,R,L). An availability operation AV that happens-after W and that includes (A,R,L) in its source scope makes (W,L) *available* to the memory domains in its destination scope.

A memory domain operation DOM that happens-after AV and for which (W,L) is available in the source scope makes (W,L) available in the destination memory domain.

A visibility operation VIS that happens-after AV (or DOM) and for which (W,L) is available in any domain in the source scope makes (W,L) *visible* to all (agent,reference,L) tuples included in its destination scope.

If write W_2 happens-after W, and their sets of memory locations overlap, then W will not be available/visible to all agents/references for those memory locations that overlap (and future AV/DOM/VIS ops cannot revive W's write to those locations).

Availability, memory domain, and visibility operations are treated like other non-atomic memory

accesses for the purpose of memory semantics, meaning they can be ordered by release-acquire sequences or memory barriers.

An *availability chain* is a sequence of availability operations to increasingly broad memory domains, where element N+1 of the chain is performed in the dual scope instance of the destination memory domain of element N and element N happens-before element N+1. An example is an availability operation with destination scope of the workgroup instance domain that happens-before an availability operation to the shader domain performed by an invocation in the same workgroup. An availability chain AVC that happens-after W and that includes (A,R,L) in the source scope makes (W,L) *available* to the memory domains in its final destination scope. An availability chain with a single element is just the availability operation.

Similarly, a *visibility chain* is a sequence of visibility operations from increasingly narrow memory domains, where element N of the chain is performed in the dual scope instance of the source memory domain of element N+1 and element N happens-before element N+1. An example is a visibility operation with source scope of the shader domain that happens-before a visibility operation with source scope of the workgroup instance domain performed by an invocation in the same workgroup. A visibility chain VISC that happens-after AVC (or DOM) and for which (W,L) is available in any domain in the source scope makes (W,L) *visible* to all (agent,reference,L) tuples included in its final destination scope. A visibility chain with a single element is just the visibility operation.

Availability, Visibility, and Domain Operations

The following operations generate availability, visibility, and domain operations. When multiple availability/visibility/domain operations are described, they are system-synchronized-with each other in the order listed.

An operation that performs a memory dependency generates:

- If the source access mask includes `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from host domain to device domain.
- An availability operation with source scope of all writes in the first access scope of the dependency and a destination scope of the device domain.
- A visibility operation with source scope of the device domain and destination scope of the second access scope of the dependency.
- If the destination access mask includes `VK_ACCESS_HOST_READ_BIT` or `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from device domain to host domain.

vkFlushMappedMemoryRanges performs an availability operation, with a source scope of (agents,references) = (all host threads, all mapped memory ranges passed to the command), and destination scope of the host domain.

vkInvalidateMappedMemoryRanges performs a visibility operation, with a source scope of the host domain and a destination scope of (agents,references) = (all host threads, all mapped memory ranges passed to the command).

vkQueueSubmit performs a memory domain operation from host to device, and a visibility

operation with source scope of the device domain and destination scope of all agents and references on the device.

Availability and Visibility Semantics

A memory barrier or atomic operation via agent A that includes MakeAvailable in its semantics performs an availability operation whose source scope includes agent A and all references in the storage classes in that instruction's storage class semantics, and all memory locations, and whose destination scope is a set of memory domains selected as specified below. The implicit availability operation is program-ordered between the barrier or atomic and all other operations program-ordered before the barrier or atomic.

A memory barrier or atomic operation via agent A that includes MakeVisible in its semantics performs a visibility operation whose source scope is a set of memory domains selected as specified below, and whose destination scope includes agent A and all references in the storage classes in that instruction's storage class semantics, and all memory locations. The implicit visibility operation is program-ordered between the barrier or atomic and all other operations program-ordered after the barrier or atomic.

The memory domains are selected based on the memory scope of the instruction as follows:

- `Device` scope uses the shader domain
- `QueueFamily` scope uses the queue family instance domain
- `FragmentInterlock` scope uses the fragment interlock instance domain
- `ShaderCallKHR` scope uses the shader call instance domain
- `Workgroup` scope uses the workgroup instance domain
- `Subgroup` uses the subgroup instance domain
- `Invocation` perform no availability/visibility operations.

When an availability operation performed by an agent A includes a memory domain D in its destination scope, where D corresponds to scope instance S, it also includes the memory domains that correspond to each smaller scope instance S' that is a subset of S and that includes A. Similarly for visibility operations.

Per-Instruction Availability and Visibility Semantics

A memory write instruction that includes MakePointerAvailable, or an image write instruction that includes MakeTexelAvailable, performs an availability operation whose source scope includes the agent and reference used to perform the write and the memory locations written by the instruction, and whose destination scope is a set of memory domains selected by the Scope operand specified in Availability and Visibility Semantics. The implicit availability operation is program-ordered between the write and all other operations program-ordered after the write.

A memory read instruction that includes MakePointerVisible, or an image read instruction that includes MakeTexelVisible, performs a visibility operation whose source scope is a set of memory domains selected by the Scope operand as specified in Availability and Visibility Semantics, and

whose destination scope includes the agent and reference used to perform the read and the memory locations read by the instruction. The implicit visibility operation is program-ordered between read and all other operations program-ordered before the read.

NOTE Although reads with per-instruction visibility only perform visibility ops from the shader or fragment interlock instance or shader call instance or workgroup instance or subgroup instance domain, they will also see writes that were made visible via the device domain, i.e. those writes previously performed by non-shader agents and made visible via API commands.

NOTE It is expected that all invocations in a subgroup execute on the same processor with the same path to memory, and thus availability and visibility operations with subgroup scope can be expected to be “free”.

Location-Ordered

Let X and Y be memory accesses to overlapping sets of memory locations M, where X != Y. Let (A_X,R_X) be the agent and reference used for X, and (A_Y,R_Y) be the agent and reference used for Y. For now, let “→” denote happens-before and “$\rightarrow^{rcpo}$” denote the reflexive closure of program-ordered before.

If D_1 and D_2 are different memory domains, then let DOM(D_1,D_2) be a memory domain operation from D_1 to D_2. Otherwise, let DOM(D,D) be a placeholder such that X→DOM(D,D)→Y if and only if X→Y.

X is *location-ordered* before Y for a location L in M if and only if any of the following is true:

- A_X == A_Y and R_X == R_Y and X→Y
  - NOTE: this case means no availability/visibility ops are required when it is the same (agent,reference).
- X is a read, both X and Y are non-private, and X→Y
- X is a read, and X (transitively) system-synchronizes with Y
- If R_X == R_Y and A_X and A_Y access a common memory domain D (e.g. are in the same workgroup instance if D is the workgroup instance domain), and both X and Y are non-private:
  - X is a write, Y is a write, AVC(A_X,R_X,D,L) is an availability chain making (X,L) available to domain D, and X→^{rcpo}AVC(A_X,R_X,D,L)→Y
  - X is a write, Y is a read, AVC(A_X,R_X,D,L) is an availability chain making (X,L) available to domain D, VISC(A_Y,R_Y,D,L) is a visibility chain making writes to L available in domain D visible to Y, and X→^{rcpo}AVC(A_X,R_X,D,L)→VISC(A_Y,R_Y,D,L)→^{rcpo}Y
  - If VkPhysicalDeviceVulkanMemoryModelFeatures::`vulkanMemoryModelAvailabilityVisibilityChains` is `VK_FALSE`, then AVC and VISC **must** each only have a single element in the chain, in each sub-bullet above.
- Let D_X and D_Y each be either the device domain or the host domain, depending on whether A_X and A_Y execute on the device or host:
  - X is a write and Y is a write, and X→AV(A_X,R_X,D_X,L)→DOM(D_X,D_Y)→Y

- X is a write and Y is a read, and $X \rightarrow AV(A_X,R_X,D_X,L) \rightarrow DOM(D_X,D_Y) \rightarrow VIS(A_Y,R_Y,D_Y,L) \rightarrow Y$

NOTE	The final bullet (synchronization through device/host domain) requires API-level synchronization operations, since the device/host domains are not accessible via shader instructions. And “device domain” is not to be confused with “device scope”, which synchronizes through the “shader domain”.

Data Race

Let X and Y be operations that access overlapping sets of memory locations M, where X != Y, and at least one of X and Y is a write, and X and Y are not mutually-ordered atomic operations. If there does not exist a location-ordered relation between X and Y for each location in M, then there is a *data race*.

Applications **must** ensure that no data races occur during the execution of their application.

NOTE	Data races can only occur due to instructions that are actually executed. For example, an instruction skipped due to control flow must not contribute to a data race.

Visible-To

Let X be a write and Y be a read whose sets of memory locations overlap, and let M be the set of memory locations that overlap. Let M_2 be a non-empty subset of M. Then X is *visible-to* Y for memory locations M_2 if and only if all of the following are true:

- X is location-ordered before Y for each location L in M_2.
- There does not exist another write Z to any location L in M_2 such that X is location-ordered before Z for location L and Z is location-ordered before Y for location L.

If X is visible-to Y, then Y reads the value written by X for locations M_2.

NOTE	It is possible for there to be a write between X and Y that overwrites a subset of the memory locations, but the remaining memory locations (M_2) will still be visible-to Y.

Acyclicity

Reads-from is a relation between operations, where the first operation is a write, the second operation is a read, and the second operation reads the value written by the first operation. *From-reads* is a relation between operations, where the first operation is a read, the second operation is a write, and the first operation reads a value written earlier than the second operation in the second operation’s scoped modification order or location order (or the first operation reads from the initial value, and the second operation is any write to the same locations).

Then the implementation **must** guarantee that no cycles exist in the union of the following relations:

- location-ordered
- scoped modification order (over all atomic writes)
- reads-from
- from-reads

NOTE	This is a “consistency” axiom, which informally guarantees that sequences of operations cannot violate causality.

Scoped Modification Order Coherence

Let A and B be mutually-ordered atomic operations, where A is location-ordered before B. Then the following rules are a consequence of acyclicity:

- If A and B are both reads and A does not read the initial value, then the write that A takes its value from **must** be earlier in its own scoped modification order than (or the same as) the write that B takes its value from (no cycles between location-order, reads-from, and from-reads).
- If A is a read and B is a write and A does not read the initial value, then A **must** take its value from a write earlier than B in B’s scoped modification order (no cycles between location-order, scope modification order, and reads-from).
- If A is a write and B is a read, then B **must** take its value from A or a write later than A in A’s scoped modification order (no cycles between location-order, scoped modification order, and from-reads).
- If A and B are both writes, then A **must** be earlier than B in A’s scoped modification order (no cycles between location-order and scoped modification order).
- If A is a write and B is a read-modify-write and B reads the value written by A, then B comes immediately after A in A’s scoped modification order (no cycles between scoped modification order and from-reads).

Shader I/O

If a shader invocation A in a shader stage other than `Vertex` performs a memory read operation X from an object in storage class `CallableDataKHR`, `IncomingCallableDataKHR`, `RayPayloadKHR`, `HitAttributeKHR`, `IncomingRayPayloadKHR`, or `Input`, then X is system-synchronized-after all writes to the corresponding `CallableDataKHR`, `IncomingCallableDataKHR`, `RayPayloadKHR`, `HitAttributeKHR`, `IncomingRayPayloadKHR`, or `Output` storage variable(s) in the shader invocation(s) that contribute to generating invocation A, and those writes are all visible-to X.

NOTE	It is not necessary for the upstream shader invocations to have completed execution, they only need to have generated the output that is being read.

Deallocation

A call to vkFreeMemory **must** happen-after all memory operations on all memory locations in that VkDeviceMemory object.

NOTE	Normally, device memory operations in a given queue are synchronized with vkFreeMemory by having a host thread wait on a fence signaled by that queue, and the wait happens-before the call to vkFreeMemory on the host.

The deallocation of SPIR-V variables is managed by the system and happens-after all operations on those variables.

Descriptions (Informative)

This subsection offers more easily understandable consequences of the memory model for app/compiler developers.

Let SC be the storage class(es) specified by a release or acquire operation or barrier.

- An atomic write with release semantics must not be reordered against any read or write to SC that is program-ordered before it (regardless of the storage class the atomic is in).
- An atomic read with acquire semantics must not be reordered against any read or write to SC that is program-ordered after it (regardless of the storage class the atomic is in).
- Any write to SC program-ordered after a release barrier must not be reordered against any read or write to SC program-ordered before that barrier.
- Any read from SC program-ordered before an acquire barrier must not be reordered against any read or write to SC program-ordered after the barrier.

A control barrier (even if it has no memory semantics) must not be reordered against any memory barriers.

This memory model allows memory accesses with and without availability and visibility operations, as well as atomic operations, all to be performed on the same memory location. This is critical to allow it to reason about memory that is reused in multiple ways, e.g. across the lifetime of different shader invocations or draw calls. While GLSL (and legacy SPIR-V) applies the “coherent” decoration to variables (for historical reasons), this model treats each memory access instruction as having optional implicit availability/visibility operations. GLSL to SPIR-V compilers should map all (non-atomic) operations on a coherent variable to Make{Pointer,Texel}{Available}{Visible} flags in this model.

Atomic operations implicitly have availability/visibility operations, and the scope of those operations is taken from the atomic operation’s scope.

Tessellation Output Ordering

For SPIR-V that uses the Vulkan Memory Model, the `OutputMemory` storage class is used to synchronize accesses to tessellation control output variables. For legacy SPIR-V that does not enable the Vulkan Memory Model via `OpMemoryModel`, tessellation outputs can be ordered using a control barrier with no particular memory scope or semantics, as defined below.

Let X and Y be memory operations performed by shader invocations A_X and A_Y. Operation X is *tessellation-output-ordered* before operation Y if and only if all of the following are true:

- There is a dynamic instance of an `OpControlBarrier` instruction C such that X is program-ordered before C in A_X and C is program-ordered before Y in A_Y.
- A_X and A_Y are in the same instance of C's execution scope.

If shader invocations A_X and A_Y in the `TessellationControl` execution model execute memory operations X and Y, respectively, on the `Output` storage class, and X is tessellation-output-ordered before Y with a scope of `Workgroup`, then X is location-ordered before Y, and if X is a write and Y is a read then X is visible-to Y.

Cooperative Matrix Memory Access

For each dynamic instance of a cooperative matrix load instruction (`OpCooperativeMatrixLoadKHR` , `OpCooperativeMatrixLoadNV` , `OpCooperativeMatrixLoadTensorNV`), some implementation-dependent invocation(s) within the instance of the matrix's scope perform a non-atomic load from each memory location that is defined to be accessed by the instruction.

For each memory location accessed by a dynamic instance of a cooperative matrix store instruction (`OpCooperativeMatrixStoreKHR` , `OpCooperativeMatrixStoreNV` , `OpCooperativeMatrixStoreTensorNV`), a single implementation-dependent invocation within the instance of the matrix's scope performs a non-atomic store to that memory location.

Appendix C: Compressed Image Formats

The compressed texture formats used by Vulkan are described in the specifically identified sections of the Khronos Data Format Specification, version 1.3.

Unless otherwise described, the quantities encoded in these compressed formats are treated as normalized, unsigned values.

Those formats listed as sRGB-encoded have in-memory representations of R, G and B components which are nonlinearly-encoded as R', G', and B'; any alpha component is unchanged. As part of filtering, the nonlinear R', G', and B' values are converted to linear R, G, and B components; any alpha component is unchanged. The conversion between linear and nonlinear encoding is performed as described in the “KHR_DF_TRANSFER_SRGB” section of the Khronos Data Format Specification.

Block-Compressed Image Formats

BC1, BC2 and BC3 formats are described in “S3TC Compressed Texture Image Formats” chapter of the Khronos Data Format Specification. BC4 and BC5 are described in the “RGTC Compressed Texture Image Formats” chapter. BC6H and BC7 are described in the “BPTC Compressed Texture Image Formats” chapter.

Table 106. Mapping of Vulkan BC Formats to Descriptions

VkFormat	Khronos Data Format Specification **description**
Formats described in the “S3TC Compressed Texture Image Formats” chapter	
VK_FORMAT_BC1_RGB_UNORM_BLOCK	BC1 with no alpha
VK_FORMAT_BC1_RGB_SRGB_BLOCK	BC1 with no alpha, sRGB-encoded
VK_FORMAT_BC1_RGBA_UNORM_BLOCK	BC1 with alpha
VK_FORMAT_BC1_RGBA_SRGB_BLOCK	BC1 with alpha, sRGB-encoded
VK_FORMAT_BC2_UNORM_BLOCK	BC2
VK_FORMAT_BC2_SRGB_BLOCK	BC2, sRGB-encoded
VK_FORMAT_BC3_UNORM_BLOCK	BC3
VK_FORMAT_BC3_SRGB_BLOCK	BC3, sRGB-encoded
Formats described in the “RGTC Compressed Texture Image Formats” chapter	
VK_FORMAT_BC4_UNORM_BLOCK	BC4 unsigned
VK_FORMAT_BC4_SNORM_BLOCK	BC4 signed
VK_FORMAT_BC5_UNORM_BLOCK	BC5 unsigned
VK_FORMAT_BC5_SNORM_BLOCK	BC5 signed
Formats described in the “BPTC Compressed Texture Image Formats” chapter	
VK_FORMAT_BC6H_UFLOAT_BLOCK	BC6H (unsigned version)
VK_FORMAT_BC6H_SFLOAT_BLOCK	BC6H (signed version)
VK_FORMAT_BC7_UNORM_BLOCK	BC7
VK_FORMAT_BC7_SRGB_BLOCK	BC7, sRGB-encoded

ETC Compressed Image Formats

The following formats are described in the “ETC2 Compressed Texture Image Formats” chapter of the Khronos Data Format Specification.

Table 107. Mapping of Vulkan ETC Formats to Descriptions

VkFormat	Khronos Data Format Specification description
VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK	RGB ETC2
VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK	RGB ETC2 with sRGB encoding
VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK	RGB ETC2 with punch-through alpha
VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK	RGB ETC2 with punch-through alpha and sRGB
VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK	RGBA ETC2
VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK	RGBA ETC2 with sRGB encoding
VK_FORMAT_EAC_R11_UNORM_BLOCK	Unsigned R11 EAC
VK_FORMAT_EAC_R11_SNORM_BLOCK	Signed R11 EAC
VK_FORMAT_EAC_R11G11_UNORM_BLOCK	Unsigned RG11 EAC
VK_FORMAT_EAC_R11G11_SNORM_BLOCK	Signed RG11 EAC

ASTC Compressed Image Formats

ASTC formats are described in the “ASTC Compressed Texture Image Formats” chapter of the Khronos Data Format Specification.

Table 108. Mapping of Vulkan ASTC Formats to Descriptions

VkFormat	Compressed texel block dimensions	Requested mode
VK_FORMAT_ASTC_4x4_UNORM_BLOCK	4 × 4	Linear LDR
VK_FORMAT_ASTC_4x4_SRGB_BLOCK	4 × 4	sRGB
VK_FORMAT_ASTC_5x4_UNORM_BLOCK	5 × 4	Linear LDR
VK_FORMAT_ASTC_5x4_SRGB_BLOCK	5 × 4	sRGB
VK_FORMAT_ASTC_5x5_UNORM_BLOCK	5 × 5	Linear LDR
VK_FORMAT_ASTC_5x5_SRGB_BLOCK	5 × 5	sRGB
VK_FORMAT_ASTC_6x5_UNORM_BLOCK	6 × 5	Linear LDR
VK_FORMAT_ASTC_6x5_SRGB_BLOCK	6 × 5	sRGB
VK_FORMAT_ASTC_6x6_UNORM_BLOCK	6 × 6	Linear LDR
VK_FORMAT_ASTC_6x6_SRGB_BLOCK	6 × 6	sRGB
VK_FORMAT_ASTC_8x5_UNORM_BLOCK	8 × 5	Linear LDR
VK_FORMAT_ASTC_8x5_SRGB_BLOCK	8 × 5	sRGB
VK_FORMAT_ASTC_8x6_UNORM_BLOCK	8 × 6	Linear LDR
VK_FORMAT_ASTC_8x6_SRGB_BLOCK	8 × 6	sRGB
VK_FORMAT_ASTC_8x8_UNORM_BLOCK	8 × 8	Linear LDR
VK_FORMAT_ASTC_8x8_SRGB_BLOCK	8 × 8	sRGB
VK_FORMAT_ASTC_10x5_UNORM_BLOCK	10 × 5	Linear LDR
VK_FORMAT_ASTC_10x5_SRGB_BLOCK	10 × 5	sRGB
VK_FORMAT_ASTC_10x6_UNORM_BLOCK	10 × 6	Linear LDR
VK_FORMAT_ASTC_10x6_SRGB_BLOCK	10 × 6	sRGB
VK_FORMAT_ASTC_10x8_UNORM_BLOCK	10 × 8	Linear LDR
VK_FORMAT_ASTC_10x8_SRGB_BLOCK	10 × 8	sRGB
VK_FORMAT_ASTC_10x10_UNORM_BLOCK	10 × 10	Linear LDR
VK_FORMAT_ASTC_10x10_SRGB_BLOCK	10 × 10	sRGB
VK_FORMAT_ASTC_12x10_UNORM_BLOCK	12 × 10	Linear LDR
VK_FORMAT_ASTC_12x10_SRGB_BLOCK	12 × 10	sRGB
VK_FORMAT_ASTC_12x12_UNORM_BLOCK	12 × 12	Linear LDR

VkFormat	Compressed texel block dimensions	Requested mode
VK_FORMAT_ASTC_12x12_SRGB_BLOCK	12 × 12	sRGB
VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK	4 × 4	HDR
VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK	5 × 4	HDR
VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK	5 × 5	HDR
VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK	6 × 5	HDR
VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK	6 × 6	HDR
VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK	8 × 5	HDR
VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK	8 × 6	HDR
VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK	8 × 8	HDR
VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK	10 × 5	HDR
VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK	10 × 6	HDR
VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK	10 × 8	HDR
VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK	10 × 10	HDR
VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK	12 × 10	HDR
VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK	12 × 12	HDR

ASTC textures containing HDR block encodings **should** be passed to the API using an ASTC SFLOAT texture format.

NOTE An HDR block in a texture passed using a LDR UNORM format will return the appropriate ASTC error color if the implementation supports only the ASTC LDR profile, but may result in either the error color or a decompressed HDR color if the implementation supports HDR decoding.

ASTC Decode Mode

If the VK_EXT_astc_decode_mode extension is enabled, the decode mode is determined as follows:

Table 109. Mapping of Vulkan ASTC Decoding Format to ASTC Decoding Modes

VkFormat	Decoding mode
VK_FORMAT_R16G16B16A16_SFLOAT	decode_float16
VK_FORMAT_R8G8B8A8_UNORM	decode_unorm8
VK_FORMAT_E5B9G9R9_UFLOAT_PACK32	decode_rgb9e5

Otherwise, the ASTC decode mode is decode_float16.

Note that an implementation **may** use HDR mode when linear LDR mode is requested unless the decode mode is decode_unorm8.

PVRTC Compressed Image Formats

PVRTC formats are described in the “PVRTC Compressed Texture Image Formats” chapter of the Khronos Data Format Specification.

Table 110. Mapping of Vulkan PVRTC Formats to Descriptions

VkFormat	Compressed texel block dimensions	sRGB-encoded
VK_FORMAT_PVRTC1_2BPP_UNORM_BLOCK_IMG	8 × 4	No
VK_FORMAT_PVRTC1_4BPP_UNORM_BLOCK_IMG	4 × 4	No
VK_FORMAT_PVRTC2_2BPP_UNORM_BLOCK_IMG	8 × 4	No
VK_FORMAT_PVRTC2_4BPP_UNORM_BLOCK_IMG	4 × 4	No
VK_FORMAT_PVRTC1_2BPP_SRGB_BLOCK_IMG	8 × 4	Yes
VK_FORMAT_PVRTC1_4BPP_SRGB_BLOCK_IMG	4 × 4	Yes
VK_FORMAT_PVRTC2_2BPP_SRGB_BLOCK_IMG	8 × 4	Yes
VK_FORMAT_PVRTC2_4BPP_SRGB_BLOCK_IMG	4 × 4	Yes

Appendix D: Core Revisions (Informative)

New minor versions of the Vulkan API are defined periodically by the Khronos Vulkan Working Group. These consist of some amount of additional functionality added to the core API, potentially including both new functionality and functionality promoted from extensions.

It is possible to build the specification for earlier versions, but to aid readability of the latest versions, this appendix gives an overview of the changes as compared to earlier versions.

Vulkan Version 1.1

Vulkan Version 1.1 promoted a number of key extensions into the core API:

- VK_KHR_16bit_storage
- VK_KHR_bind_memory2
- VK_KHR_dedicated_allocation
- VK_KHR_descriptor_update_template
- VK_KHR_device_group
- VK_KHR_device_group_creation
- VK_KHR_external_fence
- VK_KHR_external_fence_capabilities
- VK_KHR_external_memory
- VK_KHR_external_memory_capabilities
- VK_KHR_external_semaphore
- VK_KHR_external_semaphore_capabilities
- VK_KHR_get_memory_requirements2
- VK_KHR_get_physical_device_properties2
- VK_KHR_maintenance1
- VK_KHR_maintenance2
- VK_KHR_maintenance3
- VK_KHR_multiview
- VK_KHR_relaxed_block_layout
- VK_KHR_sampler_ycbcr_conversion

- VK_KHR_shader_draw_parameters
- VK_KHR_storage_buffer_storage_class
- VK_KHR_variable_pointers

All differences in behavior between these extensions and the corresponding Vulkan 1.1 functionality are summarized below.

Differences Relative to VK_KHR_16bit_storage

If the VK_KHR_16bit_storage extension is not supported, support for the storageBuffer16BitAccess feature is optional. Support for this feature is defined by VkPhysicalDevice16BitStorageFeatures::storageBuffer16BitAccess when queried via vkGetPhysicalDeviceFeatures2.

Differences Relative to VK_KHR_sampler_ycbcr_conversion

If the VK_KHR_sampler_ycbcr_conversion extension is not supported, support for the samplerYcbcrConversion feature is optional. Support for this feature is defined by VkPhysicalDeviceSamplerYcbcrConversionFeatures::samplerYcbcrConversion when queried via vkGetPhysicalDeviceFeatures2.

Differences Relative to VK_KHR_shader_draw_parameters

If the VK_KHR_shader_draw_parameters extension is not supported, support for the SPV_KHR_shader_draw_parameters SPIR-V extension is optional. Support for this feature is defined by VkPhysicalDeviceShaderDrawParametersFeatures::shaderDrawParameters when queried via vkGetPhysicalDeviceFeatures2.

Differences Relative to VK_KHR_variable_pointers

If the VK_KHR_variable_pointers extension is not supported, support for the variablePointersStorageBuffer feature is optional. Support for this feature is defined by VkPhysicalDeviceVariablePointersFeatures::variablePointersStorageBuffer when queried via vkGetPhysicalDeviceFeatures2.

Additional Vulkan 1.1 Feature Support

In addition to the promoted extensions described above, Vulkan 1.1 added support for:

- The group operations and subgroup scope.
- The protected memory feature.
- A new command to enumerate the instance version: vkEnumerateInstanceVersion.
- The VkPhysicalDeviceShaderDrawParametersFeatures feature query struct (where the VK_KHR_shader_draw_parameters extension did not have one).

New Macros

- VK_API_VERSION_1_1

New Object Types

- VkDescriptorUpdateTemplate

- VkSamplerYcbcrConversion

New Commands

- vkBindBufferMemory2
- vkBindImageMemory2
- vkCmdDispatchBase
- vkCmdSetDeviceMask
- vkCreateDescriptorUpdateTemplate
- vkCreateSamplerYcbcrConversion
- vkDestroyDescriptorUpdateTemplate
- vkDestroySamplerYcbcrConversion
- vkEnumerateInstanceVersion
- vkEnumeratePhysicalDeviceGroups
- vkGetBufferMemoryRequirements2
- vkGetDescriptorSetLayoutSupport
- vkGetDeviceGroupPeerMemoryFeatures
- vkGetDeviceQueue2
- vkGetImageMemoryRequirements2
- vkGetImageSparseMemoryRequirements2
- vkGetPhysicalDeviceExternalBufferProperties
- vkGetPhysicalDeviceExternalFenceProperties
- vkGetPhysicalDeviceExternalSemaphoreProperties
- vkGetPhysicalDeviceFeatures2
- vkGetPhysicalDeviceFormatProperties2
- vkGetPhysicalDeviceImageFormatProperties2
- vkGetPhysicalDeviceMemoryProperties2
- vkGetPhysicalDeviceProperties2
- vkGetPhysicalDeviceQueueFamilyProperties2
- vkGetPhysicalDeviceSparseImageFormatProperties2
- vkTrimCommandPool
- vkUpdateDescriptorSetWithTemplate

New Structures

- VkBindBufferMemoryInfo
- VkBindImageMemoryInfo

- VkBufferMemoryRequirementsInfo2
- VkDescriptorSetLayoutSupport

Vulkan Version 1.0

Vulkan Version 1.0 was the initial release of the Vulkan API.

New Macros

- VK_API_VERSION
- VK_API_VERSION_1_0
- VK_API_VERSION_MAJOR
- VK_API_VERSION_MINOR
- VK_API_VERSION_PATCH
- VK_API_VERSION_VARIANT
- VK_DEFINE_HANDLE
- VK_DEFINE_NON_DISPATCHABLE_HANDLE
- VK_HEADER_VERSION
- VK_HEADER_VERSION_COMPLETE
- VK_MAKE_API_VERSION
- VK_MAKE_VERSION
- VK_NULL_HANDLE
- VK_USE_64_BIT_PTR_DEFINES
- VK_VERSION_MAJOR
- VK_VERSION_MINOR
- VK_VERSION_PATCH

New Base Types

- VkBool32
- VkDeviceAddress
- VkDeviceSize
- VkFlags
- VkSampleMask

New Object Types

- VkBuffer
- VkBufferView
- VkCommandBuffer
- VkCommandPool
- VkDescriptorPool
- VkDescriptorSet
- VkDescriptorSetLayout
- VkDevice
- VkDeviceMemory
- VkEvent
- VkFence
- VkFramebuffer
- VkImage
- VkImageView
- VkInstance
- VkPhysicalDevice
- VkPipeline
- VkPipelineCache
- VkPipelineLayout
- VkQueryPool
- VkQueue
- VkRenderPass
- VkSampler
- VkSemaphore
- VkShaderModule

New Commands

- vkAllocateCommandBuffers
- vkAllocateDescriptorSets
- vkAllocateMemory
- vkBeginCommandBuffer
- vkBindBufferMemory
- vkBindImageMemory

- vkCmdBeginQuery
- vkCmdBeginRenderPass
- vkCmdBindDescriptorSets
- vkCmdBindIndexBuffer
- vkCmdBindPipeline
- vkCmdBindVertexBuffers
- vkCmdBlitImage
- vkCmdClearAttachments
- vkCmdClearColorImage
- vkCmdClearDepthStencilImage
- vkCmdCopyBuffer
- vkCmdCopyBufferToImage
- vkCmdCopyImage
- vkCmdCopyImageToBuffer
- vkCmdCopyQueryPoolResults
- vkCmdDispatch
- vkCmdDispatchIndirect
- vkCmdDraw
- vkCmdDrawIndexed
- vkCmdDrawIndexedIndirect
- vkCmdDrawIndirect
- vkCmdEndQuery
- vkCmdEndRenderPass
- vkCmdExecuteCommands
- vkCmdFillBuffer

Appendix E: Layers & Extensions (Informative)

Extensions to the Vulkan API **can** be defined by authors, groups of authors, and the Khronos Vulkan Working Group. In order not to compromise the readability of the Vulkan Specification, the core Specification does not incorporate most extensions. The online Registry of extensions is available at URL

https://registry.khronos.org/vulkan/

and allows generating versions of the Specification incorporating different extensions.

Authors creating extensions and layers **must** follow the mandatory procedures described in the Vulkan Documentation and Extensions document when creating extensions and layers.

The remainder of this appendix documents a set of extensions chosen when this document was built. Versions of the Specification published in the Registry include:

- Core API + mandatory extensions required of all Vulkan implementations.
- Core API + all registered and published Khronos (`KHR`) extensions.
- Core API + all registered and published extensions.

Extensions are grouped as Khronos `KHR`, multivendor `EXT`, and then alphabetically by author ID. Within each group, extensions are listed in alphabetical order by their name.

Extension Dependencies

Extensions which have dependencies on specific core versions or on other extensions will list such dependencies.

For core versions, the specified version **must** be supported at runtime. All extensions implicitly require support for Vulkan 1.0.

For a device extension, use of any device-level functionality defined by that extension requires that any extensions that extension depends on be enabled.

For any extension, use of any instance-level functionality defined by that extension requires only that any extensions that extension depends on be supported at runtime.

Extension Interactions

Some extensions define APIs which are only supported when other extensions or core versions are supported at runtime. Such interactions are noted as “API Interactions”.

List of Current Extensions

- VK_KHR_8bit_storage (promoted to core)
- VK_KHR_acceleration_structure
- VK_KHR_android_surface
- VK_KHR_buffer_device_address (promoted to core)
- VK_KHR_calibrated_timestamps
- VK_KHR_compute_shader_derivatives
- VK_KHR_cooperative_matrix
- VK_KHR_copy_commands2 (promoted to core)
- VK_KHR_create_renderpass2 (promoted to core)
- VK_KHR_deferred_host_operations
- VK_KHR_depth_stencil_resolve (promoted to core)
- VK_KHR_display
- VK_KHR_display_swapchain
- VK_KHR_draw_indirect_count (promoted to core)
- VK_KHR_driver_properties (promoted to core)
- VK_KHR_dynamic_rendering (promoted to core)
- VK_KHR_dynamic_rendering_local_read
- VK_KHR_external_fence_fd
- VK_KHR_external_fence_win32
- VK_KHR_external_memory_fd
- VK_KHR_external_memory_win32
- VK_KHR_external_semaphore_fd
- VK_KHR_external_semaphore_win32
- VK_KHR_format_feature_flags2 (promoted to core)
- VK_KHR_fragment_shader_barycentric
- VK_KHR_fragment_shading_rate
- VK_KHR_get_display_properties2
- VK_KHR_get_surface_capabilities2
- VK_KHR_global_priority
- VK_KHR_image_format_list (promoted to core)
- VK_KHR_imageless_framebuffer (promoted to core)
- VK_KHR_incremental_present
- VK_KHR_index_type_uint8

- VK_KHR_line_rasterization
- VK_KHR_load_store_op_none
- VK_KHR_maintenance4 (promoted to core)
- VK_KHR_maintenance5
- VK_KHR_maintenance6
- VK_KHR_maintenance7
- VK_KHR_map_memory2
- VK_KHR_performance_query
- VK_KHR_pipeline_binary
- VK_KHR_pipeline_executable_properties
- VK_KHR_pipeline_library
- VK_KHR_portability_enumeration
- VK_KHR_present_id
- VK_KHR_present_wait
- VK_KHR_push_descriptor
- VK_KHR_ray_query
- VK_KHR_ray_tracing_maintenance1
- VK_KHR_ray_tracing_pipeline
- VK_KHR_ray_tracing_position_fetch
- VK_KHR_sampler_mirror_clamp_to_edge (promoted to core)
- VK_KHR_separate_depth_stencil_layouts (promoted to core)

Interactions and External Dependencies

- This extension provides API support for `GL_EXT_shader_16bit_storage`

IP Status

No known IP claims.

Contributors

- Alexander Galazin, Arm

Description

The `VK_KHR_8bit_storage` extension allows use of 8-bit types in uniform and storage buffers, and

push constant blocks. This extension introduces several new optional features which map to SPIR-V capabilities and allow access to 8-bit data in `Block`-decorated objects in the `Uniform` and the `StorageBuffer` storage classes, and objects in the `PushConstant` storage class.

The `StorageBuffer8BitAccess` capability **must** be supported by all implementations of this extension. The other capabilities are optional.

Promotion to Vulkan 1.2

Vulkan APIs in this extension are included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `StorageBuffer8BitAccess` capability is optional. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevice8BitStorageFeaturesKHR

New Enum Constants

- `VK_KHR_8BIT_STORAGE_EXTENSION_NAME`
- `VK_KHR_8BIT_STORAGE_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_8BIT_STORAGE_FEATURES_KHR`

New SPIR-V Capabilities

- `StorageBuffer8BitAccess`
- `UniformAndStorageBuffer8BitAccess`
- `StoragePushConstant8`

Version History

- Revision 1, 2018-02-05 (Alexander Galazin)
  - Initial draft

Description

In order to be efficient, rendering techniques such as ray tracing need a quick way to identify which primitives may be intersected by a ray traversing the geometries. Acceleration structures are the most common way to represent the geometry spatially sorted, in order to quickly identify such potential intersections.

This extension adds new functionalities:

- Acceleration structure objects and build commands
- Structures to describe geometry inputs to acceleration structure builds
- Acceleration structure copy commands

New Object Types

- VkAccelerationStructureKHR

New Commands

- vkBuildAccelerationStructuresKHR
- vkCmdBuildAccelerationStructuresIndirectKHR
- vkCmdBuildAccelerationStructuresKHR
- vkCmdCopyAccelerationStructureKHR
- vkCmdCopyAccelerationStructureToMemoryKHR
- vkCmdCopyMemoryToAccelerationStructureKHR
- vkCmdWriteAccelerationStructuresPropertiesKHR
- vkCopyAccelerationStructureKHR
- vkCopyAccelerationStructureToMemoryKHR
- vkCopyMemoryToAccelerationStructureKHR
- vkCreateAccelerationStructureKHR
- vkDestroyAccelerationStructureKHR
- vkGetAccelerationStructureBuildSizesKHR
- vkGetAccelerationStructureDeviceAddressKHR
- vkGetDeviceAccelerationStructureCompatibilityKHR
- vkWriteAccelerationStructuresPropertiesKHR

New Structures

- VkAabbPositionsKHR
- VkAccelerationStructureBuildGeometryInfoKHR
- VkAccelerationStructureBuildRangeInfoKHR
- VkAccelerationStructureBuildSizesInfoKHR

- VkAccelerationStructureCreateInfoKHR
- VkAccelerationStructureDeviceAddressInfoKHR
- VkAccelerationStructureGeometryAabbsDataKHR
- VkAccelerationStructureGeometryInstancesDataKHR
- VkAccelerationStructureGeometryKHR
- VkAccelerationStructureGeometryTrianglesDataKHR
- VkAccelerationStructureInstanceKHR
- VkAccelerationStructureVersionInfoKHR
- VkCopyAccelerationStructureInfoKHR
- VkCopyAccelerationStructureToMemoryInfoKHR
- VkCopyMemoryToAccelerationStructureInfoKHR
- VkTransformMatrixKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceAccelerationStructureFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceAccelerationStructurePropertiesKHR
- Extending VkWriteDescriptorSet:
  - VkWriteDescriptorSetAccelerationStructureKHR

New Unions

- VkAccelerationStructureGeometryDataKHR
- VkDeviceOrHostAddressConstKHR
- VkDeviceOrHostAddressKHR

New Enums

- VkAccelerationStructureBuildTypeKHR
- VkAccelerationStructureCompatibilityKHR
- VkAccelerationStructureCreateFlagBitsKHR
- VkAccelerationStructureTypeKHR
- VkBuildAccelerationStructureFlagBitsKHR
- VkBuildAccelerationStructureModeKHR
- VkCopyAccelerationStructureModeKHR
- VkGeometryFlagBitsKHR
- VkGeometryInstanceFlagBitsKHR
- VkGeometryTypeKHR

New Bitmasks

- VkAccelerationStructureCreateFlagsKHR
- VkBuildAccelerationStructureFlagsKHR
- VkGeometryFlagsKHR
- VkGeometryInstanceFlagsKHR

New Enum Constants

- VK_KHR_ACCELERATION_STRUCTURE_EXTENSION_NAME
- VK_KHR_ACCELERATION_STRUCTURE_SPEC_VERSION
- Extending VkAccessFlagBits:
  - VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR
  - VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR
- Extending VkBufferUsageFlagBits:
  - VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR
  - VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR
- Extending VkCopyAccelerationStructureModeKHR:
  - VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR
  - VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR
- Extending VkDescriptorType:
  - VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR
- Extending VkFormatFeatureFlagBits:
  - VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR
- Extending VkIndexType:
  - VK_INDEX_TYPE_NONE_KHR
- Extending VkObjectType:
  - VK_OBJECT_TYPE_ACCELERATION_STRUCTURE_KHR
- Extending VkPipelineStageFlagBits:
  - VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR
- Extending VkQueryType:
  - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR
  - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR
  - VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR
  - VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_KHR

    - VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_DEVICE_ADDRESS_INFO_KHR
    - VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR
    - VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR
    - VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR
    - VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR
    - VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR
    - VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_INFO_KHR
    - VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR
    - VK_STRUCTURE_TYPE_COPY_MEMORY_TO_ACCELERATION_STRUCTURE_INFO_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ACCELERATION_STRUCTURE_FEATURES_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ACCELERATION_STRUCTURE_PROPERTIES_KHR
    - VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR

If VK_EXT_debug_report is supported:

- Extending VkDebugReportObjectTypeEXT:
    - VK_DEBUG_REPORT_OBJECT_TYPE_ACCELERATION_STRUCTURE_KHR_EXT

If VK_KHR_format_feature_flags2 or Vulkan Version 1.3 is supported:

- Extending VkFormatFeatureFlagBits2:
    - VK_FORMAT_FEATURE_2_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR

Issues

(1) How does this extension differ from VK_NV_ray_tracing?

DISCUSSION:

The following is a summary of the main functional differences between VK_KHR_acceleration_structure and VK_NV_ray_tracing:

- added acceleration structure serialization / deserialization (VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR, VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR, vkCmdCopyAccelerationStructureToMemoryKHR, vkCmdCopyMemoryToAccelerationStructureKHR)
- document inactive primitives and instances
- added VkPhysicalDeviceAccelerationStructureFeaturesKHR structure
- added indirect and batched acceleration structure builds (vkCmdBuildAccelerationStructuresIndirectKHR)
- added host acceleration structure commands
- reworked geometry structures so they could be better shared between device, host, and indirect

builds

- explicitly made VkAccelerationStructureKHR use device addresses
- added acceleration structure compatibility check function (vkGetDeviceAccelerationStructureCompatibilityKHR)
- add parameter for requesting memory requirements for host and/or device build
- added format feature for acceleration structure build vertex formats (VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR)

(2) Can you give a more detailed comparison of differences and similarities between VK_NV_ray_tracing and VK_KHR_acceleration_structure?

DISCUSSION:

The following is a more detailed comparison of which commands, structures, and enums are aliased, changed, or removed.

- Aliased functionality — enums, structures, and commands that are considered equivalent:
  - VkGeometryTypeNV VkGeometryTypeKHR
  - VkAccelerationStructureTypeNV VkAccelerationStructureTypeKHR
  - VkCopyAccelerationStructureModeNV VkCopyAccelerationStructureModeKHR
  - VkGeometryFlagsNV VkGeometryFlagsKHR
  - VkGeometryFlagBitsNV VkGeometryFlagBitsKHR
  - VkGeometryInstanceFlagsNV VkGeometryInstanceFlagsKHR
  - VkGeometryInstanceFlagBitsNV VkGeometryInstanceFlagBitsKHR
  - VkBuildAccelerationStructureFlagsNV VkBuildAccelerationStructureFlagsKHR
  - VkBuildAccelerationStructureFlagBitsNV VkBuildAccelerationStructureFlagBitsKHR
  - VkTransformMatrixNV VkTransformMatrixKHR (added to VK_NV_ray_tracing for descriptive purposes)
  - VkAabbPositionsNV VkAabbPositionsKHR (added to VK_NV_ray_tracing for descriptive purposes)
  - VkAccelerationStructureInstanceNV VkAccelerationStructureInstanceKHR (added to VK_NV_ray_tracing for descriptive purposes)
- Changed enums, structures, and commands:
  - renamed VK_GEOMETRY_INSTANCE_TRIANGLE_CULL_DISABLE_BIT_NV → VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR in VkGeometryInstanceFlagBitsKHR
  - VkGeometryTrianglesNV → VkAccelerationStructureGeometryTrianglesDataKHR (device or host address instead of buffer+offset)
  - VkGeometryAABBNV → VkAccelerationStructureGeometryAabbsDataKHR (device or host address instead of buffer+offset)
  - VkGeometryDataNV → VkAccelerationStructureGeometryDataKHR (union of

triangle/aabbs/instances)

  - VkGeometryNV → VkAccelerationStructureGeometryKHR (changed type of geometry)
  - VkAccelerationStructureCreateInfoNV → VkAccelerationStructureCreateInfoKHR (reshuffle geometry layout/information)
  - VkPhysicalDeviceRayTracingPropertiesNV → VkPhysicalDeviceAccelerationStructurePropertiesKHR (for acceleration structure properties, renamed `maxTriangleCount` to `maxPrimitiveCount`, added per stage and update after bind limits) and VkPhysicalDeviceRayTracingPipelinePropertiesKHR (for ray tracing pipeline properties)
  - VkAccelerationStructureMemoryRequirementsInfoNV (deleted - replaced by allocating on top of VkBuffer)
  - VkWriteDescriptorSetAccelerationStructureNV → VkWriteDescriptorSetAccelerationStructureKHR (different acceleration structure type)
  - vkCreateAccelerationStructureNV → vkCreateAccelerationStructureKHR (device address, different geometry layout/information)
  - vkGetAccelerationStructureMemoryRequirementsNV (deleted - replaced by allocating on top of VkBuffer)
  - vkCmdBuildAccelerationStructureNV → vkCmdBuildAccelerationStructuresKHR (params moved to structs, layout differences)
  - vkCmdCopyAccelerationStructureNV → vkCmdCopyAccelerationStructureKHR (params to struct, extendable)
  - vkGetAccelerationStructureHandleNV → vkGetAccelerationStructureDeviceAddressKHR (device address instead of handle)
  - VkAccelerationStructureMemoryRequirementsTypeNV → size queries for scratch space moved to vkGetAccelerationStructureBuildSizesKHR
  - vkDestroyAccelerationStructureNV → vkDestroyAccelerationStructureKHR (different acceleration structure types)
  - vkCmdWriteAccelerationStructuresPropertiesNV → vkCmdWriteAccelerationStructuresPropertiesKHR (different acceleration structure types)

- Added enums, structures and commands:
  - `VK_GEOMETRY_TYPE_INSTANCES_KHR` to VkGeometryTypeKHR enum
  - `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`, `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR` to VkCopyAccelerationStructureModeKHR enum
  - VkPhysicalDeviceAccelerationStructureFeaturesKHR structure
  - VkAccelerationStructureBuildTypeKHR enum
  - VkBuildAccelerationStructureModeKHR enum
  - VkDeviceOrHostAddressKHR and VkDeviceOrHostAddressConstKHR unions
  - VkAccelerationStructureBuildRangeInfoKHR struct

    - VkAccelerationStructureGeometryInstancesDataKHR struct
    - VkAccelerationStructureDeviceAddressInfoKHR struct
    - VkAccelerationStructureVersionInfoKHR struct
    - VkStridedDeviceAddressRegionKHR struct
    - VkCopyAccelerationStructureToMemoryInfoKHR struct
    - VkCopyMemoryToAccelerationStructureInfoKHR struct
    - VkCopyAccelerationStructureInfoKHR struct
    - vkBuildAccelerationStructuresKHR command (host build)
    - vkCopyAccelerationStructureKHR command (host copy)
    - vkCopyAccelerationStructureToMemoryKHR (host serialize)
    - vkCopyMemoryToAccelerationStructureKHR (host deserialize)
    - vkWriteAccelerationStructuresPropertiesKHR (host properties)
    - vkCmdCopyAccelerationStructureToMemoryKHR (device serialize)
    - vkCmdCopyMemoryToAccelerationStructureKHR (device deserialize)
    - vkGetDeviceAccelerationStructureCompatibilityKHR (serialization)

(3) What are the changes between the public provisional (VK_KHR_ray_tracing v8) release and the internal provisional (VK_KHR_ray_tracing v9) release?

- added `geometryFlags` to `VkAccelerationStructureCreateGeometryTypeInfoKHR` (later reworked to obsolete this)
- added `minAccelerationStructureScratchOffsetAlignment` property to VkPhysicalDeviceRayTracingPropertiesKHR
- fix naming and return enum from vkGetDeviceAccelerationStructureCompatibilityKHR
    - renamed `VkAccelerationStructureVersionKHR` to VkAccelerationStructureVersionInfoKHR
    - renamed `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_KHR` to `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR`
    - removed `VK_ERROR_INCOMPATIBLE_VERSION_KHR`
    - added VkAccelerationStructureCompatibilityKHR enum
    - remove return value from vkGetDeviceAccelerationStructureCompatibilityKHR and added return enum parameter
- Require Vulkan 1.1
- added creation time capture and replay flags
    - added VkAccelerationStructureCreateFlagBitsKHR and VkAccelerationStructureCreateFlagsKHR
    - renamed the `flags` member of VkAccelerationStructureCreateInfoKHR to `buildFlags` (later removed) and added the `createFlags` member
- change vkCmdBuildAccelerationStructuresIndirectKHR to use buffer device address for indirect

parameter

- make VK_KHR_deferred_host_operations an interaction instead of a required extension (later went back on this)
- renamed VkAccelerationStructureBuildOffsetInfoKHR to VkAccelerationStructureBuildRangeInfoKHR
  - renamed the ppOffsetInfos parameter of vkCmdBuildAccelerationStructuresKHR to ppBuildRangeInfos
- Re-unify geometry description between build and create
  - remove VkAccelerationStructureCreateGeometryTypeInfoKHR and VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_GEOMETRY_TYPE_INFO_KHR
  - added VkAccelerationStructureCreateSizeInfoKHR structure (later removed)
  - change type of the pGeometryInfos member of VkAccelerationStructureCreateInfoKHR from VkAccelerationStructureCreateGeometryTypeInfoKHR to VkAccelerationStructureGeometryKHR (later removed)
  - added pCreateSizeInfos member to VkAccelerationStructureCreateInfoKHR (later removed)
- Fix ppGeometries ambiguity, add pGeometries
  - remove geometryArrayOfPointers member of VkAccelerationStructureBuildGeometryInfoKHR
  - disambiguate two meanings of ppGeometries by explicitly adding pGeometries to the VkAccelerationStructureBuildGeometryInfoKHR structure and require one of them be NULL
- added nullDescriptor support for acceleration structures
- changed the update member of VkAccelerationStructureBuildGeometryInfoKHR from a bool to the mode VkBuildAccelerationStructureModeKHR enum which allows future extensibility in update types
- Clarify deferred host ops for pipeline creation
  - VkDeferredOperationKHR is now a top-level parameter for vkBuildAccelerationStructuresKHR, vkCreateRayTracingPipelinesKHR, vkCopyAccelerationStructureToMemoryKHR, vkCopyAccelerationStructureKHR, and vkCopyMemoryToAccelerationStructureKHR
  - removed VkDeferredOperationInfoKHR structure
  - change deferred host creation/return parameter behavior such that the implementation can modify such parameters until the deferred host operation completes
  - VK_KHR_deferred_host_operations is required again
- Change acceleration structure build to always be sized
  - de-alias VkAccelerationStructureMemoryRequirementsTypeNV and VkAccelerationStructureMemoryRequirementsTypeKHR, and remove VkAccelerationStructureMemoryRequirementsTypeKHR
  - add vkGetAccelerationStructureBuildSizesKHR command and VkAccelerationStructureBuildSizesInfoKHR structure and VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR enum to query sizes for

acceleration structures and scratch storage

  - move size queries for scratch space to vkGetAccelerationStructureBuildSizesKHR
  - remove `compactedSize`, `buildFlags`, `maxGeometryCount`, `pGeometryInfos`, `pCreateSizeInfos` members of VkAccelerationStructureCreateInfoKHR and add the `size` member
  - add `maxVertex` member to VkAccelerationStructureGeometryTrianglesDataKHR structure
  - remove `VkAccelerationStructureCreateSizeInfoKHR` structure

(4) What are the changes between the internal provisional (VK_KHR_ray_tracing v9) release and the final (VK_KHR_acceleration_structure v11) release?

- refactor VK_KHR_ray_tracing into 3 extensions, enabling implementation flexibility and decoupling ray query support from ray pipelines:
  - `VK_KHR_acceleration_structure` (for acceleration structure operations)
  - `VK_KHR_ray_tracing_pipeline` (for ray tracing pipeline and shader stages)
  - `VK_KHR_ray_query` (for ray queries in existing shader stages)
- clarify buffer usage flags for ray tracing
  - `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` is left alone in `VK_NV_ray_tracing` (required on `scratch` and `instanceData`)
  - `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` is added as an alias of `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` in `VK_KHR_ray_tracing_pipeline` and is required on shader binding table buffers
  - `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` is added in `VK_KHR_acceleration_structure` for all vertex, index, transform, aabb, and instance buffer data referenced by device build commands
  - `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` is used for `scratchData`
- add max primitive counts (`ppMaxPrimitiveCounts`) to vkCmdBuildAccelerationStructuresIndirectKHR
- Allocate acceleration structures from `VkBuffers` and add a mode to constrain the device address
  - de-alias `VkBindAccelerationStructureMemoryInfoNV` and `vkBindAccelerationStructureMemoryNV`, and remove `VkBindAccelerationStructureMemoryInfoKHR`, `VkAccelerationStructureMemoryRequirementsInfoKHR`, and `vkGetAccelerationStructureMemoryRequirementsKHR`
  - acceleration structures now take a VkBuffer and offset at creation time for memory placement
  - add a new `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR` buffer usage for such buffers
  - add a new `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` acceleration structure type for layering
- move `VK_GEOMETRY_TYPE_INSTANCES_KHR` to main enum instead of being added via extension
- make build commands more consistent - all now build multiple acceleration structures and are

named plurally (vkCmdBuildAccelerationStructuresIndirectKHR, vkCmdBuildAccelerationStructuresKHR, vkBuildAccelerationStructuresKHR)

- add interactions with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` for acceleration structures, including a new feature (`descriptorBindingAccelerationStructureUpdateAfterBind`) and 3 new properties (`maxPerStageDescriptorAccelerationStructures`, `maxPerStageDescriptorUpdateAfterBindAccelerationStructures`, `maxDescriptorSetUpdateAfterBindAccelerationStructures`)
- extension is no longer provisional
- define synchronization requirements for builds, traces, and copies
- define synchronization requirements for AS build inputs and indirect build buffer

(5) What is `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` for?

RESOLVED: It is primarily intended for API layering. In DXR, the acceleration structure is basically just a buffer in a special layout, and you do not know at creation time whether it will be used as a top or bottom level acceleration structure. We thus added a generic acceleration structure type whose type is unknown at creation time, but is specified at build time instead. Applications which are written directly for Vulkan should not use it.

Version History

- Revision 1, 2019-12-05 (Members of the Vulkan Ray Tracing TSG)
  - Internal revisions (forked from VK_NV_ray_tracing)
- Revision 2, 2019-12-20 (Daniel Koch, Eric Werness)
  - Add const version of DeviceOrHostAddress (!3515)
  - Add VU to clarify that only handles in the current pipeline are valid (!3518)
  - Restore some missing VUs and add in-place update language (#1902, !3522)
  - rename VkAccelerationStructureInstanceKHR member from accelerationStructure to accelerationStructureReference to better match its type (!3523)
  - Allow VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS for pipeline creation if shader group handles cannot be reused (!3523)
  - update documentation for the VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS error code and add missing documentation for new return codes from VK_KHR_deferred_host_operations (!3523)
  - list new query types for VK_KHR_ray_tracing (!3523)
  - Fix VU statements for VkAccelerationStructureGeometryKHR referring to correct union members and update to use more current wording (!3523)
- Revision 3, 2020-01-10 (Daniel Koch, Jon Leech, Christoph Kubisch)
  - Fix 'instance of' and 'that/which contains/defines' markup issues (!3528)
  - factor out VK_KHR_pipeline_library as stand-alone extension (!3540)
  - Resolve Vulkan-hpp issues (!3543)

        - add missing require for VkGeometryInstanceFlagsKHR
        - de-alias VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_NV since the KHR structure is no longer equivalent
        - add len to pDataSize attribute for vkWriteAccelerationStructuresPropertiesKHR
- Revision 4, 2020-01-23 (Daniel Koch, Eric Werness)
    - Improve vkWriteAccelerationStructuresPropertiesKHR, add return value and VUs (#1947)
    - Clarify language to allow multiple raygen shaders (#1959)
    - Various editorial feedback (!3556)
    - Add language to help deal with looped self-intersecting fans (#1901)
    - Change vkCmdTraceRays{,Indirect}KHR args to pointers (!3559)
    - Add scratch address validation language (#1941, !3551)
    - Fix definition and add hierarchy information for shader call scope (#1977, !3571)
- Revision 5, 2020-02-04 (Eric Werness, Jeff Bolz, Daniel Koch)
    - remove vestigial accelerationStructureUUID (!3582)
    - update definition of repack instructions and improve memory model interactions (#1910, #1913, !3584)
    - Fix wrong sType for VkPhysicalDeviceRayTracingFeaturesKHR (#1988)
    - Use provisional SPIR-V capabilities (#1987)
    - require rayTraversalPrimitiveCulling if rayQuery is supported (#1927)
    - Miss shaders do not have object parameters (!3592)
    - Fix missing required types in XML (!3592)
    - clarify matching conditions for update (!3592)
    - add goal that host and device builds be similar (!3592)
    - clarify that `maxPrimitiveCount` limit should apply to triangles and AABBs (!3592)
    - Require alignment for instance arrayOfPointers (!3592)
    - Zero is a valid value for instance flags (!3592)
    - Add some alignment VUs that got lost in refactoring (!3592)
    - Recommend TMin epsilon rather than culling (!3592)
    - Get angle from dot product not cross product (!3592)
    - Clarify that AH can access the payload and attributes (!3592)
    - Match DXR behavior for inactive primitive definition (!3592)
    - Use a more generic term than degenerate for inactive to avoid confusion (!3592)
- Revision 6, 2020-02-20 (Daniel Koch)
    - fix some dangling NV references (#1996)
    - rename VkCmdTraceRaysIndirectCommandKHR to VkTraceRaysIndirectCommandKHR

(!3607)

- update contributor list (!3611)
- use uint64_t instead of VkAccelerationStructureReferenceKHR in VkAccelerationStructureInstanceKHR (#2004)

- Revision 7, 2020-02-28 (Tobias Hector)
  - remove HitTKHR SPIR-V builtin (spirv/spirv-extensions#7)
- Revision 8, 2020-03-06 (Tobias Hector, Dae Kim, Daniel Koch, Jeff Bolz, Eric Werness)
  - explicitly state that Tmax is updated when new closest intersection is accepted (#2020,!3536)
  - Made references to min and max t values consistent (!3644)
  - finish enumerating differences relative to VK_NV_ray_tracing in issues (1) and (2) (#1974,!3642)
  - fix formatting in some math equations (!3642)
  - Restrict the Hit Kind operand of `OpReportIntersectionKHR` to 7-bits (spirv/spirv-extensions#8,!3646)
  - Say ray tracing '**should**' be watertight (#2008,!3631)
  - Clarify memory requirements for ray tracing buffers (#2005,!3649)
  - Add callable size limits (#1997,!3652)
- Revision 9, 2020-04-15 (Eric Werness, Daniel Koch, Tobias Hector, Joshua Barczak)
  - Add geometry flags to acceleration structure creation (!3672)
  - add build scratch memory alignment (minAccelerationStructureScratchOffsetAlignment) (#2065,!3725)
  - fix naming and return enum from vkGetDeviceAccelerationStructureCompatibilityKHR (#2051,!3726)
  - require SPIR-V 1.4 (#2096,!3777)
  - added creation time capture/replay flags (#2104,!3774)
  - require Vulkan 1.1 (#2133,!3806)
  - use device addresses instead of VkBuffers for ray tracing commands (#2074,!3815)
  - add interactions with Vulkan 1.2 and VK_KHR_vulkan_memory_model (#2133,!3830)
  - make VK_KHR_pipeline_library an interaction instead of required (#2045,#2108,!3830)
  - make VK_KHR_deferred_host_operations an interaction instead of required (#2045,!3830)
  - removed maxCallableSize and added explicit stack size management for ray pipelines (#1997,!3817,!3772,!3844)
  - improved documentation for VkAccelerationStructureVersionInfoKHR (#2135,3835)
  - rename VkAccelerationStructureBuildOffsetInfoKHR to VkAccelerationStructureBuildRangeInfoKHR (#2058,!3754)
  - Re-unify geometry description between build and create (!3754)
  - Fix ppGeometries ambiguity, add pGeometries (#2032,!3811)

- add interactions with VK_EXT_robustness2 and allow nullDescriptor support for acceleration structures (#1920,!3848)
- added future extensibility for AS updates (#2114,!3849)
- Fix VU for dispatchrays and add a limit on the size of the full grid (#2160,!3851)
- Add shaderGroupHandleAlignment property (#2180,!3875)
- Clarify deferred host ops for pipeline creation (#2067,!3813)
- Change acceleration structure build to always be sized (#2131,#2197,#2198,!3854,!3883,!3880)

- Revision 10, 2020-07-03 (Mathieu Robart, Daniel Koch, Eric Werness, Tobias Hector)
  - Decomposition of the specification, from VK_KHR_ray_tracing to VK_KHR_acceleration_structure (#1918,!3912)
  - clarify buffer usage flags for ray tracing (#2181,!3939)
  - add max primitive counts to build indirect command (#2233,!3944)
  - Allocate acceleration structures from VkBuffers and add a mode to constrain the device address (#2131,!3936)
  - Move VK_GEOMETRY_TYPE_INSTANCES_KHR to main enum (#2243,!3952)
  - make build commands more consistent (#2247,!3958)
  - add interactions with UPDATE_AFTER_BIND (#2128,!3986)
  - correct and expand build command VUs (!4020)
  - fix copy command VUs (!4018)
  - added various alignment requirements (#2229,!3943)
  - fix valid usage for arrays of geometryCount items (#2198,!4010)
  - define what is allowed to change on RTAS updates and relevant VUs (#2177,!3961)
- Revision 11, 2020-11-12 (Eric Werness, Josh Barczak, Daniel Koch, Tobias Hector)
  - de-alias NV and KHR acceleration structure types and associated commands (#2271,!4035)
  - specify alignment for host copy commands (#2273,!4037)
  - document `VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR`
  - specify that acceleration structures are non-linear (#2289,!4068)
  - add several missing VUs for strides, vertexFormat, and indexType (#2315,!4069)
  - restore VUs for VkAccelerationStructureBuildGeometryInfoKHR (#2337,!4098)
  - ban multi-instance memory for host operations (#2324,!4102)
  - allow dstAccelerationStructure to be null for vkGetAccelerationStructureBuildSizesKHR (#2330,!4111)
  - more build VU cleanup (#2138,#4130)
  - specify host endianness for AS serialization (#2261,!4136)
  - add invertible transform matrix VU (#1710,!4140)

    - require geometryCount to be 1 for TLAS builds (!4145)
    - improved validity conditions for build addresses (#4142)
    - add single statement SPIR-V VUs, build limit VUs (!4158)
    - document limits for vertex and aabb strides (#2390,!4184)
    - specify that `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` applies to AS copies (#2382,#4173)
    - define sync for AS build inputs and indirect buffer (#2407,!4208)
- Revision 12, 2021-08-06 (Samuel Bourasseau)
    - rename VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR to VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR (keep previous as alias).
    - Clarify description and add note.
- Revision 13, 2021-09-30 (Jon Leech)
    - Add interaction with `VK_KHR_format_feature_flags2` to `vk.xml`

Description

The `VK_KHR_android_surface` extension is an instance extension. It provides a mechanism to create a VkSurfaceKHR object (defined by the `VK_KHR_surface` extension) that refers to an ANativeWindow, Android's native surface type. The ANativeWindow represents the producer endpoint of any buffer queue, regardless of consumer endpoint. Common consumer endpoints for `ANativeWindows` are the system window compositor, video encoders, and application-specific compositors importing the images through a `SurfaceTexture`.

New Base Types

- ANativeWindow

New Commands

- vkCreateAndroidSurfaceKHR

New Structures

- VkAndroidSurfaceCreateInfoKHR

New Bitmasks

- VkAndroidSurfaceCreateFlagsKHR

New Enum Constants

- `VK_KHR_ANDROID_SURFACE_EXTENSION_NAME`
- `VK_KHR_ANDROID_SURFACE_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR`

Issues

1) Does Android need a way to query for compatibility between a particular physical device (and queue family?) and a specific Android display?

RESOLVED: No. Currently on Android, any physical device is expected to be able to present to the system compositor, and all queue families must support the necessary image layout transitions and synchronization operations.

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
  - Initial draft.
- Revision 2, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_android_surface to VK_KHR_android_surface.
- Revision 3, 2015-11-03 (Daniel Rakos)
  - Added allocation callbacks to surface creation function.
- Revision 4, 2015-11-10 (Jesse Hall)
  - Removed VK_ERROR_INVALID_ANDROID_WINDOW_KHR.
- Revision 5, 2015-11-28 (Daniel Rakos)
  - Updated the surface create function to take a pCreateInfo structure.
- Revision 6, 2016-01-14 (James Jones)
  - Moved VK_ERROR_NATIVE_WINDOW_IN_USE_KHR from the VK_KHR_android_surface to the VK_KHR_surface extension.

Interactions and External Dependencies

- This extension provides API support for `GL_EXT_buffer_reference` and `GL_EXT_buffer_reference2` and `GL_EXT_buffer_reference_uvec2`

Contributors

- Jeff Bolz, NVIDIA
- Neil Henning, AMD
- Tobias Hector, AMD
- Faith Ekstrand, Intel
- Baldur Karlsson, Valve
- Jan-Harald Fredriksen, Arm

Description

This extension allows the application to query a 64-bit buffer device address value for a buffer, which can be used to access the buffer memory via the `PhysicalStorageBuffer` storage class in the `GL_EXT_buffer_reference` GLSL extension and `SPV_KHR_physical_storage_buffer` SPIR-V extension.

Another way to describe this extension is that it adds “pointers to buffer memory in shaders”. By calling vkGetBufferDeviceAddressKHR with a VkBuffer, it will return a VkDeviceAddress value which represents the address of the start of the buffer.

vkGetBufferOpaqueCaptureAddressKHR and vkGetDeviceMemoryOpaqueCaptureAddressKHR allow opaque addresses for buffers and memory objects to be queried for the current process. A trace capture and replay tool can then supply these addresses to be used at replay time to match the addresses used when the trace was captured. To enable tools to insert these queries, new memory allocation flags must be specified for memory objects that will be bound to buffers accessed via the PhysicalStorageBuffer storage class. **Note that this mechanism is intended only to support capture/replay tools, and is not recommended for use in other applications.**

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the bufferDeviceAddress feature is optional. The original type, enum, and command names are still available as aliases of the core functionality.

Promotion to Vulkan 1.3

Support for the bufferDeviceAddress feature is mandatory in Vulkan 1.3, regardless of whether this extension is supported.

New Commands

- vkGetBufferDeviceAddressKHR
- vkGetBufferOpaqueCaptureAddressKHR
- vkGetDeviceMemoryOpaqueCaptureAddressKHR

New Structures

- Hans-Kristian Arntzen, Valve
- Matthew Netsh, Qualcomm

Description

This extension adds Vulkan support for the `SPV_KHR_compute_shader_derivatives` SPIR-V extension.

The SPIR-V extension provides two new execution modes, both of which allow execution models with defined workgroups to use built-ins that evaluate derivatives explicitly or implicitly. Derivatives will be computed via differencing over a 2x2 group of shader invocations. The `DerivativeGroupQuadsKHR` execution mode assembles shader invocations into 2x2 groups, where each group has x and y coordinates of the local invocation ID of the form (2m+{0,1}, 2n+{0,1}). The `DerivativeGroupLinearKHR` execution mode assembles shader invocations into 2x2 groups, where each group has local invocation index values of the form 4m+{0,1,2,3}.

The new execution modes are supported in compute shaders and optionally (see meshAndTaskShaderDerivatives) in mesh and task shaders.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceComputeShaderDerivativesFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceComputeShaderDerivativesPropertiesKHR

New Enum Constants

- `VK_KHR_COMPUTE_SHADER_DERIVATIVES_EXTENSION_NAME`

- VK_KHR_COMPUTE_SHADER_DERIVATIVES_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_FEATURES_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_PROPERTIES_KHR

New SPIR-V Capability

- ComputeDerivativeGroupQuadsKHR
- ComputeDerivativeGroupLinearKHR

Examples

None.

Version History

- Revision 1, 2023-02-27 (Jean-Noe Morissette)

Extension Proposal

VK_KHR_cooperative_matrix

Other Extension Metadata

Last Modified Date

2023-05-03

Interactions and External Dependencies

- This extension provides API support for `GLSL_KHR_cooperative_matrix`

Contributors

- Jeff Bolz, NVIDIA
- Markus Tavenrath, NVIDIA
- Daniel Koch, NVIDIA
- Kevin Petit, Arm Ltd.
- Boris Zanin, AMD

Description

This extension adds support for using cooperative matrix types in SPIR-V. Cooperative matrix types are medium-sized matrices that are primarily supported in compute shaders, where the storage for the matrix is spread across all invocations in some scope (usually a subgroup) and those invocations cooperate to efficiently perform matrix multiplies.

Cooperative matrix types are defined by the `SPV_KHR_cooperative_matrix` SPIR-V extension and can be used with the `GLSL_KHR_cooperative_matrix` GLSL extension.

This extension includes support for enumerating the matrix types and dimensions that are supported by the implementation.

New Commands

- vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR

New Structures

- VkCooperativeMatrixPropertiesKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceCooperativeMatrixFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceCooperativeMatrixPropertiesKHR

New Enums

- VkComponentTypeKHR

- VkScopeKHR

New Enum Constants

- VK_KHR_COOPERATIVE_MATRIX_EXTENSION_NAME
- VK_KHR_COOPERATIVE_MATRIX_SPEC_VERSION
- Extending VkStructureType:

Description

This extension provides extensible versions of the Vulkan buffer and image copy commands. The new commands are functionally identical to the core commands, except that their copy parameters are specified using extensible structures that can be used to pass extension-specific information.

The following extensible copy commands are introduced with this extension: vkCmdCopyBuffer2KHR, vkCmdCopyImage2KHR, vkCmdCopyBufferToImage2KHR, vkCmdCopyImageToBuffer2KHR, vkCmdBlitImage2KHR, and vkCmdResolveImage2KHR. Each command contains an `*Info2KHR` structure parameter that includes `sType`/`pNext` members. Lower level structures describing each region to be copied are also extended with `sType`/`pNext` members.

New Commands

- vkCmdBlitImage2KHR
- vkCmdCopyBuffer2KHR
- vkCmdCopyBufferToImage2KHR
- vkCmdCopyImage2KHR
- vkCmdCopyImageToBuffer2KHR
- vkCmdResolveImage2KHR

New Structures

- VkBlitImageInfo2KHR
- VkBufferCopy2KHR
- VkBufferImageCopy2KHR
- VkCopyBufferInfo2KHR
- VkCopyBufferToImageInfo2KHR

- VkCopyImageInfo2KHR
- VkCopyImageToBufferInfo2KHR
- VkImageBlit2KHR
- VkImageCopy2KHR
- VkImageResolve2KHR
- VkResolveImageInfo2KHR

New Enum Constants

- VK_KHR_COPY_COMMANDS_2_EXTENSION_NAME
- VK_KHR_COPY_COMMANDS_2_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2_KHR
  - VK_STRUCTURE_TYPE_BUFFER_COPY_2_KHR
  - VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2_KHR
  - VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2_KHR
  - VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2_KHR
  - VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2_KHR
  - VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2_KHR
  - VK_STRUCTURE_TYPE_IMAGE_BLIT_2_KHR
  - VK_STRUCTURE_TYPE_IMAGE_COPY_2_KHR
  - VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2_KHR
  - VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2_KHR

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the KHR suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Description

This extension provides a new command to create render passes in a way that can be easily extended by other extensions through the substructures of render pass creation. The Vulkan 1.0 render pass creation sub-structures do not include `sType`/`pNext` members. Additionally, the render pass begin/next/end commands have been augmented with new extensible structures for passing additional subpass information.

The VkRenderPassMultiviewCreateInfo and VkInputAttachmentAspectReference structures that extended the original VkRenderPassCreateInfo are not accepted into the new creation functions, and instead their parameters are folded into this extension as follows:

- Elements of VkRenderPassMultiviewCreateInfo::`pViewMasks` are now specified in VkSubpassDescription2KHR::`viewMask`.

- Elements of VkRenderPassMultiviewCreateInfo::pViewOffsets are now specified in VkSubpassDependency2KHR::viewOffset.
- VkRenderPassMultiviewCreateInfo::correlationMaskCount and VkRenderPassMultiviewCreateInfo::pCorrelationMasks are directly specified in VkRenderPassCreateInfo2KHR.
- VkInputAttachmentAspectReference::aspectMask is now specified in the relevant input attachment reference in VkAttachmentReference2KHR::aspectMask

The details of these mappings are explained fully in the new structures.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Commands

- vkCmdBeginRenderPass2KHR
- vkCmdEndRenderPass2KHR
- vkCmdNextSubpass2KHR
- vkCreateRenderPass2KHR

New Structures

Description

The `VK_KHR_deferred_host_operations` extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands **must** not be deferred unless the deferral is specifically allowed by another extension which depends on `VK_KHR_deferred_host_operations`.

New Object Types

- VkDeferredOperationKHR

New Commands

- vkCreateDeferredOperationKHR
- vkDeferredOperationJoinKHR
- vkDestroyDeferredOperationKHR
- vkGetDeferredOperationMaxConcurrencyKHR
- vkGetDeferredOperationResultKHR

New Enum Constants

- `VK_KHR_DEFERRED_HOST_OPERATIONS_EXTENSION_NAME`
- `VK_KHR_DEFERRED_HOST_OPERATIONS_SPEC_VERSION`
- Extending VkObjectType:
  - `VK_OBJECT_TYPE_DEFERRED_OPERATION_KHR`
- Extending VkResult:
  - `VK_OPERATION_DEFERRED_KHR`
  - `VK_OPERATION_NOT_DEFERRED_KHR`
  - `VK_THREAD_DONE_KHR`
  - `VK_THREAD_IDLE_KHR`

Code Examples

The following examples will illustrate the concept of deferrable operations using a hypothetical example. The command `vkDoSomethingExpensive` denotes a deferrable command.

The following example illustrates how a vulkan application might request deferral of an expensive operation:

```
// create a deferred operation
VkDeferredOperationKHR hOp;
VkResult result = vkCreateDeferredOperationKHR(device, pCallbacks, &hOp);
assert(result == VK_SUCCESS);

result = vkDoSomethingExpensive(device, hOp, ...);
assert( result == VK_OPERATION_DEFERRED_KHR );

// operation was deferred.  Execute it asynchronously
std::async::launch(
    [ hOp ] ( )
    {
        vkDeferredOperationJoinKHR(device, hOp);

        result = vkGetDeferredOperationResultKHR(device, hOp);

        // deferred operation is now complete.  'result' indicates success or failure

        vkDestroyDeferredOperationKHR(device, hOp, pCallbacks);
    }
);
```

The following example illustrates extracting concurrency from a single deferred operation:

```
// create a deferred operation
VkDeferredOperationKHR hOp;
VkResult result = vkCreateDeferredOperationKHR(device, pCallbacks, &hOp);
assert(result == VK_SUCCESS);

result = vkDoSomethingExpensive(device, hOp, ...);
assert( result == VK_OPERATION_DEFERRED_KHR );

// Query the maximum amount of concurrency and clamp to the desired maximum
uint32_t numLaunches = std::min(vkGetDeferredOperationMaxConcurrencyKHR(device, hOp),
maxThreads);

std::vector<std::future<void> > joins;

for (uint32_t i = 0; i < numLaunches; i++) {
  joins.emplace_back(std::async::launch(
    [ hOp ] ( )
    {
        vkDeferredOperationJoinKHR(device, hOp);
                // in a job system, a return of VK_THREAD_IDLE_KHR should queue
another
                // job, but it is not functionally required
    }
  ));
}
```

```
for (auto &f : joins) {
  f.get();
}

result = vkGetDeferredOperationResultKHR(device, hOp);

// deferred operation is now complete.  'result' indicates success or failure

vkDestroyDeferredOperationKHR(device, hOp, pCallbacks);
```

The following example shows a subroutine which guarantees completion of a deferred operation, in the presence of multiple worker threads, and returns the result of the operation.

```
VkResult FinishDeferredOperation(VkDeferredOperationKHR hOp)
{
    // Attempt to join the operation until the implementation indicates that we should
stop

    VkResult result = vkDeferredOperationJoinKHR(device, hOp);
    while( result == VK_THREAD_IDLE_KHR )
    {
        std::this_thread::yield();
        result = vkDeferredOperationJoinKHR(device, hOp);
    }

    switch( result )
    {
    case VK_SUCCESS:
        {
            // deferred operation has finished.  Query its result.
            result = vkGetDeferredOperationResultKHR(device, hOp);
        }
        break;

    case VK_THREAD_DONE_KHR:
        {
            // deferred operation is being wrapped up by another thread
            //  wait for that thread to finish
            do
            {
                std::this_thread::yield();
                result = vkGetDeferredOperationResultKHR(device, hOp);
            } while( result == VK_NOT_READY );
        }
        break;

    default:
        assert(false); // other conditions are illegal.
        break;
```

```
    }

    return result;
}
```

Issues

1. Should this extension have a VkPhysicalDevice*FeaturesKHR structure?

RESOLVED: No. This extension does not add any functionality on its own and requires a dependent extension to actually enable functionality and thus there is no value in adding a feature structure. If necessary, any dependent extension could add a feature boolean if it wanted to indicate that it is adding optional deferral support.

Version History

- Revision 1, 2019-12-05 (Josh Barczak, Daniel Koch)
  - Initial draft.
- Revision 2, 2020-03-06 (Daniel Koch, Tobias Hector)
  - Add missing VK_OBJECT_TYPE_DEFERRED_OPERATION_KHR enum
  - fix sample code
  - Clarified deferred operation parameter lifetimes (#2018,!3647)
- Revision 3, 2020-05-15 (Josh Barczak)
  - Clarify behavior of vkGetDeferredOperationMaxConcurrencyKHR, allowing it to return 0 if the operation is complete (#2036,!3850)
- Revision 4, 2020-11-12 (Tobias Hector, Daniel Koch)
  - Remove VkDeferredOperationInfoKHR and change return value semantics when deferred host operations are in use (#2067,3813)
  - clarify return value of vkGetDeferredOperationResultKHR (#2339,!4110)

Description

This extension adds support for automatically resolving multisampled depth/stencil attachments in a subpass in a similar manner as for color attachments.

Multisampled color attachments can be resolved at the end of a subpass by specifying `pResolveAttachments` entries corresponding to the `pColorAttachments` array entries. This does not allow for a way to map the resolve attachments to the depth/stencil attachment. The vkCmdResolveImage command does not allow for depth/stencil images. While there are other ways to resolve the depth/stencil attachment, they can give sub-optimal performance. Extending the `VkSubpassDescription2` in this extension allows an application to add a `pDepthStencilResolveAttachment`, that is similar to the color `pResolveAttachments`, that the `pDepthStencilAttachment` can be resolved into.

Depth and stencil samples are resolved to a single value based on the resolve mode. The set of possible resolve modes is defined in the VkResolveModeFlagBits enum. The `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` mode is the only mode that is required of all implementations (that support the extension or support Vulkan 1.2 or higher). Some implementations may also support averaging (the same as color sample resolve) or taking the minimum or maximum sample, which may be more suitable for depth/stencil resolve.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

- VkDisplayPlaneAlphaFlagsKHR
- VkDisplaySurfaceCreateFlagsKHR
- VkSurfaceTransformFlagsKHR

New Enum Constants

- `VK_KHR_DISPLAY_EXTENSION_NAME`
- `VK_KHR_DISPLAY_SPEC_VERSION`
- Extending VkObjectType:
  - `VK_OBJECT_TYPE_DISPLAY_KHR`
  - `VK_OBJECT_TYPE_DISPLAY_MODE_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR`

Issues

1) Which properties of a mode should be fixed in the mode information vs. settable in some other function when setting the mode? E.g., do we need to double the size of the mode pool to include

both stereo and non-stereo modes? YUV and RGB scanout even if they both take RGB input images? BGR vs. RGB input? etc.

RESOLVED: Many modern displays support at most a handful of resolutions and timings natively. Other "modes" are expected to be supported using scaling hardware on the display engine or GPU. Other properties, such as rotation and mirroring should not require duplicating hardware modes just to express all combinations. Further, these properties may be implemented on a per-display or per-overlay granularity.

To avoid the exponential growth of modes as mutable properties are added, as was the case with `EGLConfig`/WGL pixel formats/`GLXFBConfig`, this specification should separate out hardware properties and configurable state into separate objects. Modes and overlay planes will express capabilities of the hardware, while a separate structure will allow applications to configure scaling, rotation, mirroring, color keys, LUT values, alpha masks, etc. for a given swapchain independent of the mode in use. Constraints on these settings will be established by properties of the immutable objects.

Note the resolution of this issue may affect issue 5 as well.

2) What properties of a display itself are useful?

RESOLVED: This issue is too broad. It was meant to prompt general discussion, but resolving this issue amounts to completing this specification. All interesting properties should be included. The issue will remain as a placeholder since removing it would make it hard to parse existing discussion notes that refer to issues by number.

3) How are multiple overlay planes within a display or mode enumerated?

RESOLVED: They are referred to by an index. Each display will report the number of overlay planes it contains.

4) Should swapchains be created relative to a mode or a display?

RESOLVED: When using this extension, swapchains are created relative to a mode and a plane. The mode implies the display object the swapchain will present to. If the specified mode is not the display's current mode, the new mode will be applied when the first image is presented to the swapchain, and the default operating system mode, if any, will be restored when the swapchain is destroyed.

5) Should users query generic ranges from displays and construct their own modes explicitly using those constraints rather than querying a fixed set of modes (Most monitors only have one real "mode" these days, even though many support relatively arbitrary scaling, either on the monitor side or in the GPU display engine, making "modes" something of a relic/compatibility construct).

RESOLVED: Expose both. Display information structures will expose a set of predefined modes, as well as any attributes necessary to construct a customized mode.

6) Is it fine if we return the display and display mode handles in the structure used to query their properties?

RESOLVED: Yes.

7) Is there a possibility that not all displays of a device work with all of the present queues of a device? If yes, how do we determine which displays work with which present queues?

RESOLVED: No known hardware has such limitations, but determining such limitations is supported automatically using the existing `VK_KHR_surface` and `VK_KHR_swapchain` query mechanisms.

8) Should all presentation need to be done relative to an overlay plane, or can a display mode + display be used alone to target an output?

RESOLVED: Require specifying a plane explicitly.

9) Should displays have an associated window system display, such as an `HDC` or `Display*`?

RESOLVED: No. Displays are independent of any windowing system in use on the system. Further, neither `HDC` nor `Display*` refer to a physical display object.

10) Are displays queried from a physical GPU or from a device instance?

RESOLVED: Developers prefer to query modes directly from the physical GPU so they can use display information as an input to their device selection algorithms prior to device creation. This avoids the need to create placeholder device instances to enumerate displays.

This preference must be weighed against the extra initialization that must be done by driver vendors prior to device instance creation to support this usage.

11) Should displays and/or modes be dispatchable objects? If functions are to take displays, overlays, or modes as their first parameter, they must be dispatchable objects as defined in Khronos bug 13529. If they are not added to the list of dispatchable objects, functions operating on them must take some higher-level object as their first parameter. There is no performance case against making them dispatchable objects, but they would be the first extension objects to be dispatchable.

RESOLVED: Do not make displays or modes dispatchable. They will dispatch based on their associated physical device.

12) Should hardware cursor capabilities be exposed?

RESOLVED: Defer. This could be a separate extension on top of the base WSI specs.

13) How many display objects should be enumerated for "tiled" display devices? There are ongoing design discussions among lower-level display API authors regarding how to expose displays if they are one physical display device to an end user, but may internally be implemented as two side-by-side displays using the same display engine (and sometimes cabling) resources as two physically separate display devices.

RESOLVED: Tiled displays will appear as a single display object in this API.

14) Should the raw EDID data be included in the display information?

RESOLVED: No. A future extension could be added which reports the EDID if necessary. This may be complicated by the outcome of issue 13.

15) Should min and max scaling factor capabilities of overlays be exposed?

RESOLVED: Yes. This is exposed indirectly by allowing applications to query the min/max position and extent of the source and destination regions from which image contents are fetched by the display engine when using a particular mode and overlay pair.

16) Should devices be able to expose planes that can be moved between displays? If so, how?

RESOLVED: Yes. Applications can determine which displays a given plane supports using vkGetDisplayPlaneSupportedDisplaysKHR.

17) Should there be a way to destroy display modes? If so, does it support destroying "built in" modes?

RESOLVED: Not in this extension. A future extension could add this functionality.

18) What should the lifetime of display and built-in display mode objects be?

RESOLVED: The lifetime of the instance. These objects cannot be destroyed. A future extension may be added to expose a way to destroy these objects and/or support display hotplug.

19) Should persistent mode for smart panels be enabled/disabled at swapchain creation time, or on a per-present basis.

RESOLVED: On a per-present basis.

Examples

NOTE	The example code for the `VK_KHR_display` and `VK_KHR_display_swapchain` extensions was removed from the appendix after revision 1.0.43. The display enumeration example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c).

Version History

- Revision 1, 2015-02-24 (James Jones)
  - Initial draft
- Revision 2, 2015-03-12 (Norbert Nopper)
  - Added overlay enumeration for a display.
- Revision 3, 2015-03-17 (Norbert Nopper)
  - Fixed typos and namings as discussed in Bugzilla.
  - Reordered and grouped functions.
  - Added functions to query count of display, mode and overlay.
  - Added native display handle, which may be needed on some platforms to create a native Window.

- Revision 4, 2015-03-18 (Norbert Nopper)
  - Removed primary and virtualPostion members (see comment of James Jones in Bugzilla).
  - Added native overlay handle to information structure.
  - Replaced , with ; in struct.
- Revision 6, 2015-03-18 (Daniel Rakos)
  - Added WSI extension suffix to all items.
  - Made the whole API more “Vulkanish”.
  - Replaced all functions with a single vkGetDisplayInfoKHR function to better match the rest of the API.
  - Made the display, display mode, and overlay objects be first class objects, not subclasses of VkBaseObject as they do not support the common functions anyways.
  - Renamed *Info structures to *Properties.
  - Removed overlayIndex field from VkOverlayProperties as there is an implicit index already as a result of moving to a “Vulkanish” API.
  - Displays are not get through device, but through physical GPU to match the rest of the Vulkan API. Also this is something ISVs explicitly requested.
  - Added issue (6) and (7).
- Revision 7, 2015-03-25 (James Jones)
  - Added an issues section
  - Added rotation and mirroring flags
- Revision 8, 2015-03-25 (James Jones)
  - Combined the duplicate issues sections introduced in last change.
  - Added proposed resolutions to several issues.
- Revision 9, 2015-04-01 (Daniel Rakos)
  - Rebased extension against Vulkan 0.82.0
- Revision 10, 2015-04-01 (James Jones)
  - Added issues (10) and (11).
  - Added more straw-man issue resolutions, and cleaned up the proposed resolution for issue (4).
  - Updated the rotation and mirroring enums to have proper bitmask semantics.
- Revision 11, 2015-04-15 (James Jones)
  - Added proposed resolution for issues (1) and (2).
  - Added issues (12), (13), (14), and (15)
  - Removed pNativeHandle field from overlay structure.
  - Fixed small compilation errors in example code.
- Revision 12, 2015-07-29 (James Jones)

    - Rewrote the guts of the extension against the latest WSI swapchain specifications and the latest Vulkan API.
    - Address overlay planes by their index rather than an object handle and refer to them as “planes” rather than “overlays” to make it slightly clearer that even a display with no “overlays” still has at least one base “plane” that images can be displayed on.
    - Updated most of the issues.
    - Added an “extension type” section to the specification header.
    - Reused the VK_EXT_KHR_surface surface transform enumerations rather than redefining them here.
    - Updated the example code to use the new semantics.
- Revision 13, 2015-08-21 (Ian Elliott)
    - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
    - Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.
- Revision 14, 2015-09-01 (James Jones)
    - Restore single-field revision number.
- Revision 15, 2015-09-08 (James Jones)
    - Added alpha flags enum.
    - Added premultiplied alpha support.
- Revision 16, 2015-09-08 (James Jones)
    - Added description section to the spec.
    - Added issues 16 - 18.
- Revision 17, 2015-10-02 (James Jones)
    - Planes are now a property of the entire device rather than individual displays. This allows planes to be moved between multiple displays on devices that support it.
    - Added a function to create a VkSurfaceKHR object describing a display plane and mode to align with the new per-platform surface creation conventions.
    - Removed detailed mode timing data. It was agreed that the mode extents and refresh rate are sufficient for current use cases. Other information could be added back in as an extension if it is needed in the future.
    - Added support for smart/persistent/buffered display devices.
- Revision 18, 2015-10-26 (Ian Elliott)
    - Renamed from VK_EXT_KHR_display to VK_KHR_display.
- Revision 19, 2015-11-02 (James Jones)
    - Updated example code to match revision 17 changes.
- Revision 20, 2015-11-03 (Daniel Rakos)

    - Added allocation callbacks to creation functions.
- Revision 21, 2015-11-10 (Jesse Hall)
    - Added VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR, and use VkDisplayPlaneAlphaFlagBitsKHR for VkDisplayPlanePropertiesKHR::alphaMode instead of VkDisplayPlaneAlphaFlagsKHR, since it only represents one mode.
    - Added reserved flags bitmask to VkDisplayPlanePropertiesKHR.
    - Use VkSurfaceTransformFlagBitsKHR instead of obsolete VkSurfaceTransformKHR.
    - Renamed vkGetDisplayPlaneSupportedDisplaysKHR parameters for clarity.
- Revision 22, 2015-12-18 (James Jones)
    - Added missing “planeIndex” parameter to vkGetDisplayPlaneSupportedDisplaysKHR()
- Revision 23, 2017-03-13 (James Jones)
    - Closed all remaining issues. The specification and implementations have been shipping with the proposed resolutions for some time now.
    - Removed the sample code and noted it has been integrated into the official Vulkan SDK cube demo.

- Jesse Hall, Google

Description

This extension provides an API to create a swapchain directly on a device's display without any underlying window system.

New Commands

- vkCreateSharedSwapchainsKHR

New Structures

- Extending VkPresentInfoKHR:
  - VkDisplayPresentInfoKHR

New Enum Constants

- `VK_KHR_DISPLAY_SWAPCHAIN_EXTENSION_NAME`
- `VK_KHR_DISPLAY_SWAPCHAIN_SPEC_VERSION`
- Extending VkResult:
  - `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`

Issues

1) Should swapchains sharing images each hold a reference to the images, or should it be up to the application to destroy the swapchains and images in an order that avoids the need for reference counting?

RESOLVED: Take a reference. The lifetime of presentable images is already complex enough.

2) Should the `srcRect` and `dstRect` parameters be specified as part of the presentation command, or at swapchain creation time?

RESOLVED: As part of the presentation command. This allows moving and scaling the image on the screen without the need to respecify the mode or create a new swapchain and presentable images.

3) Should `srcRect` and `dstRect` be specified as rects, or separate offset/extent values?

RESOLVED: As rects. Specifying them separately might make it easier for hardware to expose support for one but not the other, but in such cases applications must just take care to obey the reported capabilities and not use non-zero offsets or extents that require scaling, as appropriate.

4) How can applications create multiple swapchains that use the same images?

RESOLVED: By calling vkCreateSharedSwapchainsKHR.

An earlier resolution used vkCreateSwapchainKHR, chaining multiple VkSwapchainCreateInfoKHR structures through `pNext`. In order to allow each swapchain to also allow other extension structs, a level of indirection was used: VkSwapchainCreateInfoKHR::`pNext` pointed to a different structure, which had both `sType` and `pNext` members for additional extensions, and also had a pointer to the next VkSwapchainCreateInfoKHR structure. The number of swapchains to be created could only be found by walking this linked list of alternating structures, and the `pSwapchains` out parameter was reinterpreted to be an array of VkSwapchainKHR handles.

Another option considered was a method to specify a "shared" swapchain when creating a new swapchain, such that groups of swapchains using the same images could be built up one at a time. This was deemed unusable because drivers need to know all of the displays an image will be used on when determining which internal formats and layouts to use for that image.

Examples

NOTE	The example code for the `VK_KHR_display` and `VK_KHR_display_swapchain` extensions was removed from the appendix after revision 1.0.43. The display swapchain creation example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c).

Version History

- Revision 1, 2015-07-29 (James Jones)
  - Initial draft
- Revision 2, 2015-08-21 (Ian Elliott)
  - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
  - Switched from "revision" to "version", including use of the VK_MAKE_VERSION macro in the header file.
- Revision 3, 2015-09-01 (James Jones)
  - Restore single-field revision number.
- Revision 4, 2015-09-08 (James Jones)
  - Allow creating multiple swapchains that share the same images using a single call to vkCreateSwapchainKHR().
- Revision 5, 2015-09-10 (Alon Or-bach)

    - Removed underscores from SWAP_CHAIN in two enums.
- Revision 6, 2015-10-02 (James Jones)
    - Added support for smart panels/buffered displays.
- Revision 7, 2015-10-26 (Ian Elliott)
    - Renamed from VK_EXT_KHR_display_swapchain to VK_KHR_display_swapchain.
- Revision 8, 2015-11-03 (Daniel Rakos)
    - Updated sample code based on the changes to VK_KHR_swapchain.
- Revision 9, 2015-11-10 (Jesse Hall)
    - Replaced VkDisplaySwapchainCreateInfoKHR with vkCreateSharedSwapchainsKHR, changing resolution of issue #4.
- Revision 10, 2017-03-13 (James Jones)
    - Closed all remaining issues. The specification and implementations have been shipping with the proposed resolutions for some time now.
    - Removed the sample code and noted it has been integrated into the official Vulkan SDK cube demo.

Description

This extension is based on the `VK_AMD_draw_indirect_count` extension. This extension allows an application to source the number of draws for indirect drawing calls from a buffer.

Applications might want to do culling on the GPU via a compute shader prior to drawing. This enables the application to generate an arbitrary number of drawing commands and execute them without host intervention.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the commands vkCmdDrawIndirectCountKHR and vkCmdDrawIndexedIndirectCountKHR are optional. The original type, enum, and command names are still available as aliases of the core functionality.

New Commands

- vkCmdDrawIndexedIndirectCountKHR
- vkCmdDrawIndirectCountKHR

New Enum Constants

- `VK_KHR_DRAW_INDIRECT_COUNT_EXTENSION_NAME`
- `VK_KHR_DRAW_INDIRECT_COUNT_SPEC_VERSION`

Version History

- Revision 1, 2017-08-25 (Piers Daniell)
  - Initial draft based on VK_AMD_draw_indirect_count

Description

This extension provides a new physical device query which allows retrieving information about the

driver implementation, allowing applications to determine which physical device corresponds to which particular vendor's driver, and which conformance test suite version the driver implementation is compliant with.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- VkConformanceVersionKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceDriverPropertiesKHR

New Enums

Description

This extension allows applications to create single-pass render pass instances without needing to create render pass objects or framebuffers. Dynamic render passes can also span across multiple primary command buffers, rather than relying on secondary command buffers.

This extension also incorporates `VK_ATTACHMENT_STORE_OP_NONE_KHR` from `VK_QCOM_render_pass_store_ops`, enabling applications to avoid unnecessary synchronization when an attachment is not written during a render pass.

New Commands

- vkCmdBeginRenderingKHR
- vkCmdEndRenderingKHR

New Structures

- VkRenderingAttachmentInfoKHR
- VkRenderingInfoKHR
- Extending VkCommandBufferInheritanceInfo:
  - VkCommandBufferInheritanceRenderingInfoKHR
- Extending VkGraphicsPipelineCreateInfo:
  - VkPipelineRenderingCreateInfoKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceDynamicRenderingFeaturesKHR

New Enums

- VkRenderingFlagBitsKHR

New Bitmasks

- VkRenderingFlagsKHR

New Enum Constants

- VK_KHR_DYNAMIC_RENDERING_EXTENSION_NAME
- VK_KHR_DYNAMIC_RENDERING_SPEC_VERSION
- Extending VkAttachmentStoreOp:
  - VK_ATTACHMENT_STORE_OP_NONE_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDERING_INFO_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DYNAMIC_RENDERING_FEATURES_KHR
  - VK_STRUCTURE_TYPE_PIPELINE_RENDERING_CREATE_INFO_KHR
  - VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_INFO_KHR
  - VK_STRUCTURE_TYPE_RENDERING_INFO_KHR

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the KHR suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Description

An application using external memory may wish to synchronize access to that memory using fences. This extension enables an application to export fence payload to and import fence payload from Windows handles.

New Commands

- vkGetFenceWin32HandleKHR
- vkImportFenceWin32HandleKHR

New Structures

- VkFenceGetWin32HandleInfoKHR
- VkImportFenceWin32HandleInfoKHR
- Extending VkFenceCreateInfo:
  - VkExportFenceWin32HandleInfoKHR

New Enum Constants

- VK_KHR_EXTERNAL_FENCE_WIN32_EXTENSION_NAME
- VK_KHR_EXTERNAL_FENCE_WIN32_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_EXPORT_FENCE_WIN32_HANDLE_INFO_KHR
  - VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR
  - VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR

Issues

This extension borrows concepts, semantics, and language from VK_KHR_external_semaphore_win32. That extension's issues apply equally to this extension.

1) Should D3D12 fence handle types be supported, like they are for semaphores?

RESOLVED: No. Doing so would require extending the fence signal and wait operations to provide

values to signal / wait for, like VkD3D12FenceSubmitInfoKHR does. A D3D12 fence can be signaled by importing it into a VkSemaphore instead of a VkFence, and applications can check status or wait on the D3D12 fence using non-Vulkan APIs. The convenience of being able to do these operations on VkFence objects does not justify the extra API complexity.

Description

An application may wish to reference device memory in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension enables an application to export POSIX file descriptor handles from Vulkan memory objects and to import Vulkan memory objects from POSIX file descriptor handles exported from other Vulkan memory objects or from similar resources in other APIs.

New Commands

- vkGetMemoryFdKHR
- vkGetMemoryFdPropertiesKHR

New Structures

- VkMemoryFdPropertiesKHR
- VkMemoryGetFdInfoKHR
- Extending VkMemoryAllocateInfo:
  - VkImportMemoryFdInfoKHR

New Enum Constants

- `VK_KHR_EXTERNAL_MEMORY_FD_EXTENSION_NAME`
- `VK_KHR_EXTERNAL_MEMORY_FD_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR`

Issues

1) Does the application need to close the file descriptor returned by vkGetMemoryFdKHR?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the memory. A successful get call transfers ownership of the file descriptor to the application, and a successful import transfers it back to the driver. Destroying the original memory object will not close the file descriptor or remove its reference to the underlying memory resource associated with it.

2) Do drivers ever need to expose multiple file descriptors per memory object?

RESOLVED: No. This would indicate there are actually multiple memory objects, rather than a single memory object.

3) How should the valid size and memory type for POSIX file descriptor memory handles created outside of Vulkan be specified?

RESOLVED: The valid memory types are queried directly from the external handle. The size will be

specified by future extensions that introduce such external memory handle types.

Description

An application may wish to reference device memory in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension enables an application to export Windows handles from Vulkan memory objects and to import Vulkan memory objects from Windows handles exported from other Vulkan memory objects or from similar resources in other APIs.

New Commands

- vkGetMemoryWin32HandleKHR
- vkGetMemoryWin32HandlePropertiesKHR

New Structures

- VkMemoryGetWin32HandleInfoKHR
- VkMemoryWin32HandlePropertiesKHR
- Extending VkMemoryAllocateInfo:
  - VkExportMemoryWin32HandleInfoKHR
  - VkImportMemoryWin32HandleInfoKHR

New Enum Constants

- `VK_KHR_EXTERNAL_MEMORY_WIN32_EXTENSION_NAME`
- `VK_KHR_EXTERNAL_MEMORY_WIN32_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR`

Issues

1) Do applications need to call `CloseHandle`() on the values returned from vkGetMemoryWin32HandleKHR when `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR`?

RESOLVED: Yes. A successful get call transfers ownership of the handle to the application. Destroying the memory object will not destroy the handle or the handle's reference to the underlying memory resource. Unlike file descriptor opaque handles, win32 opaque handle ownership can not be transferred back to a driver by an import operation.

2) Should the language regarding KMT/Windows 7 handles be moved to a separate extension so that it can be deprecated over time?

RESOLVED: No. Support for them can be deprecated by drivers if they choose, by no longer

returning them in the supported handle types of the instance level queries.

3) How should the valid size and memory type for windows memory handles created outside of Vulkan be specified?

RESOLVED: The valid memory types are queried directly from the external handle. The size is determined by the associated image or buffer memory requirements for external handle types that require dedicated allocations, and by the size specified when creating the object from which the handle was exported for other external handle types.

  - VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR
  - VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR

Issues

1) Do applications need to call CloseHandle() on the values returned from vkGetSemaphoreWin32HandleKHR when handleType is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR?

RESOLVED: Yes. A successful get call transfers ownership of the handle to the application. Destroying the semaphore object will not destroy the handle or the handle's reference to the underlying semaphore resource. Unlike file descriptor opaque handles, win32 opaque handle ownership can not be transferred back to a driver by an import operation.

2) Should the language regarding KMT/Windows 7 handles be moved to a separate extension so that it can be deprecated over time?

RESOLVED: No. Support for them can be deprecated by drivers if they choose, by no longer returning them in the supported handle types of the instance level queries.

3) Should applications be allowed to specify additional object attributes for shared handles?

RESOLVED: Yes. Applications will be allowed to provide similar attributes to those they would to any other handle creation API.

4) How do applications communicate the desired fence values to use with D3D12_FENCE-based Vulkan semaphores?

RESOLVED: There are a couple of options. The values for the signaled and reset states could be communicated up front when creating the object and remain static for the life of the Vulkan

semaphore, or they could be specified using auxiliary structures when submitting semaphore signal and wait operations, similar to what is done with the keyed mutex extensions. The latter is more flexible and consistent with the keyed mutex usage, but the former is a much simpler API.

Since Vulkan tends to favor flexibility and consistency over simplicity, a new structure specifying D3D12 fence acquire and release values is added to the vkQueueSubmit function.

Description

This extension adds a new VkFormatFeatureFlagBits2KHR 64bits format feature flag type to extend the existing VkFormatFeatureFlagBits which is limited to 31 flags. At the time of this writing 29 bits of VkFormatFeatureFlagBits are already used.

Because VkFormatProperties2 is already defined to extend the Vulkan 1.0 vkGetPhysicalDeviceFormatProperties command, this extension defines a new VkFormatProperties3KHR to extend the VkFormatProperties.

On top of replicating all the bits from VkFormatFeatureFlagBits, VkFormatFeatureFlagBits2KHR adds the following bits :

- VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT_KHR and VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT_KHR specify that an implementation supports reading and writing, respectively, a given VkFormat through storage operations without specifying the format in the shader.
- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT_KHR specifies that an implementation supports depth comparison performed by OpImage*Dref* instructions on a given VkFormat. Previously the result of executing a OpImage*Dref* instruction on an image view, where the format was not one of the depth/stencil formats with a depth component, was undefined. This bit clarifies on which formats such instructions can be used.

Prior to version 2 of this extension, implementations exposing the shaderStorageImageReadWithoutFormat and shaderStorageImageWriteWithoutFormat features may not report VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT_KHR and VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT_KHR in VkFormatProperties3KHR ::bufferFeatures. Despite this, buffer reads/writes are supported as intended by the original features.

New Structures

- Extending VkFormatProperties2:
  - VkFormatProperties3KHR

New Enums

- VkFormatFeatureFlagBits2KHR

New Bitmasks

- VkFormatFeatureFlags2KHR

New Enum Constants

- VK_KHR_FORMAT_FEATURE_FLAGS_2_EXTENSION_NAME
- VK_KHR_FORMAT_FEATURE_FLAGS_2_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_3_KHR

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the KHR suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Version History

Interactions and External Dependencies

- This extension provides API support for `GL_EXT_fragment_shader_barycentric`

Contributors

- Stu Smith, AMD
- Tobias Hector, AMD
- Graeme Leese, Broadcom
- Jan-Harald Fredriksen, Arm
- Slawek Grajewski, Intel
- Pat Brown, NVIDIA
- Hans-Kristian Arntzen, Valve
- Contributors to the VK_NV_fragment_shader_barycentric specification

Description

This extension is based on the `VK_NV_fragment_shader_barycentric` extension, and adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_fragment_shader_barycentric`

The extension provides access to three additional fragment shader variable decorations in SPIR-V:

- `PerVertexKHR`, which indicates that a fragment shader input will not have interpolated values, but instead must be accessed with an extra array index that identifies one of the vertices of the primitive producing the fragment
- `BaryCoordKHR`, which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using perspective interpolation
- `BaryCoordNoPerspKHR`, which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using linear interpolation

When using GLSL source-based shader languages, the following variables from `GL_EXT_fragment_shader_barycentric` map to these SPIR-V built-in decorations:

- `in vec3 gl_BaryCoordEXT;` → `BaryCoordKHR`
- `in vec3 gl_BaryCoordNoPerspEXT;` → `BaryCoordNoPerspKHR`

GLSL variables declared using the `pervertexEXT` GLSL qualifier are expected to be decorated with `PerVertexKHR` in SPIR-V.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR

New Enum Constants

- `VK_KHR_FRAGMENT_SHADER_BARYCENTRIC_EXTENSION_NAME`
- `VK_KHR_FRAGMENT_SHADER_BARYCENTRIC_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_PROPERTIES_KHR`

New Built-In Variables

- `BaryCoordKHR`
- `BaryCoordNoPerspKHR`

New SPIR-V Decorations

- `PerVertexKHR`

New SPIR-V Capabilities

- `FragmentBarycentricKHR`

Issues

1) What are the interactions with MSAA and how are `BaryCoordKHR` and `BaryCoordNoPerspKHR` interpolated?

RESOLVED: The inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR` **may** also be decorated with the `Centroid` or `Sample` qualifiers to specify interpolation, like any other fragment shader input. If the `shaderSampleRateInterpolationFunctions` feature is enabled, the extended instructions InterpolateAtCentroid, InterpolateAtOffset, and InterpolateAtSample from the GLSL.std.450 **may** also be used with inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR`.

- Contributors to the VK_NV_shading_rate_image specification
- Contributors to the VK_EXT_fragment_density_map specification

Description

This extension adds the ability to change the rate at which fragments are shaded. Rather than the usual single fragment invocation for each pixel covered by a primitive, multiple pixels can be shaded by a single fragment shader invocation.

Up to three methods are available to the application to change the fragment shading rate:

- Pipeline Fragment Shading Rate, which allows the specification of a rate per-draw.
- Primitive Fragment Shading Rate, which allows the specification of a rate per primitive, specified during shading.
- Attachment Fragment Shading Rate, which allows the specification of a rate per-region of the framebuffer, specified in a specialized image attachment.

Additionally, these rates can all be specified and combined in order to adjust the overall detail in the image at each point.

This functionality can be used to focus shading efforts where higher levels of detail are needed in some parts of a scene compared to others. This can be particularly useful in high resolution rendering, or for XR contexts.

This extension also adds support for the `SPV_KHR_fragment_shading_rate` extension which enables setting the primitive fragment shading rate, and allows querying the final shading rate from a fragment shader.

New Commands

- vkCmdSetFragmentShadingRateKHR
- vkGetPhysicalDeviceFragmentShadingRatesKHR

New Structures

- VkPhysicalDeviceFragmentShadingRateKHR
- Extending VkGraphicsPipelineCreateInfo:
  - VkPipelineFragmentShadingRateStateCreateInfoKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceFragmentShadingRateFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceFragmentShadingRatePropertiesKHR
- Extending VkSubpassDescription2:
  - VkFragmentShadingRateAttachmentInfoKHR

If Vulkan Version 1.3 or VK_KHR_dynamic_rendering is supported:

- Extending VkRenderingInfo:
  - VkRenderingFragmentShadingRateAttachmentInfoKHR

New Enums

- VkFragmentShadingRateCombinerOpKHR

New Enum Constants

- `VK_KHR_FRAGMENT_SHADING_RATE_EXTENSION_NAME`
- `VK_KHR_FRAGMENT_SHADING_RATE_SPEC_VERSION`
- Extending VkAccessFlagBits:
  - `VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR`
- Extending VkDynamicState:
  - `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR`
- Extending VkFormatFeatureFlagBits:
  - `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- Extending VkImageLayout:
  - `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`
- Extending VkImageUsageFlagBits:
  - `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- Extending VkPipelineStageFlagBits:

    - VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_FEATURES_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_PROPERTIES_KHR
    - VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR

If VK_KHR_format_feature_flags2 or Vulkan Version 1.3 is supported:

- Extending VkFormatFeatureFlagBits2:
    - VK_FORMAT_FEATURE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

If Vulkan Version 1.3 or VK_KHR_dynamic_rendering is supported:

- Extending VkPipelineCreateFlagBits:
    - VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
    - VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR

Description

This extension provides new queries for device display properties and capabilities that can be easily extended by other extensions, without introducing any further queries. This extension can be considered the `VK_KHR_display` equivalent of the `VK_KHR_get_physical_device_properties2` extension.

New Commands

- vkGetDisplayModeProperties2KHR
- vkGetDisplayPlaneCapabilities2KHR
- vkGetPhysicalDeviceDisplayPlaneProperties2KHR
- vkGetPhysicalDeviceDisplayProperties2KHR

New Structures

- VkDisplayModeProperties2KHR
- VkDisplayPlaneCapabilities2KHR
- VkDisplayPlaneInfo2KHR
- VkDisplayPlaneProperties2KHR
- VkDisplayProperties2KHR

New Enum Constants

- `VK_KHR_GET_DISPLAY_PROPERTIES_2_EXTENSION_NAME`
- `VK_KHR_GET_DISPLAY_PROPERTIES_2_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR`

    - VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR
    - VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR
    - VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR
    - VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR

Issues

1) What should this extension be named?

RESOLVED: VK_KHR_get_display_properties2. Other alternatives:

- VK_KHR_display2
- One extension, combined with VK_KHR_surface_capabilites2.

2) Should extensible input structs be added for these new functions:

RESOLVED:

- vkGetPhysicalDeviceDisplayProperties2KHR: No. The only current input is a VkPhysicalDevice. Other inputs would not make sense.
- vkGetPhysicalDeviceDisplayPlaneProperties2KHR: No. The only current input is a VkPhysicalDevice. Other inputs would not make sense.
- vkGetDisplayModeProperties2KHR: No. The only current inputs are a VkPhysicalDevice and a VkDisplayModeKHR. Other inputs would not make sense.

3) Should additional display query functions be extended?

RESOLVED:

- vkGetDisplayPlaneSupportedDisplaysKHR: No. Extensions should instead extend vkGetDisplayPlaneCapabilitiesKHR().

Version History

- Revision 1, 2017-02-21 (James Jones)
    - Initial draft.

Description

This extension provides new queries for device surface capabilities that can be easily extended by other extensions, without introducing any further queries. This extension can be considered the `VK_KHR_surface` equivalent of the `VK_KHR_get_physical_device_properties2` extension.

New Commands

- vkGetPhysicalDeviceSurfaceCapabilities2KHR
- vkGetPhysicalDeviceSurfaceFormats2KHR

New Structures

- VkPhysicalDeviceSurfaceInfo2KHR
- VkSurfaceCapabilities2KHR
- VkSurfaceFormat2KHR

New Enum Constants

- `VK_KHR_GET_SURFACE_CAPABILITIES_2_EXTENSION_NAME`
- `VK_KHR_GET_SURFACE_CAPABILITIES_2_SPEC_VERSION`

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR
  - VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR
  - VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR

Issues

1) What should this extension be named?

RESOLVED: VK_KHR_get_surface_capabilities2. Other alternatives:

- VK_KHR_surface2
- One extension, combining a separate display-specific query extension.

2) Should additional WSI query functions be extended?

RESOLVED:

- vkGetPhysicalDeviceSurfaceCapabilitiesKHR: Yes. The need for this motivated the extension.
- vkGetPhysicalDeviceSurfaceSupportKHR: No. Currently only has boolean output. Extensions should instead extend vkGetPhysicalDeviceSurfaceCapabilities2KHR.
- vkGetPhysicalDeviceSurfaceFormatsKHR: Yes.
- vkGetPhysicalDeviceSurfacePresentModesKHR: No. Recent discussion concluded this introduced too much variability for applications to deal with. Extensions should instead extend vkGetPhysicalDeviceSurfaceCapabilities2KHR.
- vkGetPhysicalDeviceXlibPresentationSupportKHR: Not in this extension.
- vkGetPhysicalDeviceXcbPresentationSupportKHR: Not in this extension.
- vkGetPhysicalDeviceWaylandPresentationSupportKHR: Not in this extension.
- vkGetPhysicalDeviceWin32PresentationSupportKHR: Not in this extension.

Contributors

- Tobias Hector, AMD
- Contributors to `VK_EXT_global_priority`
- Contributors to `VK_EXT_global_priority_query`

Description

In Vulkan, users can specify device-scope queue priorities. In some cases it may be useful to extend this concept to a system-wide scope. This device extension allows applications to query the global queue priorities supported by a queue family, and then set a priority when creating queues. The default queue priority is `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`.

Implementations can report which global priority levels are treated differently by the implementation. It is intended primarily for use in system integration along with certain platform-specific priority enforcement rules.

The driver implementation will attempt to skew hardware resource allocation in favor of the higher-priority task. Therefore, higher-priority work may retain similar latency and throughput characteristics even if the system is congested with lower priority work.

The global priority level of a queue shall take precedence over the per-process queue priority (`VkDeviceQueueCreateInfo`::`pQueuePriorities`).

Abuse of this feature may result in starving the rest of the system from hardware resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (`VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`) if the caller does not have sufficient privileges. In this scenario `VK_ERROR_NOT_PERMITTED_EXT` is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this

scenario VK_ERROR_INITIALIZATION_FAILED is returned.

New Structures

- Extending VkDeviceQueueCreateInfo:
  - VkDeviceQueueGlobalPriorityCreateInfoKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR
- Extending VkQueueFamilyProperties2:
  - VkQueueFamilyGlobalPriorityPropertiesKHR

New Enums

- VkQueueGlobalPriorityKHR

New Enum Constants

- VK_KHR_GLOBAL_PRIORITY_EXTENSION_NAME
- VK_KHR_GLOBAL_PRIORITY_SPEC_VERSION
- VK_MAX_GLOBAL_PRIORITY_SIZE_KHR
- Extending VkResult:
  - VK_ERROR_NOT_PERMITTED_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GLOBAL_PRIORITY_QUERY_FEATURES_KHR
  - VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR

Issues

1) Can we additionally query whether a caller is permitted to acquire a specific global queue priority in this extension?

RESOLVED: No. Whether a caller has enough privilege goes with the OS, and the Vulkan driver cannot really guarantee that the privilege will not change in between this query and the actual queue creation call.

2) If more than 1 queue using global priority is requested, is there a good way to know which queue is failing the device creation?

RESOLVED: No. There is not a good way at this moment, and it is also not quite actionable for the applications to know that because the information may not be accurate. Queue creation can fail because of runtime constraints like insufficient privilege or lack of resource, and the failure is not necessarily tied to that particular queue configuration requested.

Description

On some implementations, setting the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT on image creation can cause access to that image to perform worse than an equivalent image created without VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT because the implementation does not know what view formats will be paired with the image.

This extension allows an application to provide the list of all formats that **can** be used with an image when it is created. The implementation may then be able to create a more efficient image that supports the subset of formats required by the application without having to support all formats in the format compatibility class of the image format.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

- Jeff Bolz, NVIDIA

Description

This device extension extends vkQueuePresentKHR, from the `VK_KHR_swapchain` extension, allowing an application to specify a list of rectangular, modified regions of each image to present. This should be used in situations where an application is only changing a small portion of the presentable images within a swapchain, since it enables the presentation engine to avoid wasting time presenting parts of the surface that have not changed.

This extension is leveraged from the `EGL_KHR_swap_buffers_with_damage` extension.

New Structures

- VkPresentRegionKHR
- VkRectLayerKHR
- Extending VkPresentInfoKHR:
  - VkPresentRegionsKHR

New Enum Constants

- `VK_KHR_INCREMENTAL_PRESENT_EXTENSION_NAME`
- `VK_KHR_INCREMENTAL_PRESENT_SPEC_VERSION`
- Extending VkStructureType:

- VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR

Issues

1) How should we handle steroescopic-3D swapchains? We need to add a layer for each rectangle. One approach is to create another struct containing the VkRect2D plus layer, and have VkPresentRegionsKHR point to an array of that struct. Another approach is to have two parallel arrays, pRectangles and pLayers, where pRectangles[i] and pLayers[i] must be used together. Which approach should we use, and if the array of a new structure, what should that be called?

RESOLVED: Create a new structure, which is a VkRect2D plus a layer, and will be called VkRectLayerKHR.

2) Where is the origin of the VkRectLayerKHR?

RESOLVED: The upper left corner of the presentable image(s) of the swapchain, per the definition of framebuffer coordinates.

3) Does the rectangular region, VkRectLayerKHR, specify pixels of the swapchain's image(s), or of the surface?

RESOLVED: Of the image(s). Some presentation engines may scale the pixels of a swapchain's image(s) to the size of the surface. The size of the swapchain's image(s) will be consistent, where the size of the surface may vary over time.

4) What if all of the rectangles for a given swapchain contain a width and/or height of zero?

RESOLVED: The application is indicating that no pixels changed since the last present. The presentation engine may use such a hint and not update any pixels for the swapchain. However, all other semantics of vkQueuePresentKHR must still be honored, including waiting for semaphores to signal.

5) When the swapchain is created with VkSwapchainCreateInfoKHR::preTransform set to a value other than VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, should the rectangular region, VkRectLayerKHR, be transformed to align with the preTransform?

RESOLVED: No. The rectangular region in VkRectLayerKHR should not be transformed. As such, it may not align with the extents of the swapchain's image(s). It is the responsibility of the presentation engine to transform the rectangular region. This matches the behavior of the Android presentation engine, which set the precedent.

- Piers Daniell [GitHub]pdaniell-nv

Other Extension Metadata

Last Modified Date

2023-06-08

IP Status

No known IP claims.

Contributors

- Jeff Bolz, NVIDIA

- Allen Jensen, NVIDIA
- Faith Ekstrand, Intel

Description

This extension adds some line rasterization features that are commonly used in CAD applications and supported in other APIs like OpenGL. Bresenham-style line rasterization is supported, smooth rectangular lines (coverage to alpha) are supported, and stippled lines are supported for all three line rasterization modes.

New Commands

- vkCmdSetLineStippleKHR

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceLineRasterizationFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceLineRasterizationPropertiesKHR
- Extending VkPipelineRasterizationStateCreateInfo:
  - VkPipelineRasterizationLineStateCreateInfoKHR

New Enums

- VkLineRasterizationModeKHR

New Enum Constants

- `VK_KHR_LINE_RASTERIZATION_EXTENSION_NAME`
- `VK_KHR_LINE_RASTERIZATION_SPEC_VERSION`
- Extending VkDynamicState:
  - `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_KHR`
  - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_KHR`

Issues

1) Do we need to support Bresenham-style and smooth lines with more than one rasterization sample? i.e. the equivalent of glDisable(GL_MULTISAMPLE) in OpenGL when the framebuffer has more than one sample?

RESOLVED: Yes. For simplicity, Bresenham line rasterization carries forward a few restrictions

from OpenGL, such as not supporting per-sample shading, alpha to coverage, or alpha to one.

VK_KHR_load_store_op_none

Other Extension Metadata

Last Modified Date

2023-05-16

Contributors

- Shahbaz Youssefi, Google
- Bill Licea-Kane, Qualcomm Technologies, Inc.
- Tobias Hector, AMD

Description

This extension provides `VK_ATTACHMENT_LOAD_OP_NONE_KHR` and `VK_ATTACHMENT_STORE_OP_NONE_KHR`, which are identically promoted from the `VK_EXT_load_store_op_none` extension.

New Enum Constants

- VK_KHR_LOAD_STORE_OP_NONE_EXTENSION_NAME
- VK_KHR_LOAD_STORE_OP_NONE_SPEC_VERSION
- Extending VkAttachmentLoadOp:
  - VK_ATTACHMENT_LOAD_OP_NONE_KHR
- Extending VkAttachmentStoreOp:
  - VK_ATTACHMENT_STORE_OP_NONE_KHR

> **NOTE** While VK_ATTACHMENT_STORE_OP_NONE is part of Vulkan 1.3, this extension was not promoted to core either in whole or in part. This functionality was promoted from VK_KHR_dynamic_rendering.

Version History

- Revision 1, 2023-05-16 (Shahbaz Youssefi)
  - Initial revision, based on VK_EXT_load_store_op_none.

Interactions and External Dependencies

- Requires SPIR-V 1.2 for `LocalSizeId`

Contributors

- Lionel Duc, NVIDIA
- Faith Ekstrand, Intel
- Spencer Fricke, Samsung
- Tobias Hector, AMD
- Lionel Landwerlin, Intel
- Graeme Leese, Broadcom
- Tom Olson, Arm
- Stu Smith, AMD
- Yiwei Zhang, Google

Description

`VK_KHR_maintenance4` adds a collection of minor features, none of which would warrant an entire extension of their own.

The new features are as follows:

- Allow the application to destroy their VkPipelineLayout object immediately after it was used to create another object. It is no longer necessary to keep its handle valid while the created object is in use.
- Add a new `maxBufferSize` implementation-defined limit for the maximum size `VkBuffer` that **can** be created.
- Add support for the SPIR-V 1.2 `LocalSizeId` execution mode, which can be used as an alternative to `LocalSize` to specify the local workgroup size with specialization constants.
- Add a guarantee that images created with identical creation parameters will always have the same alignment requirements.
- Add new vkGetDeviceBufferMemoryRequirementsKHR, vkGetDeviceImageMemoryRequirementsKHR, and vkGetDeviceImageSparseMemoryRequirementsKHR to allow the application to query the image memory requirements without having to create an image object and query it.
- Relax the requirement that push constants must be initialized before they are dynamically accessed.
- Relax the interface matching rules to allow a larger output vector to match with a smaller input vector, with additional values being discarded.
- Add a guarantee for buffer memory requirement that the size memory requirement is never greater than the result of aligning create size with the alignment memory requirement.

New Commands

- vkGetDeviceBufferMemoryRequirementsKHR
- vkGetDeviceImageMemoryRequirementsKHR
- vkGetDeviceImageSparseMemoryRequirementsKHR

New Structures

- VkDeviceBufferMemoryRequirementsKHR
- VkDeviceImageMemoryRequirementsKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMaintenance4FeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceMaintenance4PropertiesKHR

New Enum Constants

- `VK_KHR_MAINTENANCE_4_EXTENSION_NAME`
- `VK_KHR_MAINTENANCE_4_SPEC_VERSION`
- Extending VkImageAspectFlagBits:
  - `VK_IMAGE_ASPECT_NONE_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DEVICE_BUFFER_MEMORY_REQUIREMENTS_KHR`
  - `VK_STRUCTURE_TYPE_DEVICE_IMAGE_MEMORY_REQUIREMENTS_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_4_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_4_PROPERTIES_KHR`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the KHR suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Issues

None.

Version History

- Revision 1, 2021-08-18 (Piers Daniell)
  - Internal revisions
- Revision 2, 2021-10-25 (Yiwei Zhang)
  - More guarantees on buffer memory requirements

- Jon Leech, Khronos
- Mike Blumenkrantz, Valve

Description

`VK_KHR_maintenance5` adds a collection of minor features, none of which would warrant an entire extension of their own.

The new features are as follows:

- A new VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR format
- A new VK_FORMAT_A8_UNORM_KHR format
- A property to indicate that multisample coverage operations are performed after sample counting in EarlyFragmentTests mode
- Relax VkBufferView creation requirements by allowing subsets of the associated VkBuffer usage using VkBufferUsageFlags2CreateInfoKHR
- A new command vkCmdBindIndexBuffer2KHR, allowing a range of memory to be bound as an index buffer
- vkGetDeviceProcAddr must return NULL for supported core functions beyond the version requested by the application.
- A property to indicate that the sample mask test is performed after sample counting in EarlyFragmentTests mode
- vkCmdBindVertexBuffers2 now supports using VK_WHOLE_SIZE in the pSizes parameter.
- A default size of 1.0 is used if PointSize is not written
- Shader modules are deprecated - applications can now pass VkShaderModuleCreateInfo as a chained struct to pipeline creation via VkPipelineShaderStageCreateInfo
- A function vkGetRenderingAreaGranularityKHR to query the optimal render area for a dynamic rendering instance.
- A property to indicate that depth/stencil texturing operations with VK_COMPONENT_SWIZZLE_ONE have defined behavior
- Add vkGetImageSubresourceLayout2KHR and a new function vkGetDeviceImageSubresourceLayoutKHR to allow the application to query the image memory layout without having to create an image object and query it.
- Allow VK_REMAINING_ARRAY_LAYERS as the layerCount member of VkImageSubresourceLayers
- Adds stronger guarantees for propagation of VK_ERROR_DEVICE_LOST return values
- A property to indicate whether PointSize controls the final rasterization of polygons if polygon mode is VK_POLYGON_MODE_POINT
- Two properties to indicate the non-strict line rasterization algorithm used
- Two new flags words VkPipelineCreateFlagBits2KHR and VkBufferUsageFlagBits2KHR
- Physical-device-level functions can now be called with any value in the valid range for a type beyond the defined enumerants, such that applications can avoid checking individual features, extensions, or versions before querying supported properties of a particular enumerant.
- Clarification that copies between images of any type are allowed, treating 1D images as 2D images with a height of 1.

New Commands

- vkCmdBindIndexBuffer2KHR
- vkGetDeviceImageSubresourceLayoutKHR

- vkGetImageSubresourceLayout2KHR
- vkGetRenderingAreaGranularityKHR

New Structures

- VkDeviceImageSubresourceInfoKHR
- VkImageSubresource2KHR
- VkRenderingAreaInfoKHR
- VkSubresourceLayout2KHR
- Extending VkBufferViewCreateInfo, VkBufferCreateInfo, VkPhysicalDeviceExternalBufferInfo, VkDescriptorBufferBindingInfoEXT:
  - VkBufferUsageFlags2CreateInfoKHR
- Extending VkComputePipelineCreateInfo, VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoNV, VkRayTracingPipelineCreateInfoKHR:
  - VkPipelineCreateFlags2CreateInfoKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMaintenance5FeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceMaintenance5PropertiesKHR

New Enums

- VkBufferUsageFlagBits2KHR
- VkPipelineCreateFlagBits2KHR

New Bitmasks

- VkBufferUsageFlags2KHR
- VkPipelineCreateFlags2KHR

New Enum Constants

- `VK_KHR_MAINTENANCE_5_EXTENSION_NAME`
- `VK_KHR_MAINTENANCE_5_SPEC_VERSION`
- Extending VkFormat:
  - `VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR`
  - `VK_FORMAT_A8_UNORM_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_BUFFER_USAGE_FLAGS_2_CREATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_DEVICE_IMAGE_SUBRESOURCE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_IMAGE_SUBRESOURCE_2_KHR`

    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_5_FEATURES_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_5_PROPERTIES_KHR
    - VK_STRUCTURE_TYPE_PIPELINE_CREATE_FLAGS_2_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_RENDERING_AREA_INFO_KHR
    - VK_STRUCTURE_TYPE_SUBRESOURCE_LAYOUT_2_KHR

If VK_KHR_dynamic_rendering or Vulkan Version 1.3 and VK_EXT_fragment_density_map is supported:

- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

If VK_KHR_dynamic_rendering or Vulkan Version 1.3 and VK_KHR_fragment_shading_rate is supported:

- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

If VK_EXT_attachment_feedback_loop_layout is supported:

- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT
    - VK_PIPELINE_CREATE_2_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT

If VK_EXT_conditional_rendering is supported:

- Extending VkBufferUsageFlagBits2KHR:
    - VK_BUFFER_USAGE_2_CONDITIONAL_RENDERING_BIT_EXT

If VK_EXT_descriptor_buffer is supported:

- Extending VkBufferUsageFlagBits2KHR:
    - VK_BUFFER_USAGE_2_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT
    - VK_BUFFER_USAGE_2_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT
    - VK_BUFFER_USAGE_2_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT
- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_DESCRIPTOR_BUFFER_BIT_EXT

If VK_EXT_graphics_pipeline_library is supported:

- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT
    - VK_PIPELINE_CREATE_2_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT

If VK_EXT_opacity_micromap is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT
  - VK_BUFFER_USAGE_2_MICROMAP_STORAGE_BIT_EXT
- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT

If VK_EXT_pipeline_protected_access is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_NO_PROTECTED_ACCESS_BIT_EXT
  - VK_PIPELINE_CREATE_2_PROTECTED_ACCESS_ONLY_BIT_EXT

If VK_EXT_transform_feedback is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT
  - VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT

If VK_KHR_acceleration_structure is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR
  - VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR

If VK_KHR_pipeline_executable_properties is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR
  - VK_PIPELINE_CREATE_2_CAPTURE_STATISTICS_BIT_KHR

If VK_KHR_pipeline_library is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR

If VK_KHR_ray_tracing_pipeline is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - VK_BUFFER_USAGE_2_SHADER_BINDING_TABLE_BIT_KHR
- Extending VkPipelineCreateFlagBits2KHR:
  - VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR
  - VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR
  - VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR

    - VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR
    - VK_PIPELINE_CREATE_2_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
    - VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBS_BIT_KHR
    - VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR

If VK_KHR_video_decode_queue is supported:

- Extending VkBufferUsageFlagBits2KHR:
    - VK_BUFFER_USAGE_2_VIDEO_DECODE_DST_BIT_KHR
    - VK_BUFFER_USAGE_2_VIDEO_DECODE_SRC_BIT_KHR

If VK_KHR_video_encode_queue is supported:

- Extending VkBufferUsageFlagBits2KHR:
    - VK_BUFFER_USAGE_2_VIDEO_ENCODE_DST_BIT_KHR
    - VK_BUFFER_USAGE_2_VIDEO_ENCODE_SRC_BIT_KHR

If VK_NV_device_generated_commands is supported:

- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_NV

If VK_NV_displacement_micromap is supported:

- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV

If VK_NV_ray_tracing is supported:

- Extending VkBufferUsageFlagBits2KHR:
    - VK_BUFFER_USAGE_2_RAY_TRACING_BIT_NV
- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_DEFER_COMPILE_BIT_NV

If VK_NV_ray_tracing_motion_blur is supported:

- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_RAY_TRACING_ALLOW_MOTION_BIT_NV

If Vulkan Version 1.1 or VK_KHR_device_group is supported:

- Extending VkPipelineCreateFlagBits2KHR:
    - VK_PIPELINE_CREATE_2_DISPATCH_BASE_BIT_KHR
    - VK_PIPELINE_CREATE_2_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR

If Vulkan Version 1.2 or VK_KHR_buffer_device_address or VK_EXT_buffer_device_address is supported:

- Extending VkBufferUsageFlagBits2KHR:
  - `VK_BUFFER_USAGE_2_SHADER_DEVICE_ADDRESS_BIT_KHR`

If Vulkan Version 1.3 or VK_EXT_pipeline_creation_cache_control is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - `VK_PIPELINE_CREATE_2_EARLY_RETURN_ON_FAILURE_BIT_KHR`
  - `VK_PIPELINE_CREATE_2_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_KHR`

Issues

None.

- James Fitzpatrick, Imagination Technologies
- Piers Daniell, NVIDIA
- Daniel Story, Nintendo

Description

VK_KHR_maintenance6 adds a collection of minor features, none of which would warrant an entire extension of their own.

The new features are as follows:

- VkBindMemoryStatusKHR may be included in the `pNext` chain of VkBindBufferMemoryInfo and VkBindImageMemoryInfo, allowing applications to identify individual resources for which memory binding failed during calls to vkBindBufferMemory2 and vkBindImageMemory2.
- A new property `fragmentShadingRateClampCombinerInputs` to indicate if an implementation clamps the inputs to fragment shading rate combiner operations.
- VK_NULL_HANDLE is allowed to be used when binding an index buffer, instead of a valid VkBuffer handle. When the `nullDescriptor` feature is enabled, every index fetched results in a value of zero.
- A new property `maxCombinedImageSamplerDescriptorCount` to indicate the maximum number of descriptors needed for any of the formats that require a sampler $Y'C_BC_R$ conversion supported by the implementation.
- A new property `blockTexelViewCompatibleMultipleLayers` indicating whether `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` is allowed to be used with `layerCount` > 1
- `pNext` extensible *2 versions of all descriptor binding commands.

New Commands

- vkCmdBindDescriptorSets2KHR

- vkCmdPushConstants2KHR

If VK_EXT_descriptor_buffer is supported:

- vkCmdBindDescriptorBufferEmbeddedSamplers2EXT
- vkCmdSetDescriptorBufferOffsets2EXT

If VK_KHR_push_descriptor is supported:

- vkCmdPushDescriptorSet2KHR
- vkCmdPushDescriptorSetWithTemplate2KHR

New Structures

- VkBindDescriptorSetsInfoKHR
- VkPushConstantsInfoKHR
- Extending VkBindBufferMemoryInfo, VkBindImageMemoryInfo:
  - VkBindMemoryStatusKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMaintenance6FeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceMaintenance6PropertiesKHR

If VK_EXT_descriptor_buffer is supported:

- VkBindDescriptorBufferEmbeddedSamplersInfoEXT
- VkSetDescriptorBufferOffsetsInfoEXT

If VK_KHR_push_descriptor is supported:

- VkPushDescriptorSetInfoKHR
- VkPushDescriptorSetWithTemplateInfoKHR

New Enum Constants

- `VK_KHR_MAINTENANCE_6_EXTENSION_NAME`
- `VK_KHR_MAINTENANCE_6_SPEC_VERSION`

- Daniel Story, Nintendo
- Shahbaz Youssefi, Google
- Yiwei Zhang, Google
- Matthew Netsch, Qualcomm

Description

VK_KHR_maintenance7 adds a collection of minor features, none of which would warrant an entire extension of their own.

The proposed new features are as follows:

- Add a property query to determine if a framebuffer writes to depth or stencil aspect does not trigger a write access in the sibling aspect. For example, this allows sampling stencil aspect as a texture while rendering to the sibling depth attachment and vice-versa given appropriate image layouts.
- Add a way to query information regarding the underlying devices in environments where the Vulkan implementation is provided through layered implementations. For example, running on Mesa/Venus, driver ID is returned as `VK_DRIVER_ID_MESA_VENUS`, but it can be necessary to know what the real driver under the hood is. The new VkPhysicalDeviceLayeredApiPropertiesKHR structure can be used to gather information regarding layers underneath the top-level physical device.
- Promote `VK_RENDERING_CONTENTS_INLINE_BIT_EXT` and `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT` to KHR
- Add a limit to report the maximum total count of dynamic uniform buffers and dynamic storage buffers that can be included in a pipeline layout.
- Require that for an unsigned integer query, the 32-bit result value **must** be equal to the 32 least significant bits of the equivalent 64-bit result value.
- Add query for robust access support when using fragment shading rate attachments

New Structures

- VkPhysicalDeviceLayeredApiPropertiesKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMaintenance7FeaturesKHR

Description

The `VK_KHR_performance_query` extension adds a mechanism to allow querying of performance counters for use in applications and by profiling tools.

Each queue family **may** expose counters that **can** be enabled on a queue of that family. We extend VkQueryType to add a new query type for performance queries, and chain a structure on VkQueryPoolCreateInfo to specify the performance queries to enable.

New Commands

- vkAcquireProfilingLockKHR
- vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR
- vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR
- vkReleaseProfilingLockKHR

New Structures

- VkAcquireProfilingLockInfoKHR
- VkPerformanceCounterDescriptionKHR
- VkPerformanceCounterKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePerformanceQueryFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDevicePerformanceQueryPropertiesKHR
- Extending VkQueryPoolCreateInfo:
  - VkQueryPoolPerformanceCreateInfoKHR
- Extending VkSubmitInfo, VkSubmitInfo2:
  - VkPerformanceQuerySubmitInfoKHR

New Unions

- VkPerformanceCounterResultKHR

New Enums

- VkAcquireProfilingLockFlagBitsKHR
- VkPerformanceCounterDescriptionFlagBitsKHR
- VkPerformanceCounterScopeKHR
- VkPerformanceCounterStorageKHR
- VkPerformanceCounterUnitKHR

New Bitmasks

- VkAcquireProfilingLockFlagsKHR
- VkPerformanceCounterDescriptionFlagsKHR

New Enum Constants

- `VK_KHR_PERFORMANCE_QUERY_EXTENSION_NAME`
- `VK_KHR_PERFORMANCE_QUERY_SPEC_VERSION`

- Extending VkQueryType:
  - VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR
  - VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR
  - VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR
  - VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_FEATURES_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_PROPERTIES_KHR
  - VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR

Issues

1) Should this extension include a mechanism to begin a query in command buffer *A* and end the query in command buffer *B*?

RESOLVED No - queries are tied to command buffer creation and thus have to be encapsulated within a single command buffer.

2) Should this extension include a mechanism to begin and end queries globally on the queue, not using the existing command buffer commands?

RESOLVED No - for the same reasoning as the resolution of 1).

3) Should this extension expose counters that require multiple passes?

RESOLVED Yes - users should re-submit a command buffer with the same commands in it multiple times, specifying the pass to count as the query parameter in VkPerformanceQuerySubmitInfoKHR.

4) How to handle counters across parallel workloads?

RESOLVED In the spirit of Vulkan, a counter description flag VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR denotes that the accuracy of a counter result is affected by parallel workloads.

5) How to handle secondary command buffers?

RESOLVED Secondary command buffers inherit any counter pass index specified in the parent primary command buffer. Note: this is no longer an issue after change from issue 10 resolution

6) What commands does the profiling lock have to be held for?

RESOLVED For any command buffer that is being queried with a performance query pool, the profiling lock **must** be held while that command buffer is in the *recording*, *executable*, or *pending state*.

7) Should we support vkCmdCopyQueryPoolResults?

RESOLVED Yes.

8) Should we allow performance queries to interact with multiview?

RESOLVED Yes, but the performance queries must be performed once for each pass per view.

9) Should a `queryCount > 1` be usable for performance queries?

RESOLVED Yes. Some vendors will have costly performance counter query pool creation, and would rather if a certain set of counters were to be used multiple times that a `queryCount > 1` can be used to amortize the instantiation cost.

10) Should we introduce an indirect mechanism to set the counter pass index?

RESOLVED Specify the counter pass index at submit time instead, to avoid requiring re-recording of command buffers when multiple counter passes are needed.

Examples

The following example shows how to find what performance counters a queue family supports, setup a query pool to record these performance counters, how to add the query pool to the command buffer to record information, and how to get the results from the query pool.

```
// A previously created physical device
VkPhysicalDevice physicalDevice;

// One of the queue families our device supports
uint32_t queueFamilyIndex;

uint32_t counterCount;

// Get the count of counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
  physicalDevice,
  queueFamilyIndex,
  &counterCount,
  NULL,
  NULL);

VkPerformanceCounterKHR* counters =
  malloc(sizeof(VkPerformanceCounterKHR) * counterCount);
VkPerformanceCounterDescriptionKHR* counterDescriptions =
  malloc(sizeof(VkPerformanceCounterDescriptionKHR) * counterCount);

// Get the counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
  physicalDevice,
  queueFamilyIndex,
  &counterCount,
  counters,
  counterDescriptions);
```

```
// Try to enable the first 8 counters
uint32_t enabledCounters[8];

const uint32_t enabledCounterCount = min(counterCount, 8));

for (uint32_t i = 0; i < enabledCounterCount; i++) {
  enabledCounters[i] = i;
}

// A previously created device that had the performanceCounterQueryPools feature
// set to VK_TRUE
VkDevice device;

VkQueryPoolPerformanceCreateInfoKHR performanceQueryCreateInfo = {
  .sType = VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR,
  .pNext = NULL,

  // Specify the queue family that this performance query is performed on
  .queueFamilyIndex = queueFamilyIndex,

  // The number of counters to enable
  .counterIndexCount = enabledCounterCount,

  // The array of indices of counters to enable
  .pCounterIndices = enabledCounters
};

// Get the number of passes our counters will require.
uint32_t numPasses;

vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
  physicalDevice,
  &performanceQueryCreateInfo,
  &numPasses);

VkQueryPoolCreateInfo queryPoolCreateInfo = {
  .sType = VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO,
  .pNext = &performanceQueryCreateInfo,
  .flags = 0,
  // Using our new query type here
  .queryType = VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR,
  .queryCount = 1,
  .pipelineStatistics = 0
};

VkQueryPool queryPool;

VkResult result = vkCreateQueryPool(
  device,
```

```
  &queryPoolCreateInfo,
  NULL,
  &queryPool);

assert(VK_SUCCESS == result);

// A queue from queueFamilyIndex
VkQueue queue;

// A command buffer we want to record counters on
VkCommandBuffer commandBuffer;

VkCommandBufferBeginInfo commandBufferBeginInfo = {
  .sType = VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO,
  .pNext = NULL,
  .flags = 0,
  .pInheritanceInfo = NULL
};

VkAcquireProfilingLockInfoKHR lockInfo = {
  .sType = VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR,
  .pNext = NULL,
  .flags = 0,
  .timeout = UINT64_MAX // Wait forever for the lock
};

// Acquire the profiling lock before we record command buffers
// that will use performance queries

result = vkAcquireProfilingLockKHR(device, &lockInfo);

assert(VK_SUCCESS == result);

result = vkBeginCommandBuffer(commandBuffer, &commandBufferBeginInfo);

assert(VK_SUCCESS == result);

vkCmdResetQueryPool(
  commandBuffer,
  queryPool,
  0,
  1);

vkCmdBeginQuery(
  commandBuffer,
  queryPool,
  0,
  0);

// Perform the commands you want to get performance information on
// ...
```

```
// Perform a barrier to ensure all previous commands were complete before
// ending the query
vkCmdPipelineBarrier(commandBuffer,
  VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT,
  VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT,
  0,
  0,
  NULL,
  0,
  NULL,
  0,
  NULL);

vkCmdEndQuery(
  commandBuffer,
  queryPool,
  0);

result = vkEndCommandBuffer(commandBuffer);

assert(VK_SUCCESS == result);

for (uint32_t counterPass = 0; counterPass < numPasses; counterPass++) {

  VkPerformanceQuerySubmitInfoKHR performanceQuerySubmitInfo = {
    VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR,
    NULL,
    counterPass
  };

  // Submit the command buffer and wait for its completion
  // ...
}

// Release the profiling lock after the command buffer is no longer in the
// pending state.
vkReleaseProfilingLockKHR(device);

result = vkResetCommandBuffer(commandBuffer, 0);

assert(VK_SUCCESS == result);

// Create an array to hold the results of all counters
VkPerformanceCounterResultKHR* recordedCounters = malloc(
  sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount);

result = vkGetQueryPoolResults(
  device,
  queryPool,
```

```
  0,
  1,
  sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount,
  recordedCounters,
  sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount,
  NULL);

// recordedCounters is filled with our counters, we will look at one for posterity
switch (counters[0].storage) {
  case VK_PERFORMANCE_COUNTER_STORAGE_INT32:
    // use recordCounters[0].int32 to get at the counter result!
    break;
  case VK_PERFORMANCE_COUNTER_STORAGE_INT64:
    // use recordCounters[0].int64 to get at the counter result!
    break;
  case VK_PERFORMANCE_COUNTER_STORAGE_UINT32:
    // use recordCounters[0].uint32 to get at the counter result!
    break;
  case VK_PERFORMANCE_COUNTER_STORAGE_UINT64:
    // use recordCounters[0].uint64 to get at the counter result!
    break;
  case VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32:
    // use recordCounters[0].float32 to get at the counter result!
    break;
  case VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64:
    // use recordCounters[0].float64 to get at the counter result!
    break;
}
```

Description

This extension provides a method to obtain binary data associated with individual pipelines such that applications can manage caching themselves instead of using VkPipelineCache objects.

New Object Types

- VkPipelineBinaryKHR

New Commands

- vkCreatePipelineBinariesKHR
- vkDestroyPipelineBinaryKHR
- vkGetPipelineBinaryDataKHR
- vkGetPipelineKeyKHR
- vkReleaseCapturedPipelineDataKHR

New Structures

- VkPipelineBinaryCreateInfoKHR
- VkPipelineBinaryDataInfoKHR
- VkPipelineBinaryDataKHR
- VkPipelineBinaryHandlesInfoKHR
- VkPipelineBinaryKeyKHR
- VkPipelineBinaryKeysAndDataKHR
- VkPipelineCreateInfoKHR
- VkReleaseCapturedPipelineDataInfoKHR
- Extending VkDeviceCreateInfo:
  - VkDevicePipelineBinaryInternalCacheControlKHR
- Extending VkGraphicsPipelineCreateInfo, VkComputePipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR:
  - VkPipelineBinaryInfoKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePipelineBinaryFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDevicePipelineBinaryPropertiesKHR

New Enum Constants

- `VK_KHR_PIPELINE_BINARY_EXTENSION_NAME`
- `VK_KHR_PIPELINE_BINARY_SPEC_VERSION`
- `VK_MAX_PIPELINE_BINARY_KEY_SIZE_KHR`
- Extending VkObjectType:
  - `VK_OBJECT_TYPE_PIPELINE_BINARY_KHR`
- Extending VkPipelineCreateFlagBits2KHR:
  - `VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR`
- Extending VkResult:

    - VK_ERROR_NOT_ENOUGH_SPACE_KHR
    - VK_PIPELINE_BINARY_MISSING_KHR
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_DEVICE_PIPELINE_BINARY_INTERNAL_CACHE_CONTROL_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_BINARY_FEATURES_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_BINARY_PROPERTIES_KHR
    - VK_STRUCTURE_TYPE_PIPELINE_BINARY_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_PIPELINE_BINARY_DATA_INFO_KHR
    - VK_STRUCTURE_TYPE_PIPELINE_BINARY_HANDLES_INFO_KHR
    - VK_STRUCTURE_TYPE_PIPELINE_BINARY_INFO_KHR
    - VK_STRUCTURE_TYPE_PIPELINE_BINARY_KEY_KHR
    - VK_STRUCTURE_TYPE_PIPELINE_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_RELEASE_CAPTURED_PIPELINE_DATA_INFO_KHR

Version History

Description

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. This extension adds a mechanism to query properties and statistics about the different executables produced by the pipeline compilation process. This is intended to be used by debugging and performance tools to allow them to provide more detailed information to the user. Certain compile time shader statistics provided through this extension may be useful to developers for debugging or performance analysis.

New Commands

- vkGetPipelineExecutableInternalRepresentationsKHR
- vkGetPipelineExecutablePropertiesKHR
- vkGetPipelineExecutableStatisticsKHR

New Structures

- VkPipelineExecutableInfoKHR
- VkPipelineExecutableInternalRepresentationKHR
- VkPipelineExecutablePropertiesKHR
- VkPipelineExecutableStatisticKHR
- VkPipelineInfoKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR

New Unions

- VkPipelineExecutableStatisticValueKHR

New Enums

- VkPipelineExecutableStatisticFormatKHR

New Enum Constants

- `VK_KHR_PIPELINE_EXECUTABLE_PROPERTIES_EXTENSION_NAME`
- `VK_KHR_PIPELINE_EXECUTABLE_PROPERTIES_SPEC_VERSION`
- Extending VkPipelineCreateFlagBits:
  - `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`
  - `VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_EXECUTABLE_PROPERTIES_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR`
  - `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR`
  - `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR`
  - `VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR`

Issues

1) What should we call the pieces of the pipeline which are produced by the compilation process and about which you can query properties and statistics?

RESOLVED: Call them “executables”. The name “binary” was used in early drafts of the extension but it was determined that “pipeline binary” could have a fairly broad meaning (such as a binary serialized form of an entire pipeline) and was too big of a namespace for the very specific needs of this extension.

Description

A pipeline library is a special pipeline that cannot be bound, instead it defines a set of shaders and shader groups which can be linked into other pipelines. This extension defines the infrastructure for pipeline libraries, but does not specify the creation or usage of pipeline libraries. This is left to additional dependent extensions.

New Structures

- Extending VkGraphicsPipelineCreateInfo:

    - VkPipelineLibraryCreateInfoKHR

New Enum Constants

- VK_KHR_PIPELINE_LIBRARY_EXTENSION_NAME

Interactions and External Dependencies

- Interacts with VK_KHR_portability_subset

Contributors

- Lenny Komow, LunarG
- Charles Giessen, LunarG

Description

This extension allows applications to control whether devices that expose the VK_KHR_portability_subset extension are included in the results of physical device enumeration. Since devices which support the VK_KHR_portability_subset extension are not fully conformant Vulkan implementations, the Vulkan loader does not report those devices unless the application explicitly asks for them. This prevents applications which may not be aware of non-conformant devices from accidentally using them, as any device which supports the VK_KHR_portability_subset extension mandates that the extension must be enabled if that device is used.

This extension is implemented in the loader.

New Enum Constants

- VK_KHR_PORTABILITY_ENUMERATION_EXTENSION_NAME
- VK_KHR_PORTABILITY_ENUMERATION_SPEC_VERSION

IP Status

No known IP claims.

Contributors

- Keith Packard, Valve
- Ian Elliott, Google
- Tobias Hector, AMD

- Daniel Stone, Collabora

Description

This device extension allows an application that uses the VK_KHR_swapchain extension to wait for present operations to complete. An application can use this to monitor and control the pacing of the application by managing the number of outstanding images yet to be presented.

New Commands

- vkWaitForPresentKHR

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePresentWaitFeaturesKHR

New Enum Constants

- VK_KHR_PRESENT_WAIT_EXTENSION_NAME
- VK_KHR_PRESENT_WAIT_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_WAIT_FEATURES_KHR

Issues

1) When does the wait finish?

RESOLVED. The wait will finish when the present is visible to the user. There is no requirement for any precise timing relationship between the presentation of the image to the user, but implementations **should** signal the wait as close as possible to the presentation of the first pixel in the new image to the user.

2) Should this use fences or other existing synchronization mechanism.

RESOLVED. Because display and rendering are often implemented in separate drivers, this extension will provide a separate synchronization API.

3) Should this extension share present identification with other extensions?

RESOLVED. Yes. A new extension, VK_KHR_present_id, should be created to provide a shared structure for presentation identifiers.

4) What happens when presentations complete out of order wrt calls to vkQueuePresent? This could happen if the semaphores for the presentations were ready out of order.

OPTION A: Require that when a PresentId is set that the driver ensure that images are always presented in the order of calls to vkQueuePresent.

OPTION B: Finish both waits when the earliest present completes. This will complete the later

present wait earlier than the actual presentation. This should be the easiest to implement as the driver need only track the largest present ID completed. This is also the 'natural' consequence of interpreting the existing vkWaitForPresentKHR specificationn.

OPTION C: Finish both waits when both have completed. This will complete the earlier presentation later than the actual presentation time. This is allowed by the current specification as there is no precise timing requirement for when the presentId value is updated. This requires slightly more complexity in the driver as it will need to track all outstanding presentId values.

Description

Rasterization has been the dominant method to produce interactive graphics, but increasing performance of graphics hardware has made ray tracing a viable option for interactive rendering. Being able to integrate ray tracing with traditional rasterization makes it easier for applications to incrementally add ray traced effects to existing applications or to do hybrid approaches with rasterization for primary visibility and ray tracing for secondary queries.

Ray queries are available to all shader types, including graphics, compute and ray tracing pipelines. Ray queries are not able to launch additional shaders, instead returning traversal results to the calling shader.

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_ray_query`

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRayQueryFeaturesKHR

New Enum Constants

- `VK_KHR_RAY_QUERY_EXTENSION_NAME`
- `VK_KHR_RAY_QUERY_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_QUERY_FEATURES_KHR`

New SPIR-V Capabilities

- `RayQueryKHR`
- `RayTraversalPrimitiveCullingKHR`

Sample Code

Example of ray query in a GLSL shader, illustrating how to use ray queries to determine whether a given position (at ray origin) is in shadow or not, by tracing a ray towards the light, and checking for any intersections with geometry occluding the light.

```
rayQueryEXT rq;

rayQueryInitializeEXT(rq, accStruct, gl_RayFlagsTerminateOnFirstHitEXT, cullMask,
origin, tMin, direction, tMax);

// Traverse the acceleration structure and store information about the first
intersection (if any)
rayQueryProceedEXT(rq);
```

```
if (rayQueryGetIntersectionTypeEXT(rq, true) ==
gl_RayQueryCommittedIntersectionNoneEXT) {
    // Not in shadow
}
```

Issues

(1) What are the changes between the public provisional (VK_KHR_ray_tracing v8) release and the final (VK_KHR_acceleration_structure v11 / VK_KHR_ray_query v1) release?

- refactor VK_KHR_ray_tracing into 3 extensions, enabling implementation flexibility and decoupling ray query support from ray pipelines:
  - `VK_KHR_acceleration_structure` (for acceleration structure operations)
  - `VK_KHR_ray_tracing_pipeline` (for ray tracing pipeline and shader stages)
  - `VK_KHR_ray_query` (for ray queries in existing shader stages)
- Update SPIRV capabilities to use `RayQueryKHR`
- extension is no longer provisional

Version History

- Revision 1, 2020-11-12 (Mathieu Robart, Daniel Koch, Andrew Garrard)
  - Decomposition of the specification, from VK_KHR_ray_tracing to VK_KHR_ray_query (#1918,!3912)
  - update to use `RayQueryKHR` SPIR-V capability
  - add numerical limits for ray parameters (#2235,!3960)
  - relax formula for ray intersection candidate determination (#2322,!4080)
  - restrict traces to TLAS (#2239,!4141)
  - require `HitT` to be in ray interval for `OpRayQueryGenerateIntersectionKHR` (#2359,!4146)
  - add ray query shader stages for AS read bit (#2407,!4203)

Description

VK_KHR_ray_tracing_maintenance1 adds a collection of minor ray tracing features, none of which would warrant an entire extension of their own.

The new features are as follows:

- Adds support for the SPV_KHR_ray_cull_mask SPIR-V extension in Vulkan. This extension provides access to built-in CullMaskKHR shader variable which contains the value of the OpTrace* Cull Mask parameter. This new shader variable is accessible in the intersection, any-hit, closest hit and miss shader stages.
- Adds support for a new pipeline stage and access mask built on top of VK_KHR_synchronization2:
  - VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR to specify execution of acceleration structure copy commands
  - VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR to specify read access to a shader binding table in any shader pipeline stage
- Adds two new acceleration structure query parameters:
  - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR to query the acceleration structure size on the device timeline
  - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR to query the number of bottom level acceleration structure pointers for serialization
- Adds an optional new indirect ray tracing dispatch command, vkCmdTraceRaysIndirect2KHR, which sources the shader binding table parameters as well as the dispatch dimensions from the device. The rayTracingPipelineTraceRaysIndirect2 feature indicates whether this functionality is supported.

New Commands

If VK_KHR_ray_tracing_pipeline is supported:

- vkCmdTraceRaysIndirect2KHR

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR

If VK_KHR_ray_tracing_pipeline is supported:

- VkTraceRaysIndirectCommand2KHR

New Enum Constants

- VK_KHR_RAY_TRACING_MAINTENANCE_1_EXTENSION_NAME
- VK_KHR_RAY_TRACING_MAINTENANCE_1_SPEC_VERSION
- Extending VkQueryType:

    - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR
    - VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_MAINTENANCE_1_FEATURES_KHR

If VK_KHR_synchronization2 or Vulkan Version 1.3 and VK_KHR_ray_tracing_pipeline is supported:

- Extending VkAccessFlagBits2:
    - VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR

If VK_EXT_device_generated_commands is supported:

- Extending VkIndirectCommandsTokenTypeEXT:
    - VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT

If VK_KHR_synchronization2 or Vulkan Version 1.3 is supported:

- Extending VkPipelineStageFlagBits2:
    - VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR

New Built-In Variables

- CullMaskKHR

New SPIR-V Capabilities

- RayCullMaskKHR

Interactions and External Dependencies

- This extension provides API support for `GLSL_EXT_ray_tracing`
- This extension interacts with Vulkan 1.2 and `VK_KHR_vulkan_memory_model`, adding the shader-call-related relation of invocations, shader-call-order partial order of dynamic instances of instructions, and the `ShaderCallKHR` scope.
- This extension interacts with `VK_KHR_pipeline_library`, enabling pipeline libraries to be used with ray tracing pipelines and enabling usage of VkRayTracingPipelineInterfaceCreateInfoKHR.

Description

Rasterization has been the dominant method to produce interactive graphics, but increasing performance of graphics hardware has made ray tracing a viable option for interactive rendering. Being able to integrate ray tracing with traditional rasterization makes it easier for applications to

incrementally add ray traced effects to existing applications or to do hybrid approaches with rasterization for primary visibility and ray tracing for secondary queries.

To enable ray tracing, this extension adds a few different categories of new functionality:

- A new ray tracing pipeline type with new shader domains: ray generation, intersection, any-hit, closest hit, miss, and callable
- A shader binding indirection table to link shader groups with acceleration structure items
- Ray tracing commands which initiate the ray pipeline traversal and invocation of the various new shader domains depending on which traversal conditions are met

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_ray_tracing`

New Commands

- vkCmdSetRayTracingPipelineStackSizeKHR
- vkCmdTraceRaysIndirectKHR
- vkCmdTraceRaysKHR
- vkCreateRayTracingPipelinesKHR
- vkGetRayTracingCaptureReplayShaderGroupHandlesKHR
- vkGetRayTracingShaderGroupHandlesKHR
- vkGetRayTracingShaderGroupStackSizeKHR

New Structures

- VkRayTracingPipelineCreateInfoKHR
- VkRayTracingPipelineInterfaceCreateInfoKHR
- VkRayTracingShaderGroupCreateInfoKHR
- VkStridedDeviceAddressRegionKHR
- VkTraceRaysIndirectCommandKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRayTracingPipelineFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceRayTracingPipelinePropertiesKHR

New Enums

- VkRayTracingShaderGroupTypeKHR
- VkShaderGroupShaderKHR

New Enum Constants

- VK_KHR_RAY_TRACING_PIPELINE_EXTENSION_NAME
- VK_KHR_RAY_TRACING_PIPELINE_SPEC_VERSION
- VK_SHADER_UNUSED_KHR
- Extending VkBufferUsageFlagBits:
  - VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR
- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR
- Extending VkPipelineBindPoint:
  - VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR
- Extending VkPipelineCreateFlagBits:
  - VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR
  - VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR
  - VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR
  - VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR
  - VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
  - VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR
  - VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR
- Extending VkPipelineStageFlagBits:
  - VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR
- Extending VkShaderStageFlagBits:
  - VK_SHADER_STAGE_ANY_HIT_BIT_KHR
  - VK_SHADER_STAGE_CALLABLE_BIT_KHR
  - VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR
  - VK_SHADER_STAGE_INTERSECTION_BIT_KHR
  - VK_SHADER_STAGE_MISS_BIT_KHR
  - VK_SHADER_STAGE_RAYGEN_BIT_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PIPELINE_FEATURES_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PIPELINE_PROPERTIES_KHR
  - VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR
  - VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR
  - VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR

New or Modified Built-In Variables

- `LaunchIdKHR`
- `LaunchSizeKHR`
- `WorldRayOriginKHR`
- `WorldRayDirectionKHR`
- `ObjectRayOriginKHR`
- `ObjectRayDirectionKHR`
- `RayTminKHR`
- `RayTmaxKHR`
- `InstanceCustomIndexKHR`
- `InstanceId`
- `ObjectToWorldKHR`
- `WorldToObjectKHR`
- `HitKindKHR`
- `IncomingRayFlagsKHR`
- `RayGeometryIndexKHR`
- (modified)`PrimitiveId`

New SPIR-V Capabilities

- `RayTracingKHR`
- `RayTraversalPrimitiveCullingKHR`

Issues

(1) How does this extension differ from VK_NV_ray_tracing?

DISCUSSION:

The following is a summary of the main functional differences between VK_KHR_ray_tracing_pipeline and VK_NV_ray_tracing:

- added support for indirect ray tracing (vkCmdTraceRaysIndirectKHR)
- uses SPV_KHR_ray_tracing instead of SPV_NV_ray_tracing
  - refer to KHR SPIR-V enums instead of NV SPIR-V enums (which are functionally equivalent and aliased to the same values).
  - added `RayGeometryIndexKHR` built-in
- removed vkCompileDeferredNV compilation functionality and replaced with deferred host operations interactions for ray tracing
- added VkPhysicalDeviceRayTracingPipelineFeaturesKHR structure

- extended VkPhysicalDeviceRayTracingPipelinePropertiesKHR structure
  - renamed `maxRecursionDepth` to `maxRayRecursionDepth` and it has a minimum of 1 instead of 31
  - require `shaderGroupHandleSize` to be 32 bytes
  - added `maxRayDispatchInvocationCount`, `shaderGroupHandleAlignment` and `maxRayHitAttributeSize`
- reworked geometry structures so they could be better shared between device, host, and indirect builds
- changed SBT parameters to a structure and added size (VkStridedDeviceAddressRegionKHR)
- add parameter for requesting memory requirements for host and/or device build
- added pipeline library support for ray tracing
- added watertightness guarantees
- added no-null-shader pipeline flags (`VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_*_SHADERS_BIT_KHR`)
- added memory model interactions with ray tracing and define how subgroups work and can be repacked

(2) Can you give a more detailed comparison of differences and similarities between VK_NV_ray_tracing and VK_KHR_ray_tracing_pipeline?

DISCUSSION:

The following is a more detailed comparison of which commands, structures, and enums are aliased, changed, or removed.

- Aliased functionality — enums, structures, and commands that are considered equivalent:
  - VkRayTracingShaderGroupTypeNV VkRayTracingShaderGroupTypeKHR
  - vkGetRayTracingShaderGroupHandlesNV vkGetRayTracingShaderGroupHandlesKHR
- Changed enums, structures, and commands:
  - VkRayTracingShaderGroupCreateInfoNV → VkRayTracingShaderGroupCreateInfoKHR (added `pShaderGroupCaptureReplayHandle`)
  - VkRayTracingPipelineCreateInfoNV → VkRayTracingPipelineCreateInfoKHR (changed type of `pGroups`, added `libraries`, `pLibraryInterface`, and `pDynamicState`)
  - VkPhysicalDeviceRayTracingPropertiesNV → VkPhysicalDeviceRayTracingPropertiesKHR (renamed `maxTriangleCount` to `maxPrimitiveCount`, added `shaderGroupHandleCaptureReplaySize`)
  - vkCmdTraceRaysNV → vkCmdTraceRaysKHR (params to struct)
  - vkCreateRayTracingPipelinesNV → vkCreateRayTracingPipelinesKHR (different struct, changed functionality)
- Added enums, structures and commands:
  - `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`
    `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`,
    `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`,
    `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`,

VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR, VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR to VkPipelineCreateFlagBits

  - VkPhysicalDeviceRayTracingPipelineFeaturesKHR structure
  - VkDeviceOrHostAddressKHR and VkDeviceOrHostAddressConstKHR unions
  - VkPipelineLibraryCreateInfoKHR struct
  - VkRayTracingPipelineInterfaceCreateInfoKHR struct
  - VkStridedDeviceAddressRegionKHR struct
  - vkCmdTraceRaysIndirectKHR command and VkTraceRaysIndirectCommandKHR struct
  - vkGetRayTracingCaptureReplayShaderGroupHandlesKHR (shader group capture/replay)
  - vkCmdSetRayTracingPipelineStackSizeKHR and vkGetRayTracingShaderGroupStackSizeKHR commands for stack size control
- Functionality removed:
  - VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV
  - vkCompileDeferredNV command (replaced with VK_KHR_deferred_host_operations)

(3) What are the changes between the public provisional (VK_KHR_ray_tracing v8) release and the internal provisional (VK_KHR_ray_tracing v9) release?

- Require Vulkan 1.1 and SPIR-V 1.4
- Added interactions with Vulkan 1.2 and VK_KHR_vulkan_memory_model
- added creation time capture and replay flags
  - added VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR to VkPipelineCreateFlagBits
- replace VkStridedBufferRegionKHR with VkStridedDeviceAddressRegionKHR and change vkCmdTraceRaysKHR, vkCmdTraceRaysIndirectKHR, to take these for the shader binding table and use device addresses instead of buffers.
- require the shader binding table buffers to have the VK_BUFFER_USAGE_RAY_TRACING_BIT_KHR set
- make VK_KHR_pipeline_library an interaction instead of required extension
- rename the libraries member of VkRayTracingPipelineCreateInfoKHR to pLibraryInfo and make it a pointer
- make VK_KHR_deferred_host_operations an interaction instead of a required extension (later went back on this)
- added explicit stack size management for ray tracing pipelines
  - removed the maxCallableSize member of VkRayTracingPipelineInterfaceCreateInfoKHR
  - added the pDynamicState member to VkRayTracingPipelineCreateInfoKHR
  - added VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR dynamic state for ray tracing pipelines
  - added vkGetRayTracingShaderGroupStackSizeKHR and vkCmdSetRayTracingPipelineStackSizeKHR commands

    - added VkShaderGroupShaderKHR enum
- Added maxRayDispatchInvocationCount limit to VkPhysicalDeviceRayTracingPipelinePropertiesKHR
- Added shaderGroupHandleAlignment property to VkPhysicalDeviceRayTracingPipelinePropertiesKHR
- Added maxRayHitAttributeSize property to VkPhysicalDeviceRayTracingPipelinePropertiesKHR
- Clarify deferred host ops for pipeline creation
    - VkDeferredOperationKHR is now a top-level parameter for vkCreateRayTracingPipelinesKHR
    - removed VkDeferredOperationInfoKHR structure
    - change deferred host creation/return parameter behavior such that the implementation can modify such parameters until the deferred host operation completes
    - VK_KHR_deferred_host_operations is required again

(4) What are the changes between the internal provisional (VK_KHR_ray_tracing v9) release and the final (VK_KHR_acceleration_structure v11 / VK_KHR_ray_tracing_pipeline v1) release?

- refactor VK_KHR_ray_tracing into 3 extensions, enabling implementation flexibility and decoupling ray query support from ray pipelines:
    - VK_KHR_acceleration_structure (for acceleration structure operations)
    - VK_KHR_ray_tracing_pipeline (for ray tracing pipeline and shader stages)
    - VK_KHR_ray_query (for ray queries in existing shader stages)
- Require Volatile for the following builtins in the ray generation, closest hit, miss, intersection, and callable shader stages:
    - SubgroupSize, SubgroupLocalInvocationId, SubgroupEqMask, SubgroupGeMask, SubgroupGtMask, SubgroupLeMask, SubgroupLtMask
    - SMIDNV, WarpIDNV
- clarify buffer usage flags for ray tracing
    - VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR is added as an alias of VK_BUFFER_USAGE_RAY_TRACING_BIT_NV and is required on shader binding table buffers
    - VK_BUFFER_USAGE_STORAGE_BUFFER_BIT is used in VK_KHR_acceleration_structure for scratchData
- rename maxRecursionDepth to maxRayPipelineRecursionDepth (pipeline creation) and maxRayRecursionDepth (limit) to reduce confusion
- Add queryable maxRayHitAttributeSize limit and rename members of VkRayTracingPipelineInterfaceCreateInfoKHR to maxPipelineRayPayloadSize and maxPipelineRayHitAttributeSize for clarity
- Update SPIRV capabilities to use RayTracingKHR
- extension is no longer provisional
- define synchronization requirements for indirect trace rays and indirect buffer

(5) This extension adds gl_InstanceID for the intersection, any-hit, and closest hit shaders, but in KHR_vulkan_glsl, gl_InstanceID is replaced with gl_InstanceIndex. Which should be used for Vulkan in this extension?

RESOLVED: This extension uses gl_InstanceID and maps it to `InstanceId` in SPIR-V. It is acknowledged that this is different than other shader stages in Vulkan. There are two main reasons for the difference here:

- symmetry with gl_PrimitiveID which is also available in these shaders
- there is no "baseInstance" relevant for these shaders, and so ID makes it more obvious that this is zero-based.

(6) Why is `VK_KHR_pipeline_library` an interaction instead of a required dependency, particularly when the "Feature Requirements" section says it is required to be supported anyhow?

RESOLVED: If the `VK_KHR_pipeline_library` extensino were a required dependency, then every application would need to enable the extension whether or not they actually want to use the pipeline library functionality. Developers found this to be annoying and unfriendly behavior. We do wish to require all **implementations** to support it though, and thus it is listed in the feature requirements section.

Sample Code

Example ray generation GLSL shader

```
#version 450 core
#extension GL_EXT_ray_tracing : require
layout(set = 0, binding = 0, rgba8) uniform image2D image;
layout(set = 0, binding = 1) uniform accelerationStructureEXT as;
layout(location = 0) rayPayloadEXT float payload;

void main()
{
   vec4 col = vec4(0, 0, 0, 1);

   vec3 origin = vec3(float(gl_LaunchIDEXT.x)/float(gl_LaunchSizeEXT.x), float
(gl_LaunchIDEXT.y)/float(gl_LaunchSizeEXT.y), 1.0);
   vec3 dir = vec3(0.0, 0.0, -1.0);

   traceRayEXT(as, 0, 0xff, 0, 1, 0, origin, 0.0, dir, 1000.0, 0);

   col.y = payload;

   imageStore(image, ivec2(gl_LaunchIDEXT.xy), col);
}
```

Version History

- Revision 1, 2020-11-12 (Mathieu Robart, Daniel Koch, Eric Werness, Tobias Hector)

- Decomposition of the specification, from VK_KHR_ray_tracing to VK_KHR_ray_tracing_pipeline (#1918,!3912)
- require certain subgroup and sm_shader_builtin shader builtins to be decorated as volatile in the ray generation, closest hit, miss, intersection, and callable stages (#1924,!3903,!3954)
- clarify buffer usage flags for ray tracing (#2181,!3939)
- rename maxRecursionDepth to maxRayPipelineRecursionDepth and maxRayRecursionDepth (#2203,!3937)
- add queryable maxRayHitAttributeSize and rename members of VkRayTracingPipelineInterfaceCreateInfoKHR (#2102,!3966)
- update to use `RayTracingKHR` SPIR-V capability
- add VUs for matching hit group type against geometry type (#2245,!3994)
- require `RayTMaxKHR` be volatile in intersection shaders (#2268,!4030)
- add numerical limits for ray parameters (#2235,!3960)
- fix SBT indexing rules for device addresses (#2308,!4079)
- relax formula for ray intersection candidate determination (#2322,!4080)
- add more details on `ShaderRecordBufferKHR` variables (#2230,!4083)
- clarify valid bits for `InstanceCustomIndexKHR` (GLSL/GLSL#19,!4128)
- allow at most one `IncomingRayPayloadKHR`, `IncomingCallableDataKHR`, and `HitAttributeKHR` (!4129)
- add minimum for maxShaderGroupStride (#2353,!4131)
- require VK_KHR_pipeline_library extension to be supported (#2348,!4135)
- clarify meaning of 'geometry index' (#2272,!4137)
- restrict traces to TLAS (#2239,!4141)
- add note about maxPipelineRayPayloadSize (#2383,!4172)
- do not require raygen shader in pipeline libraries (!4185)
- define sync for indirect trace rays and indirect buffer (#2407,!4208)

- Yunpeng Zhu, Huawei Technologies
- Marius Bjorge, Arm
- Daniel Koch, NVIDIA

Description

`VK_KHR_ray_tracing_position_fetch` adds the ability to fetch the vertex positions in the shader from a hit triangle as stored in the acceleration structure.

An application adds `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR` to the acceleration structure at build time. Then, if the hit is a triangle geometry, the shader (any-hit or closest hit for

ray pipelines or using ray query) **can** fetch the three, three-component vertex positions in object space, of the triangle which was hit.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR

New Enum Constants

- `VK_KHR_RAY_TRACING_POSITION_FETCH_EXTENSION_NAME`
- `VK_KHR_RAY_TRACING_POSITION_FETCH_SPEC_VERSION`
- Extending VkBuildAccelerationStructureFlagBitsKHR:
  - `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_POSITION_FETCH_FEATURES_KHR`

New Built-In Variables

- `HitTriangleVertexPositionsKHR`

New SPIR-V Capabilities

- RayTracingPositionFetchKHR
- RayQueryPositionFetchKHR

Issues

Deprecation State

- *Promoted* to Vulkan 1.2

Contact

- Tobias Hector [GitHub]tobski

Other Extension Metadata

Last Modified Date

2019-08-17

Contributors

- Tobias Hector, Imagination Technologies
- Jon Leech, Khronos

Description

`VK_KHR_sampler_mirror_clamp_to_edge` extends the set of sampler address modes to include an additional mode (`VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`) that effectively uses a texture map twice as large as the original image in which the additional half of the new image is a mirror image of the original image.

This new mode relaxes the need to generate images whose opposite edges match by using the original image to generate a matching "mirror image". This mode allows the texture to be mirrored only once in the negative s, t, and r directions.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2. However, if Vulkan 1.2 is supported and this extension is not, the VkSamplerAddressMode `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` is optional. Since the original extension did not use an author suffix on the enum `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`, it is used by both core and extension implementations.

New Enum Constants

- `VK_KHR_SAMPLER_MIRROR_CLAMP_TO_EDGE_EXTENSION_NAME`
- `VK_KHR_SAMPLER_MIRROR_CLAMP_TO_EDGE_SPEC_VERSION`
- Extending VkSamplerAddressMode:

- VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE
- VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR

Example

Creating a sampler with the new address mode in each dimension

```
VkSamplerCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO,
    // Other members set to application-desired values
};

createInfo.addressModeU = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE;
createInfo.addressModeV = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE;
createInfo.addressModeW = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE;

VkSampler sampler;
VkResult result = vkCreateSampler(
    device,
    &createInfo,
    &sampler);
```

Issues

1) Why are both KHR and core versions of the VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE token present?

RESOLVED: This functionality was intended to be required in Vulkan 1.0. We realized shortly before public release that not all implementations could support it, and moved the functionality into an optional extension, but did not apply the KHR extension suffix. Adding a KHR-suffixed alias of the non-suffixed enum has been done to comply with our own naming rules.

In a related change, before spec revision 1.1.121 this extension was hardwiring into the spec Makefile so it was always included with the Specification, even in the core-only versions. This has now been reverted, and it is treated as any other extension.

Version History

- Revision 1, 2016-02-16 (Tobias Hector)
  - Initial draft
- Revision 2, 2019-08-14 (Jon Leech)
  - Add KHR-suffixed alias of non-suffixed enum.
- Revision 3, 2019-08-17 (Jon Leech)
  - Add an issue explaining the reason for the extension API not being suffixed with KHR.

Other Extension Metadata

Last Modified Date

2019-06-25

Contributors

- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA
- Jesse Barker, Unity
- Tobias Hector, AMD

Description

This extension allows image memory barriers for depth/stencil images to have just one of the `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` aspect bits set, rather than require both. This allows their layouts to be set independently. To support depth/stencil images with different

layouts for the depth and stencil aspects, the depth/stencil attachment interface has been updated to support a separate layout for stencil.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- Extending VkAttachmentDescription2:
  - VkAttachmentDescriptionStencilLayoutKHR
- Extending VkAttachmentReference2:
  - VkAttachmentReferenceStencilLayoutKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceSeparateDepthStencilLayoutsFeaturesKHR

New Enum Constants

- `VK_KHR_SEPARATE_DEPTH_STENCIL_LAYOUTS_EXTENSION_NAME`
- `VK_KHR_SEPARATE_DEPTH_STENCIL_LAYOUTS_SPEC_VERSION`
- Extending VkImageLayout:
  - `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`
  - `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`
  - `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`
  - `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT_KHR`
  - `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SEPARATE_DEPTH_STENCIL_LAYOUTS_FEATURES_KHR`

Contributors

- Aaron Hagan, AMD
- Daniel Rakos, AMD
- Jeff Bolz, NVIDIA
- Neil Henning, Codeplay

Description

This extension advertises the SPIR-V **Int64Atomics** capability for Vulkan, which allows a shader to contain 64-bit atomic operations on signed and unsigned integers. The supported operations include OpAtomicMin, OpAtomicMax, OpAtomicAnd, OpAtomicOr, OpAtomicXor, OpAtomicAdd, OpAtomicExchange, and OpAtomicCompareExchange.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `shaderBufferInt64Atomics` capability is optional. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderAtomicInt64FeaturesKHR

New Enum Constants

- VK_KHR_SHADER_ATOMIC_INT64_EXTENSION_NAME
- VK_KHR_SHADER_ATOMIC_INT64_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES_KHR

Interactions and External Dependencies

- This extension provides API support for `GL_ARB_shader_clock` and `GL_EXT_shader_realtime_clock`

Contributors

- Aaron Hagan, AMD
- Daniel Koch, NVIDIA

Description

This extension advertises the SPIR-V `ShaderClockKHR` capability for Vulkan, which allows a shader to query a real-time or monotonically incrementing counter at the subgroup level or across the device level. The two valid SPIR-V scopes for `OpReadClockKHR` are `Subgroup` and `Device`.

When using GLSL source-based shading languages, the `clockRealtime*EXT`() timing functions map to the `OpReadClockKHR` instruction with a scope of `Device`, and the `clock*ARB`() timing functions map to the `OpReadClockKHR` instruction with a scope of `Subgroup`.

New Structures

- Graeme Leese, Broadcom
- Daniel Rakos, AMD

Description

The `VK_KHR_shader_float16_int8` extension allows use of 16-bit floating-point types and 8-bit integer types in shaders for arithmetic operations.

It introduces two new optional features `shaderFloat16` and `shaderInt8` which directly map to the `Float16` and the `Int8` SPIR-V capabilities. The `VK_KHR_shader_float16_int8` extension also specifies precision requirements for half-precision floating-point SPIR-V operations. This extension does not enable use of 8-bit integer types or 16-bit floating-point types in any shader input and output interfaces and therefore does not supersede the `VK_KHR_8bit_storage` or `VK_KHR_16bit_storage` extensions.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, both the `shaderFloat16` and `shaderInt8` capabilities are optional. The original type, enum, and command names are still available as aliases of the core functionality.

- Graeme Leese, Broadcom
- Daniel Rakos, AMD

Description

The `VK_KHR_shader_float_controls` extension enables efficient use of floating-point computations through the ability to query and override the implementation's default behavior for rounding modes, denormals, signed zero, and infinity.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceFloatControlsPropertiesKHR

New Enums

- VkShaderFloatControlsIndependenceKHR

New Enum Constants

- `VK_KHR_SHADER_FLOAT_CONTROLS_EXTENSION_NAME`
- `VK_KHR_SHADER_FLOAT_CONTROLS_SPEC_VERSION`
- Extending VkShaderFloatControlsIndependence:
  - `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY_KHR`
  - `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL_KHR`
  - `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FLOAT_CONTROLS_PROPERTIES_KHR`

New SPIR-V Capabilities

- `DenormPreserve`
- `DenormFlushToZero`

- `SignedZeroInfNanPreserve`
- `RoundingModeRTE`
- `RoundingModeRTZ`

Issues

1) Which instructions must flush denorms?

RESOLVED: Only floating-point conversion, floating-point arithmetic, floating-point relational (except `OpIsNaN`, `OpIsInf`), and floating-point GLSL.std.450 extended instructions must flush denormals.

2) What is the denorm behavior for intermediate results?

RESOLVED: When a SPIR-V instruction is implemented as a sequence of other instructions:

- in the `DenormFlushToZero` execution mode, the intermediate instructions may flush denormals, the final result of the sequence **must** not be denormal.
- in the `DenormPreserve` execution mode, denormals must be preserved throughout the whole sequence.

3) Do denorm and rounding mode controls apply to `OpSpecConstantOp`?

RESOLVED: Yes, except when the opcode is `OpQuantizeToF16`.

4) The SPIR-V specification says that `OpConvertFToU` and `OpConvertFToS` unconditionally round towards zero. Do the rounding mode controls specified through the execution modes apply to them?

RESOLVED: No, these instructions unconditionally round towards zero.

5) Do any of the "Pack" GLSL.std.450 instructions count as conversion instructions and have the rounding mode applied?

RESOLVED: No, only instructions listed in "section 3.32.11. Conversion Instructions" of the SPIR-V specification count as conversion instructions.

6) When using inf/nan-ignore mode, what is expected of `OpIsNan` and `OpIsInf`?

RESOLVED: These instructions must always accurately detect inf/nan if it is passed to them.

Version 4 API Incompatibility

The original versions of `VK_KHR_shader_float_controls` shipped with booleans named "separateDenormSettings" and "separateRoundingModeSettings", which at first glance could have indicated "they can all be set independently, or not". However the spec language as written indicated that the 32-bit value could always be set independently, and only the 16- and 64-bit controls needed to be the same if these values were `VK_FALSE`.

As a result of this slight disparity, and lack of test coverage for this facet of the extension, we ended

up with two different behaviors in the wild, where some implementations worked as written, and others worked based on the naming. As these are hard limits in hardware with reasons for exposure as written, it was not possible to standardize on a single way to make this work within the existing API.

No known users of this part of the extension exist in the wild, and as such the Vulkan WG took the unusual step of retroactively changing the once boolean value into a tri-state enum, breaking source compatibility. This was however done in such a way as to retain ABI compatibility, in case any code using this did exist; with the numerical values 0 and 1 retaining their original specified meaning, and a new value signifying the additional "all need to be set together" state. If any applications exist today, compiled binaries will continue to work as written in most cases, but will need changes before the code can be recompiled.

Interactions and External Dependencies

- This extension requires `SPV_KHR_float_controls2`.

Contributors

- Graeme Leese, Broadcom

Description

This extension enables use of the more expressive fast floating-point math flags in the SPV_KHR_float_controls2 extension. These flags give finer- grained control over which optimizations compilers may apply, potentially speeding up execution while retaining correct results.

The extension also adds control over the fast-math modes to the GLSL extended instruction set, making these operations more consistent with SPIR-V and allowing their use in situations where floating-point conformance is important.

New Structures

Interactions and External Dependencies

- Requires SPIR-V 1.3.
- This extension requires `SPV_KHR_maximal_reconvergence`

Contributors

- Alan Baker, Google

Description

This extension allows the use of the `SPV_KHR_maximal_reconvergence` SPIR-V extension in shader modules. `SPV_KHR_maximal_reconvergence` provides stronger guarantees that diverged subgroups will reconverge. These guarantees should match shader author intuition about divergence and reconvergence of invocations based on the structure of the code in the HLL.

Developers should utilize this extension if they require stronger guarantees about reconvergence than either the core spec or SPV_KHR_subgroup_uniform_control_flow. This extension will define the rules that govern how invocations diverge and reconverge in a way that should match developer intuition. It allows robust programs to be written relying on subgroup operations and other tangled instructions.

New Structures

Interactions and External Dependencies

- Requires SPIR-V 1.3.
- This extension provides API support for `GL_EXT_subgroupuniform_qualifier`

Contributors

- Alan Baker, Google
- Jeff Bolz, NVIDIA

Description

This extension allows the use of the `SPV_KHR_subgroup_uniform_control_flow` SPIR-V extension in shader modules. `SPV_KHR_subgroup_uniform_control_flow` provides stronger guarantees that diverged subgroups will reconverge.

Developers should utilize this extension if they use subgroup operations to reduce the work performed by a uniform subgroup. This extension will guarantee that uniform subgroup will reconverge in the same manner as invocation groups (see “Uniform Control Flow” in the Khronos SPIR-V Specification).

New Structures

Description

This extension adds Vulkan support for the `SPV_KHR_terminate_invocation` SPIR-V extension. That SPIR-V extension provides a new instruction, `OpTerminateInvocation`, which causes a shader invocation to immediately terminate and sets the coverage of shaded samples to `0`; only previously executed instructions will have observable effects. The `OpTerminateInvocation` instruction, along with the `OpDemoteToHelperInvocation` instruction from the `VK_EXT_shader_demote_to_helper_invocation` extension, together replace the `OpKill` instruction, which could behave like either of these instructions. `OpTerminateInvocation` provides the behavior required by the GLSL `discard` statement, and should be used when available by GLSL compilers and

applications that need the GLSL `discard` behavior.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderTerminateInvocationFeaturesKHR

New Enum Constants

- `VK_KHR_SHADER_TERMINATE_INVOCATION_EXTENSION_NAME`
- `VK_KHR_SHADER_TERMINATE_INVOCATION_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TERMINATE_INVOCATION_FEATURES_KHR`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the KHR suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Description

This extension extends `VK_KHR_swapchain` to enable creation of a shared presentable image. This allows the application to use the image while the presention engine is accessing it, in order to reduce the latency between rendering and presentation.

New Commands

- vkGetSwapchainStatusKHR

New Structures

- Extending VkSurfaceCapabilities2KHR:
  - VkSharedPresentSurfaceCapabilitiesKHR

New Enum Constants

- `VK_KHR_SHARED_PRESENTABLE_IMAGE_EXTENSION_NAME`
- `VK_KHR_SHARED_PRESENTABLE_IMAGE_SPEC_VERSION`
- Extending VkImageLayout:
  - `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- Extending VkPresentModeKHR:
  - `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`
  - `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

Issues

1) Should we allow a Vulkan WSI swapchain to toggle between normal usage and shared presentation usage?

RESOLVED: No. WSI swapchains are typically recreated with new properties instead of having their properties changed. This can also save resources, assuming that fewer images are needed for shared presentation, and assuming that most VR applications do not need to switch between normal and shared usage.

2) Should we have a query for determining how the presentation engine refresh is triggered?

RESOLVED: Yes. This is done via which presentation modes a surface supports.

3) Should the object representing a shared presentable image be an extension of a VkSwapchainKHR or a separate object?

RESOLVED: Extension of a swapchain due to overlap in creation properties and to allow common functionality between shared and normal presentable images and swapchains.

4) What should we call the extension and the new structures it creates?

RESOLVED: Shared presentable image / shared present.

5) Should the `minImageCount` and `presentMode` values of the VkSwapchainCreateInfoKHR be ignored, or required to be compatible values?

RESOLVED: `minImageCount` must be 1, and `presentMode` should be set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

6) What should the layout of the shared presentable image be?

RESOLVED: After acquiring the shared presentable image, the application must transition it to the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout prior to it being used. After this initial transition, any image usage that was requested during swapchain creation **can** be performed on the image without layout transitions being performed.

7) Do we need a new API for the trigger to refresh new content?

RESOLVED: vkQueuePresentKHR to act as API to trigger a refresh, as will allow combination with other compatible extensions to vkQueuePresentKHR.

8) How should an application detect a VK_ERROR_OUT_OF_DATE_KHR error on a swapchain using the VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR present mode?

RESOLVED: Introduce vkGetSwapchainStatusKHR to allow applications to query the status of a swapchain using a shared presentation mode.

9) What should subsequent calls to vkQueuePresentKHR for VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR swapchains be defined to do?

RESOLVED: State that implementations may use it as a hint for updated content.

10) Can the ownership of a shared presentable image be transferred to a different queue?

RESOLVED: No. It is not possible to transfer ownership of a shared presentable image obtained from a swapchain created using VK_SHARING_MODE_EXCLUSIVE after it has been presented.

11) How should vkQueueSubmit behave if a command buffer uses an image from a VK_ERROR_OUT_OF_DATE_KHR swapchain?

RESOLVED: vkQueueSubmit is expected to return the VK_ERROR_DEVICE_LOST error.

12) Can Vulkan provide any guarantee on the order of rendering, to enable beam chasing?

RESOLVED: This could be achieved via use of render passes to ensure strip rendering.

Interactions and External Dependencies

- Requires SPIR-V 1.4.

Contributors

- Alexander Galazin, Arm
- David Neto, Google
- Jesse Hall, Google
- John Kessenich, Google
- Neil Henning, AMD
- Tom Olson, Arm

Description

This extension allows the use of SPIR-V 1.4 shader modules. SPIR-V 1.4's new features primarily make it an easier target for compilers from high-level languages, rather than exposing new hardware functionality.

SPIR-V 1.4 incorporates features that are also available separately as extensions. SPIR-V 1.4 shader modules do not need to enable those extensions with the `OpExtension` opcode, since they are integral parts of SPIR-V 1.4.

SPIR-V 1.4 introduces new floating-point execution mode capabilities, also available via `SPV_KHR_float_controls`. Implementations are not required to support all of these new capabilities; support can be queried using VkPhysicalDeviceFloatControlsPropertiesKHR from the `VK_KHR_shader_float_controls` extension.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Enum Constants

- `VK_KHR_SPIRV_1_4_EXTENSION_NAME`
- `VK_KHR_SPIRV_1_4_SPEC_VERSION`

Issues

1. Should we have an extension specific to this SPIR-V version, or add a version-generic query for SPIR-V version? SPIR-V 1.4 does not need any other API changes.

RESOLVED: Just expose SPIR-V 1.4.

Most new SPIR-V versions introduce optionally-required capabilities or have implementation-defined limits, and would need more API and specification changes specific to that version to make them available in Vulkan. For example, to support the subgroup capabilities added in SPIR-V 1.3 required introducing VkPhysicalDeviceSubgroupProperties to allow querying the supported group operation categories, maximum supported subgroup size, etc. While we could expose the parts of a new SPIR-V version that do not need accompanying changes generically, we will still end up writing extensions specific to each version for the remaining parts. Thus the generic mechanism will not reduce future spec-writing effort. In addition, making it clear which parts of a future version are supported by the generic mechanism and which cannot be used without specific support would be difficult to get right ahead of time.

2. Can different stages of the same pipeline use shaders with different SPIR-V versions?

RESOLVED: Yes.

Mixing SPIR-V versions 1.0-1.3 in the same pipeline has not been disallowed, so it would be inconsistent to disallow mixing 1.4 with previous versions. SPIR-V 1.4 does not introduce anything that should cause new difficulties here.

3. Must Vulkan extensions corresponding to SPIR-V extensions that were promoted to core in 1.4 be enabled in order to use that functionality in a SPIR-V 1.4 module?

RESOLVED: No, with caveats.

The SPIR-V 1.4 module does not need to declare the SPIR-V extensions, since the functionality is now part of core, so there is no need to enable the Vulkan extension that allows SPIR-V modules to declare the SPIR-V extension. However, when the functionality that is now core in SPIR-V 1.4 is optionally supported, the query for support is provided by a Vulkan extension, and that query can only be used if the extension is enabled.

This applies to any SPIR-V version; specifically for SPIR-V 1.4 this only applies to the functionality from `SPV_KHR_float_controls`, which was made available in Vulkan by `VK_KHR_shader_float_controls`. Even though the extension was promoted in SPIR-V 1.4, the

capabilities are still optional in implementations that support VK_KHR_spirv_1_4.

A SPIR-V 1.4 module does not need to enable SPV_KHR_float_controls in order to use the capabilities, so if the application has *a priori* knowledge that the implementation supports the capabilities, it does not need to enable VK_KHR_shader_float_controls. However, if it does not have this knowledge and has to query for support at runtime, it must enable VK_KHR_shader_float_controls in order to use VkPhysicalDeviceFloatControlsPropertiesKHR.

Description

The `VK_KHR_surface` extension is an instance extension. It introduces VkSurfaceKHR objects, which abstract native platform surface or window objects for use with Vulkan. It also provides a way to determine whether a queue family in a physical device supports presenting to particular surface.

Separate extensions for each platform provide the mechanisms for creating VkSurfaceKHR objects, but once created they may be used in this and other platform-independent extensions, in particular the `VK_KHR_swapchain` extension.

New Object Types

- VkSurfaceKHR

New Commands

- vkDestroySurfaceKHR
- vkGetPhysicalDeviceSurfaceCapabilitiesKHR
- vkGetPhysicalDeviceSurfaceFormatsKHR
- vkGetPhysicalDeviceSurfacePresentModesKHR
- vkGetPhysicalDeviceSurfaceSupportKHR

New Structures

- VkSurfaceCapabilitiesKHR
- VkSurfaceFormatKHR

New Enums

- VkColorSpaceKHR
- VkCompositeAlphaFlagBitsKHR

- VkPresentModeKHR
- VkSurfaceTransformFlagBitsKHR

New Bitmasks

- VkCompositeAlphaFlagsKHR

New Enum Constants

- VK_KHR_SURFACE_EXTENSION_NAME
- VK_KHR_SURFACE_SPEC_VERSION
- Extending VkObjectType:
  - VK_OBJECT_TYPE_SURFACE_KHR
- Extending VkResult:
  - VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
  - VK_ERROR_SURFACE_LOST_KHR

Examples

NOTE	The example code for the VK_KHR_surface and VK_KHR_swapchain extensions was removed from the appendix after revision 1.0.29. This WSI example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c).

Issues

1) Should this extension include a method to query whether a physical device supports presenting to a specific window or native surface on a given platform?

RESOLVED: Yes. Without this, applications would need to create a device instance to determine whether a particular window can be presented to. Knowing that a device supports presentation to a platform in general is not sufficient, as a single machine might support multiple seats, or instances of the platform that each use different underlying physical devices. Additionally, on some platforms, such as the X Window System, different drivers and devices might be used for different windows depending on which section of the desktop they exist on.

2) Should the vkGetPhysicalDeviceSurfaceCapabilitiesKHR, vkGetPhysicalDeviceSurfaceFormatsKHR, and vkGetPhysicalDeviceSurfacePresentModesKHR functions be in this extension and operate on physical devices, rather than being in VK_KHR_swapchain (i.e. device extension) and being dependent on VkDevice?

RESOLVED: Yes. While it might be useful to depend on VkDevice (and therefore on enabled extensions and features) for the queries, Vulkan was released only with the VkPhysicalDevice versions. Many cases can be resolved by a Valid Usage statement, and/or by a separate pNext chain version of the query struct specific to a given extension or parameters, via extensible versions of

the queries: vkGetPhysicalDeviceSurfacePresentModes2EXT, vkGetPhysicalDeviceSurfaceCapabilities2KHR, and vkGetPhysicalDeviceSurfaceFormats2KHR.

3) Should Vulkan support Xlib or XCB as the API for accessing the X Window System platform?

RESOLVED: Both. XCB is a more modern and efficient API, but Xlib usage is deeply ingrained in many applications and likely will remain in use for the foreseeable future. Not all drivers necessarily need to support both, but including both as options in the core specification will probably encourage support, which should in turn ease adoption of the Vulkan API in older codebases. Additionally, the performance improvements possible with XCB likely will not have a measurable impact on the performance of Vulkan presentation and other minimal window system interactions defined here.

4) Should the GBM platform be included in the list of platform enums?

RESOLVED: Deferred, and will be addressed with a platform-specific extension to be written in the future.

Version History

- Revision 1, 2015-05-20 (James Jones)
  - Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
- Revision 2, 2015-05-22 (Ian Elliott)
  - Created initial Description section.
  - Removed query for whether a platform requires the use of a queue for presentation, since it was decided that presentation will always be modeled as being part of the queue.
  - Fixed typos and other minor mistakes.
- Revision 3, 2015-05-26 (Ian Elliott)
  - Improved the Description section.
- Revision 4, 2015-05-27 (James Jones)
  - Fixed compilation errors in example code.
- Revision 5, 2015-06-01 (James Jones)
  - Added issues 1 and 2 and made related spec updates.
- Revision 6, 2015-06-01 (James Jones)
  - Merged the platform type mappings table previously removed from VK_KHR_swapchain with the platform description table in this spec.
  - Added issues 3 and 4 documenting choices made when building the initial list of native platforms supported.
- Revision 7, 2015-06-11 (Ian Elliott)
  - Updated table 1 per input from the KHR TSG.
  - Updated issue 4 (GBM) per discussion with Daniel Stone. He will create a platform-specific extension sometime in the future.

- Revision 8, 2015-06-17 (James Jones)
  - Updated enum-extending values using new convention.
  - Fixed the value of VK_SURFACE_PLATFORM_INFO_TYPE_SUPPORTED_KHR.
- Revision 9, 2015-06-17 (James Jones)
  - Rebased on Vulkan API version 126.
- Revision 10, 2015-06-18 (James Jones)
  - Marked issues 2 and 3 resolved.
- Revision 11, 2015-06-23 (Ian Elliott)
  - Examples now show use of function pointers for extension functions.
  - Eliminated extraneous whitespace.
- Revision 12, 2015-07-07 (Daniel Rakos)
  - Added error section describing when each error is expected to be reported.
  - Replaced the term “queue node index” with “queue family index” in the spec as that is the agreed term to be used in the latest version of the core header and spec.
  - Replaced bool32_t with VkBool32.
- Revision 13, 2015-08-06 (Daniel Rakos)
  - Updated spec against latest core API header version.
- Revision 14, 2015-08-20 (Ian Elliott)
  - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
  - Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.
  - Did miscellaneous cleanup, etc.
- Revision 15, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)
  - Moved the surface transform enums here from VK_WSI_swapchain so they could be reused by VK_WSI_display.
- Revision 16, 2015-09-01 (James Jones)
  - Restore single-field revision number.
- Revision 17, 2015-09-01 (James Jones)
  - Fix example code compilation errors.
- Revision 18, 2015-09-26 (Jesse Hall)
  - Replaced VkSurfaceDescriptionKHR with the VkSurfaceKHR object, which is created via layered extensions. Added VkDestroySurfaceKHR.
- Revision 19, 2015-09-28 (Jesse Hall)
  - Renamed from VK_EXT_KHR_swapchain to VK_EXT_KHR_surface.
- Revision 20, 2015-09-30 (Jeff Vigil)

    - Add error result VK_ERROR_SURFACE_LOST_KHR.
- Revision 21, 2015-10-15 (Daniel Rakos)
    - Updated the resolution of issue #2 and include the surface capability queries in this extension.
    - Renamed SurfaceProperties to SurfaceCapabilities as it better reflects that the values returned are the capabilities of the surface on a particular device.
    - Other minor cleanup and consistency changes.
- Revision 22, 2015-10-26 (Ian Elliott)
    - Renamed from VK_EXT_KHR_surface to VK_KHR_surface.
- Revision 23, 2015-11-03 (Daniel Rakos)
    - Added allocation callbacks to vkDestroySurfaceKHR.
- Revision 24, 2015-11-10 (Jesse Hall)
    - Removed VkSurfaceTransformKHR. Use VkSurfaceTransformFlagBitsKHR instead.
    - Rename VkSurfaceCapabilitiesKHR member maxImageArraySize to maxImageArrayLayers.
- Revision 25, 2016-01-14 (James Jones)
    - Moved VK_ERROR_NATIVE_WINDOW_IN_USE_KHR from the VK_KHR_android_surface to the VK_KHR_surface extension.
- 2016-08-23 (Ian Elliott)
    - Update the example code, to not have so many characters per line, and to split out a new example to show how to obtain function pointers.
- 2016-08-25 (Ian Elliott)
    - A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.

Description

This extension extends VkSurfaceCapabilities2KHR, providing applications a way to query whether swapchains **can** be created with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set.

Vulkan 1.1 added (optional) support for protect memory and protected resources including buffers (`VK_BUFFER_CREATE_PROTECTED_BIT`), images (`VK_IMAGE_CREATE_PROTECTED_BIT`), and swapchains (`VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR`). However, on implementations which support multiple windowing systems, not all window systems **may** be able to provide a protected display path.

This extension provides a way to query if a protected swapchain created for a surface (and thus a specific windowing system) **can** be displayed on screen. It extends the existing VkSurfaceCapabilities2KHR structure with a new VkSurfaceProtectedCapabilitiesKHR structure from which the application **can** obtain information about support for protected swapchain creation through vkGetPhysicalDeviceSurfaceCapabilities2KHR.

New Structures

- Extending VkSurfaceCapabilities2KHR:
  - VkSurfaceProtectedCapabilitiesKHR

New Enum Constants

- `VK_KHR_SURFACE_PROTECTED_CAPABILITIES_EXTENSION_NAME`
- `VK_KHR_SURFACE_PROTECTED_CAPABILITIES_SPEC_VERSION`
- Extending VkStructureType:

    - VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR

Version History

Description

The `VK_KHR_swapchain` extension is the device-level companion to the `VK_KHR_surface` extension. It introduces VkSwapchainKHR objects, which provide the ability to present rendering results to a surface.

New Object Types

- VkSwapchainKHR

New Commands

- vkAcquireNextImageKHR
- vkCreateSwapchainKHR
- vkDestroySwapchainKHR
- vkGetSwapchainImagesKHR
- vkQueuePresentKHR

If Vulkan Version 1.1 is supported:

- vkAcquireNextImage2KHR
- vkGetDeviceGroupPresentCapabilitiesKHR
- vkGetDeviceGroupSurfacePresentModesKHR
- vkGetPhysicalDevicePresentRectanglesKHR

New Structures

- VkPresentInfoKHR

- VkSwapchainCreateInfoKHR

If Vulkan Version 1.1 is supported:

- VkAcquireNextImageInfoKHR
- VkDeviceGroupPresentCapabilitiesKHR
- Extending VkBindImageMemoryInfo:
  - VkBindImageMemorySwapchainInfoKHR
- Extending VkImageCreateInfo:
  - VkImageSwapchainCreateInfoKHR
- Extending VkPresentInfoKHR:
  - VkDeviceGroupPresentInfoKHR
- Extending VkSwapchainCreateInfoKHR:
  - VkDeviceGroupSwapchainCreateInfoKHR

New Enums

- VkSwapchainCreateFlagBitsKHR

If Vulkan Version 1.1 is supported:

- VkDeviceGroupPresentModeFlagBitsKHR

New Bitmasks

- VkSwapchainCreateFlagsKHR

If Vulkan Version 1.1 is supported:

- VkDeviceGroupPresentModeFlagsKHR

New Enum Constants

- `VK_KHR_SWAPCHAIN_EXTENSION_NAME`
- `VK_KHR_SWAPCHAIN_SPEC_VERSION`
- Extending VkImageLayout:
  - `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- Extending VkObjectType:
  - `VK_OBJECT_TYPE_SWAPCHAIN_KHR`
- Extending VkResult:
  - `VK_ERROR_OUT_OF_DATE_KHR`
  - `VK_SUBOPTIMAL_KHR`
- Extending VkStructureType:

    - VK_STRUCTURE_TYPE_PRESENT_INFO_KHR
    - VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR

If Vulkan Version 1.1 is supported:

- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR
    - VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR
    - VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR
    - VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR
    - VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR
- Extending VkSwapchainCreateFlagBitsKHR:
    - VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR
    - VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR

Issues

1) Does this extension allow the application to specify the memory backing of the presentable images?

RESOLVED: No. Unlike standard images, the implementation will allocate the memory backing of the presentable image.

2) What operations are allowed on presentable images?

RESOLVED: This is determined by the image usage flags specified when creating the presentable image's swapchain.

3) Does this extension support MSAA presentable images?

RESOLVED: No. Presentable images are always single-sampled. Multi-sampled rendering must use regular images. To present the rendering results the application must manually resolve the multi-sampled image to a single-sampled presentable image prior to presentation.

4) Does this extension support stereo/multi-view presentable images?

RESOLVED: Yes. The number of views associated with a presentable image is determined by the `imageArrayLayers` specified when creating a swapchain. All presentable images in a given swapchain use the same array size.

5) Are the layers of stereo presentable images half-sized?

RESOLVED: No. The image extents always match those requested by the application.

6) Do the "present" and "acquire next image" commands operate on a queue? If not, do they need to include explicit semaphore objects to interlock them with queue operations?

RESOLVED: The present command operates on a queue. The image ownership operation it represents happens in order with other operations on the queue, so no explicit semaphore object is required to synchronize its actions.

Applications may want to acquire the next image in separate threads from those in which they manage their queue, or in multiple threads. To make such usage easier, the acquire next image command takes a semaphore to signal as a method of explicit synchronization. The application must later queue a wait for this semaphore before queuing execution of any commands using the image.

7) Does vkAcquireNextImageKHR block if no images are available?

RESOLVED: The command takes a timeout parameter. Special values for the timeout are 0, which makes the call a non-blocking operation, and `UINT64_MAX`, which blocks indefinitely. Values in between will block for up to the specified time. The call will return when an image becomes available or an error occurs. It may, but is not required to, return before the specified timeout expires if the swapchain becomes out of date.

8) Can multiple presents be queued using one vkQueuePresentKHR call?

RESOLVED: Yes. VkPresentInfoKHR contains a list of swapchains and corresponding image indices that will be presented. When supported, all presentations queued with a single vkQueuePresentKHR call will be applied atomically as one operation. The same swapchain must not appear in the list more than once. Later extensions may provide applications stronger guarantees of atomicity for such present operations, and/or allow them to query whether atomic presentation of a particular group of swapchains is possible.

9) How do the presentation and acquire next image functions notify the application the targeted surface has changed?

RESOLVED: Two new result codes are introduced for this purpose:

- `VK_SUBOPTIMAL_KHR` - Presentation will still succeed, subject to the window resize behavior, but the swapchain is no longer configured optimally for the surface it targets. Applications should query updated surface information and recreate their swapchain at the next convenient opportunity.
- `VK_ERROR_OUT_OF_DATE_KHR` - Failure. The swapchain is no longer compatible with the surface it targets. The application must query updated surface information and recreate the swapchain before presentation will succeed.

These can be returned by both vkAcquireNextImageKHR and vkQueuePresentKHR.

10) Does the vkAcquireNextImageKHR command return a semaphore to the application via an output parameter, or accept a semaphore to signal from the application as an object handle parameter?

RESOLVED: Accept a semaphore to signal as an object handle. This avoids the need to specify whether the application must destroy the semaphore or whether it is owned by the swapchain, and if the latter, what its lifetime is and whether it can be reused for other operations once it is received from vkAcquireNextImageKHR.

11) What types of swapchain queuing behavior should be exposed? Options include swap interval specification, mailbox/most recent vs. FIFO queue management, targeting specific vertical blank intervals or absolute times for a given present operation, and probably others. For some of these, whether they are specified at swapchain creation time or as per-present parameters needs to be decided as well.

RESOLVED: The base swapchain extension will expose 3 possible behaviors (of which, FIFO will always be supported):

- Immediate present: Does not wait for vertical blanking period to update the current image, likely resulting in visible tearing. No internal queue is used. Present requests are applied immediately.
- Mailbox queue: Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application.
- FIFO queue: Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal queue containing `numSwapchainImages` - 1 entries is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty

Not all surfaces will support all of these modes, so the modes supported will be returned using a surface information query. All surfaces must support the FIFO queue mode. Applications must choose one of these modes up front when creating a swapchain. Switching modes can be accomplished by recreating the swapchain.

12) Can `VK_PRESENT_MODE_MAILBOX_KHR` provide non-blocking guarantees for vkAcquireNextImageKHR? If so, what is the proper criteria?

RESOLVED: Yes. The difficulty is not immediately obvious here. Naively, if at least 3 images are requested, mailbox mode should always have an image available for the application if the application does not own any images when the call to vkAcquireNextImageKHR was made. However, some presentation engines may have more than one “current” image, and would still need to block in some cases. The right requirement appears to be that if the application allocates the surface’s minimum number of images + 1 then it is guaranteed non-blocking behavior when it does not currently own any images.

13) Is there a way to create and initialize a new swapchain for a surface that has generated a `VK_SUBOPTIMAL_KHR` return code while still using the old swapchain?

RESOLVED: Not as part of this specification. This could be useful to allow the application to create an “optimal” replacement swapchain and rebuild all its command buffers using it in a background thread at a low priority while continuing to use the “suboptimal” swapchain in the main thread. It could probably use the same “atomic replace” semantics proposed for recreating direct-to-device swapchains without incurring a mode switch. However, after discussion, it was determined some platforms probably could not support concurrent swapchains for the same surface though, so this

will be left out of the base KHR extensions. A future extension could add this for platforms where it is supported.

14) Should there be a special value for VkSurfaceCapabilitiesKHR::`maxImageCount` to indicate there are no practical limits on the number of images in a swapchain?

RESOLVED: Yes. There will often be cases where there is no practical limit to the number of images in a swapchain other than the amount of available resources (i.e., memory) in the system. Trying to derive a hard limit from things like memory size is prone to failure. It is better in such cases to leave it to applications to figure such soft limits out via trial/failure iterations.

15) Should there be a special value for VkSurfaceCapabilitiesKHR::`currentExtent` to indicate the size of the platform surface is undefined?

RESOLVED: Yes. On some platforms (Wayland, for example), the surface size is defined by the images presented to it rather than the other way around.

16) Should there be a special value for VkSurfaceCapabilitiesKHR::`maxImageExtent` to indicate there is no practical limit on the surface size?

RESOLVED: No. It seems unlikely such a system would exist. 0 could be used to indicate the platform places no limits on the extents beyond those imposed by Vulkan for normal images, but this query could just as easily return those same limits, so a special "unlimited" value does not seem useful for this field.

17) How should surface rotation and mirroring be exposed to applications? How do they specify rotation and mirroring transforms applied prior to presentation?

RESOLVED: Applications can query both the supported and current transforms of a surface. Both are specified relative to the device's "natural" display rotation and direction. The supported transforms indicate which orientations the presentation engine accepts images in. For example, a presentation engine that does not support transforming surfaces as part of presentation, and which is presenting to a surface that is displayed with a 90-degree rotation, would return only one supported transform bit: `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR`. Applications must transform their rendering by the transform they specify when creating the swapchain in `preTransform` field.

18) Can surfaces ever not support `VK_MIRROR_NONE`? Can they support vertical and horizontal mirroring simultaneously? Relatedly, should `VK_MIRROR_NONE`[_BIT] be zero, or bit one, and should applications be allowed to specify multiple pre and current mirror transform bits, or exactly one?

RESOLVED: Since some platforms may not support presenting with a transform other than the native window's current transform, and prerotation/mirroring are specified relative to the device's natural rotation and direction, rather than relative to the surface's current rotation and direction, it is necessary to express lack of support for no mirroring. To allow this, the `MIRROR_NONE` enum must occupy a bit in the flags. Since `MIRROR_NONE` must be a bit in the bitmask rather than a bitmask with no values set, allowing more than one bit to be set in the bitmask would make it possible to describe undefined transforms such as `VK_MIRROR_NONE_BIT | VK_MIRROR_HORIZONTAL_BIT`, or a transform that includes both "no mirroring" and "horizontal mirroring" simultaneously. Therefore, it is desirable to allow specifying all supported mirroring transforms using only one bit. The question then becomes, should there be a `VK_MIRROR_HORIZONTAL_AND_VERTICAL_BIT` to represent a

simultaneous horizontal and vertical mirror transform? However, such a transform is equivalent to a 180 degree rotation, so presentation engines and applications that wish to support or use such a transform can express it through rotation instead. Therefore, 3 exclusive bits are sufficient to express all needed mirroring transforms.

19) Should support for sRGB be required?

RESOLVED: In the advent of UHD and HDR display devices, proper color space information is vital to the display pipeline represented by the swapchain. The application can discover the supported format/color-space pairs and select a pair most suited to its rendering needs. Currently only the sRGB color space is supported, future extensions may provide support for more color spaces. See issues 23 and 24.

20) Is there a mechanism to modify or replace an existing swapchain with one targeting the same surface?

RESOLVED: Yes. This is described above in the text.

21) Should there be a way to set prerotation and mirroring using native APIs when presenting using a Vulkan swapchain?

RESOLVED: Yes. The transforms that can be expressed in this extension are a subset of those possible on native platforms. If a platform exposes a method to specify the transform of presented images for a given surface using native methods and exposes more transforms or other properties for surfaces than Vulkan supports, it might be impossible, difficult, or inconvenient to set some of those properties using Vulkan KHR extensions and some using the native interfaces. To avoid overwriting properties set using native commands when presenting using a Vulkan swapchain, the application can set the pretransform to “inherit”, in which case the current native properties will be used, or if none are available, a platform-specific default will be used. Platforms that do not specify a reasonable default or do not provide native mechanisms to specify such transforms should not include the inherit bits in the `supportedTransforms` bitmask they return in VkSurfaceCapabilitiesKHR.

22) Should the content of presentable images be clipped by objects obscuring their target surface?

RESOLVED: Applications can choose which behavior they prefer. Allowing the content to be clipped could enable more efficient presentation methods on some platforms, but some applications might rely on the content of presentable images to perform techniques such as partial updates or motion blurs.

23) What is the purpose of specifying a VkColorSpaceKHR along with VkFormat when creating a swapchain?

RESOLVED: While Vulkan itself is color space agnostic (e.g. even the meaning of R, G, B and A can be freely defined by the rendering application), the swapchain eventually will have to present the images on a display device with specific color reproduction characteristics. If any color space transformations are necessary before an image can be displayed, the color space of the presented image must be known to the swapchain. A swapchain will only support a restricted set of color format and -space pairs. This set can be discovered via vkGetPhysicalDeviceSurfaceFormatsKHR. As it can be expected that most display devices support the sRGB color space, at least one format/color-

space pair has to be exposed, where the color space is VK_COLOR_SPACE_SRGB_NONLINEAR_KHR.

24) How are sRGB formats and the sRGB color space related?

RESOLVED: While Vulkan exposes a number of SRGB texture formats, using such formats does not guarantee working in a specific color space. It merely means that the hardware can directly support applying the non-linear transfer functions defined by the sRGB standard color space when reading from or writing to images of those formats. Still, it is unlikely that a swapchain will expose a *_SRGB format along with any color space other than VK_COLOR_SPACE_SRGB_NONLINEAR_KHR.

On the other hand, non-*_SRGB formats will be very likely exposed in pair with a SRGB color space. This means, the hardware will not apply any transfer function when reading from or writing to such images, yet they will still be presented on a device with sRGB display characteristics. In this case the application is responsible for applying the transfer function, for instance by using shader math.

25) How are the lifetimes of surfaces and swapchains targeting them related?

RESOLVED: A surface must outlive any swapchains targeting it. A VkSurfaceKHR owns the binding of the native window to the Vulkan driver.

26) How can the application control the way the alpha component of swapchain images is treated by the presentation engine during compositing?

RESOLVED: We should add new enum values to allow the application to negotiate with the presentation engine on how to treat image alpha values during the compositing process. Since not all platforms can practically control this through the Vulkan driver, a value of VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR is provided like for surface transforms.

27) Is vkCreateSwapchainKHR the right function to return VK_ERROR_NATIVE_WINDOW_IN_USE_KHR, or should the various platform-specific VkSurfaceKHR factory functions catch this error earlier?

RESOLVED: For most platforms, the VkSurfaceKHR structure is a simple container holding the data that identifies a native window or other object representing a surface on a particular platform. For the surface factory functions to return this error, they would likely need to register a reference on the native objects with the native display server somehow, and ensure no other such references exist. Surfaces were not intended to be that heavyweight.

Swapchains are intended to be the objects that directly manipulate native windows and communicate with the native presentation mechanisms. Swapchains will already need to communicate with the native display server to negotiate allocation and/or presentation of presentable images for a native surface. Therefore, it makes more sense for swapchain creation to be the point at which native object exclusivity is enforced. Platforms may choose to enforce further restrictions on the number of VkSurfaceKHR objects that may be created for the same native window if such a requirement makes sense on a particular platform, but a global requirement is only sensible at the swapchain level.

Examples

NOTE	The example code for the VK_KHR_surface and VK_KHR_swapchain extensions was

> removed from the appendix after revision 1.0.29. This WSI example code was ported to the cube demo that is shipped with the official Khronos SDK, and is being kept up-to-date in that location (see: https://github.com/KhronosGroup/Vulkan-Tools/blob/main/cube/cube.c).

Version History

- Revision 1, 2015-05-20 (James Jones)
  - Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
- Revision 2, 2015-05-22 (Ian Elliott)
  - Made many agreed-upon changes from 2015-05-21 KHR TSG meeting. This includes using only a queue for presentation, and having an explicit function to acquire the next image.
  - Fixed typos and other minor mistakes.
- Revision 3, 2015-05-26 (Ian Elliott)
  - Improved the Description section.
  - Added or resolved issues that were found in improving the Description. For example, pSurfaceDescription is used consistently, instead of sometimes using pSurface.
- Revision 4, 2015-05-27 (James Jones)
  - Fixed some grammatical errors and typos
  - Filled in the description of imageUseFlags when creating a swapchain.
  - Added a description of swapInterval.
  - Replaced the paragraph describing the order of operations on a queue for image ownership and presentation.
- Revision 5, 2015-05-27 (James Jones)
  - Imported relevant issues from the (abandoned) vk_wsi_persistent_swapchain_images extension.
  - Added issues 6 and 7, regarding behavior of the acquire next image and present commands with respect to queues.
  - Updated spec language and examples to align with proposed resolutions to issues 6 and 7.
- Revision 6, 2015-05-27 (James Jones)
  - Added issue 8, regarding atomic presentation of multiple swapchains
  - Updated spec language and examples to align with proposed resolution to issue 8.
- Revision 7, 2015-05-27 (James Jones)
  - Fixed compilation errors in example code, and made related spec fixes.
- Revision 8, 2015-05-27 (James Jones)
  - Added issue 9, and the related VK_SUBOPTIMAL_KHR result code.
  - Renamed VK_OUT_OF_DATE_KHR to VK_ERROR_OUT_OF_DATE_KHR.
- Revision 9, 2015-05-27 (James Jones)

    - Added inline proposed resolutions (marked with [JRJ]) to some XXX questions/issues. These should be moved to the issues section in a subsequent update if the proposals are adopted.
- Revision 10, 2015-05-28 (James Jones)
    - Converted vkAcquireNextImageKHR back to a non-queue operation that uses a VkSemaphore object for explicit synchronization.
    - Added issue 10 to determine whether vkAcquireNextImageKHR generates or returns semaphores, or whether it operates on a semaphore provided by the application.
- Revision 11, 2015-05-28 (James Jones)
    - Marked issues 6, 7, and 8 resolved.
    - Renamed VkSurfaceCapabilityPropertiesKHR to VkSurfacePropertiesKHR to better convey the mutable nature of the information it contains.
- Revision 12, 2015-05-28 (James Jones)
    - Added issue 11 with a proposed resolution, and the related issue 12.
    - Updated various sections of the spec to match the proposed resolution to issue 11.
- Revision 13, 2015-06-01 (James Jones)
    - Moved some structures to VK_EXT_KHR_swap_chain to resolve the specification's issues 1 and 2.
- Revision 14, 2015-06-01 (James Jones)
    - Added code for example 4 demonstrating how an application might make use of the two different present and acquire next image KHR result codes.
    - Added issue 13.
- Revision 15, 2015-06-01 (James Jones)
    - Added issues 14 - 16 and related spec language.
    - Fixed some spelling errors.
    - Added language describing the meaningful return values for vkAcquireNextImageKHR and vkQueuePresentKHR.
- Revision 16, 2015-06-02 (James Jones)
    - Added issues 17 and 18, as well as related spec language.
    - Removed some erroneous text added by mistake in the last update.
- Revision 17, 2015-06-15 (Ian Elliott)
    - Changed special value from "-1" to "0" so that the data types can be unsigned.
- Revision 18, 2015-06-15 (Ian Elliott)
    - Clarified the values of VkSurfacePropertiesKHR::minImageCount and the timeout parameter of the vkAcquireNextImageKHR function.
- Revision 19, 2015-06-17 (James Jones)
    - Misc. cleanup. Removed resolved inline issues and fixed typos.
    - Fixed clarification of VkSurfacePropertiesKHR::minImageCount made in version 18.

    - Added a brief “Image Ownership” definition to the list of terms used in the spec.
- Revision 20, 2015-06-17 (James Jones)
    - Updated enum-extending values using new convention.
- Revision 21, 2015-06-17 (James Jones)
    - Added language describing how to use VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR.
    - Cleaned up an XXX comment regarding the description of which queues vkQueuePresentKHR can be used on.
- Revision 22, 2015-06-17 (James Jones)
    - Rebased on Vulkan API version 126.
- Revision 23, 2015-06-18 (James Jones)
    - Updated language for issue 12 to read as a proposed resolution.
    - Marked issues 11, 12, 13, 16, and 17 resolved.
    - Temporarily added links to the relevant bugs under the remaining unresolved issues.
    - Added issues 19 and 20 as well as proposed resolutions.
- Revision 24, 2015-06-19 (Ian Elliott)
    - Changed special value for VkSurfacePropertiesKHR::currentExtent back to “-1” from “0”. This value will never need to be unsigned, and “0” is actually a legal value.
- Revision 25, 2015-06-23 (Ian Elliott)
    - Examples now show use of function pointers for extension functions.
    - Eliminated extraneous whitespace.
- Revision 26, 2015-06-25 (Ian Elliott)
    - Resolved Issues 9 & 10 per KHR TSG meeting.
- Revision 27, 2015-06-25 (James Jones)
    - Added oldSwapchain member to VkSwapchainCreateInfoKHR.
- Revision 28, 2015-06-25 (James Jones)
    - Added the “inherit” bits to the rotation and mirroring flags and the associated issue 21.
- Revision 29, 2015-06-25 (James Jones)
    - Added the “clipped” flag to VkSwapchainCreateInfoKHR, and the associated issue 22.
    - Specified that presenting an image does not modify it.
- Revision 30, 2015-06-25 (James Jones)
    - Added language to the spec that clarifies the behavior of vkCreateSwapchainKHR() when the oldSwapchain field of VkSwapchainCreateInfoKHR is not NULL.
- Revision 31, 2015-06-26 (Ian Elliott)
    - Example of new VkSwapchainCreateInfoKHR members, “oldSwapchain” and “clipped”.
    - Example of using VkSurfacePropertiesKHR::{min|max}ImageCount to set VkSwapchainCreateInfoKHR::minImageCount.

    - Rename vkGetSurfaceInfoKHR()'s 4th parameter to “pDataSize”, for consistency with other functions.
    - Add macro with C-string name of extension (just to header file).
- Revision 32, 2015-06-26 (James Jones)
    - Minor adjustments to the language describing the behavior of “oldSwapchain”
    - Fixed the version date on my previous two updates.
- Revision 33, 2015-06-26 (Jesse Hall)
    - Add usage flags to VkSwapchainCreateInfoKHR
- Revision 34, 2015-06-26 (Ian Elliott)
    - Rename vkQueuePresentKHR()'s 2nd parameter to “pPresentInfo”, for consistency with other functions.
- Revision 35, 2015-06-26 (Faith Ekstrand)
    - Merged the VkRotationFlagBitsKHR and VkMirrorFlagBitsKHR enums into a single VkSurfaceTransformFlagBitsKHR enum.
- Revision 36, 2015-06-26 (Faith Ekstrand)
    - Added a VkSurfaceTransformKHR enum that is not a bitmask. Each value in VkSurfaceTransformKHR corresponds directly to one of the bits in VkSurfaceTransformFlagBitsKHR so transforming from one to the other is easy. Having a separate enum means that currentTransform and preTransform are now unambiguous by definition.
- Revision 37, 2015-06-29 (Ian Elliott)
    - Corrected one of the signatures of vkAcquireNextImageKHR, which had the last two parameters switched from what it is elsewhere in the specification and header files.
- Revision 38, 2015-06-30 (Ian Elliott)
    - Corrected a typo in description of the vkGetSwapchainInfoKHR() function.
    - Corrected a typo in header file comment for VkPresentInfoKHR::sType.
- Revision 39, 2015-07-07 (Daniel Rakos)
    - Added error section describing when each error is expected to be reported.
    - Replaced bool32_t with VkBool32.
- Revision 40, 2015-07-10 (Ian Elliott)
    - Updated to work with version 138 of the `vulkan.h` header. This includes declaring the VkSwapchainKHR type using the new VK_DEFINE_NONDISP_HANDLE macro, and no longer extending VkObjectType (which was eliminated).
- Revision 41 2015-07-09 (Mathias Heyer)
    - Added color space language.
- Revision 42, 2015-07-10 (Daniel Rakos)
    - Updated query mechanism to reflect the convention changes done in the core spec.

    - Removed “queue” from the name of VK_STRUCTURE_TYPE_QUEUE_PRESENT_INFO_KHR to be consistent with the established naming convention.
    - Removed reference to the no longer existing VkObjectType enum.
- Revision 43, 2015-07-17 (Daniel Rakos)
    - Added support for concurrent sharing of swapchain images across queue families.
    - Updated sample code based on recent changes
- Revision 44, 2015-07-27 (Ian Elliott)
    - Noted that support for VK_PRESENT_MODE_FIFO_KHR is required. That is ICDs may optionally support IMMEDIATE and MAILBOX, but must support FIFO.
- Revision 45, 2015-08-07 (Ian Elliott)
    - Corrected a typo in spec file (type and variable name had wrong case for the imageColorSpace member of the VkSwapchainCreateInfoKHR struct).
    - Corrected a typo in header file (last parameter in PFN_vkGetSurfacePropertiesKHR was missing “KHR” at the end of type: VkSurfacePropertiesKHR).
- Revision 46, 2015-08-20 (Ian Elliott)
    - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
    - Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.
    - Made improvements to several descriptions.
    - Changed the status of several issues from PROPOSED to RESOLVED, leaving no unresolved issues.
    - Resolved several TODOs, did miscellaneous cleanup, etc.
- Revision 47, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)
    - Moved the surface transform enums to VK_WSI_swapchain so they could be reused by VK_WSI_display.
- Revision 48, 2015-09-01 (James Jones)
    - Various minor cleanups.
- Revision 49, 2015-09-01 (James Jones)
    - Restore single-field revision number.
- Revision 50, 2015-09-01 (James Jones)
    - Update Example #4 to include code that illustrates how to use the oldSwapchain field.
- Revision 51, 2015-09-01 (James Jones)
    - Fix example code compilation errors.
- Revision 52, 2015-09-08 (Matthaeus G. Chajdas)
    - Corrected a typo.
- Revision 53, 2015-09-10 (Alon Or-bach)

    - Removed underscore from SWAP_CHAIN left in VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR.
- Revision 54, 2015-09-11 (Jesse Hall)
    - Described the execution and memory coherence requirements for image transitions to and from VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR.
- Revision 55, 2015-09-11 (Ray Smith)
    - Added errors for destroying and binding memory to presentable images
- Revision 56, 2015-09-18 (James Jones)
    - Added fence argument to vkAcquireNextImageKHR
    - Added example of how to meter a host thread based on presentation rate.
- Revision 57, 2015-09-26 (Jesse Hall)
    - Replace VkSurfaceDescriptionKHR with VkSurfaceKHR.
    - Added issue 25 with agreed resolution.
- Revision 58, 2015-09-28 (Jesse Hall)
    - Renamed from VK_EXT_KHR_device_swapchain to VK_EXT_KHR_swapchain.
- Revision 59, 2015-09-29 (Ian Elliott)
    - Changed vkDestroySwapchainKHR() to return void.
- Revision 60, 2015-10-01 (Jeff Vigil)
    - Added error result VK_ERROR_SURFACE_LOST_KHR.
- Revision 61, 2015-10-05 (Faith Ekstrand)
    - Added the VkCompositeAlpha enum and corresponding structure fields.
- Revision 62, 2015-10-12 (Daniel Rakos)
    - Added VK_PRESENT_MODE_FIFO_RELAXED_KHR.
- Revision 63, 2015-10-15 (Daniel Rakos)
    - Moved surface capability queries to VK_EXT_KHR_surface.
- Revision 64, 2015-10-26 (Ian Elliott)
    - Renamed from VK_EXT_KHR_swapchain to VK_KHR_swapchain.
- Revision 65, 2015-10-28 (Ian Elliott)
    - Added optional pResult member to VkPresentInfoKHR, so that per-swapchain results can be obtained from vkQueuePresentKHR().
- Revision 66, 2015-11-03 (Daniel Rakos)
    - Added allocation callbacks to create and destroy functions.
    - Updated resource transition language.
    - Updated sample code.
- Revision 67, 2015-11-10 (Jesse Hall)

    - Add reserved flags bitmask to VkSwapchainCreateInfoKHR.
    - Modify naming and member ordering to match API style conventions, and so the VkSwapchainCreateInfoKHR image property members mirror corresponding VkImageCreateInfo members but with an 'image' prefix.
    - Make VkPresentInfoKHR::pResults non-const; it is an output array parameter.
    - Make pPresentInfo parameter to vkQueuePresentKHR const.
- Revision 68, 2016-04-05 (Ian Elliott)
    - Moved the “validity” include for vkAcquireNextImage to be in its proper place, after the prototype and list of parameters.
    - Clarified language about presentable images, including how they are acquired, when applications can and cannot use them, etc. As part of this, removed language about “ownership” of presentable images, and replaced it with more-consistent language about presentable images being “acquired” by the application.
- 2016-08-23 (Ian Elliott)
    - Update the example code, to use the final API command names, to not have so many characters per line, and to split out a new example to show how to obtain function pointers. This code is more similar to the LunarG “cube” demo program.
- 2016-08-25 (Ian Elliott)
    - A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.
- Revision 69, 2017-09-07 (Tobias Hector)
    - Added interactions with Vulkan 1.1
- Revision 70, 2017-10-06 (Ian Elliott)
    - Corrected interactions with Vulkan 1.1

Description

This extension allows processing of swapchain images as different formats to that used by the window system, which is particularly useful for switching between sRGB and linear RGB formats.

It adds a new swapchain creation flag that enables creating image views from presentable images with a different format than the one used to create the swapchain.

New Enum Constants

- `VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_EXTENSION_NAME`
- `VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_SPEC_VERSION`
- Extending VkSwapchainCreateFlagBitsKHR:
  - `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR`

Issues

1) Are there any new capabilities needed?

RESOLVED: No. It is expected that all implementations exposing this extension support swapchain image format mutability.

2) Do we need a separate `VK_SWAPCHAIN_CREATE_EXTENDED_USAGE_BIT_KHR`?

RESOLVED: No. This extension requires `VK_KHR_maintenance2` and presentable images of swapchains created with `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` are created internally in a way equivalent to specifying both `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR`.

3) Do we need a separate structure to allow specifying an image format list for swapchains?

RESOLVED: No. We simply use the same VkImageFormatListCreateInfoKHR structure introduced by `VK_KHR_image_format_list`. The structure is required to be included in the `pNext` chain of VkSwapchainCreateInfoKHR for swapchains created with `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR`.

Description

This extension modifies the original core synchronization APIs to simplify the interface and improve usability of these APIs. It also adds new pipeline stage and access flag types that extend into the 64-bit range, as we have run out within the 32-bit range. The new flags are identical to the old values within the 32-bit range, with new stages and bits beyond that.

Pipeline stages and access flags are now specified together in memory barrier structures, making the connection between the two more obvious. Additionally, scoping the pipeline stages into the barrier structs allows the use of the `MEMORY_READ` and `MEMORY_WRITE` flags without sacrificing precision. The per-stage access flags should be used to disambiguate specific accesses in a given stage or set of stages - for instance, between uniform reads and sampling operations.

Layout transitions have been simplified as well; rather than requiring a different set of layouts for depth/stencil/color attachments, there are generic `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` and `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR` layouts which are contextually applied based on the image

format. For example, for a depth format image, VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR. VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR also functionally replaces VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL.

Events are now more efficient, because they include memory dependency information when you set them on the device. Previously, this information was only known when waiting on an event, so the dependencies could not be satisfied until the wait occurred. That sometimes meant stalling the pipeline when the wait occurred. The new API provides enough information for implementations to satisfy these dependencies in parallel with other tasks.

Queue submission has been changed to wrap command buffers and semaphores in extensible structures, which incorporate changes from Vulkan 1.1, VK_KHR_device_group, and VK_KHR_timeline_semaphore. This also adds a pipeline stage to the semaphore signal operation, mirroring the existing pipeline stage specification for wait operations.

Other miscellaneous changes include:

- Events can now be specified as interacting only with the device, allowing more efficient access to the underlying object.
- Image memory barriers that do not perform an image layout transition can be specified by setting oldLayout equal to newLayout.
    - E.g. the old and new layout can both be set to VK_IMAGE_LAYOUT_UNDEFINED, without discarding data in the image.
- Queue family ownership transfer parameters are simplified in some cases.
- Extensions with commands or functions with a VkPipelineStageFlags or VkPipelineStageFlagBits parameter have had those APIs replaced with equivalents using VkPipelineStageFlags2KHR.
- The new event and barrier interfaces are now more extensible for future changes.
- Relevant pipeline stage masks can now be specified as empty with the new VK_PIPELINE_STAGE_NONE_KHR and VK_PIPELINE_STAGE_2_NONE_KHR values.
- VkMemoryBarrier2KHR can be chained to VkSubpassDependency2, overriding the original 32-bit stage and access masks.

New Base Types

- VkFlags64

New Commands

- vkCmdPipelineBarrier2KHR
- vkCmdResetEvent2KHR
- vkCmdSetEvent2KHR
- vkCmdWaitEvents2KHR
- vkCmdWriteTimestamp2KHR

- VkSubmitInfo2KHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceSynchronization2FeaturesKHR
- Extending VkSubpassDependency2:
  - VkMemoryBarrier2KHR

New Enums

- VkAccessFlagBits2KHR
- VkPipelineStageFlagBits2KHR
- VkSubmitFlagBitsKHR

New Bitmasks

- VkAccessFlags2KHR
- VkPipelineStageFlags2KHR
- VkSubmitFlagsKHR

New Enum Constants

- `VK_KHR_SYNCHRONIZATION_2_EXTENSION_NAME`
- `VK_KHR_SYNCHRONIZATION_2_SPEC_VERSION`
- Extending VkAccessFlagBits:
  - `VK_ACCESS_NONE_KHR`
- Extending VkEventCreateFlagBits:
  - `VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR`
- Extending VkImageLayout:
  - `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR`
  - `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- Extending VkPipelineStageFlagBits:
  - `VK_PIPELINE_STAGE_NONE_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2_KHR`

    - VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO_KHR
    - VK_STRUCTURE_TYPE_DEPENDENCY_INFO_KHR
    - VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2_KHR
    - VK_STRUCTURE_TYPE_MEMORY_BARRIER_2_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SYNCHRONIZATION_2_FEATURES_KHR
    - VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO_KHR
    - VK_STRUCTURE_TYPE_SUBMIT_INFO_2_KHR

If VK_EXT_blend_operation_advanced is supported:

- Extending VkAccessFlagBits2:
    - VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT

If VK_EXT_conditional_rendering is supported:

- Extending VkAccessFlagBits2:
    - VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT
- Extending VkPipelineStageFlagBits2:
    - VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

If VK_EXT_device_generated_commands is supported:

- Extending VkAccessFlagBits2:
    - VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_EXT
    - VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_EXT
- Extending VkPipelineStageFlagBits2:
    - VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT

If VK_EXT_fragment_density_map is supported:

- Extending VkAccessFlagBits2:
    - VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT
- Extending VkPipelineStageFlagBits2:
    - VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT

If VK_EXT_mesh_shader is supported:

- Extending VkPipelineStageFlagBits2:
    - VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT
    - VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

If VK_EXT_transform_feedback is supported:

- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT
  - VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT
  - VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT
- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

If VK_KHR_acceleration_structure is supported:

- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR
  - VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR
- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

If VK_KHR_fragment_shading_rate is supported:

- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR
- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

If VK_KHR_ray_tracing_pipeline is supported:

- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

If VK_NV_device_generated_commands is supported:

- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV
  - VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV
- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV

If VK_NV_mesh_shader is supported:

- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_NV
  - VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV

If VK_NV_ray_tracing is supported:

- Extending VkAccessFlagBits2:
  - `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_NV`
  - `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_NV`
- Extending VkPipelineStageFlagBits2:
  - `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_NV`
  - `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_NV`

If VK_NV_shading_rate_image is supported:

- Extending VkAccessFlagBits2:
  - `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV`
- Extending VkPipelineStageFlagBits2:
  - `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the KHR suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

- Yuriy O'Donnell, Epic Games
- Faith Ekstrand, Intel
- Jesse Hall, Google
- James Jones, NVIDIA
- Jeff Juliano, NVIDIA
- Daniel Rakos, AMD
- Ray Smith, Arm

Description

This extension introduces a new type of semaphore that has an integer payload identifying a point in a timeline. Such timeline semaphores support the following operations:

- Host query - A host operation that allows querying the payload of the timeline semaphore.
- Host wait - A host operation that allows a blocking wait for a timeline semaphore to reach a specified value.
- Host signal - A host operation that allows advancing the timeline semaphore to a specified value.
- Device wait - A device operation that allows waiting for a timeline semaphore to reach a

specified value.

- Device signal - A device operation that allows advancing the timeline semaphore to a specified value.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Commands

- vkGetSemaphoreCounterValueKHR
- vkSignalSemaphoreKHR
- vkWaitSemaphoresKHR

New Structures

- VkSemaphoreSignalInfoKHR
- VkSemaphoreWaitInfoKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceTimelineSemaphoreFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceTimelineSemaphorePropertiesKHR
- Extending VkSemaphoreCreateInfo, VkPhysicalDeviceExternalSemaphoreInfo:
  - VkSemaphoreTypeCreateInfoKHR
- Extending VkSubmitInfo, VkBindSparseInfo:
  - VkTimelineSemaphoreSubmitInfoKHR

New Enums

- VkSemaphoreTypeKHR
- VkSemaphoreWaitFlagBitsKHR

New Bitmasks

- VkSemaphoreWaitFlagsKHR

New Enum Constants

- `VK_KHR_TIMELINE_SEMAPHORE_EXTENSION_NAME`
- `VK_KHR_TIMELINE_SEMAPHORE_SPEC_VERSION`
- Extending VkSemaphoreType:
  - `VK_SEMAPHORE_TYPE_BINARY_KHR`

    - VK_SEMAPHORE_TYPE_TIMELINE_KHR
- Extending VkSemaphoreWaitFlagBits:
    - VK_SEMAPHORE_WAIT_ANY_BIT_KHR
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_FEATURES_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_PROPERTIES_KHR
    - VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO_KHR
    - VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO_KHR
    - VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO_KHR

Issues

1) Do we need a new object type for this?

RESOLVED: No, we just introduce a new type of semaphore object, as VK_KHR_external_semaphore_win32 already uses semaphores as the destination for importing D3D12 fence objects, which are semantically close/identical to the proposed synchronization primitive.

2) What type of payload the new synchronization primitive has?

RESOLVED: A 64-bit unsigned integer that can only be set to strictly increasing values by signal operations and is not changed by wait operations.

3) Does the new synchronization primitive have the same signal-before-wait requirement as the existing semaphores do?

RESOLVED: No. Timeline semaphores support signaling and waiting entirely asynchronously. It is the responsibility of the application to avoid deadlock.

4) Does the new synchronization primitive allow resetting its payload?

RESOLVED: No, allowing the payload value to “go backwards” is problematic. Applications looking for reset behavior should create a new instance of the synchronization primitive instead.

5) How do we enable host waits on the synchronization primitive?

RESOLVED: Both a non-blocking query of the current payload value of the synchronization primitive, and a blocking wait operation are provided.

6) How do we enable device waits and signals on the synchronization primitive?

RESOLVED: Similar to VK_KHR_external_semaphore_win32, this extension introduces a new structure that can be chained to VkSubmitInfo to specify the values signaled semaphores should be set to, and the values waited semaphores need to reach.

7) Can the new synchronization primitive be used to synchronize presentation and swapchain

image acquisition operations?

RESOLVED: Some implementations may have problems with supporting that directly, thus it is not allowed in this extension.

8) Do we want to support external sharing of the new synchronization primitive type?

RESOLVED: Yes. Timeline semaphore specific external sharing capabilities can be queried using vkGetPhysicalDeviceExternalSemaphoreProperties by chaining the new VkSemaphoreTypeCreateInfoKHR structure to its `pExternalSemaphoreInfo` structure. This allows having a different set of external semaphore handle types supported for timeline semaphores vs. binary semaphores.

9) Do we need to add a host signal operation for the new synchronization primitive type?

RESOLVED: Yes. This helps in situations where one host thread submits a workload but another host thread has the information on when the workload is ready to be executed.

10) How should the new synchronization primitive interact with the ordering requirements of the original `VkSemaphore`?

RESOLVED: Prior to calling any command which **may** cause a wait operation on a binary semaphore, the application **must** ensure that the semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution.

11) Should we have separate feature bits for different sub-features of timeline semaphores?

RESOLVED: No. The only feature which cannot be supported universally is timeline semaphore import/export. For import/export, the application is already required to query available external handle types via vkGetPhysicalDeviceExternalSemaphoreProperties and provide the semaphore type by adding a VkSemaphoreTypeCreateInfoKHR structure to the `pNext` chain of VkPhysicalDeviceExternalSemaphoreInfo so no new feature bit is required.

Description

This extension enables tighter array and struct packing to be used with uniform buffers.

It modifies the alignment rules for uniform buffers, allowing for tighter packing of arrays and structures. This allows, for example, the std430 layout, as defined in GLSL to be supported in uniform buffers.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

Description

This extension builds upon the `VK_KHR_video_decode_queue` extension by adding support for decoding elementary video stream sequences compliant with the H.264/AVC video compression standard.

NOTE This extension was promoted to `KHR` from the provisional extension

VK_EXT_video_decode_h264.

New Structures

- Extending VkVideoCapabilitiesKHR:
  - VkVideoDecodeH264CapabilitiesKHR
- Extending VkVideoDecodeInfoKHR:
  - VkVideoDecodeH264PictureInfoKHR
- Extending VkVideoProfileInfoKHR, VkQueryPoolCreateInfo:
  - VkVideoDecodeH264ProfileInfoKHR
- Extending VkVideoReferenceSlotInfoKHR:
  - VkVideoDecodeH264DpbSlotInfoKHR
- Extending VkVideoSessionParametersCreateInfoKHR:
  - VkVideoDecodeH264SessionParametersCreateInfoKHR
- Extending VkVideoSessionParametersUpdateInfoKHR:
  - VkVideoDecodeH264SessionParametersAddInfoKHR

New Enums

- VkVideoDecodeH264PictureLayoutFlagBitsKHR

New Bitmasks

- VkVideoDecodeH264PictureLayoutFlagsKHR

New Enum Constants

- VK_KHR_VIDEO_DECODE_H264_EXTENSION_NAME
- VK_KHR_VIDEO_DECODE_H264_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_CAPABILITIES_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_DPB_SLOT_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PICTURE_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PROFILE_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR
- Extending VkVideoCodecOperationFlagBitsKHR:
  - VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR

Version History

- Revision 1, 2018-6-11 (Peter Fang)
  - Initial draft
- Revision 2, March 29 2021 (Tony Zlatinski)
  - Spec and API Updates
- Revision 3, August 1 2021 (Srinath Kumarapuram)
  - Rename `VkVideoDecodeH264FieldLayoutFlagsEXT` to `VkVideoDecodeH264PictureLayoutFlagsEXT`, `VkVideoDecodeH264FieldLayoutFlagBitsEXT` to `VkVideoDecodeH264PictureLayoutFlagBitsEXT` (along with the names of enumerants it defines), and `VkVideoDecodeH264ProfileEXT.fieldLayout` to `VkVideoDecodeH264ProfileEXT.pictureLayout`, following Vulkan naming conventions.
- Revision 4, 2022-03-16 (Ahmed Abdelkhalek)
  - Relocate Std header version reporting/requesting from this extension to VK_KHR_video_queue extension.
  - Remove the now empty VkVideoDecodeH264SessionCreateInfoEXT.
- Revision 5, 2022-03-31 (Ahmed Abdelkhalek)
  - Use type StdVideoH264Level for VkVideoDecodeH264Capabilities.maxLevel
- Revision 6, 2022-08-09 (Daniel Rakos)
  - Rename `VkVideoDecodeH264ProfileEXT` to `VkVideoDecodeH264ProfileInfoEXT`
  - Rename `VkVideoDecodeH264MvcEXT` to `VkVideoDecodeH264MvcInfoEXT`
- Revision 7, 2022-09-18 (Daniel Rakos)
  - Change type of `VkVideoDecodeH264ProfileInfoEXT::pictureLayout` to `VkVideoDecodeH264PictureLayoutFlagBitsEXT`
  - Remove MVC support and related `VkVideoDecodeH264MvcInfoEXT` structure
  - Rename `spsStdCount`, `pSpsStd`, `ppsStdCount`, and `pPpsStd` to `stdSPSCount`, `pStdSPSs`, `stdPPSCount`, and `pStdPPSs`, respectively, in `VkVideoDecodeH264SessionParametersAddInfoEXT`
  - Rename `maxSpsStdCount` and `maxPpsStdCount` to `maxStdSPSCount` and `maxStdPPSCount`, respectively, in `VkVideoDecodeH264SessionParametersCreateInfoEXT`
  - Rename `slicesCount` and `pSlicesDataOffsets` to `sliceCount` and `pSliceOffsets`, respectively, in `VkVideoDecodeH264PictureInfoEXT`
- Revision 8, 2022-09-29 (Daniel Rakos)
  - Change extension from `EXT` to `KHR`
  - Extension is no longer provisional
- Revision 9, 2023-12-05 (Daniel Rakos)
  - Condition reference picture setup based on the value of `StdVideoDecodeH264PictureInfo::flags.is_reference`

Description

This extension builds upon the VK_KHR_video_decode_queue extension by adding support for decoding elementary video stream sequences compliant with the H.265/HEVC video compression standard.

NOTE	This extension was promoted to KHR from the provisional extension VK_EXT_video_decode_h265.

New Structures

- Extending VkVideoCapabilitiesKHR:
  - VkVideoDecodeH265CapabilitiesKHR
- Extending VkVideoDecodeInfoKHR:
  - VkVideoDecodeH265PictureInfoKHR
- Extending VkVideoProfileInfoKHR, VkQueryPoolCreateInfo:
  - VkVideoDecodeH265ProfileInfoKHR
- Extending VkVideoReferenceSlotInfoKHR:
  - VkVideoDecodeH265DpbSlotInfoKHR
- Extending VkVideoSessionParametersCreateInfoKHR:
  - VkVideoDecodeH265SessionParametersCreateInfoKHR
- Extending VkVideoSessionParametersUpdateInfoKHR:
  - VkVideoDecodeH265SessionParametersAddInfoKHR

New Enum Constants

- VK_KHR_VIDEO_DECODE_H265_EXTENSION_NAME
- VK_KHR_VIDEO_DECODE_H265_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_CAPABILITIES_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_DPB_SLOT_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PICTURE_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PROFILE_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_ADD_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_CREATE_INFO_KHR
- Extending VkVideoCodecOperationFlagBitsKHR:
  - VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR

Version History

- Revision 1, 2018-6-11 (Peter Fang)

    - Initial draft
- Revision 1.6, March 29 2021 (Tony Zlatinski)
    - Spec and API updates.
- Revision 2, 2022-03-16 (Ahmed Abdelkhalek)
    - Relocate Std header version reporting/requesting from this extension to VK_KHR_video_queue extension.
    - Remove the now empty VkVideoDecodeH265SessionCreateInfoEXT.
- Revision 3, 2022-03-31 (Ahmed Abdelkhalek)
    - Use type StdVideoH265Level for VkVideoDecodeH265Capabilities.maxLevel
- Revision 4, 2022-08-09 (Daniel Rakos)
    - Rename `VkVideoDecodeH265ProfileEXT` to `VkVideoDecodeH265ProfileInfoEXT`
- Revision 5, 2022-09-18 (Daniel Rakos)
    - Rename `vpsStdCount`, `pVpsStd`, `spsStdCount`, `pSpsStd`, `ppsStdCount`, and `pPpsStd` to `stdVPSCount`, `pStdVPSs`, `stdSPSCount`, `pStdSPSs`, `stdPPSCount`, and `pStdPPSs`, respectively, in `VkVideoDecodeH265SessionParametersAddInfoEXT`
    - Rename `maxVpsStdCount`, `maxSpsStdCount`, and `maxPpsStdCount` to `maxStdVPSCount`, `maxStdSPSCount` and `maxStdPPSCount`, respectively, in `VkVideoDecodeH265SessionParametersCreateInfoEXT`
    - Rename `slicesCount` and `pSlicesDataOffsets` to `sliceCount` and `pSliceOffsets`, respectively, in `VkVideoDecodeH265PictureInfoEXT`
- Revision 6, 2022-11-14 (Daniel Rakos)
    - Rename `slice` to `sliceSegment` in the APIs for better clarity
- Revision 7, 2022-11-14 (Daniel Rakos)
    - Change extension from `EXT` to `KHR`
    - Extension is no longer provisional
- Revision 8, 2023-12-05 (Daniel Rakos)
    - Condition reference picture setup based on the value of `StdVideoDecodeH265PictureInfo::flags.IsReference`

- Daniel Rakos, RasterGrid

Description

This extension builds upon the `VK_KHR_video_queue` extension by adding common APIs specific to video decoding and thus enabling implementations to expose queue families supporting video decode operations.

More specifically, it adds video decode specific capabilities and a new command buffer command that allows recording video decode operations against a video session.

This extension is to be used in conjunction with other codec specific video decode extensions that enable decoding video sequences of specific video compression standards.

New Commands

- vkCmdDecodeVideoKHR

New Structures

- VkVideoDecodeInfoKHR
- Extending VkVideoCapabilitiesKHR:
  - VkVideoDecodeCapabilitiesKHR
- Extending VkVideoProfileInfoKHR, VkQueryPoolCreateInfo:
  - VkVideoDecodeUsageInfoKHR

New Enums

- VkVideoDecodeCapabilityFlagBitsKHR
- VkVideoDecodeUsageFlagBitsKHR

New Bitmasks

- VkVideoDecodeCapabilityFlagsKHR
- VkVideoDecodeFlagsKHR
- VkVideoDecodeUsageFlagsKHR

New Enum Constants

- `VK_KHR_VIDEO_DECODE_QUEUE_EXTENSION_NAME`
- `VK_KHR_VIDEO_DECODE_QUEUE_SPEC_VERSION`
- Extending VkAccessFlagBits2:
  - `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`
  - `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`
- Extending VkBufferUsageFlagBits:
  - `VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR`
  - `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR`
- Extending VkFormatFeatureFlagBits:
  - `VK_FORMAT_FEATURE_VIDEO_DECODE_DPB_BIT_KHR`
  - `VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR`
- Extending VkImageLayout:

    - VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR
    - VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR
    - VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR
- Extending VkImageUsageFlagBits:
    - VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR
    - VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR
    - VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- Extending VkPipelineStageFlagBits2:
    - VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR
- Extending VkQueueFlagBits:
    - VK_QUEUE_VIDEO_DECODE_BIT_KHR
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_VIDEO_DECODE_CAPABILITIES_KHR
    - VK_STRUCTURE_TYPE_VIDEO_DECODE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_DECODE_USAGE_INFO_KHR

If VK_KHR_format_feature_flags2 or Vulkan Version 1.3 is supported:

- Extending VkFormatFeatureFlagBits2:
    - VK_FORMAT_FEATURE_2_VIDEO_DECODE_DPB_BIT_KHR
    - VK_FORMAT_FEATURE_2_VIDEO_DECODE_OUTPUT_BIT_KHR

Version History

- Revision 1, 2018-6-11 (Peter Fang)
    - Initial draft
- Revision 1.5, Nov 09 2018 (Tony Zlatinski)
    - API Updates
- Revision 1.6, Jan 08 2020 (Tony Zlatinski)
    - API unify with the video_encode_queue spec
- Revision 1.7, March 29 2021 (Tony Zlatinski)
    - Spec and API updates.
- Revision 2, September 30 2021 (Jon Leech)
    - Add interaction with VK_KHR_format_feature_flags2 to vk.xml
- Revision 3, 2022-02-25 (Ahmed Abdelkhalek)
    - Add VkVideoDecodeCapabilitiesKHR with new flags to report support for decode DPB and output coinciding in the same image, or in distinct images.
- Revision 4, 2022-03-31 (Ahmed Abdelkhalek)

    - Remove redundant VkVideoDecodeInfoKHR.coded{Offset|Extent}
- Revision 5, 2022-07-18 (Daniel Rakos)
    - Remove `VkVideoDecodeFlagBitsKHR` as it contains no defined flags for now
- Revision 6, 2022-08-12 (Daniel Rakos)
    - Add VkVideoDecodeUsageInfoKHR structure and related flags
- Revision 7, 2022-09-29 (Daniel Rakos)
    - Extension is no longer provisional
- Revision 8, 2023-12-05 (Daniel Rakos)
    - Require the specification of a reconstructed picture in all cases, except when the video session was created with no DPB slots to match shipping implementations
    - Make DPB slot activation behavior codec-specific to continue allowing application control over reference picture setup now that a reconstructed picture is always mandatory

Description

This extension builds upon the `VK_KHR_video_encode_queue` extension by adding support for encoding elementary video stream sequences compliant with the AV1 video compression standard.

New Structures

- VkVideoEncodeAV1FrameSizeKHR
- VkVideoEncodeAV1QIndexKHR
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVideoEncodeAV1FeaturesKHR
- Extending VkVideoBeginCodingInfoKHR:
  - VkVideoEncodeAV1GopRemainingFrameInfoKHR
- Extending VkVideoCapabilitiesKHR:
  - VkVideoEncodeAV1CapabilitiesKHR
- Extending VkVideoCodingControlInfoKHR, VkVideoBeginCodingInfoKHR:
  - VkVideoEncodeAV1RateControlInfoKHR
- Extending VkVideoEncodeInfoKHR:
  - VkVideoEncodeAV1PictureInfoKHR
- Extending VkVideoEncodeQualityLevelPropertiesKHR:

    - VkVideoEncodeAV1QualityLevelPropertiesKHR
- Extending VkVideoEncodeRateControlLayerInfoKHR:
    - VkVideoEncodeAV1RateControlLayerInfoKHR
- Extending VkVideoProfileInfoKHR, VkQueryPoolCreateInfo:
    - VkVideoEncodeAV1ProfileInfoKHR
- Extending VkVideoReferenceSlotInfoKHR:
    - VkVideoEncodeAV1DpbSlotInfoKHR
- Extending VkVideoSessionCreateInfoKHR:
    - VkVideoEncodeAV1SessionCreateInfoKHR
- Extending VkVideoSessionParametersCreateInfoKHR:
    - VkVideoEncodeAV1SessionParametersCreateInfoKHR

New Enums

- VkVideoEncodeAV1CapabilityFlagBitsKHR
- VkVideoEncodeAV1PredictionModeKHR
- VkVideoEncodeAV1RateControlFlagBitsKHR
- VkVideoEncodeAV1RateControlGroupKHR
- VkVideoEncodeAV1StdFlagBitsKHR
- VkVideoEncodeAV1SuperblockSizeFlagBitsKHR

New Bitmasks

- VkVideoEncodeAV1CapabilityFlagsKHR
- VkVideoEncodeAV1RateControlFlagsKHR
- VkVideoEncodeAV1StdFlagsKHR
- VkVideoEncodeAV1SuperblockSizeFlagsKHR

New Enum Constants

- `VK_KHR_VIDEO_ENCODE_AV1_EXTENSION_NAME`
- `VK_KHR_VIDEO_ENCODE_AV1_SPEC_VERSION`
- `VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR`
- Extending VkStructureType:
    - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_ENCODE_AV1_FEATURES_KHR`
    - `VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_CAPABILITIES_KHR`
    - `VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_DPB_SLOT_INFO_KHR`
    - `VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_GOP_REMAINING_FRAME_INFO_KHR`
    - `VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_PICTURE_INFO_KHR`

    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_PROFILE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_QUALITY_LEVEL_PROPERTIES_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_RATE_CONTROL_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_RATE_CONTROL_LAYER_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_SESSION_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_SESSION_PARAMETERS_CREATE_INFO_KHR
- Extending VkVideoCodecOperationFlagBitsKHR:
    - VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR

Version History

- Revision 1, 2024-09-23 (Daniel Rakos)

Description

This extension builds upon the `VK_KHR_video_encode_queue` extension by adding support for encoding elementary video stream sequences compliant with the H.264/AVC video compression standard.

NOTE	This extension was promoted to `KHR` from the provisional extension `VK_EXT_video_encode_h264`.

New Structures

- VkVideoEncodeH264FrameSizeKHR
- VkVideoEncodeH264NaluSliceInfoKHR
- VkVideoEncodeH264QpKHR
- Extending VkVideoBeginCodingInfoKHR:
  - VkVideoEncodeH264GopRemainingFrameInfoKHR
- Extending VkVideoCapabilitiesKHR:
  - VkVideoEncodeH264CapabilitiesKHR
- Extending VkVideoCodingControlInfoKHR, VkVideoBeginCodingInfoKHR:
  - VkVideoEncodeH264RateControlInfoKHR
- Extending VkVideoEncodeInfoKHR:
  - VkVideoEncodeH264PictureInfoKHR

- Extending VkVideoEncodeQualityLevelPropertiesKHR:
  - VkVideoEncodeH264QualityLevelPropertiesKHR
- Extending VkVideoEncodeRateControlLayerInfoKHR:
  - VkVideoEncodeH264RateControlLayerInfoKHR
- Extending VkVideoEncodeSessionParametersFeedbackInfoKHR:
  - VkVideoEncodeH264SessionParametersFeedbackInfoKHR
- Extending VkVideoEncodeSessionParametersGetInfoKHR:
  - VkVideoEncodeH264SessionParametersGetInfoKHR
- Extending VkVideoProfileInfoKHR, VkQueryPoolCreateInfo:
  - VkVideoEncodeH264ProfileInfoKHR
- Extending VkVideoReferenceSlotInfoKHR:
  - VkVideoEncodeH264DpbSlotInfoKHR
- Extending VkVideoSessionCreateInfoKHR:
  - VkVideoEncodeH264SessionCreateInfoKHR
- Extending VkVideoSessionParametersCreateInfoKHR:
  - VkVideoEncodeH264SessionParametersCreateInfoKHR
- Extending VkVideoSessionParametersUpdateInfoKHR:
  - VkVideoEncodeH264SessionParametersAddInfoKHR

New Enums

- VkVideoEncodeH264CapabilityFlagBitsKHR
- VkVideoEncodeH264RateControlFlagBitsKHR
- VkVideoEncodeH264StdFlagBitsKHR

New Bitmasks

- VkVideoEncodeH264CapabilityFlagsKHR
- VkVideoEncodeH264RateControlFlagsKHR
- VkVideoEncodeH264StdFlagsKHR

New Enum Constants

- `VK_KHR_VIDEO_ENCODE_H264_EXTENSION_NAME`
- `VK_KHR_VIDEO_ENCODE_H264_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_CAPABILITIES_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_DPB_SLOT_INFO_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_GOP_REMAINING_FRAME_INFO_KHR`

    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_NALU_SLICE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PICTURE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PROFILE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_QUALITY_LEVEL_PROPERTIES_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_LAYER_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_FEEDBACK_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_GET_INFO_KHR
- Extending VkVideoCodecOperationFlagBitsKHR:
    - VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR

Version History

- Revision 0, 2018-7-23 (Ahmed Abdelkhalek)
    - Initial draft
- Revision 0.5, 2020-02-13 (Tony Zlatinski)
    - General Spec cleanup
    - Added DPB structures
    - Change the VCL frame encode structure
    - Added a common Non-VCL Picture Paramarameters structure
- Revision 1, 2021-03-29 (Tony Zlatinski)
    - Spec and API updates
- Revision 2, August 1 2021 (Srinath Kumarapuram)
    - Rename VkVideoEncodeH264CapabilitiesFlagsEXT to VkVideoEncodeH264CapabilityFlagsEXT and VkVideoEncodeH264CapabilitiesFlagsEXT to VkVideoEncodeH264CapabilityFlagsEXT, following Vulkan naming conventions.
- Revision 3, 2021-12-08 (Ahmed Abdelkhalek)
    - Rate control updates
- Revision 4, 2022-02-04 (Ahmed Abdelkhalek)
    - Align VkVideoEncodeH264VclFrameInfoEXT structure to similar one in VK_EXT_video_encode_h265 extension
- Revision 5, 2022-02-10 (Ahmed Abdelkhalek)
    - Updates to encode capability interface
- Revision 6, 2022-03-16 (Ahmed Abdelkhalek)

    - Relocate Std header version reporting/requesting from this extension to VK_KHR_video_queue extension.
    - Remove redundant maxPictureSizeInMbs from VkVideoEncodeH264SessionCreateInfoEXT.
    - Remove the now empty VkVideoEncodeH264SessionCreateInfoEXT.
- Revision 7, 2022-04-06 (Ahmed Abdelkhalek)
    - Add capability flag to report support to use B frame in L1 reference list.
    - Add capability flag to report support for disabling SPS direct_8x8_inference_flag.
- Revision 8, 2022-07-18 (Daniel Rakos)
    - Replace `VkVideoEncodeH264RateControlStructureFlagBitsEXT` bit enum with `VkVideoEncodeH264RateControlStructureEXT` enum
    - Rename `VkVideoEncodeH264ProfileEXT` to `VkVideoEncodeH264ProfileInfoEXT`
    - Rename `VkVideoEncodeH264ReferenceListsEXT` to `VkVideoEncodeH264ReferenceListsInfoEXT`
    - Rename `VkVideoEncodeH264EmitPictureParametersEXT` to `VkVideoEncodeH264EmitPictureParametersInfoEXT`
    - Rename `VkVideoEncodeH264NaluSliceEXT` to `VkVideoEncodeH264NaluSliceInfoEXT`
- Revision 9, 2022-09-18 (Daniel Rakos)
    - Rename `spsStdCount`, `pSpsStd`, `ppsStdCount`, and `pPpsStd` to `stdSPSCount`, `pStdSPSs`, `stdPPSCount`, and `pStdPPSs`, respectively, in `VkVideoEncodeH264SessionParametersAddInfoEXT`
    - Rename `maxSpsStdCount` and `maxPpsStdCount` to `maxStdSPSCount` and `maxStdPPSCount`, respectively, in `VkVideoEncodeH264SessionParametersCreateInfoEXT`
- Revision 10, 2023-03-06 (Daniel Rakos)
    - Removed `VkVideoEncodeH264EmitPictureParametersInfoEXT`
    - Changed member types in `VkVideoEncodeH264CapabilitiesEXT` and `VkVideoEncodeH264ReferenceListsInfoEXT` from `uint8_t` to `uint32_t`
    - Changed the type of `VkVideoEncodeH264RateControlInfoEXT::temporalLayerCount` and `VkVideoEncodeH264RateControlLayerInfoEXT::temporalLayerId` from `uint8_t` to `uint32_t`
    - Removed `VkVideoEncodeH264InputModeFlagsEXT` and `VkVideoEncodeH264OutputModeFlagsEXT` as we only support frame-in-frame-out mode for now
    - Rename `pCurrentPictureInfo` in `VkVideoEncodeH264VclFrameInfoEXT` to `pStdPictureInfo`
    - Rename `pSliceHeaderStd` in `VkVideoEncodeH264NaluSliceInfoEXT` to `pStdSliceHeader`
    - Rename `pReferenceFinalLists` in `VkVideoEncodeH264VclFrameInfoEXT` and `VkVideoEncodeH264NaluSliceInfoEXT` to `pStdReferenceFinalLists`
    - Removed the `slotIndex` member of `VkVideoEncodeH264DpbSlotInfoEXT` and changed it to be chained to `VkVideoReferenceSlotInfoKHR`
    - Replaced `VkVideoEncodeH264ReferenceListsInfoEXT` with the new Video Std header structure `StdVideoEncodeH264ReferenceLists` that also includes data previously part of the now removed `StdVideoEncodeH264RefMemMgmtCtrlOperations` structure
    - Added new capability flag

VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_REFERENCE_FINAL_LISTS_BIT_EXT

- Revision 11, 2023-05-22 (Daniel Rakos)
  - Renamed VkVideoEncodeH264VclFrameInfoEXT to VkVideoEncodeH264PictureInfoEXT
  - Added VkVideoEncodeH264PictureInfoEXT::generatePrefixNalu and VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_EXT to enable the generation of H.264 prefix NALUs when supported by the implementation
  - Removed VkVideoEncodeH264RateControlLayerInfoEXT::temporalLayerId
  - Added expectDyadicTemporalLayerPattern capability
  - Added the VkVideoEncodeH264SessionParametersGetInfoEXT structure to identify the H.264 parameter sets to retrieve encoded parameter data for, and the VkVideoEncodeH264SessionParametersFeedbackInfoEXT structure to retrieve H.264 parameter set override information when using the new vkGetEncodedVideoSessionParametersKHR command
  - Added VkVideoEncodeH264NaluSliceInfoEXT::constantQp to specify per-slice constant QP when rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR
  - Added VkVideoEncodeH264QualityLevelPropertiesEXT for retrieving H.264 specific quality level recommendations
  - Replaced VkVideoEncodeH264RateControlStructureEXT enum with the flags type VkVideoEncodeH264RateControlFlagsEXT and bits defined in VkVideoEncodeH264RateControlFlagBitsEXT and added HRD compliance flag
  - Removed useInitialRcQp and initialRcQp members of VkVideoEncodeH264RateControlLayerInfoEXT
  - Added prefersGopRemainingFrames and requiresGopRemainingFrames, and the new VkVideoEncodeH264GopRemainingFrameInfoEXT structure to allow specifying remaining frames of each type in the rate control GOP
  - Added maxTemporalLayers, maxQp, and minQp capabilities
  - Added maxLevelIdc capability and new VkVideoEncodeH264SessionCreateInfoEXT structure to specify upper bounds on the H.264 level of the produced video bitstream
  - Moved capability flags specific to codec syntax restrictions from VkVideoEncodeH264CapabilityFlagsEXT to the new VkVideoEncodeH264StdFlagsEXT which is now included as a separate stdSyntaxFlags member in VkVideoEncodeH264CapabilitiesEXT
  - Removed codec syntax override values from VkVideoEncodeH264CapabilitiesEXT
  - Removed VkVideoEncodeH264NaluSliceInfoEXT::mbCount and VK_VIDEO_ENCODE_H264_CAPABILITY_SLICE_MB_COUNT_BIT_EXT
  - Replaced VK_VIDEO_ENCODE_H264_CAPABILITY_MULTIPLE_SLICES_PER_FRAME_BIT_EXT with the new maxSliceCount capability
  - Removed capability flag VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_REFERENCE_FINAL_LISTS_BIT_EXT and removed pStdReferenceFinalLists members from the VkVideoEncodeH264PictureInfoEXT and VkVideoEncodeH264NaluSliceInfoEXT structures as reference lists info is now included in pStdPictureInfo

    - Added capability flag VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT
- Revision 12, 2023-07-19 (Daniel Rakos)
    - Added video std capability flags VK_VIDEO_ENCODE_H264_STD_SLICE_QP_DELTA_BIT_EXT and VK_VIDEO_ENCODE_H264_STD_DIFFERENT_SLICE_QP_DELTA_BIT_EXT
    - Fixed optionality of the array members of VkVideoEncodeH264SessionParametersAddInfoEXT
    - Fixed optionality of VkVideoEncodeH264RateControlInfoEXT::flags
- Revision 13, 2023-09-04 (Daniel Rakos)
    - Change extension from EXT to KHR
    - Extension is no longer provisional
- Revision 14, 2023-12-05 (Daniel Rakos)
    - Condition reference picture setup based on the value of StdVideoEncodeH264PictureInfo::flags.is_reference

Description

This extension builds upon the `VK_KHR_video_encode_queue` extension by adding support for encoding elementary video stream sequences compliant with the H.265/HEVC video compression standard.

NOTE	This extension was promoted to `KHR` from the provisional extension `VK_EXT_video_encode_h265`.

New Structures

- VkVideoEncodeH265FrameSizeKHR
- VkVideoEncodeH265NaluSliceSegmentInfoKHR
- VkVideoEncodeH265QpKHR
- Extending VkVideoBeginCodingInfoKHR:
  - VkVideoEncodeH265GopRemainingFrameInfoKHR
- Extending VkVideoCapabilitiesKHR:
  - VkVideoEncodeH265CapabilitiesKHR
- Extending VkVideoCodingControlInfoKHR, VkVideoBeginCodingInfoKHR:
  - VkVideoEncodeH265RateControlInfoKHR
- Extending VkVideoEncodeInfoKHR:
  - VkVideoEncodeH265PictureInfoKHR
- Extending VkVideoEncodeQualityLevelPropertiesKHR:

    - VkVideoEncodeH265QualityLevelPropertiesKHR
- Extending VkVideoEncodeRateControlLayerInfoKHR:
    - VkVideoEncodeH265RateControlLayerInfoKHR
- Extending VkVideoEncodeSessionParametersFeedbackInfoKHR:
    - VkVideoEncodeH265SessionParametersFeedbackInfoKHR
- Extending VkVideoEncodeSessionParametersGetInfoKHR:
    - VkVideoEncodeH265SessionParametersGetInfoKHR
- Extending VkVideoProfileInfoKHR, VkQueryPoolCreateInfo:
    - VkVideoEncodeH265ProfileInfoKHR
- Extending VkVideoReferenceSlotInfoKHR:
    - VkVideoEncodeH265DpbSlotInfoKHR
- Extending VkVideoSessionCreateInfoKHR:
    - VkVideoEncodeH265SessionCreateInfoKHR
- Extending VkVideoSessionParametersCreateInfoKHR:
    - VkVideoEncodeH265SessionParametersCreateInfoKHR
- Extending VkVideoSessionParametersUpdateInfoKHR:
    - VkVideoEncodeH265SessionParametersAddInfoKHR

New Enums

- VkVideoEncodeH265CapabilityFlagBitsKHR
- VkVideoEncodeH265CtbSizeFlagBitsKHR
- VkVideoEncodeH265RateControlFlagBitsKHR
- VkVideoEncodeH265StdFlagBitsKHR
- VkVideoEncodeH265TransformBlockSizeFlagBitsKHR

New Bitmasks

- VkVideoEncodeH265CapabilityFlagsKHR
- VkVideoEncodeH265CtbSizeFlagsKHR
- VkVideoEncodeH265RateControlFlagsKHR
- VkVideoEncodeH265StdFlagsKHR
- VkVideoEncodeH265TransformBlockSizeFlagsKHR

New Enum Constants

- `VK_KHR_VIDEO_ENCODE_H265_EXTENSION_NAME`
- `VK_KHR_VIDEO_ENCODE_H265_SPEC_VERSION`
- Extending VkStructureType:

    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_CAPABILITIES_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_DPB_SLOT_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_GOP_REMAINING_FRAME_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_NALU_SLICE_SEGMENT_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PICTURE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PROFILE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_QUALITY_LEVEL_PROPERTIES_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_LAYER_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_ADD_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_FEEDBACK_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_GET_INFO_KHR
- Extending VkVideoCodecOperationFlagBitsKHR:
    - VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR

Version History

- Revision 0, 2019-11-14 (Ahmed Abdelkhalek)
    - Initial draft
- Revision 0.5, 2020-02-13 (Tony Zlatinski)
    - General Spec cleanup
    - Added DPB structures
    - Change the VCL frame encode structure
    - Added a common Non-VCL Picture Paramarameters structure
- Revision 2, Oct 10 2021 (Srinath Kumarapuram)
    - Vulkan Video Encode h.265 update and spec edits
- Revision 3, 2021-12-08 (Ahmed Abdelkhalek)
    - Rate control updates
- Revision 4, 2022-01-11 (Ahmed Abdelkhalek)
    - Replace occurrences of “slice” by “slice segment” and rename structures/enums to reflect this.
- Revision 5, 2022-02-10 (Ahmed Abdelkhalek)
    - Updates to encode capability interface
- Revision 6, 2022-03-16 (Ahmed Abdelkhalek)

- Relocate Std header version reporting/requesting from this extension to VK_KHR_video_queue extension.
- Remove the now empty VkVideoEncodeH265SessionCreateInfoEXT.

- Revision 7, 2022-03-24 (Ahmed Abdelkhalek)
  - Add capability flags to report support to disable transform skip and support to use B frame in L1 reference list.
- Revision 8, 2022-07-18 (Daniel Rakos)
  - Replace `VkVideoEncodeH265RateControlStructureFlagBitsEXT` bit enum with `VkVideoEncodeH265RateControlStructureEXT` enum
  - Rename `VkVideoEncodeH265ProfileEXT` to `VkVideoEncodeH265ProfileInfoEXT`
  - Rename `VkVideoEncodeH265ReferenceListsEXT` to `VkVideoEncodeH265ReferenceListsInfoEXT`
  - Rename `VkVideoEncodeH265EmitPictureParametersEXT` to `VkVideoEncodeH265EmitPictureParametersInfoEXT`
  - Rename `VkVideoEncodeH265NaluSliceSegmentEXT` to `VkVideoEncodeH265NaluSliceSegmentInfoEXT`
- Revision 9, 2022-09-18 (Daniel Rakos)
  - Rename `vpsStdCount`, `pVpsStd`, `spsStdCount`, `pSpsStd`, `ppsStdCount`, and `pPpsStd` to `stdVPSCount`, `pStdVPSs`, `stdSPSCount`, `pStdSPSs`, `stdPPSCount`, and `pStdPPSs`, respectively, in `VkVideoEncodeH265SessionParametersAddInfoEXT`
  - Rename `maxVpsStdCount`, `maxSpsStdCount`, and `maxPpsStdCount` to `maxStdVPSCount`, `maxStdSPSCount` and `maxStdPPSCount`, respectively, in `VkVideoEncodeH265SessionParametersCreateInfoEXT`
- Revision 10, 2023-03-06 (Daniel Rakos)
  - Removed `VkVideoEncodeH265EmitPictureParametersInfoEXT`
  - Changed member types in `VkVideoEncodeH265CapabilitiesEXT` and `VkVideoEncodeH265ReferenceListsInfoEXT` from `uint8_t` to `uint32_t`
  - Changed the type of `VkVideoEncodeH265RateControlInfoEXT::subLayerCount` and `VkVideoEncodeH265RateControlLayerInfoEXT::temporalId` from `uint8_t` to `uint32_t`
  - Removed `VkVideoEncodeH265InputModeFlagsEXT` and `VkVideoEncodeH265OutputModeFlagsEXT` as we only support frame-in-frame-out mode for now
  - Rename `pCurrentPictureInfo` in `VkVideoEncodeH265VclFrameInfoEXT` to `pStdPictureInfo`
  - Rename `pSliceSegmentHeaderStd` in `VkVideoEncodeH265NaluSliceSegmentInfoEXT` to `pStdSliceSegmentHeader`
  - Rename `pReferenceFinalLists` in `VkVideoEncodeH265VclFrameInfoEXT` and `VkVideoEncodeH265NaluSliceSegmentInfoEXT` to `pStdReferenceFinalLists`
  - Removed the `slotIndex` member of `VkVideoEncodeH265DpbSlotInfoEXT` and changed it to be chained to `VkVideoReferenceSlotInfoKHR`
  - Replaced `VkVideoEncodeH265ReferenceListsInfoEXT` with the new Video Std header structure `StdVideoEncodeH265ReferenceLists`
  - Added new capability flag

VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_REFERENCE_FINAL_LISTS_BIT_EXT

- Revision 11, 2023-05-26 (Daniel Rakos)
  - Renamed VkVideoEncodeH265VclFrameInfoEXT to VkVideoEncodeH265PictureInfoEXT
  - Removed VkVideoEncodeH265RateControlLayerInfoEXT::temporalId
  - Added expectDyadicTemporalSubLayerPattern capability
  - Added the VkVideoEncodeH265SessionParametersGetInfoEXT structure to identify the H.265 parameter sets to retrieve encoded parameter data for, and the VkVideoEncodeH265SessionParametersFeedbackInfoEXT structure to retrieve H.265 parameter set override information when using the new vkGetEncodedVideoSessionParametersKHR command
  - Added VkVideoEncodeH265NaluSliceSegmentInfoEXT::constantQp to specify per-slice segment constant QP when rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR
  - Added VkVideoEncodeH265QualityLevelPropertiesEXT for retrieving H.265 specific quality level recommendations
  - Replaced VkVideoEncodeH265RateControlStructureEXT enum with the flags type VkVideoEncodeH265RateControlFlagsEXT and bits defined in VkVideoEncodeH265RateControlFlagBitsEXT and added HRD compliance flag
  - Removed useInitialRcQp and initialRcQp members of VkVideoEncodeH265RateControlLayerInfoEXT
  - Added prefersGopRemainingFrames and requiresGopRemainingFrames, and the new VkVideoEncodeH265GopRemainingFrameInfoEXT structure to allow specifying remaining frames of each type in the rate control GOP
  - Renamed maxSubLayersCount capability to maxSubLayerCount
  - Added maxQp, and minQp capabilities
  - Added maxLevelIdc capability and new VkVideoEncodeH265SessionCreateInfoEXT structure to specify upper bounds on the H.265 level of the produced video bitstream
  - Moved capability flags specific to codec syntax restrictions from VkVideoEncodeH265CapabilityFlagsEXT to the new VkVideoEncodeH265StdFlagsEXT which is now included as a separate stdSyntaxFlags member in VkVideoEncodeH265CapabilitiesEXT
  - Added std prefix to codec syntax capabilities in VkVideoEncodeH265CapabilitiesEXT
  - Removed VkVideoEncodeH265NaluSliceSegmentInfoEXT::ctbCount and VK_VIDEO_ENCODE_H265_CAPABILITY_SLICE_SEGMENT_CTB_COUNT_BIT_EXT
  - Replaced VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_FRAME_BIT_EXT with the new maxSliceSegmentCount capability
  - Added maxTiles capability
  - Removed codec syntax min/max capabilities from VkVideoEncodeH265CapabilitiesEXT
  - Removed capability flag VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_REFERENCE_FINAL_LISTS_BIT_EXT and removed pStdReferenceFinalLists members from the VkVideoEncodeH265PictureInfoEXT and VkVideoEncodeH265NaluSliceSegmentInfoEXT structures as reference lists info is now included

in pStdPictureInfo
    - Added capability flag VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT
- Revision 12, 2023-07-19 (Daniel Rakos)
    - Added video std capability flags VK_VIDEO_ENCODE_H265_STD_SLICE_QP_DELTA_BIT_EXT and VK_VIDEO_ENCODE_H265_STD_DIFFERENT_SLICE_QP_DELTA_BIT_EXT
    - Fixed optionality of the array members of VkVideoEncodeH265SessionParametersAddInfoEXT
    - Fixed optionality of VkVideoEncodeH265RateControlInfoEXT::flags
- Revision 13, 2023-09-04 (Daniel Rakos)
    - Change extension from EXT to KHR
    - Extension is no longer provisional
- Revision 14, 2023-12-05 (Daniel Rakos)
    - Condition reference picture setup based on the value of StdVideoEncodeH265PictureInfo::flags.is_reference

Description

This extension builds upon the `VK_KHR_video_encode_queue` extension by enabling fine grained control of codec-specific quantization parameters in video encode operations.

More specifically, it adds support for quantization maps:

- Quantization delta maps to directly control the relative value of quantization parameter values on a per-block basis for all rate control modes (including when rate control is disabled).
- Emphasis maps to indirectly control the relative quantization parameter values on a per-block basis when rate control is not disabled and the rate control mode is not configured to the implementation-defined default mode.

This extension is to be used in conjunction with other codec specific video encode extensions that specify the codec specific quantization parameters these maps control.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVideoEncodeQuantizationMapFeaturesKHR
- Extending VkVideoCapabilitiesKHR:
  - VkVideoEncodeQuantizationMapCapabilitiesKHR
- Extending VkVideoEncodeInfoKHR:
  - VkVideoEncodeQuantizationMapInfoKHR

- Extending VkVideoFormatPropertiesKHR:
  - VkVideoFormatQuantizationMapPropertiesKHR
- Extending VkVideoSessionParametersCreateInfoKHR:
  - VkVideoEncodeQuantizationMapSessionParametersCreateInfoKHR

If VK_KHR_video_encode_av1 is supported:

- Extending VkVideoCapabilitiesKHR:
  - VkVideoEncodeAV1QuantizationMapCapabilitiesKHR
- Extending VkVideoFormatPropertiesKHR:
  - VkVideoFormatAV1QuantizationMapPropertiesKHR

If VK_KHR_video_encode_h264 is supported:

- Extending VkVideoCapabilitiesKHR:
  - VkVideoEncodeH264QuantizationMapCapabilitiesKHR

If VK_KHR_video_encode_h265 is supported:

- Extending VkVideoCapabilitiesKHR:
  - VkVideoEncodeH265QuantizationMapCapabilitiesKHR
- Extending VkVideoFormatPropertiesKHR:
  - VkVideoFormatH265QuantizationMapPropertiesKHR

New Enums

- VkVideoEncodeFlagBitsKHR
- VkVideoSessionParametersCreateFlagBitsKHR

New Enum Constants

- `VK_KHR_VIDEO_ENCODE_QUANTIZATION_MAP_EXTENSION_NAME`
- `VK_KHR_VIDEO_ENCODE_QUANTIZATION_MAP_SPEC_VERSION`
- Extending VkFormatFeatureFlagBits2:
  - `VK_FORMAT_FEATURE_2_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR`
  - `VK_FORMAT_FEATURE_2_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR`
- Extending VkImageLayout:
  - `VK_IMAGE_LAYOUT_VIDEO_ENCODE_QUANTIZATION_MAP_KHR`
- Extending VkImageUsageFlagBits:
  - `VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR`
  - `VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR`
- Extending VkStructureType:

    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_ENCODE_QUANTIZATION_MAP_FEATURES_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUANTIZATION_MAP_CAPABILITIES_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUANTIZATION_MAP_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUANTIZATION_MAP_SESSION_PARAMETERS_CREATE_INFO_KHR
    - VK_STRUCTURE_TYPE_VIDEO_FORMAT_QUANTIZATION_MAP_PROPERTIES_KHR
- Extending VkVideoEncodeCapabilityFlagBitsKHR:
    - VK_VIDEO_ENCODE_CAPABILITY_EMPHASIS_MAP_BIT_KHR
    - VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR
- Extending VkVideoEncodeFlagBitsKHR:
    - VK_VIDEO_ENCODE_WITH_EMPHASIS_MAP_BIT_KHR
    - VK_VIDEO_ENCODE_WITH_QUANTIZATION_DELTA_MAP_BIT_KHR
- Extending VkVideoSessionCreateFlagBitsKHR:
    - VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_EMPHASIS_MAP_BIT_KHR
    - VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR
- Extending VkVideoSessionParametersCreateFlagBitsKHR:
    - VK_VIDEO_SESSION_PARAMETERS_CREATE_QUANTIZATION_MAP_COMPATIBLE_BIT_KHR

If VK_KHR_video_encode_av1 is supported:

- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_AV1_QUANTIZATION_MAP_CAPABILITIES_KHR
    - VK_STRUCTURE_TYPE_VIDEO_FORMAT_AV1_QUANTIZATION_MAP_PROPERTIES_KHR

If VK_KHR_video_encode_h264 is supported:

- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_QUANTIZATION_MAP_CAPABILITIES_KHR
- Extending VkVideoEncodeH264CapabilityFlagBitsKHR:
    - VK_VIDEO_ENCODE_H264_CAPABILITY_MB_QP_DIFF_WRAPAROUND_BIT_KHR

If VK_KHR_video_encode_h265 is supported:

- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_QUANTIZATION_MAP_CAPABILITIES_KHR
    - VK_STRUCTURE_TYPE_VIDEO_FORMAT_H265_QUANTIZATION_MAP_PROPERTIES_KHR
- Extending VkVideoEncodeH265CapabilityFlagBitsKHR:
    - VK_VIDEO_ENCODE_H265_CAPABILITY_CU_QP_DIFF_WRAPAROUND_BIT_KHR

Version History

- Revision 1, 2024-08-21 (Daniel Rakos)
  - Internal revisions
- Revision 2, 2024-09-23 (Daniel Rakos)

Description

This extension builds upon the `VK_KHR_video_queue` extension by adding common APIs specific to video encoding and thus enabling implementations to expose queue families supporting video encode operations.

More specifically, it adds video encode specific capabilities and a new command buffer command that allows recording video encode operations against a video session.

This extension is to be used in conjunction with other codec specific video encode extensions that enable encoding video sequences of specific video compression standards.

New Commands

- vkCmdEncodeVideoKHR
- vkGetEncodedVideoSessionParametersKHR
- vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR

New Structures

- VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR
- VkVideoEncodeInfoKHR
- VkVideoEncodeQualityLevelPropertiesKHR
- VkVideoEncodeRateControlLayerInfoKHR

- VkVideoEncodeSessionParametersFeedbackInfoKHR
- VkVideoEncodeSessionParametersGetInfoKHR
- Extending VkQueryPoolCreateInfo:
  - VkQueryPoolVideoEncodeFeedbackCreateInfoKHR
- Extending VkVideoCapabilitiesKHR:
  - VkVideoEncodeCapabilitiesKHR
- Extending VkVideoCodingControlInfoKHR, VkVideoBeginCodingInfoKHR:
  - VkVideoEncodeRateControlInfoKHR
- Extending VkVideoCodingControlInfoKHR, VkVideoSessionParametersCreateInfoKHR:
  - VkVideoEncodeQualityLevelInfoKHR
- Extending VkVideoProfileInfoKHR, VkQueryPoolCreateInfo:
  - VkVideoEncodeUsageInfoKHR

New Enums

- VkVideoEncodeCapabilityFlagBitsKHR
- VkVideoEncodeContentFlagBitsKHR
- VkVideoEncodeFeedbackFlagBitsKHR
- VkVideoEncodeRateControlModeFlagBitsKHR
- VkVideoEncodeTuningModeKHR
- VkVideoEncodeUsageFlagBitsKHR

New Bitmasks

- VkVideoEncodeCapabilityFlagsKHR
- VkVideoEncodeContentFlagsKHR
- VkVideoEncodeFeedbackFlagsKHR
- VkVideoEncodeFlagsKHR
- VkVideoEncodeRateControlFlagsKHR
- VkVideoEncodeRateControlModeFlagsKHR
- VkVideoEncodeUsageFlagsKHR

New Enum Constants

- `VK_KHR_VIDEO_ENCODE_QUEUE_EXTENSION_NAME`
- `VK_KHR_VIDEO_ENCODE_QUEUE_SPEC_VERSION`
- Extending VkAccessFlagBits2:
  - `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`
  - `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`

- Extending VkBufferUsageFlagBits:
  - VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR
  - VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- Extending VkFormatFeatureFlagBits:
  - VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR
  - VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR
- Extending VkImageLayout:
  - VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR
  - VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR
  - VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR
- Extending VkImageUsageFlagBits:
  - VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR
  - VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR
  - VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR
- Extending VkQueryResultStatusKHR:
  - VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR
- Extending VkQueryType:
  - VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR
- Extending VkQueueFlagBits:
  - VK_QUEUE_VIDEO_ENCODE_BIT_KHR
- Extending VkResult:
  - VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR
  - VK_STRUCTURE_TYPE_QUERY_POOL_VIDEO_ENCODE_FEEDBACK_CREATE_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_ENCODE_CAPABILITIES_KHR
  - VK_STRUCTURE_TYPE_VIDEO_ENCODE_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_PROPERTIES_KHR
  - VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_LAYER_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_FEEDBACK_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_GET_INFO_KHR

    - VK_STRUCTURE_TYPE_VIDEO_ENCODE_USAGE_INFO_KHR
- Extending VkVideoCodingControlFlagBitsKHR:
    - VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR
    - VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR
- Extending VkVideoSessionCreateFlagBitsKHR:
    - VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR

If VK_KHR_format_feature_flags2 or Vulkan Version 1.3 is supported:

- Extending VkFormatFeatureFlagBits2:
    - VK_FORMAT_FEATURE_2_VIDEO_ENCODE_DPB_BIT_KHR
    - VK_FORMAT_FEATURE_2_VIDEO_ENCODE_INPUT_BIT_KHR

Version History

- Revision 1, 2018-07-23 (Ahmed Abdelkhalek)
    - Initial draft
- Revision 1.1, 10/29/2019 (Tony Zlatinski)
    - Updated the reserved spec tokens and renamed VkVideoEncoderKHR to VkVideoSessionKHR
- Revision 1.6, Jan 08 2020 (Tony Zlatinski)
    - API unify with the video_decode_queue spec
- Revision 2, March 29 2021 (Tony Zlatinski)
    - Spec and API updates.
- Revision 3, 2021-09-30 (Jon Leech)
    - Add interaction with VK_KHR_format_feature_flags2 to vk.xml
- Revision 4, 2022-02-10 (Ahmed Abdelkhalek)
    - Updates to encode capability interface
- Revision 5, 2022-03-31 (Ahmed Abdelkhalek)
    - Remove redundant VkVideoEncodeInfoKHR.codedExtent
- Revision 6, 2022-07-18 (Daniel Rakos)
    - Remove VkVideoEncodeRateControlFlagBitsKHR and VkVideoEncodeFlagBitsKHR as they contain no defined flags for now
    - Add VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR and VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR to indicate rate control and rate control layer change requests, respectively, in video coding control operations
- Revision 7, 2022-08-12 (Daniel Rakos)
    - Add VkVideoEncodeUsageInfoKHR structure and related flags
- Revision 8, 2023-03-06 (Daniel Rakos)

- Replace VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR queries with more generic VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR queries that can be extended in the future with more feedback values
- Rename dstBitstreamBuffer, dstBitstreamBufferOffset, and dstBitstreamBufferMaxRange in VkVideoEncodeInfoKHR to dstBuffer, dstBufferOffset, and dstBufferRange, respectively, for consistency with the naming convention in the video decode extensions
- Change the type of rateControlLayerCount and qualityLevelCount in VkVideoEncodeCapabilitiesKHR from uint8_t to uint32_t and rename them to maxRateControlLayers and maxQualityLevels, respectively
- Change the type of averageBitrate and maxBitrate in VkVideoEncodeRateControlLayerInfoKHR` from uint32_t to uint64_t
- Fixed the definition of rate control flag bits and added the new VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR constant to indicate implementation-specific automatic rate control
- Change the type of VkVideoEncodeRateControlInfoKHR::layerCount from uint8_t to uint32_t
- Rename pLayerConfigs to pLayers in VkVideoEncodeRateControlInfoKHR

- Revision 9, 2023-03-28 (Daniel Rakos)
  - Removed VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR and the ability to change the state of individual rate control layers
  - Added new VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR flag to video encode feedback queries
  - Added new video session create flag VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR to opt-in to video session and encoding parameter optimizations
  - Added the vkGetEncodedVideoSessionParametersKHR command to enable retrieving encoded video session parameter data
  - Moved virtualBufferSizeInMs and initialVirtualBufferSizeInMs from VkVideoEncodeRateControlLayerInfoKHR to VkVideoEncodeRateControlInfoKHR
  - Added maxBitrate capability
  - Renamed inputImageDataFillAlignment capability to encodeInputPictureGranularity to better reflect its purpose
  - Added new vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR command and related structures to enable querying recommended settings for video encode quality levels
  - Added VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR flag and VkVideoEncodeQualityLevelInfoKHR structure to allow controlling video encode quality level and removed qualityLevel from the encode operation parameters
- Revision 10, 2023-07-19 (Daniel Rakos)
  - Added VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR query result status code and the related capability flag VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR

- Revision 11, 2023-09-04 (Daniel Rakos)
  - Extension is no longer provisional
- Revision 12, 2023-12-05 (Daniel Rakos)
  - Require the specification of a reconstructed picture in all cases, except when the video session was created with no DPB slots to match shipping implementations
  - Make DPB slot activation behavior codec-specific to continue allowing application control over reference picture setup now that a reconstructed picture is always mandatory

Description

`VK_KHR_video_maintenance1` adds a collection of minor video coding features, none of which would warrant an entire extension of their own.

The new features are as follows:

- Allow creating buffers that can be used in video coding operations, independent of the used video profile, using the new buffer creation flag `VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`.
- Allow creating images that can be used as decode output or encode input pictures, independent of the used video profile, using the new image creation flag `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`.
- Allow specifying queries used by video coding operations as part of the video coding command parameters, instead of using begin/end query when the video session is created using the new video session creation flag `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVideoMaintenance1FeaturesKHR
- Extending VkVideoDecodeInfoKHR, VkVideoEncodeInfoKHR:
  - VkVideoInlineQueryInfoKHR

New Enum Constants

- `VK_KHR_VIDEO_MAINTENANCE_1_EXTENSION_NAME`
- `VK_KHR_VIDEO_MAINTENANCE_1_SPEC_VERSION`
- Extending VkBufferCreateFlagBits:
  - `VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`
- Extending VkImageCreateFlagBits:
  - `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_MAINTENANCE_1_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_VIDEO_INLINE_QUERY_INFO_KHR`
- Extending VkVideoSessionCreateFlagBitsKHR:
  - `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`

- Daniel Rakos, RasterGrid

Description

This extension provides common APIs to enable exposing queue families with support for video codec operations by introducing the following new object types and related functionalities:

- Video session objects that represent and maintain the state needed to perform video codec operations.
- Video session parameters objects that act as a container for codec specific parameters.

In addition, it also introduces query commands that allow applications to determine video coding related capabilities, and command buffer commands that enable recording video coding operations against a video session.

This extension is to be used in conjunction with other extensions that enable specific video coding operations.

New Object Types

- VkVideoSessionKHR
- VkVideoSessionParametersKHR

New Commands

- vkBindVideoSessionMemoryKHR
- vkCmdBeginVideoCodingKHR
- vkCmdControlVideoCodingKHR
- vkCmdEndVideoCodingKHR
- vkCreateVideoSessionKHR
- vkCreateVideoSessionParametersKHR
- vkDestroyVideoSessionKHR
- vkDestroyVideoSessionParametersKHR
- vkGetPhysicalDeviceVideoCapabilitiesKHR
- vkGetPhysicalDeviceVideoFormatPropertiesKHR
- vkGetVideoSessionMemoryRequirementsKHR
- vkUpdateVideoSessionParametersKHR

New Structures

- VkBindVideoSessionMemoryInfoKHR
- VkPhysicalDeviceVideoFormatInfoKHR
- VkVideoBeginCodingInfoKHR
- VkVideoCapabilitiesKHR
- VkVideoCodingControlInfoKHR
- VkVideoEndCodingInfoKHR
- VkVideoFormatPropertiesKHR
- VkVideoPictureResourceInfoKHR
- VkVideoReferenceSlotInfoKHR
- VkVideoSessionCreateInfoKHR
- VkVideoSessionMemoryRequirementsKHR
- VkVideoSessionParametersCreateInfoKHR
- VkVideoSessionParametersUpdateInfoKHR
- Extending VkPhysicalDeviceImageFormatInfo2, VkPhysicalDeviceVideoFormatInfoKHR, VkImageCreateInfo, VkBufferCreateInfo:
  - VkVideoProfileListInfoKHR
- Extending VkQueryPoolCreateInfo:
  - VkVideoProfileInfoKHR
- Extending VkQueueFamilyProperties2:
  - VkQueueFamilyQueryResultStatusPropertiesKHR
  - VkQueueFamilyVideoPropertiesKHR

New Enums

- VkQueryResultStatusKHR
- VkVideoCapabilityFlagBitsKHR
- VkVideoChromaSubsamplingFlagBitsKHR
- VkVideoCodecOperationFlagBitsKHR
- VkVideoCodingControlFlagBitsKHR
- VkVideoComponentBitDepthFlagBitsKHR
- VkVideoSessionCreateFlagBitsKHR

New Bitmasks

- VkVideoBeginCodingFlagsKHR
- VkVideoCapabilityFlagsKHR

- VkVideoChromaSubsamplingFlagsKHR
- VkVideoCodecOperationFlagsKHR
- VkVideoCodingControlFlagsKHR
- VkVideoComponentBitDepthFlagsKHR
- VkVideoEndCodingFlagsKHR
- VkVideoSessionCreateFlagsKHR
- VkVideoSessionParametersCreateFlagsKHR

New Enum Constants

- VK_KHR_VIDEO_QUEUE_EXTENSION_NAME
- VK_KHR_VIDEO_QUEUE_SPEC_VERSION
- Extending VkObjectType:
  - VK_OBJECT_TYPE_VIDEO_SESSION_KHR
  - VK_OBJECT_TYPE_VIDEO_SESSION_PARAMETERS_KHR
- Extending VkQueryResultFlagBits:
  - VK_QUERY_RESULT_WITH_STATUS_BIT_KHR
- Extending VkQueryType:
  - VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR
- Extending VkResult:
  - VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR
  - VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR
  - VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR
  - VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR
  - VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
  - VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_BIND_VIDEO_SESSION_MEMORY_INFO_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_FORMAT_INFO_KHR
  - VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_KHR
  - VK_STRUCTURE_TYPE_QUEUE_FAMILY_VIDEO_PROPERTIES_KHR
  - VK_STRUCTURE_TYPE_VIDEO_BEGIN_CODING_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_CAPABILITIES_KHR
  - VK_STRUCTURE_TYPE_VIDEO_CODING_CONTROL_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_END_CODING_INFO_KHR
  - VK_STRUCTURE_TYPE_VIDEO_FORMAT_PROPERTIES_KHR

- VK_STRUCTURE_TYPE_VIDEO_PICTURE_RESOURCE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_PROFILE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_PROFILE_LIST_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_REFERENCE_SLOT_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_SESSION_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_SESSION_MEMORY_REQUIREMENTS_KHR
- VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_CREATE_INFO_KHR
- VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_UPDATE_INFO_KHR

Version History

- Revision 0.1, 2019-11-21 (Tony Zlatinski)
  - Initial draft
- Revision 0.2, 2019-11-27 (Tony Zlatinski)
  - Make vulkan video core common between decode and encode
- Revision 1, March 29 2021 (Tony Zlatinski)
  - Spec and API updates.
- Revision 2, August 1 2021 (Srinath Kumarapuram)
  - Rename VkVideoCapabilitiesFlagBitsKHR to VkVideoCapabilityFlagBitsKHR (along with the names of enumerants it defines) and VkVideoCapabilitiesFlagsKHR to VkVideoCapabilityFlagsKHR, following Vulkan naming conventions.
- Revision 3, 2022-03-16 (Ahmed Abdelkhalek)
  - Relocate Std header version reporting/requesting from codec-operation specific extensions to this extension.
  - Make Std header versions codec-operation specific instead of only codec-specific.
- Revision 4, 2022-05-30 (Daniel Rakos)
  - Refactor the video format query APIs and related language
  - Extend VkResult with video-specific error codes
- Revision 5, 2022-08-11 (Daniel Rakos)
  - Add VkVideoSessionParametersCreateFlagsKHR
  - Remove VkVideoCodingQualityPresetFlagsKHR
  - Rename VkQueueFamilyQueryResultStatusProperties2KHR to VkQueueFamilyQueryResultStatusPropertiesKHR
  - Rename VkVideoQueueFamilyProperties2KHR to VkQueueFamilyVideoPropertiesKHR
  - Rename VkVideoProfileKHR to VkVideoProfileInfoKHR
  - Rename VkVideoProfilesKHR to VkVideoProfileListInfoKHR
  - Rename VkVideoGetMemoryPropertiesKHR to VkVideoSessionMemoryRequirementsKHR

    - Rename `VkVideoBindMemoryKHR` to `VkBindVideoSessionMemoryInfoKHR`
    - Fix `pNext` constness of `VkPhysicalDeviceVideoFormatInfoKHR` and `VkVideoSessionMemoryRequirementsKHR`
    - Fix incorrectly named value enums in bit enum types `VkVideoCodecOperationFlagBitsKHR` and `VkVideoChromaSubsamplingFlagBitsKHR`
    - Remove unnecessary default values from `VkVideoSessionCreateFlagBitsKHR` and `VkVideoCodingControlFlagBitsKHR`
    - Eliminate nested pointer in `VkVideoSessionMemoryRequirementsKHR`
    - Rename `VkVideoPictureResourceKHR` to `VkVideoPictureResourceInfoKHR`
    - Rename `VkVideoReferenceSlotKHR` to `VkVideoReferenceSlotInfoKHR`
- Revision 6, 2022-09-18 (Daniel Rakos)
    - Rename the `maxReferencePicturesSlotsCount` and `maxReferencePicturesActiveCount` fields of `VkVideoCapabilitiesKHR` and `VkVideoSessionCreateInfoKHR` to `maxDpbSlots` and `maxActiveReferencePictures`, respectively, to clarify their meaning
    - Rename `capabilityFlags` to `flags` in `VkVideoCapabilitiesKHR`
    - Rename `videoPictureExtentGranularity` to `pictureAccessGranularity` in `VkVideoCapabilitiesKHR`
    - Rename `minExtent` and `maxExtent` to `minCodedExtent` and `maxCodedExtent`, respectively, in `VkVideoCapabilitiesKHR`
    - Rename `referencePicturesFormat` to `referencePictureFormat` in `VkVideoSessionCreateInfoKHR`
- Revision 7, 2022-09-26 (Daniel Rakos)
    - Change type of `VkVideoReferenceSlotInfoKHR::slotIndex` from `int8_t` to `int32_t`
- Revision 8, 2022-09-29 (Daniel Rakos)
    - Extension is no longer provisional

Description

The VK_KHR_vulkan_memory_model extension allows use of the features guarded by the `VulkanMemoryModel`, `VulkanMemoryModelDeviceScope`, and `VulkanMemoryModelAvailabilityVisibilityChains` capabilities in shader modules. The Vulkan Memory Model formally defines how to synchronize memory accesses to the same memory locations performed by multiple shader invocations.

NOTE	Version 3 of the spec added a member (`vulkanMemoryModelAvailabilityVisibilityChains`) to VkPhysicalDeviceVulkanMemoryModelFeaturesKHR, which is an incompatible change from version 2.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the KHR suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `vulkanMemoryModel` capability is

optional. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVulkanMemoryModelFeaturesKHR

New Enum Constants

- `VK_KHR_VULKAN_MEMORY_MODEL_EXTENSION_NAME`
- `VK_KHR_VULKAN_MEMORY_MODEL_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_MEMORY_MODEL_FEATURES_KHR`

New SPIR-V Capabilities

- `VulkanMemoryModelKHR`

Version History

- Revision 1, 2018-06-24 (Jeff Bolz)
  - Initial draft
- Revision 3, 2018-12-10 (Jeff Bolz)
  - Add vulkanMemoryModelAvailabilityVisibilityChains member to the VkPhysicalDeviceVulkanMemoryModelFeaturesKHR structure.

Description

The `VK_KHR_wayland_surface` extension is an instance extension. It provides a mechanism to create a VkSurfaceKHR object (defined by the `VK_KHR_surface` extension) that refers to a Wayland `wl_surface`, as well as a query to determine support for rendering to a Wayland compositor.

New Commands

- vkCreateWaylandSurfaceKHR
- vkGetPhysicalDeviceWaylandPresentationSupportKHR

New Structures

- VkWaylandSurfaceCreateInfoKHR

New Bitmasks

- VkWaylandSurfaceCreateFlagsKHR

New Enum Constants

- `VK_KHR_WAYLAND_SURFACE_EXTENSION_NAME`
- `VK_KHR_WAYLAND_SURFACE_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR`

Issues

1) Does Wayland need a way to query for compatibility between a particular physical device and a specific Wayland display? This would be a more general query than vkGetPhysicalDeviceSurfaceSupportKHR: if the Wayland-specific query returned `VK_TRUE` for a (VkPhysicalDevice, `struct wl_display*`) pair, then the physical device could be assumed to support presentation to any VkSurfaceKHR for surfaces on the display.

RESOLVED: Yes. vkGetPhysicalDeviceWaylandPresentationSupportKHR was added to address this issue.

2) Should we require surfaces created with vkCreateWaylandSurfaceKHR to support the `VK_PRESENT_MODE_MAILBOX_KHR` present mode?

RESOLVED: Yes. Wayland is an inherently mailbox window system and mailbox support is required for some Wayland compositor interactions to work as expected. While handling these interactions may be possible with `VK_PRESENT_MODE_FIFO_KHR`, it is much more difficult to do without deadlock and requiring all Wayland applications to be able to support implementations which only support `VK_PRESENT_MODE_FIFO_KHR` would be an onerous restriction on application developers.

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
  - Initial draft, based on the previous contents of VK_EXT_KHR_swapchain (later renamed VK_EXT_KHR_surface).
- Revision 2, 2015-10-02 (James Jones)
  - Added vkGetPhysicalDeviceWaylandPresentationSupportKHR() to resolve issue #1.
  - Adjusted wording of issue #1 to match the agreed-upon solution.
  - Renamed “window” parameters to “surface” to match Wayland conventions.
- Revision 3, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_wayland_surface to VK_KHR_wayland_surface.

- Revision 4, 2015-11-03 (Daniel Rakos)
  - Added allocation callbacks to vkCreateWaylandSurfaceKHR.
- Revision 5, 2015-11-28 (Daniel Rakos)
  - Updated the surface create function to take a pCreateInfo structure.
- Revision 6, 2017-02-08 (Faith Ekstrand)
  - Added the requirement that implementations support `VK_PRESENT_MODE_MAILBOX_KHR`.
  - Added wording about interactions between vkQueuePresentKHR and the Wayland requests sent to the compositor.

Description

Applications that wish to import Direct3D 11 memory objects into the Vulkan API may wish to use the native keyed mutex mechanism to synchronize access to the memory between Vulkan and Direct3D. This extension provides a way for an application to access the keyed mutex associated with an imported Vulkan memory object when submitting command buffers to a queue.

New Structures

Description

The `VK_KHR_win32_surface` extension is an instance extension. It provides a mechanism to create a VkSurfaceKHR object (defined by the `VK_KHR_surface` extension) that refers to a Win32 `HWND`, as well as a query to determine support for rendering to the windows desktop.

New Commands

- vkCreateWin32SurfaceKHR
- vkGetPhysicalDeviceWin32PresentationSupportKHR

New Structures

- VkWin32SurfaceCreateInfoKHR

New Bitmasks

- VkWin32SurfaceCreateFlagsKHR

New Enum Constants

- `VK_KHR_WIN32_SURFACE_EXTENSION_NAME`
- `VK_KHR_WIN32_SURFACE_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`

Issues

1) Does Win32 need a way to query for compatibility between a particular physical device and a specific screen? Compatibility between a physical device and a window generally only depends on what screen the window is on. However, there is not an obvious way to identify a screen without already having a window on the screen.

RESOLVED: No. While it may be useful, there is not a clear way to do this on Win32. However, a method was added to query support for presenting to the windows desktop as a whole.

2) If a native window object (`HWND`) is used by one graphics API, and then is later used by a different graphics API (one of which is Vulkan), can these uses interfere with each other?

RESOLVED: Yes.

Uses of a window object by multiple graphics APIs results in undefined behavior. Such behavior may succeed when using one Vulkan implementation but fail when using a different Vulkan implementation. Potential failures include:

- Creating then destroying a flip presentation model DXGI swapchain on a window object can prevent vkCreateSwapchainKHR from succeeding on the same window object.
- Creating then destroying a VkSwapchainKHR on a window object can prevent creation of a bitblt model DXGI swapchain on the same window object.
- Creating then destroying a VkSwapchainKHR on a window object can effectively `SetPixelFormat` to a different format than the format chosen by an OpenGL application.
- Creating then destroying a VkSwapchainKHR on a window object on one VkPhysicalDevice can prevent vkCreateSwapchainKHR from succeeding on the same window object, but on a different VkPhysicalDevice that is associated with a different Vulkan ICD.

In all cases the problem can be worked around by creating a new window object.

Technical details include:

- Creating a DXGI swapchain over a window object can alter the object for the remainder of its lifetime. The alteration persists even after the DXGI swapchain has been destroyed. This alteration can make it impossible for a conformant Vulkan implementation to create a VkSwapchainKHR over the same window object. Mention of this alteration can be found in the

remarks section of the MSDN documentation for `DXGI_SWAP_EFFECT`.

- Calling GDI's `SetPixelFormat` (needed by OpenGL's WGL layer) on a window object alters the object for the remainder of its lifetime. The MSDN documentation for `SetPixelFormat` explains that a window object's pixel format can be set only one time.
- Creating a VkSwapchainKHR over a window object can alter the object for its remaining lifetime. Either of the above alterations may occur as a side effect of vkCreateSwapchainKHR.

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
  - Initial draft, based on the previous contents of VK_EXT_KHR_swapchain (later renamed VK_EXT_KHR_surface).
- Revision 2, 2015-10-02 (James Jones)
  - Added presentation support query for win32 desktops.
- Revision 3, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_win32_surface to VK_KHR_win32_surface.
- Revision 4, 2015-11-03 (Daniel Rakos)
  - Added allocation callbacks to vkCreateWin32SurfaceKHR.
- Revision 5, 2015-11-28 (Daniel Rakos)
  - Updated the surface create function to take a pCreateInfo structure.
- Revision 6, 2017-04-24 (Jeff Juliano)
  - Add issue 2 addressing reuse of a native window object in a different Graphics API, or by a different Vulkan ICD.

Interactions and External Dependencies

- This extension provides API support for `GL_EXT_shared_memory_block`

Contributors

- Caio Marcelo de Oliveira Filho, Intel
- Jeff Bolz, NVIDIA
- Graeme Leese, Broadcom
- Faith Ekstrand, Intel
- Daniel Koch, NVIDIA

Description

This extension adds Vulkan support for the `SPV_KHR_workgroup_memory_explicit_layout` SPIR-V extension, which allows shaders to explicitly define the layout of `Workgroup` storage class memory and create aliases between variables from that storage class in a compute shader.

The aliasing feature allows different “views” on the same data, so the shader can bulk copy data from another storage class using one type (e.g. an array of large vectors), and then use the data with a more specific type. It also enables reducing the amount of workgroup memory consumed by allowing the shader to alias data whose lifetimes do not overlap.

The explicit layout support and some form of aliasing is also required for layering OpenCL on top of Vulkan.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR

New Enum Constants

- `VK_KHR_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_EXTENSION_NAME`
- `VK_KHR_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_FEATURES_KHR`

New SPIR-V Capabilities

- `WorkgroupMemoryExplicitLayoutKHR`
- `WorkgroupMemoryExplicitLayout8BitAccessKHR`
- `WorkgroupMemoryExplicitLayout16BitAccessKHR`

Version History

- Revision 1, 2020-06-01 (Caio Marcelo de Oliveira Filho)
  - Initial version

Description

The `VK_KHR_xcb_surface` extension is an instance extension. It provides a mechanism to create a VkSurfaceKHR object (defined by the `VK_KHR_surface` extension) that refers to an X11 `Window`, using the XCB client-side library, as well as a query to determine support for rendering via XCB.

New Commands

- vkCreateXcbSurfaceKHR
- vkGetPhysicalDeviceXcbPresentationSupportKHR

New Structures

- VkXcbSurfaceCreateInfoKHR

New Bitmasks

- VkXcbSurfaceCreateFlagsKHR

New Enum Constants

- `VK_KHR_XCB_SURFACE_EXTENSION_NAME`

- VK_KHR_XCB_SURFACE_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR

Issues

1) Does XCB need a way to query for compatibility between a particular physical device and a specific screen? This would be a more general query than vkGetPhysicalDeviceSurfaceSupportKHR: If it returned VK_TRUE, then the physical device could be assumed to support presentation to any window on that screen.

RESOLVED: Yes, this is needed for toolkits that want to create a VkDevice before creating a window. To ensure the query is reliable, it must be made against a particular X visual rather than the screen in general.

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
  - Initial draft, based on the previous contents of VK_EXT_KHR_swapchain (later renamed VK_EXT_KHR_surface).
- Revision 2, 2015-10-02 (James Jones)
  - Added presentation support query for an (xcb_connection_t*, xcb_visualid_t) pair.
  - Removed “root” parameter from CreateXcbSurfaceKHR(), as it is redundant when a window on the same screen is specified as well.
  - Adjusted wording of issue #1 and added agreed upon resolution.
- Revision 3, 2015-10-14 (Ian Elliott)
  - Removed “root” parameter from CreateXcbSurfaceKHR() in one more place.
- Revision 4, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_xcb_surface to VK_KHR_xcb_surface.
- Revision 5, 2015-10-23 (Daniel Rakos)
  - Added allocation callbacks to vkCreateXcbSurfaceKHR.
- Revision 6, 2015-11-28 (Daniel Rakos)
  - Updated the surface create function to take a pCreateInfo structure.

- VkXlibSurfaceCreateInfoKHR

New Bitmasks

- VkXlibSurfaceCreateFlagsKHR

New Enum Constants

- VK_KHR_XLIB_SURFACE_EXTENSION_NAME
- VK_KHR_XLIB_SURFACE_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR

Issues

1) Does X11 need a way to query for compatibility between a particular physical device and a specific screen? This would be a more general query than vkGetPhysicalDeviceSurfaceSupportKHR; if it returned VK_TRUE, then the physical device could be assumed to support presentation to any window on that screen.

RESOLVED: Yes, this is needed for toolkits that want to create a VkDevice before creating a window. To ensure the query is reliable, it must be made against a particular X visual rather than the screen in general.

Version History

- Revision 1, 2015-09-23 (Jesse Hall)
  - Initial draft, based on the previous contents of VK_EXT_KHR_swapchain (later renamed VK_EXT_KHR_surface).
- Revision 2, 2015-10-02 (James Jones)
  - Added presentation support query for (Display*, VisualID) pair.
  - Removed “root” parameter from CreateXlibSurfaceKHR(), as it is redundant when a window on the same screen is specified as well.
  - Added appropriate X errors.

    - Adjusted wording of issue #1 and added agreed upon resolution.
- Revision 3, 2015-10-14 (Ian Elliott)
    - Renamed this extension from VK_EXT_KHR_x11_surface to VK_EXT_KHR_xlib_surface.
- Revision 4, 2015-10-26 (Ian Elliott)
    - Renamed from VK_EXT_KHR_xlib_surface to VK_KHR_xlib_surface.
- Revision 5, 2015-11-03 (Daniel Rakos)
    - Added allocation callbacks to vkCreateXlibSurfaceKHR.
- Revision 6, 2015-11-28 (Daniel Rakos)
    - Updated the surface create function to take a pCreateInfo structure.

Description

This extension allows the use of a null constant initializer on shader Workgroup memory variables, allowing implementations to expose any special hardware or instructions they may have. Zero initialization is commonly used by applications running untrusted content (e.g. web browsers) as way of defeating memory-scraping attacks.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeaturesKHR

New Enum Constants

- `VK_KHR_ZERO_INITIALIZE_WORKGROUP_MEMORY_EXTENSION_NAME`
- `VK_KHR_ZERO_INITIALIZE_WORKGROUP_MEMORY_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ZERO_INITIALIZE_WORKGROUP_MEMORY_FEATURES_KHR`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the KHR suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

- Faith Ekstrand, Intel

Description

This extension defines the `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT` and `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT` formats which are defined in other current graphics APIs.

This extension may be useful for building translation layers for those APIs or for porting applications that use these formats without having to resort to swizzles.

When VK_EXT_custom_border_color is used, these formats are not subject to the same restrictions for border color without format as with VK_FORMAT_B4G4R4A4_UNORM_PACK16.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevice4444FormatsFeaturesEXT

New Enum Constants

- `VK_EXT_4444_FORMATS_EXTENSION_NAME`
- `VK_EXT_4444_FORMATS_SPEC_VERSION`

- Extending VkFormat:
  - `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT`
  - `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT`

Promotion to Vulkan 1.3

This extension has been partially promoted. The format enumerants introduced by the extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, runtime support for these formats is optional in core Vulkan 1.3, while if this extension is supported, runtime support is mandatory. The feature structure is not promoted. The original enum names are still available as aliases of the core functionality.

Description

This extension allows an application to take exclusive control on a display currently associated with an X11 screen. When control is acquired, the display will be deassociated from the X11 screen until control is released or the specified display connection is closed. Essentially, the X11 screen will behave as if the monitor has been unplugged until control is released.

New Commands

- vkAcquireXlibDisplayEXT
- vkGetRandROutputDisplayEXT

New Enum Constants

- `VK_EXT_ACQUIRE_XLIB_DISPLAY_EXTENSION_NAME`
- `VK_EXT_ACQUIRE_XLIB_DISPLAY_SPEC_VERSION`

Issues

1) Should vkAcquireXlibDisplayEXT take an RandR display ID, or a Vulkan display handle as input?

RESOLVED: A Vulkan display handle. Otherwise there would be no way to specify handles to displays that had been prevented from being included in the X11 display list by some native

platform or vendor-specific mechanism.

2) How does an application figure out which RandR display corresponds to a Vulkan display?

RESOLVED: A new function, vkGetRandROutputDisplayEXT, is introduced for this purpose.

3) Should vkGetRandROutputDisplayEXT be part of this extension, or a general Vulkan / RandR or Vulkan / Xlib extension?

RESOLVED: To avoid yet another extension, include it in this extension.

Version History

Description

The existing specification requires that low dynamic range (LDR) ASTC textures are decompressed to FP16 values per component. In many cases, decompressing LDR textures to a lower precision intermediate result gives acceptable image quality. Source material for LDR textures is typically authored as 8-bit UNORM values, so decoding to FP16 values adds little value. On the other hand, reducing precision of the decoded result reduces the size of the decompressed data, potentially improving texture cache performance and saving power.

The goal of this extension is to enable this efficiency gain on existing ASTC texture data. This is achieved by giving the application the ability to select the intermediate decoding precision.

Three decoding options are provided:

- Decode to `VK_FORMAT_R16G16B16A16_SFLOAT` precision: This is the default, and matches the required behavior in the core API.
- Decode to `VK_FORMAT_R8G8B8A8_UNORM` precision: This is provided as an option in LDR mode.
- Decode to `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32` precision: This is provided as an option in both LDR and HDR mode. In this mode, negative values cannot be represented and are clamped to zero. The alpha component is ignored, and the results are as if alpha was 1.0. This decode mode is optional and support can be queried via the physical device properties.

New Structures

- Extending VkImageViewCreateInfo:
  - VkImageViewASTCDecodeModeEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceASTCDecodeFeaturesEXT

New Enum Constants

- `VK_EXT_ASTC_DECODE_MODE_EXTENSION_NAME`
- `VK_EXT_ASTC_DECODE_MODE_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT`

Issues

1) Are implementations allowed to decode at a higher precision than what is requested?

```
RESOLUTION: No.
If we allow this, then this extension could be exposed on all
implementations that support ASTC.
But developers would have no way of knowing what precision was actually
used, and thus whether the image quality is sufficient at reduced
```

```
precision.
```

2) Should the decode mode be image view state and/or sampler state?

```
RESOLUTION: Image view state only.
Some implementations treat the different decode modes as different
texture formats.
```

Example

Create an image view that decodes to VK_FORMAT_R8G8B8A8_UNORM precision:

```
    VkImageViewASTCDecodeModeEXT decodeMode =
    {
        .sType = VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT,
        .pNext = NULL,
        .decodeMode = VK_FORMAT_R8G8B8A8_UNORM
    };

    VkImageViewCreateInfo createInfo =
    {
        .sType = VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO,
        .pNext = &decodeMode,
        // flags, image, viewType set to application-desired values
        .format = VK_FORMAT_ASTC_8x8_UNORM_BLOCK,
        // components, subresourceRange set to application-desired values
    };

    VkImageView imageView;
    VkResult result = vkCreateImageView(
        device,
        &createInfo,
        NULL,
        &imageView);
```

Description

This extension adds a number of “advanced” blending operations that **can** be used to perform new color blending operations, many of which are more complex than the standard blend modes provided by unextended Vulkan. This extension requires different styles of usage, depending on the level of hardware support and the enabled features:

- If VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations is VK_FALSE, the new blending operations are supported, but a memory dependency **must** separate each advanced blend operation on a given sample. VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT is used to synchronize reads using advanced blend operations.
- If VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations is VK_TRUE, advanced blend operations obey primitive order just like basic blend operations.

In unextended Vulkan, the set of blending operations is limited, and **can** be expressed very simply. The VK_BLEND_OP_MIN and VK_BLEND_OP_MAX blend operations simply compute component-wise minimums or maximums of source and destination color components. The VK_BLEND_OP_ADD, VK_BLEND_OP_SUBTRACT, and VK_BLEND_OP_REVERSE_SUBTRACT modes multiply the source and destination colors by source and destination factors and either add the two products together or subtract one from the other. This limited set of operations supports many common blending operations but precludes the use of more sophisticated transparency and blending operations commonly available in many dedicated imaging APIs.

This extension provides a number of new “advanced” blending operations. Unlike traditional blending operations using VK_BLEND_OP_ADD, these blending equations do not use source and destination factors specified by VkBlendFactor. Instead, each blend operation specifies a complete equation based on the source and destination colors. These new blend operations are used for both RGB and alpha components; they **must** not be used to perform separate RGB and alpha blending (via different values of color and alpha VkBlendOp).

These blending operations are performed using premultiplied colors, where RGB colors **can** be considered premultiplied or non-premultiplied by alpha, according to the srcPremultiplied and dstPremultiplied members of VkPipelineColorBlendAdvancedStateCreateInfoEXT. If a color is considered non-premultiplied, the (R,G,B) color components are multiplied by the alpha component prior to blending. For non-premultiplied color components in the range [0,1], the corresponding premultiplied color component would have values in the range [0 × A, 1 × A].

Many of these advanced blending equations are formulated where the result of blending source and destination colors with partial coverage have three separate contributions: from the portions covered by both the source and the destination, from the portion covered only by the source, and from the portion covered only by the destination. The blend parameter VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap **can** be used to specify a correlation between source and destination pixel coverage. If set to VK_BLEND_OVERLAP_CONJOINT_EXT, the source and destination are considered to have maximal overlap, as would be the case if drawing two objects on top of each other. If set to VK_BLEND_OVERLAP_DISJOINT_EXT, the source and

destination are considered to have minimal overlap, as would be the case when rendering a complex polygon tessellated into individual non-intersecting triangles. If set to VK_BLEND_OVERLAP_UNCORRELATED_EXT, the source and destination coverage are assumed to have no spatial correlation within the pixel.

In addition to the coherency issues on implementations not supporting advancedBlendCoherentOperations, this extension has several limitations worth noting. First, the new blend operations have a limit on the number of color attachments they **can** be used with, as indicated by VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT ::advancedBlendMaxColorAttachments. Additionally, blending precision **may** be limited to 16-bit floating-point, which **may** result in a loss of precision and dynamic range for framebuffer formats with 32-bit floating-point components, and in a loss of precision for formats with 12- and 16-bit signed or unsigned normalized integer components.

New Structures

Description

After the publication of VK_EXT_custom_border_color, it was discovered that some implementations had undefined behavior when combining a sampler that uses a custom border color with image views whose component mapping is not the identity mapping.

Since VK_EXT_custom_border_color has already shipped, this new extension VK_EXT_border_color_swizzle was created to define the interaction between custom border colors and non-identity image view swizzles, and provide a work-around for implementations that must pre-swizzle the sampler border color to match the image view component mapping it is combined with.

This extension also defines the behavior between samplers with an opaque black border color and image views with a non-identity component swizzle, which was previously left undefined.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceBorderColorSwizzleFeaturesEXT
- Extending VkSamplerCreateInfo:
  - VkSamplerBorderColorComponentMappingCreateInfoEXT

Description

This extension allows for selectively enabling and disabling writes to output color attachments via a pipeline dynamic state.

The intended use cases for this new state are mostly identical to those of colorWriteMask, such as selectively disabling writes to avoid feedback loops between subpasses or bandwidth savings for unused outputs. By making the state dynamic, one additional benefit is the ability to reduce pipeline counts and pipeline switching via shaders that write a superset of the desired data of which subsets are selected dynamically. The reason for a new state, colorWriteEnable, rather than making colorWriteMask dynamic is that, on many implementations, the more flexible per-component semantics of the colorWriteMask state cannot be made dynamic in a performant manner.

New Commands

Description

This extension allows the execution of one or more rendering commands to be conditional on a value in buffer memory. This may help an application reduce the latency by conditionally discarding rendering commands without application intervention. The conditional rendering commands are limited to draws, compute dispatches and clearing attachments within a conditional rendering block.

New Commands

- vkCmdBeginConditionalRenderingEXT
- vkCmdEndConditionalRenderingEXT

New Structures

- VkConditionalRenderingBeginInfoEXT
- Extending VkCommandBufferInheritanceInfo:
  - VkCommandBufferInheritanceConditionalRenderingInfoEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceConditionalRenderingFeaturesEXT

New Enums

- VkConditionalRenderingFlagBitsEXT

New Bitmasks

- VkConditionalRenderingFlagsEXT

New Enum Constants

- `VK_EXT_CONDITIONAL_RENDERING_EXTENSION_NAME`
- `VK_EXT_CONDITIONAL_RENDERING_SPEC_VERSION`
- Extending VkAccessFlagBits:
  - `VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT`
- Extending VkBufferUsageFlagBits:
  - `VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT`
- Extending VkPipelineStageFlagBits:
  - `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_CONDITIONAL_RENDERING_INFO_EXT`
  - `VK_STRUCTURE_TYPE_CONDITIONAL_RENDERING_BEGIN_INFO_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONDITIONAL_RENDERING_FEATURES_EXT`

Issues

1) Should conditional rendering affect copy and blit commands?

RESOLVED: Conditional rendering should not affect copies and blits.

2) Should secondary command buffers be allowed to execute while conditional rendering is active in the primary command buffer?

RESOLVED: The rendering commands in secondary command buffer will be affected by an active conditional rendering in primary command buffer if the `conditionalRenderingEnable` is set to `VK_TRUE`. Conditional rendering **must** not be active in the primary command buffer if `conditionalRenderingEnable` is `VK_FALSE`.

Examples

None.

Version History

Description

This extension adds a new rasterization mode called conservative rasterization. There are two modes of conservative rasterization; overestimation and underestimation.

When overestimation is enabled, if any part of the primitive, including its edges, covers any part of the rectangular pixel area, including its sides, then a fragment is generated with all coverage samples turned on. This extension allows for some variation in implementations by accounting for differences in overestimation, where the generating primitive size is increased at each of its edges by some sub-pixel amount to further increase conservative pixel coverage. Implementations can allow the application to specify an extra overestimation beyond the base overestimation the implementation already does. It also allows implementations to either cull degenerate primitives or rasterize them.

When underestimation is enabled, fragments are only generated if the rectangular pixel area is fully covered by the generating primitive. If supported by the implementation, when a pixel rectangle is fully covered the fragment shader input variable builtin called FullyCoveredEXT is set to true. The shader variable works in either overestimation or underestimation mode.

Implementations can process degenerate triangles and lines by either discarding them or generating conservative fragments for them. Degenerate triangles are those that end up with zero area after the rasterizer quantizes them to the fixed-point pixel grid. Degenerate lines are those with zero length after quantization.

New Structures

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceConservativeRasterizationPropertiesEXT
- Extending VkPipelineRasterizationStateCreateInfo:
  - VkPipelineRasterizationConservativeStateCreateInfoEXT

New Enums

- VkConservativeRasterizationModeEXT

Description

This extension provides cross-vendor functionality to specify a custom border color for use when the sampler address mode `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` is used.

To create a sampler which uses a custom border color set VkSamplerCreateInfo::`borderColor` to one of:

- `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
- `VK_BORDER_COLOR_INT_CUSTOM_EXT`

When `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT` is used, applications must provide a VkSamplerCustomBorderColorCreateInfoEXT in the `pNext` chain for VkSamplerCreateInfo.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceCustomBorderColorFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceCustomBorderColorPropertiesEXT
- Extending VkSamplerCreateInfo:
  - VkSamplerCustomBorderColorCreateInfoEXT

New Enum Constants

- `VK_EXT_CUSTOM_BORDER_COLOR_EXTENSION_NAME`
- `VK_EXT_CUSTOM_BORDER_COLOR_SPEC_VERSION`
- Extending VkBorderColor:
  - `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
  - `VK_BORDER_COLOR_INT_CUSTOM_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_CREATE_INFO_EXT`

Issues

1) Should VkClearColorValue be used for the border color value, or should we have our own struct/union? Do we need to specify the type of the input values for the components? This is more

of a concern if VkClearColorValue is used here because it provides a union of float,int,uint types.

RESOLVED: Will reuse existing VkClearColorValue structure in order to easily take advantage of float,int,uint borderColor types.

2) For hardware which supports a limited number of border colors what happens if that number is exceeded? Should this be handled by the driver unbeknownst to the application? In Revision 1 we had solved this issue using a new Object type, however that may have lead to additional system resource consumption which would otherwise not be required.

RESOLVED: Added `VkPhysicalDeviceCustomBorderColorPropertiesEXT::maxCustomBorderColorSamplers` for tracking implementation-specific limit, and Valid Usage statement handling overflow.

3) Should this be supported for immutable samplers at all, or by a feature bit? Some implementations may not be able to support custom border colors on immutable samplers — is it worthwhile enabling this to work on them for implementations that can support it, or forbidding it entirely.

RESOLVED: Samplers created with a custom border color are forbidden from being immutable. This resolves concerns for implementations where the custom border color is an index to a LUT instead of being directly embedded into sampler state.

4) Should UINT and SINT (unsigned integer and signed integer) border color types be separated or should they be combined into one generic INT (integer) type?

RESOLVED: Separating these does not make much sense as the existing fixed border color types do not have this distinction, and there is no reason in hardware to do so. This separation would also create unnecessary work and considerations for the application.

Version History

- Revision 1, 2019-10-10 (Joshua Ashton)
  - Internal revisions.
- Revision 2, 2019-10-11 (Liam Middlebrook)
  - Remove VkCustomBorderColor object and associated functions
  - Add issues concerning HW limitations for custom border color count
- Revision 3, 2019-10-12 (Joshua Ashton)
  - Re-expose the limits for the maximum number of unique border colors
  - Add extra details about border color tracking
  - Fix typos
- Revision 4, 2019-10-12 (Joshua Ashton)
  - Changed maxUniqueCustomBorderColors to a uint32_t from a VkDeviceSize
- Revision 5, 2019-10-14 (Liam Middlebrook)
  - Added features bit
- Revision 6, 2019-10-15 (Joshua Ashton)

    - Type-ize VK_BORDER_COLOR_CUSTOM
    - Fix const-ness on `pNext` of VkSamplerCustomBorderColorCreateInfoEXT
- Revision 7, 2019-11-26 (Liam Middlebrook)
    - Renamed maxUniqueCustomBorderColors to maxCustomBorderColors
- Revision 8, 2019-11-29 (Joshua Ashton)
    - Renamed borderColor member of VkSamplerCustomBorderColorCreateInfoEXT to customBorderColor
- Revision 9, 2020-02-19 (Joshua Ashton)
    - Renamed maxCustomBorderColors to maxCustomBorderColorSamplers
- Revision 10, 2020-02-21 (Joshua Ashton)
    - Added format to VkSamplerCustomBorderColorCreateInfoEXT and feature bit
- Revision 11, 2020-04-07 (Joshua Ashton)
    - Dropped UINT/SINT border color differences, consolidated types
- Revision 12, 2020-04-16 (Joshua Ashton)
    - Renamed VK_BORDER_COLOR_CUSTOM_FLOAT_EXT to VK_BORDER_COLOR_FLOAT_CUSTOM_EXT for consistency

Description

Due to the nature of the Vulkan interface, there is very little error information available to the developer and application. By using the `VK_EXT_debug_utils` extension, developers **can** obtain more information. When combined with validation layers, even more detailed feedback on the application's use of Vulkan will be provided.

This extension provides the following capabilities:

- The ability to create a debug messenger which will pass along debug messages to an application supplied callback.
- The ability to identify specific Vulkan objects using a name or tag to improve tracking.

- The ability to identify specific sections within a `VkQueue` or `VkCommandBuffer` using labels to aid organization and offline analysis in external tools.

The main difference between this extension and `VK_EXT_debug_report` and `VK_EXT_debug_marker` is that those extensions use VkDebugReportObjectTypeEXT to identify objects. This extension uses the core VkObjectType in place of VkDebugReportObjectTypeEXT. The primary reason for this move is that no future object type handle enumeration values will be added to VkDebugReportObjectTypeEXT since the creation of VkObjectType.

In addition, this extension combines the functionality of both `VK_EXT_debug_report` and `VK_EXT_debug_marker` by allowing object name and debug markers (now called labels) to be returned to the application's callback function. This should assist in clarifying the details of a debug message including: what objects are involved and potentially which location within a VkQueue or VkCommandBuffer the message occurred.

New Object Types

- VkDebugUtilsMessengerEXT

New Commands

- vkCmdBeginDebugUtilsLabelEXT
- vkCmdEndDebugUtilsLabelEXT
- vkCmdInsertDebugUtilsLabelEXT
- vkCreateDebugUtilsMessengerEXT
- vkDestroyDebugUtilsMessengerEXT
- vkQueueBeginDebugUtilsLabelEXT
- vkQueueEndDebugUtilsLabelEXT
- vkQueueInsertDebugUtilsLabelEXT
- vkSetDebugUtilsObjectNameEXT
- vkSetDebugUtilsObjectTagEXT
- vkSubmitDebugUtilsMessageEXT

New Structures

- VkDebugUtilsLabelEXT
- VkDebugUtilsMessengerCallbackDataEXT
- VkDebugUtilsObjectTagInfoEXT
- Extending VkInstanceCreateInfo:
  - VkDebugUtilsMessengerCreateInfoEXT
- Extending VkPipelineShaderStageCreateInfo:
  - VkDebugUtilsObjectNameInfoEXT

New Function Pointers

- PFN_vkDebugUtilsMessengerCallbackEXT

New Enums

- VkDebugUtilsMessageSeverityFlagBitsEXT
- VkDebugUtilsMessageTypeFlagBitsEXT

New Bitmasks

- VkDebugUtilsMessageSeverityFlagsEXT
- VkDebugUtilsMessageTypeFlagsEXT
- VkDebugUtilsMessengerCallbackDataFlagsEXT
- VkDebugUtilsMessengerCreateFlagsEXT

New Enum Constants

- `VK_EXT_DEBUG_UTILS_EXTENSION_NAME`
- `VK_EXT_DEBUG_UTILS_SPEC_VERSION`
- Extending VkObjectType:
  - `VK_OBJECT_TYPE_DEBUG_UTILS_MESSENGER_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT`
  - `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CALLBACK_DATA_EXT`
  - `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT`
  - `VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_TAG_INFO_EXT`

Examples

Example 1

`VK_EXT_debug_utils` allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application-defined behavior. An application **can** register callbacks even when no validation layers are enabled, but they will only be called for loader and, if implemented, driver events.

To capture events that occur while creating or destroying an instance an application **can** link a VkDebugUtilsMessengerCreateInfoEXT structure to the `pNext` element of the VkInstanceCreateInfo structure given to vkCreateInstance.

Example uses: Create three callback objects. One will log errors and warnings to the debug console using Windows `OutputDebugString`. The second will cause the debugger to break at that callback

when an error happens and the third will log warnings to stdout.

```
    extern VkInstance instance;
    VkResult res;
    VkDebugUtilsMessengerEXT cb1, cb2, cb3;

    // Must call extension functions through a function pointer:
    PFN_vkCreateDebugUtilsMessengerEXT pfnCreateDebugUtilsMessengerEXT =
(PFN_vkCreateDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance,
"vkCreateDebugUtilsMessengerEXT");
    PFN_vkDestroyDebugUtilsMessengerEXT pfnDestroyDebugUtilsMessengerEXT =
(PFN_vkDestroyDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance,
"vkDestroyDebugUtilsMessengerEXT");

    VkDebugUtilsMessengerCreateInfoEXT callback1 = {
        .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = 0,
        .messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT |
                           VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT,
        .messageType= VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT |
                      VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT,
        .pfnUserCallback = myOutputDebugString,
        .pUserData = NULL
    };
    res = pfnCreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb1);
    if (res != VK_SUCCESS) {
       // Do error handling for VK_ERROR_OUT_OF_MEMORY
    }

    callback1.messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT;
    callback1.pfnUserCallback = myDebugBreak;
    callback1.pUserData = NULL;
    res = pfnCreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb2);
    if (res != VK_SUCCESS) {
       // Do error handling for VK_ERROR_OUT_OF_MEMORY
    }

    VkDebugUtilsMessengerCreateInfoEXT callback3 = {
        .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = 0,
        .messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT,
        .messageType = VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT |
                       VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT,
        .pfnUserCallback = mystdOutLogger,
        .pUserData = NULL
    };
    res = pfnCreateDebugUtilsMessengerEXT(instance, &callback3, NULL, &cb3);
    if (res != VK_SUCCESS) {
```

```
        // Do error handling for VK_ERROR_OUT_OF_MEMORY
    }

    ...

    // Remove callbacks when cleaning up
    pfnDestroyDebugUtilsMessengerEXT(instance, cb1, NULL);
    pfnDestroyDebugUtilsMessengerEXT(instance, cb2, NULL);
    pfnDestroyDebugUtilsMessengerEXT(instance, cb3, NULL);
```

Example 2

Associate a name with an image, for easier debugging in external tools or with validation layers that can print a friendly name when referring to objects in error messages.

```
    extern VkInstance instance;
    extern VkDevice device;
    extern VkImage image;

    // Must call extension functions through a function pointer:
    PFN_vkSetDebugUtilsObjectNameEXT pfnSetDebugUtilsObjectNameEXT =
(PFN_vkSetDebugUtilsObjectNameEXT)vkGetInstanceProcAddr(instance,
"vkSetDebugUtilsObjectNameEXT");

    // Set a name on the image
    const VkDebugUtilsObjectNameInfoEXT imageNameInfo =
    {
        .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT,
        .pNext = NULL,
        .objectType = VK_OBJECT_TYPE_IMAGE,
        .objectHandle = (uint64_t)image,
        .pObjectName = "Brick Diffuse Texture",
    };

    pfnSetDebugUtilsObjectNameEXT(device, &imageNameInfo);

    // A subsequent error might print:
    //   Image 'Brick Diffuse Texture' (0xc0dec0dedeadbeef) is used in a
    //   command buffer with no memory bound to it.
```

Example 3

Annotating regions of a workload with naming information so that offline analysis tools can display a more usable visualization of the commands submitted.

```
    extern VkInstance instance;
    extern VkCommandBuffer commandBuffer;

    // Must call extension functions through a function pointer:
```

```
    PFN_vkQueueBeginDebugUtilsLabelEXT pfnQueueBeginDebugUtilsLabelEXT =
(PFN_vkQueueBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkQueueBeginDebugUtilsLabelEXT");
    PFN_vkQueueEndDebugUtilsLabelEXT pfnQueueEndDebugUtilsLabelEXT =
(PFN_vkQueueEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkQueueEndDebugUtilsLabelEXT");
    PFN_vkCmdBeginDebugUtilsLabelEXT pfnCmdBeginDebugUtilsLabelEXT =
(PFN_vkCmdBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkCmdBeginDebugUtilsLabelEXT");
    PFN_vkCmdEndDebugUtilsLabelEXT pfnCmdEndDebugUtilsLabelEXT =
(PFN_vkCmdEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkCmdEndDebugUtilsLabelEXT");
    PFN_vkCmdInsertDebugUtilsLabelEXT pfnCmdInsertDebugUtilsLabelEXT =
(PFN_vkCmdInsertDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance,
"vkCmdInsertDebugUtilsLabelEXT");

    // Describe the area being rendered
    const VkDebugUtilsLabelEXT houseLabel =
    {
        .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
        .pNext = NULL,
        .pLabelName = "Brick House",
        .color = { 1.0f, 0.0f, 0.0f, 1.0f },
    };

    // Start an annotated group of calls under the 'Brick House' name
    pfnCmdBeginDebugUtilsLabelEXT(commandBuffer, &houseLabel);
    {
        // A mutable structure for each part being rendered
        VkDebugUtilsLabelEXT housePartLabel =
        {
            .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
            .pNext = NULL,
            .pLabelName = NULL,
            .color = { 0.0f, 0.0f, 0.0f, 0.0f },
        };

        // Set the name and insert the marker
        housePartLabel.pLabelName = "Walls";
        pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

        // Insert the drawcall for the walls
        vkCmdDrawIndexed(commandBuffer, 1000, 1, 0, 0, 0);

        // Insert a recursive region for two sets of windows
        housePartLabel.pLabelName = "Windows";
        pfnCmdBeginDebugUtilsLabelEXT(commandBuffer, &housePartLabel);
        {
            vkCmdDrawIndexed(commandBuffer, 75, 6, 1000, 0, 0);
            vkCmdDrawIndexed(commandBuffer, 100, 2, 1450, 0, 0);
        }
```

```
        pfnCmdEndDebugUtilsLabelEXT(commandBuffer);

        housePartLabel.pLabelName = "Front Door";
        pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

        vkCmdDrawIndexed(commandBuffer, 350, 1, 1650, 0, 0);

        housePartLabel.pLabelName = "Roof";
        pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

        vkCmdDrawIndexed(commandBuffer, 500, 1, 2000, 0, 0);
    }
    // End the house annotation started above
    pfnCmdEndDebugUtilsLabelEXT(commandBuffer);

    // Do other work

    vkEndCommandBuffer(commandBuffer);

    // Describe the queue being used
    const VkDebugUtilsLabelEXT queueLabel =
    {
        .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
        .pNext = NULL,
        .pLabelName = "Main Render Work",
        .color = { 0.0f, 1.0f, 0.0f, 1.0f },
    };

    // Identify the queue label region
    pfnQueueBeginDebugUtilsLabelEXT(queue, &queueLabel);

    // Submit the work for the main render thread
    const VkCommandBuffer cmd_bufs[] = {commandBuffer};
    VkSubmitInfo submit_info =
    {
        .sType = VK_STRUCTURE_TYPE_SUBMIT_INFO,
        .pNext = NULL,
        .waitSemaphoreCount = 0,
        .pWaitSemaphores = NULL,
        .pWaitDstStageMask = NULL,
        .commandBufferCount = 1,
        .pCommandBuffers = cmd_bufs,
        .signalSemaphoreCount = 0,
        .pSignalSemaphores = NULL
    };
    vkQueueSubmit(queue, 1, &submit_info, fence);

    // End the queue label region
    pfnQueueEndDebugUtilsLabelEXT(queue);
```

Issues

1) Should we just name this extension `VK_EXT_debug_report2`

RESOLVED: No. There is enough additional changes to the structures to break backwards compatibility. So, a new name was decided that would not indicate any interaction with the previous extension.

2) Will validation layers immediately support all the new features.

RESOLVED: Not immediately. As one can imagine, there is a lot of work involved with converting the validation layer logging over to the new functionality. Basic logging, as seen in the origin `VK_EXT_debug_report` extension will be made available immediately. However, adding the labels and object names will take time. Since the priority for Khronos at this time is to continue focusing on Valid Usage statements, it may take a while before the new functionality is fully exposed.

3) If the validation layers will not expose the new functionality immediately, then what is the point of this extension?

RESOLVED: We needed a replacement for `VK_EXT_debug_report` because the VkDebugReportObjectTypeEXT enumeration will no longer be updated and any new objects will need to be debugged using the new functionality provided by this extension.

4) Should this extension be split into two separate parts (1 extension that is an instance extension providing the callback functionality, and another device extension providing the general debug marker and annotation functionality)?

RESOLVED: No, the functionality for this extension is too closely related. If we did split up the extension, where would the structures and enums live, and how would you define that the device behavior in the instance extension is really only valid if the device extension is enabled, and the functionality is passed in. It is cleaner to just define this all as an instance extension, plus it allows the application to enable all debug functionality provided with one enable string during vkCreateInstance.

Version History

- Revision 1, 2017-09-14 (Mark Young and all listed Contributors)
  - Initial draft, based on `VK_EXT_debug_report` and `VK_EXT_debug_marker` in addition to previous feedback supplied from various companies including Valve, Epic, and Oxide games.
- Revision 2, 2020-04-03 (Mark Young and Piers Daniell)
  - Updated to allow either `NULL` or an empty string to be passed in for `pObjectName` in `VkDebugUtilsObjectNameInfoEXT`, because the loader and various drivers support `NULL` already.

Description

This extension adds a new structure, `VkDepthBiasRepresentationInfoEXT`, that can be added to a `pNext` chain of `VkPipelineRasterizationStateCreateInfo` and allows setting the scaling and representation of depth bias for a pipeline.

This state can also be set dynamically by using the new structure mentioned above in combination with the new `vkCmdSetDepthBias2EXT` command.

New Commands

- vkCmdSetDepthBias2EXT

New Structures

- VkDepthBiasInfoEXT
- Extending VkDepthBiasInfoEXT, VkPipelineRasterizationStateCreateInfo:
  - VkDepthBiasRepresentationInfoEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceDepthBiasControlFeaturesEXT

New Enums

- VkDepthBiasRepresentationEXT

New Enum Constants

- `VK_EXT_DEPTH_BIAS_CONTROL_EXTENSION_NAME`
- `VK_EXT_DEPTH_BIAS_CONTROL_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DEPTH_BIAS_INFO_EXT`
  - `VK_STRUCTURE_TYPE_DEPTH_BIAS_REPRESENTATION_INFO_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_BIAS_CONTROL_FEATURES_EXT`

Version History

Extension Proposal

VK_EXT_depth_clamp_control

Other Extension Metadata

Last Modified Date

2024-07-15

Contributors

- Jules Blok, Independent

Description

This extension allows the application to control the viewport depth clamp range separately from the viewport `minDepth` and `maxDepth`. This gives the ability for the application to restrict depth values to an application-defined range rather than the viewport depth range or the range defined in the VK_EXT_depth_clamp_zero_one extension.

It can be used to set a smaller or larger clamping range than the viewport depth range without affecting the depth mapping of the viewport transform. Another possible use of this extension is to restrict depth values beyond the viewport depth range to a clamping range other than the [0, 1] range defined in the VK_EXT_depth_clamp_zero_one extension.

New Commands

- vkCmdSetDepthClampRangeEXT

New Structures

- VkDepthClampRangeEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceDepthClampControlFeaturesEXT
- Extending VkPipelineViewportStateCreateInfo:
  - VkPipelineViewportDepthClampControlCreateInfoEXT

New Enums

- VkDepthClampModeEXT

New Enum Constants

- `VK_EXT_DEPTH_CLAMP_CONTROL_EXTENSION_NAME`
- `VK_EXT_DEPTH_CLAMP_CONTROL_SPEC_VERSION`
- Extending VkDynamicState:
  - `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLAMP_CONTROL_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLAMP_CONTROL_CREATE_INFO_EXT`

Issues

1) Should the depth clamp range be a per-viewport parameter?

RESOLVED: No. Because the depth clamp range was previously defined to be equal to the viewport depth range, conformant runtimes are already handling the depth clamp range as a per-viewport parameter. However because of complexities from interactions with multiple viewports a per-viewport clamp range is left to a future extensions if a use case arises.

2) Should this pipeline state be dynamic?

RESOLVED: Yes. Since the viewport depth range can already be a dynamic state conformant runtimes are already able to handle the depth clamp range as a dynamic state.

3) Can the depth clamp range be ignored when depth clamping is disabled?

RESOLVED: Yes. This extension overrides the clamping range used only when depth clamping is enabled. The alternative would be highly unintuitive. As a consequence the VK_EXT_depth_clip_enable extension is required if depth clipping is desired in combination with this extension.

Description

This extension allows the application to use the OpenGL depth range in NDC, i.e. with depth in range [-1, 1], as opposed to Vulkan's default of [0, 1]. The purpose of this extension is to allow efficient layering of OpenGL over Vulkan, by avoiding emulation in the pre-rasterization shader stages. This emulation, which effectively duplicates gl_Position but with a different depth value, costs ALU and consumes shader output components that the implementation may not have to spare to meet OpenGL minimum requirements.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceDepthClipControlFeaturesEXT
- Extending VkPipelineViewportStateCreateInfo:
  - VkPipelineViewportDepthClipControlCreateInfoEXT

New Enum Constants

- `VK_EXT_DEPTH_CLIP_CONTROL_EXTENSION_NAME`
- `VK_EXT_DEPTH_CLIP_CONTROL_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_CONTROL_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLIP_CONTROL_CREATE_INFO_EXT`

Issues

1) Should this extension include an origin control option to match GL_LOWER_LEFT found in ARB_clip_control?

RESOLVED: No. The fix for porting over the origin is a simple y-axis flip. The depth clip control is a much harder problem to solve than what this extension is aimed to solve. Adding an equivalent to GL_LOWER_LEFT would require more testing.

2) Should this pipeline state be dynamic?

RESOLVED: Yes. The purpose of this extension is to emulate the OpenGL depth range, which is expected to be globally fixed (in case of OpenGL ES) or very infrequently changed (with `glClipControl` in OpenGL).

3) Should the control provided in this extension be an enum that could be extended in the future?

RESOLVED: No. It is highly unlikely that the depth range is changed to anything other than [0, 1] in the future. Should that happen a new extension will be required to extend such an enum, and that extension might as well add a new struct to chain to VkPipelineViewportStateCreateInfo::`pNext`

instead.

Description

This extension allows the depth clipping operation, that is normally implicitly controlled by VkPipelineRasterizationStateCreateInfo::`depthClampEnable`, to instead be controlled explicitly by VkPipelineRasterizationDepthClipStateCreateInfoEXT::`depthClipEnable`.

This is useful for translating DX content which assumes depth clamping is always enabled, but depth clip can be controlled by the DepthClipEnable rasterization state (D3D12_RASTERIZER_DESC).

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceDepthClipEnableFeaturesEXT
- Extending VkPipelineRasterizationStateCreateInfo:
  - VkPipelineRasterizationDepthClipStateCreateInfoEXT

Description

This extension removes the VkViewport `minDepth` and `maxDepth` restrictions that the values must be between `0.0` and `1.0`, inclusive. It also removes the same restriction on VkPipelineDepthStencilStateCreateInfo `minDepthBounds` and `maxDepthBounds`. Finally it removes the restriction on the `depth` value in VkClearDepthStencilValue.

New Enum Constants

- `VK_EXT_DEPTH_RANGE_UNRESTRICTED_EXTENSION_NAME`
- `VK_EXT_DEPTH_RANGE_UNRESTRICTED_SPEC_VERSION`

Issues

1) How do VkViewport `minDepth` and `maxDepth` values outside of the `0.0` to `1.0` range interact with Primitive Clipping?

RESOLVED: The behavior described in Primitive Clipping still applies. If depth clamping is disabled the depth values are still clipped to $0 \le z_c \le w_c$ before the viewport transform. If depth clamping is enabled the above equation is ignored and the depth values are instead clamped to the VkViewport `minDepth` and `maxDepth` values, which in the case of this extension can be outside of the `0.0` to `1.0` range.

2) What happens if a resulting depth fragment is outside of the `0.0` to `1.0` range and the depth buffer is fixed-point rather than floating-point?

RESOLVED: This situation can also arise without this extension (when fragment shaders replace depth values, for example), and this extension does not change the behavior, which is defined in

the Depth Test section of the Fragment Operations chapter.

Interactions and External Dependencies

- This extension provides API support for `GL_EXT_nonuniform_qualifier`

Contributors

- Jeff Bolz, NVIDIA
- Daniel Rakos, AMD
- Slawomir Grajewski, Intel
- Tobias Hector, Imagination Technologies

Description

This extension adds several small features which together enable applications to create large descriptor sets containing substantially all of their resources, and selecting amongst those resources with dynamic (non-uniform) indexes in the shader. There are feature enables and SPIR-V capabilities for non-uniform descriptor indexing in the shader, and non-uniform indexing in the shader requires use of a new `NonUniformEXT` decoration defined in the `SPV_EXT_descriptor_indexing` SPIR-V extension. There are descriptor set layout binding creation flags enabling several features:

- Descriptors can be updated after they are bound to a command buffer, such that the execution of the command buffer reflects the most recent update to the descriptors.
- Descriptors that are not used by any pending command buffers can be updated, which enables writing new descriptors for frame N+1 while frame N is executing.
- Relax the requirement that all descriptors in a binding that is “statically used” must be valid, such that descriptors that are not accessed by a submission need not be valid and can be updated while that submission is executing.
- The final binding in a descriptor set layout can have a variable size (and unsized arrays of resources are allowed in the `GL_EXT_nonuniform_qualifier` and `SPV_EXT_descriptor_indexing` extensions).

Note that it is valid for multiple descriptor arrays in a shader to use the same set and binding number, as long as they are all compatible with the descriptor type in the pipeline layout. This means a single array binding in the descriptor set can serve multiple texture dimensionalities, or an array of buffer descriptors can be used with multiple different block layouts.

There are new descriptor set layout and descriptor pool creation flags that are required to opt in to the update-after-bind functionality, and there are separate `maxPerStage*` and `maxDescriptorSet*` limits that apply to these descriptor set layouts which **may** be much higher than the pre-existing limits. The old limits only count descriptors in non-updateAfterBind descriptor set layouts, and the new limits count descriptors in all descriptor set layouts in the pipeline layout.

New Structures

- Extending VkDescriptorSetAllocateInfo:
  - VkDescriptorSetVariableDescriptorCountAllocateInfoEXT
- Extending VkDescriptorSetLayoutCreateInfo:
  - VkDescriptorSetLayoutBindingFlagsCreateInfoEXT
- Extending VkDescriptorSetLayoutSupport:
  - VkDescriptorSetVariableDescriptorCountLayoutSupportEXT

  - `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_PROPERTIES_EXT`

Promotion to Vulkan 1.2

Vulkan APIs in this extension are included in core Vulkan 1.2, with the EXT suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `descriptorIndexing` capability is optional. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

- Andrew Ellem, Google
- Alex Walters, IMG
- Jeff Bolz, NVIDIA

Description

This extension enables applications to track the binding of regions of the GPU virtual address space, and to associate those regions with Vulkan objects. This extension is primarily intended to aid in crash postmortem, where applications may wish to map a faulting GPU address to a Vulkan object.

For example, a page fault triggered by accessing an address located within a region of the GPU virtual address space that was previously reported as bound and then unbound may indicate a use-after-free error. Similarly, faults generated by accessing virtual addresses outside the limits of a bound region of GPU virtual address space may indicate indexing beyond the bounds of a resource.

New Structures

- Extending VkDebugUtilsMessengerCallbackDataEXT:
  - VkDeviceAddressBindingCallbackDataEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceAddressBindingReportFeaturesEXT

New Enums

- VkDeviceAddressBindingFlagBitsEXT
- VkDeviceAddressBindingTypeEXT

New Bitmasks

- VkDeviceAddressBindingFlagsEXT

New Enum Constants

- `VK_EXT_DEVICE_ADDRESS_BINDING_REPORT_EXTENSION_NAME`
- `VK_EXT_DEVICE_ADDRESS_BINDING_REPORT_SPEC_VERSION`
- Extending VkDebugUtilsMessageTypeFlagBitsEXT:
  - `VK_DEBUG_UTILS_MESSAGE_TYPE_DEVICE_ADDRESS_BINDING_BIT_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DEVICE_ADDRESS_BINDING_CALLBACK_DATA_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ADDRESS_BINDING_REPORT_FEATURES_EXT`

Issues

1.) Should this extend VK_EXT_debug_utils or VK_EXT_device_memory_report?

RESOLVED: Extend VK_EXT_debug_utils. VK_EXT_device_memory_report focuses on memory allocations and would not normally trigger callbacks in all of the situations where VK_EXT_device_address_binding_report is expected to.

2.) Should this extension cover all Vulkan object types, or only resources such as buffers and images?

RESOLVED: The extension covers all Vulkan objects, and is not restricted to objects backed by VkDeviceMemory objects.

3.) Should reallocation be identified explicitly, or as an unbind/bind pair?

RESOLVED: Reallocation should be represented as an unbind/bind pair.

4.) Can multiple Vulkan objects share an overlapping virtual address range?

RESOLVED: Yes. This can be expected to occur due to resources aliasing.

5.) Can a single Vulkan object be associated with multiple virtual address ranges concurrently?

RESOLVED: Yes. These should be reported via multiple calls to the reporting callback.

6.) Should the virtual address ranges associated with internal allocations such as memory pools be reported?

RESOLVED: Virtual address ranges associated with internal allocations should only be reported when they become associated with a specific Vulkan object. In the case of internal pool allocations, a bind event should be reported when resources from the pool are assigned to a Vulkan object, and an unbind event should be reported when those resources are returned to the pool. Implementations should not report the binding or unbinding of virtual address ranges for which there are no related API objects visible to the application developer.

7.) Can an implementation report binding a virtual address range at VkImage or VkImageView creation, rather than in response to vkBindImageMemory?

RESOLVED: Yes. Virtual address range binding should be reported at the appropriate point at which it occurs within the implementation. This extension does not mandate when that should occur, and applications should anticipate receiving callback events at any point after registering callbacks.

8.) Can reporting of binding/unbinding be deferred until a resource is referenced by an executing command buffer?

RESOLVED: Changes to the virtual address ranges associated with a Vulkan object should be reported as close as possible to where they occur within the implementation. If virtual address binding is deferred, then the callback should also be deferred to match.

9.) Do bind/unbind callbacks have to form matched pairs? Can a large region be bound, and then

subregions unbound, resulting in fragmentation?

RESOLVED: Splitting of virtual address regions, and unmatched bind/unbind callbacks may occur. Developers should anticipate that sparse memory may exhibit this behavior.

10.) The specification mandates that a callback **must** be triggered whenever a GPU virtual address range associated with any Vulkan object is bound or unbound. Do we need queries or properties indicating which Vulkan objects will report binding modifications?

RESOLVED: No. This extension is not intended to mandate how and when implementations bind virtual ranges to objects. Adding queries or properties would constrain implementations, which might otherwise vary how virtual address bindings occur based on usage.

11.) Should vkAllocateMemory and vkFreeMemory trigger reporting callbacks?

RESOLVED: If an implementation binds a GPU virtual address range when vkAllocateMemory is called, then the callbacks must be triggered associating the virtual address range with the VkDeviceMemory object. If the device memory is subsequently bound to a buffer or image via vkBind*Memory, the callbacks should be triggered a second time, reporting the association between virtual address range and the buffer/image.

Description

Device loss can be triggered by a variety of issues, including invalid API usage, implementation errors, or hardware failures.

This extension introduces a new command: vkGetDeviceFaultInfoEXT, which may be called subsequent to a `VK_ERROR_DEVICE_LOST` error code having been returned by the implementation. This command allows developers to query for additional information on GPU faults which may have caused device loss, and to generate binary crash dumps, which may be loaded into external tools for further diagnosis.

Interactions and External Dependencies

- This extension requires Vulkan 1.1
- This extension requires `VK_EXT_buffer_device_address` or `VK_KHR_buffer_device_address` or Vulkan 1.2 for the ability to bind vertex and index buffers on the device.
- This extension requires `VK_KHR_maintenance5` for the ability to use VkPipelineCreateFlags2KHR.
- This extension interacts with `VK_NV_mesh_shader`. If the latter extension is not supported, remove the command tokens to initiate NV mesh tasks drawing in this extension.
- This extension interacts with `VK_EXT_mesh_shader`. If the latter extension is not supported, remove the command tokens to initiate EXT mesh tasks drawing in this extension.
- This extension interacts with `VK_KHR_ray_tracing_pipeline`. If the latter extension is not supported, remove the command tokens to initiate ray tracing in this extension.
- This extension interacts with `VK_EXT_shader_object`. If the latter extension is not supported, remove references to shader objects in this extension.

Description

This extension allows the device to generate a number of commands for command buffers. It provides a subset of functionality from both `VK_NV_device_generated_commands` and `VK_NV_device_generated_commands_compute` as well as some new features.

When rendering a large number of objects, the device can be leveraged to implement a number of critical functions, like updating matrices, or implementing occlusion culling, frustum culling, front to back sorting, etc. Implementing those on the device does not require any special extension, since an application is free to define its own data structures, and just process them using shaders.

To render objects which have been processed on the device, Vulkan has several ways to perform indirect rendering, from the most basic `vkCmdDrawIndirect` with one indirect draw to `vkCmdDrawIndirectCount` which supports multiple indirect draws batched together, with a way to determine number of draws at device execution time.

However, if rendering state needs to change between the indirect draws, then unextended Vulkan forces the application to speculatively record a prohibitive number of redundant indirect commands covering all possible state combinations - which could end up processing nothing after culling - or read back the processed stream and issue graphics command from the host. For very large scenes, the synchronization overhead and cost to generate the command buffer can become the bottleneck. This extension allows an application to generate a device side stream of state changes and commands, and convert it efficiently into a command buffer without having to read it back to the host.

Furthermore, it allows incremental changes to such command buffers by manipulating only partial sections of a command stream — for example pipeline and shader object bindings. Unextended Vulkan requires re-creation of entire command buffers in such a scenario, or updates synchronized on the host.

The intended usage for this extension is for the application to:

- create `VkBuffer` objects and retrieve physical addresses from them via vkGetBufferDeviceAddressKHR
- create a `VkIndirectExecutionSetEXT` for the ability to change shaders on the device.
- create a VkIndirectCommandsLayoutEXT, which lists the VkIndirectCommandsTokenTypeEXT it wants to dynamically execute as an atomic command sequence. This step likely involves some internal device code compilation, since the intent is for the GPU to generate the command

buffer based on the layout.

- fill the input stream buffers with the data for each of the inputs it needs. Each input is an array that will be filled with token-dependent data.
- set up a preprocess `VkBuffer` that uses memory according to the information retrieved via vkGetGeneratedCommandsMemoryRequirementsEXT.
- optionally preprocess the generated content using vkCmdPreprocessGeneratedCommandsEXT, for example on an asynchronous compute queue, or for the purpose of re-using the data in multiple executions.
- call vkCmdExecuteGeneratedCommandsEXT to create and execute the actual device commands for all sequences based on the inputs provided.

For each draw in a sequence, the following can be specified:

- a number of vertex buffer bindings
- a different index buffer, with an optional dynamic offset and index type
- a number of different push constants
- updates to bound shader stages

For each dispatch in a sequence, the following can be specified:

- a number of different push constants
- updates to bound shader stages

For each trace rays in a sequence, the following can be specified:

- a number of different push constants
- updates to bound shader stages

While the GPU can be faster than a CPU to generate the commands, it will not happen asynchronously to the device, therefore the primary use case is generating “less” total work (occlusion culling, classification to use specialized shaders, etc.).

New Object Types

- VkIndirectCommandsLayoutEXT
- VkIndirectExecutionSetEXT

New Commands

- vkCmdExecuteGeneratedCommandsEXT
- vkCmdPreprocessGeneratedCommandsEXT
- vkCreateIndirectCommandsLayoutEXT
- vkCreateIndirectExecutionSetEXT
- vkDestroyIndirectCommandsLayoutEXT

Description

This device extension allows registration of device memory event callbacks upon device creation, so that applications or middleware can obtain detailed information about memory usage and how memory is associated with Vulkan objects. This extension exposes the actual underlying device memory usage, including allocations that are not normally visible to the application, such as memory consumed by vkCreateGraphicsPipelines. It is intended primarily for use by debug tooling rather than for production applications.

New Structures

- VkDeviceMemoryReportCallbackDataEXT
- Extending VkDeviceCreateInfo:
  - VkDeviceDeviceMemoryReportCreateInfoEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceDeviceMemoryReportFeaturesEXT

New Function Pointers

- PFN_vkDeviceMemoryReportCallbackEXT

New Enums

- VkDeviceMemoryReportEventTypeEXT

New Bitmasks

- VkDeviceMemoryReportFlagsEXT

New Enum Constants

- `VK_EXT_DEVICE_MEMORY_REPORT_EXTENSION_NAME`
- `VK_EXT_DEVICE_MEMORY_REPORT_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DEVICE_DEVICE_MEMORY_REPORT_CREATE_INFO_EXT`

- VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_MEMORY_REPORT_FEATURES_EXT

Issues

1) Should this be better expressed as an extension to VK_EXT_debug_utils and its general-purpose messenger construct?

RESOLVED: No. The intended lifecycle is quite different. We want to make this extension tied to the device's lifecycle. Each ICD just handles its own implementation of this extension, and this extension will only be directly exposed from the ICD. So we can avoid the extra implementation complexity used to accommodate the flexibility of VK_EXT_debug_utils extension.

2) Can we extend and use the existing internal allocation callbacks instead of adding the new callback structure in this extension?

RESOLVED: No. Our memory reporting layer that combines this information with other memory information it collects directly (e.g. bindings of resources to VkDeviceMemory) would have to intercept all entry points that take a VkAllocationCallbacks parameter and inject its own pfnInternalAllocation and pfnInternalFree. That may be doable for the extensions we know about, but not for ones we do not. The proposal would work fine in the face of most unknown extensions. But even for ones we know about, since apps can provide a different set of callbacks and userdata and those can be retained by the driver and used later (esp. for pool object, but not just those), we would have to dynamically allocate the interception trampoline every time. That is getting to be an unreasonably large amount of complexity and (possibly) overhead.

We are interested in both alloc/free and import/unimport. The latter is fairly important for tracking (and avoiding double-counting) of swapchain images (still true with "native swapchains" based on external memory) and media/camera interop. Though we might be able to handle this with additional VkInternalAllocationType values, for import/export we do want to be able to tie this to the external resource, which is one thing that the memoryObjectId is for.

The internal alloc/free callbacks are not extensible except via new VkInternalAllocationType values. The VkDeviceMemoryReportCallbackDataEXT in this extension is extensible. That was deliberate: there is a real possibility we will want to get extra information in the future. As one example, currently this reports only physical allocations, but we believe there are interesting cases for tracking how populated that VA region is.

The callbacks are clearly specified as only callable within the context of a call from the application into Vulkan. We believe there are some cases where drivers can allocate device memory asynchronously. This was one of the sticky issues that derailed the internal device memory allocation reporting design (which is essentially what this extension is trying to do) leading up to 1.0.

VkAllocationCallbacks is described in a section called "Host memory" and the intro to it is very explicitly about host memory. The other callbacks are all inherently about host memory. But this extension is very focused on device memory.

3) Should the callback be reporting which heap is used?

RESOLVED: Yes. It is important for non-UMA systems to have all the device memory allocations attributed to the corresponding device memory heaps. For internally-allocated device memory, `heapIndex` will always correspond to an advertised heap, rather than having a magic value indicating a non-advertised heap. Drivers can advertise heaps that do not have any corresponding memory types if they need to.

4) Should we use an array of callback for the layers to intercept instead of chaining multiple of the VkDeviceDeviceMemoryReportCreateInfoEXT structures in the `pNext` of VkDeviceCreateInfo?

RESOLVED No. The pointer to the VkDeviceDeviceMemoryReportCreateInfoEXT structure itself is const and you cannot just cast it away. Thus we cannot update the callback array inside the structure. In addition, we cannot drop this `pNext` chain either, so making a copy of this whole structure does not work either.

5) Should we track bulk allocations shared among multiple objects?

RESOLVED No. Take the shader heap as an example. Some implementations will let multiple VkPipeline objects share the same shader heap. We are not asking the implementation to report `VK_OBJECT_TYPE_PIPELINE` along with a VK_NULL_HANDLE for this bulk allocation. Instead, this bulk allocation is considered as a layer below what this extension is interested in. Later, when the actual VkPipeline objects are created by suballocating from the bulk allocation, we ask the implementation to report the valid handles of the VkPipeline objects along with the actual suballocated sizes and different `memoryObjectId`.

6) Can we require the callbacks to be always called in the same thread with the Vulkan commands?

RESOLVED No. Some implementations might choose to multiplex work from multiple application threads into a single backend thread and perform JIT allocations as a part of that flow. Since this behavior is theoretically legit, we cannot require the callbacks to be always called in the same thread with the Vulkan commands, and the note is to remind the applications to handle this case properly.

7) Should we add an additional “allocation failed” event type with things like size and heap index reported?

RESOLVED Yes. This fits in well with the callback infrastructure added in this extension, and implementation touches the same code and has the same overheads as the rest of the extension. It could help debugging things like getting a `VK_ERROR_OUT_OF_HOST_MEMORY` error when ending a command buffer. Right now the allocation failure could have happened anywhere during recording, and a callback would be really useful to understand where and why.

Description

This is extension, along with related platform extensions, allows applications to take exclusive control of displays associated with a native windowing system. This is especially useful for virtual reality applications that wish to hide HMDs (head mounted displays) from the native platform's display management system, desktop, and/or other applications.

New Commands

- vkReleaseDisplayEXT

New Enum Constants

- VK_EXT_DIRECT_MODE_DISPLAY_EXTENSION_NAME
- VK_EXT_DIRECT_MODE_DISPLAY_SPEC_VERSION

Issues

1) Should this extension and its related platform-specific extensions leverage VK_KHR_display, or provide separate equivalent interfaces.

RESOLVED: Use VK_KHR_display concepts and objects. VK_KHR_display can be used to enumerate all displays on the system, including those attached to/in use by a window system or native platform, but VK_KHR_display_swapchain will fail to create a swapchain on in-use displays. This extension and its platform-specific children will allow applications to grab in-use displays away from window systems and/or native platforms, allowing them to be used with VK_KHR_display_swapchain.

2) Are separate calls needed to acquire displays and enable direct mode?

RESOLVED: No, these operations happen in one combined command. Acquiring a display puts it into direct mode.

Interactions and External Dependencies

- Interacts with `VK_KHR_device_group`
- Interacts with Vulkan 1.1

Contributors

- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension provides additional orthogonally aligned “discard rectangles” specified in framebuffer-space coordinates that restrict rasterization of all points, lines and triangles.

From zero to an implementation-dependent limit (specified by `maxDiscardRectangles`) number of discard rectangles can be operational at once. When one or more discard rectangles are active, rasterized fragments can either survive if the fragment is within any of the operational discard rectangles (`VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT` mode) or be rejected if the fragment is within any of the operational discard rectangles (`VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT` mode).

These discard rectangles operate orthogonally to the existing scissor test functionality. The discard

rectangles can be different for each physical device in a device group by specifying the device mask and setting discard rectangle dynamic state.

Version 2 of this extension introduces new dynamic states VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT and VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT, and the corresponding functions vkCmdSetDiscardRectangleEnableEXT and vkCmdSetDiscardRectangleModeEXT. Applications that use these dynamic states must ensure the implementation advertises at least specVersion 2 of this extension.

New Commands

Description

This extension defines a set of utility functions for use with the VK_KHR_display and VK_KHR_display_swapchain extensions.

New Commands

- vkDisplayPowerControlEXT
- vkGetSwapchainCounterEXT
- vkRegisterDeviceEventEXT
- vkRegisterDisplayEventEXT

New Structures

- VkDeviceEventInfoEXT
- VkDisplayEventInfoEXT
- VkDisplayPowerInfoEXT
- Extending VkSwapchainCreateInfoKHR:
  - VkSwapchainCounterCreateInfoEXT

New Enums

- VkDeviceEventTypeEXT
- VkDisplayEventTypeEXT
- VkDisplayPowerStateEXT

New Enum Constants

- VK_EXT_DISPLAY_CONTROL_EXTENSION_NAME
- VK_EXT_DISPLAY_CONTROL_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT
  - VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT
  - VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT
  - VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT

Issues

1) Should this extension add an explicit “WaitForVsync” API or a fence signaled at vsync that the application can wait on?

RESOLVED: A fence. A separate API could later be provided that allows exporting the fence to a native object that could be inserted into standard run loops on POSIX and Windows systems.

2) Should callbacks be added for a vsync event, or in general to monitor events in Vulkan?

RESOLVED: No, fences should be used. Some events are generated by interrupts which are managed in the kernel. In order to use a callback provided by the application, drivers would need to have the userspace driver spawn threads that would wait on the kernel event, and hence the callbacks could be difficult for the application to synchronize with its other work given they would arrive on a foreign thread.

3) Should vblank or scanline events be exposed?

RESOLVED: Vblank events. Scanline events could be added by a separate extension, but the latency of processing an interrupt and waking up a userspace event is high enough that the accuracy of a scanline event would be rather low. Further, per-scanline interrupts are not supported by all hardware.

  - `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP_EXT`
  - `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_FRONT_FACE_EXT`
  - `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT`
  - `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT`
  - `VK_DYNAMIC_STATE_STENCIL_OP_EXT`
  - `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT`
  - `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_FEATURES_EXT`

Promotion to Vulkan 1.3

This extension has been partially promoted. All dynamic state enumerants and commands in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. The feature structure is not promoted. Extension interfaces that were promoted remain available as aliases of the core functionality.

Issues

1) Why are the values of `pStrides` in vkCmdBindVertexBuffers2EXT limited to be between 0 and the maximum extent of the binding, when this restriction is not present for the same static state?

Implementing these edge cases adds overhead to some implementations that would require significant cost when calling this function, and the intention is that this state should be more or less free to change.

VK_EXT_vertex_input_dynamic_state allows the stride to be changed freely when supported via vkCmdSetVertexInputEXT.

Description

This extension adds some more dynamic state to support applications that need to reduce the number of pipeline state objects they compile and bind.

New Commands

- vkCmdSetDepthBiasEnableEXT
- vkCmdSetLogicOpEXT
- vkCmdSetPatchControlPointsEXT
- vkCmdSetPrimitiveRestartEnableEXT
- vkCmdSetRasterizerDiscardEnableEXT

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceExtendedDynamicState2FeaturesEXT

New Enum Constants

- `VK_EXT_EXTENDED_DYNAMIC_STATE_2_EXTENSION_NAME`
- `VK_EXT_EXTENDED_DYNAMIC_STATE_2_SPEC_VERSION`
- Extending VkDynamicState:
  - `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_LOGIC_OP_EXT`
  - `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`
  - `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_2_FEATURES_EXT`

Promotion to Vulkan 1.3

This extension has been partially promoted. The dynamic state enumerants `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT`, `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT`, and

VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT; and the corresponding commands in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. The enumerants and commands for dynamic logic operation and patch control points are not promoted, nor is the feature structure. Extension interfaces that were promoted remain available as aliases of the core functionality.

Description

This extension adds almost all of the remaining pipeline state as dynamic state to help applications further reduce the number of monolithic pipelines they need to create and bind.

New Commands

- vkCmdSetAlphaToCoverageEnableEXT
- vkCmdSetAlphaToOneEnableEXT
- vkCmdSetColorBlendEnableEXT
- vkCmdSetColorBlendEquationEXT
- vkCmdSetColorWriteMaskEXT
- vkCmdSetDepthClampEnableEXT
- vkCmdSetLogicOpEnableEXT
- vkCmdSetPolygonModeEXT
- vkCmdSetRasterizationSamplesEXT
- vkCmdSetSampleMaskEXT

If VK_EXT_blend_operation_advanced is supported:

- vkCmdSetColorBlendAdvancedEXT

If VK_EXT_conservative_rasterization is supported:

- vkCmdSetConservativeRasterizationModeEXT
- vkCmdSetExtraPrimitiveOverestimationSizeEXT

If VK_EXT_depth_clip_control is supported:

- vkCmdSetDepthClipNegativeOneToOneEXT

If VK_EXT_depth_clip_enable is supported:

- vkCmdSetDepthClipEnableEXT

If VK_EXT_line_rasterization is supported:

- vkCmdSetLineRasterizationModeEXT
- vkCmdSetLineStippleEnableEXT

If VK_EXT_provoking_vertex is supported:

- vkCmdSetProvokingVertexModeEXT

If VK_EXT_sample_locations is supported:

- vkCmdSetSampleLocationsEnableEXT

If VK_EXT_transform_feedback is supported:

- vkCmdSetRasterizationStreamEXT

If VK_KHR_maintenance2 or Vulkan Version 1.1 is supported:

- vkCmdSetTessellationDomainOriginEXT

If VK_NV_clip_space_w_scaling is supported:

- vkCmdSetViewportWScalingEnableNV

If VK_NV_coverage_reduction_mode is supported:

- vkCmdSetCoverageReductionModeNV

If VK_NV_fragment_coverage_to_color is supported:

- vkCmdSetCoverageToColorEnableNV
- vkCmdSetCoverageToColorLocationNV

If VK_NV_framebuffer_mixed_samples is supported:

- vkCmdSetCoverageModulationModeNV
- vkCmdSetCoverageModulationTableEnableNV
- vkCmdSetCoverageModulationTableNV

If VK_NV_representative_fragment_test is supported:

- vkCmdSetRepresentativeFragmentTestEnableNV

If VK_NV_shading_rate_image is supported:

- vkCmdSetShadingRateImageEnableNV

If VK_NV_viewport_swizzle is supported:

- vkCmdSetViewportSwizzleNV

New Structures

- VkColorBlendAdvancedEXT
- VkColorBlendEquationEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceExtendedDynamicState3FeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT

New Enum Constants

- VK_EXT_EXTENDED_DYNAMIC_STATE_3_EXTENSION_NAME
- VK_EXT_EXTENDED_DYNAMIC_STATE_3_SPEC_VERSION
- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT
  - VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT
  - VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT
  - VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT
  - VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT
  - VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT
  - VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT
  - VK_DYNAMIC_STATE_POLYGON_MODE_EXT
  - VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT
  - VK_DYNAMIC_STATE_SAMPLE_MASK_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_3_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_3_PROPERTIES_EXT

If VK_EXT_blend_operation_advanced is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT

If VK_EXT_conservative_rasterization is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT
  - VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT

If VK_EXT_depth_clip_control is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT

If VK_EXT_depth_clip_enable is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT

If VK_EXT_line_rasterization is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT
  - VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT

If VK_EXT_provoking_vertex is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT

If VK_EXT_sample_locations is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT

If VK_EXT_transform_feedback is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT

If VK_KHR_maintenance2 or Vulkan Version 1.1 is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT

If VK_NV_clip_space_w_scaling is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV

If VK_NV_coverage_reduction_mode is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV

If VK_NV_fragment_coverage_to_color is supported:

- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV

    - VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV

If VK_NV_framebuffer_mixed_samples is supported:

- Extending VkDynamicState:
    - VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV
    - VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV
    - VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV

If VK_NV_representative_fragment_test is supported:

- Extending VkDynamicState:
    - VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV

If VK_NV_shading_rate_image is supported:

- Extending VkDynamicState:
    - VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV

If VK_NV_viewport_swizzle is supported:

- Extending VkDynamicState:
    - VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV

Issues

1) What about the VkPipelineMultisampleStateCreateInfo state sampleShadingEnable and minSampleShading?

UNRESOLVED

- sampleShadingEnable and minSampleShading are required when compiling the fragment shader, and it is not meaningful to set them dynamically since they always need to match the fragment shader state, so this hardware state may as well just come from the pipeline with the fragment shader.

Description

A memory barrier **may** have a performance penalty when acquiring ownership of a subresource range from an external queue family. This extension provides API that **may** reduce the performance penalty if ownership of the subresource range was previously released to the external queue family and if the resource's memory has remained unmodified between the release and acquire operations.

New Structures

- Extending VkBufferMemoryBarrier, VkBufferMemoryBarrier2, VkImageMemoryBarrier, VkImageMemoryBarrier2:
  - VkExternalMemoryAcquireUnmodifiedEXT

New Enum Constants

- `VK_EXT_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXTENSION_NAME`
- `VK_EXT_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXT`

Description

A dma_buf is a type of file descriptor, defined by the Linux kernel, that allows sharing memory across kernel device drivers and across processes. This extension enables applications to import a dma_buf as VkDeviceMemory, to export VkDeviceMemory as a dma_buf, and to create VkBuffer objects that **can** be bound to that memory.

New Enum Constants

- VK_EXT_EXTERNAL_MEMORY_DMA_BUF_EXTENSION_NAME
- VK_EXT_EXTERNAL_MEMORY_DMA_BUF_SPEC_VERSION
- Extending VkExternalMemoryHandleTypeFlagBits:
  - VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT

Issues

1) How does the application, when creating a VkImage that it intends to bind to dma_buf VkDeviceMemory containing an externally produced image, specify the memory layout (such as row pitch and DRM format modifier) of the VkImage? In other words, how does the application achieve behavior comparable to that provided by EGL_EXT_image_dma_buf_import and EGL_EXT_image_dma_buf_import_modifiers ?

RESOLVED: Features comparable to those in EGL_EXT_image_dma_buf_import and EGL_EXT_image_dma_buf_import_modifiers will be provided by an extension layered atop this one.

2) Without the ability to specify the memory layout of external dma_buf images, how is this extension useful?

RESOLVED: This extension provides exactly one new feature: the ability to import/export between dma_buf and VkDeviceMemory. This feature, together with features provided by VK_KHR_external_memory_fd, is sufficient to bind a VkBuffer to dma_buf.

Description

This extension enables an application to import host allocations and host mapped foreign device memory to Vulkan memory objects.

New Commands

- vkGetMemoryHostPointerPropertiesEXT

New Structures

- VkMemoryHostPointerPropertiesEXT
- Extending VkMemoryAllocateInfo:
  - VkImportMemoryHostPointerInfoEXT
- Extending VkPhysicalDeviceProperties2:

    - VkPhysicalDeviceExternalMemoryHostPropertiesEXT

New Enum Constants

- VK_EXT_EXTERNAL_MEMORY_HOST_EXTENSION_NAME
- VK_EXT_EXTERNAL_MEMORY_HOST_SPEC_VERSION
- Extending VkExternalMemoryHandleTypeFlagBits:
    - VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT
    - VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT
    - VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_HOST_PROPERTIES_EXT

Issues

1) What memory type has to be used to import host pointers?

RESOLVED: Depends on the implementation. Applications have to use the new vkGetMemoryHostPointerPropertiesEXT command to query the supported memory types for a particular host pointer. The reported memory types may include memory types that come from a memory heap that is otherwise not usable for regular memory object allocation and thus such a heap's size may be zero.

2) Can the application still access the contents of the host allocation after importing?

RESOLVED: Yes. However, usual synchronization requirements apply.

3) Can the application free the host allocation?

RESOLVED: No, it violates valid usage conditions. Using the memory object imported from a host allocation that is already freed thus results in undefined behavior.

4) Is vkMapMemory expected to return the same host address which was specified when importing it to the memory object?

RESOLVED: No. Implementations are allowed to return the same address but it is not required. Some implementations might return a different virtual mapping of the allocation, although the same physical pages will be used.

5) Is there any limitation on the alignment of the host pointer and/or size?

RESOLVED: Yes. Both the address and the size have to be an integer multiple of `minImportedHostPointerAlignment`. In addition, some platforms and foreign devices may have additional restrictions.

6) Can the same host allocation be imported multiple times into a given physical device?

RESOLVED: No, at least not guaranteed by this extension. Some platforms do not allow locking the same physical pages for device access multiple times, so attempting to do it may result in undefined behavior.

7) Does this extension support exporting the new handle type?

RESOLVED: No.

8) Should we include the possibility to import host mapped foreign device memory using this API?

RESOLVED: Yes, through a separate handle type. Implementations are still allowed to support only one of the handle types introduced by this extension by not returning import support for a particular handle type as returned in VkExternalMemoryPropertiesKHR.

Description

`VK_EXT_filter_cubic` extends `VK_IMG_filter_cubic`.

It documents cubic filtering of other image view types. It adds new structures that **can** be added to the `pNext` chain of VkPhysicalDeviceImageFormatInfo2 and VkImageFormatProperties2 that **can** be used to determine which image types and which image view types support cubic filtering.

New Structures

- Extending VkImageFormatProperties2:
  - VkFilterCubicImageViewImageFormatPropertiesEXT
- Extending VkPhysicalDeviceImageFormatInfo2:
  - VkPhysicalDeviceImageViewImageFormatInfoEXT

New Enum Constants

- `VK_EXT_FILTER_CUBIC_EXTENSION_NAME`
- `VK_EXT_FILTER_CUBIC_SPEC_VERSION`
- Extending VkFilter:
  - `VK_FILTER_CUBIC_EXT`
- Extending VkFormatFeatureFlagBits:
  - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- Extending VkStructureType:

- Daniel Rakos, AMD
- Piers Daniell, NVIDIA

Description

This extension allows an application to specify areas of the render target where the fragment shader may be invoked fewer times. These fragments are broadcasted out to multiple pixels to cover the render target.

The primary use of this extension is to reduce workloads in areas where lower quality may not be perceived such as the distorted edges of a lens or the periphery of a user's gaze.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceFragmentDensityMapFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceFragmentDensityMapPropertiesEXT
- Extending VkRenderPassCreateInfo, VkRenderPassCreateInfo2:
  - VkRenderPassFragmentDensityMapCreateInfoEXT

If Vulkan Version 1.3 or VK_KHR_dynamic_rendering is supported:

- Extending VkRenderingInfo:
  - VkRenderingFragmentDensityMapAttachmentInfoEXT

New Enum Constants

- `VK_EXT_FRAGMENT_DENSITY_MAP_EXTENSION_NAME`
- `VK_EXT_FRAGMENT_DENSITY_MAP_SPEC_VERSION`
- Extending VkAccessFlagBits:
  - `VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT`

- Extending VkFormatFeatureFlagBits:
  - VK_FORMAT_FEATURE_FRAGMENT_DENSITY_MAP_BIT_EXT
- Extending VkImageCreateFlagBits:
  - VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT
- Extending VkImageLayout:
  - VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT
- Extending VkImageUsageFlagBits:
  - VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT
- Extending VkImageViewCreateFlagBits:
  - VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT
- Extending VkPipelineStageFlagBits:
  - VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT
- Extending VkSamplerCreateFlagBits:
  - VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT
  - VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_PROPERTIES_EXT
  - VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_CREATE_INFO_EXT

If VK_KHR_format_feature_flags2 or Vulkan Version 1.3 is supported:

- Extending VkFormatFeatureFlagBits2:
  - VK_FORMAT_FEATURE_2_FRAGMENT_DENSITY_MAP_BIT_EXT

If Vulkan Version 1.3 or VK_KHR_dynamic_rendering is supported:

- Extending VkPipelineCreateFlagBits:
  - VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT
  - VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_INFO_EXT

New or Modified Built-In Variables

- Spencer Fricke, Samsung

Description

This extension adds support for the `FragmentShaderPixelInterlockEXT`, `FragmentShaderSampleInterlockEXT`, and `FragmentShaderShadingRateInterlockEXT` capabilities from the `SPV_EXT_fragment_shader_interlock` extension to Vulkan.

Enabling these capabilities provides a critical section for fragment shaders to avoid overlapping pixels being processed at the same time, and certain guarantees about the ordering of fragment shader invocations of fragments of overlapping pixels.

This extension can be useful for algorithms that need to access per-pixel data structures via shader loads and stores. Algorithms using this extension can access per-pixel data structures in critical sections without other invocations accessing the same per-pixel data. Additionally, the ordering guarantees are useful for cases where the API ordering of fragments is meaningful. For example, applications may be able to execute programmable blending operations in the fragment shader, where the destination buffer is read via image loads and the final value is written via image stores.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT

New Enum Constants

- VK_EXT_FRAGMENT_SHADER_INTERLOCK_EXTENSION_NAME
- VK_EXT_FRAGMENT_SHADER_INTERLOCK_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_INTERLOCK_FEATURES_EXT

New SPIR-V Capabilities

- FragmentShaderInterlockEXT
- FragmentShaderPixelInterlockEXT
- FragmentShaderShadingRateInterlockEXT

Description

VK_EXT_frame_boundary is a device extension that helps **tools** (such as debuggers) to group queue submissions per frames in non-trivial scenarios, typically when vkQueuePresentKHR is not a relevant frame boundary delimiter.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceFrameBoundaryFeaturesEXT
- Extending VkSubmitInfo, VkSubmitInfo2, VkPresentInfoKHR, VkBindSparseInfo:
  - VkFrameBoundaryEXT

New Enums

- VkFrameBoundaryFlagBitsEXT

New Bitmasks

- VkFrameBoundaryFlagsEXT

New Enum Constants

- `VK_EXT_FRAME_BOUNDARY_EXTENSION_NAME`
- `VK_EXT_FRAME_BOUNDARY_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_FRAME_BOUNDARY_EXT`

- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAME_BOUNDARY_FEATURES_EXT

Description

This extension allows applications to set the policy for swapchain creation and presentation mechanisms relating to full-screen access. Implementations may be able to acquire exclusive access to a particular display for an application window that covers the whole screen. This can increase performance on some systems by bypassing composition, however it can also result in disruptive or expensive transitions in the underlying windowing system when a change occurs.

Applications can choose between explicitly disallowing or allowing this behavior, letting the implementation decide, or managing this mode of operation directly using the new vkAcquireFullScreenExclusiveModeEXT and vkReleaseFullScreenExclusiveModeEXT commands.

New Commands

- vkAcquireFullScreenExclusiveModeEXT
- vkGetPhysicalDeviceSurfacePresentModes2EXT
- vkReleaseFullScreenExclusiveModeEXT

If VK_KHR_device_group or Vulkan Version 1.1 is supported:

- vkGetDeviceGroupSurfacePresentModes2EXT

New Structures

- Extending VkPhysicalDeviceSurfaceInfo2KHR, VkSwapchainCreateInfoKHR:
  - VkSurfaceFullScreenExclusiveInfoEXT
- Extending VkSurfaceCapabilities2KHR:
  - VkSurfaceCapabilitiesFullScreenExclusiveEXT

If VK_KHR_win32_surface is supported:

- Extending VkPhysicalDeviceSurfaceInfo2KHR, VkSwapchainCreateInfoKHR:
  - VkSurfaceFullScreenExclusiveWin32InfoEXT

New Enums

- VkFullScreenExclusiveEXT

New Enum Constants

- `VK_EXT_FULL_SCREEN_EXCLUSIVE_EXTENSION_NAME`
- `VK_EXT_FULL_SCREEN_EXCLUSIVE_SPEC_VERSION`
- Extending VkResult:
  - `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT`
  - `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_INFO_EXT`

If VK_KHR_win32_surface is supported:

- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_WIN32_INFO_EXT`

Issues

1) What should the extension & flag be called?

RESOLVED: VK_EXT_full_screen_exclusive.

Other options considered (prior to the app-controlled mode) were:

- VK_EXT_smooth_fullscreen_transition
- VK_EXT_fullscreen_behavior
- VK_EXT_fullscreen_preference
- VK_EXT_fullscreen_hint
- VK_EXT_fast_fullscreen_transition
- VK_EXT_avoid_fullscreen_exclusive

2) Do we need more than a boolean toggle?

RESOLVED: Yes.

Using an enum with default/allowed/disallowed/app-controlled enables applications to accept driver default behavior, specifically override it in either direction without implying the driver is ever required to use full-screen exclusive mechanisms, or manage this mode explicitly.

3) Should this be a KHR or EXT extension?

RESOLVED: EXT, in order to allow it to be shipped faster.

4) Can the fullscreen hint affect the surface capabilities, and if so, should the hint also be specified as input when querying the surface capabilities?

RESOLVED: Yes on both accounts.

While the hint does not guarantee a particular fullscreen mode will be used when the swapchain is created, it can sometimes imply particular modes will NOT be used. If the driver determines that it will opt-out of using a particular mode based on the policy, and knows it can only support certain capabilities if that mode is used, it would be confusing at best to the application to report those capabilities in such cases. Not allowing implementations to report this state to applications could result in situations where applications are unable to determine why swapchain creation fails when they specify certain hint values, which could result in never- terminating surface creation loops.

5) Should full-screen be one word or two?

RESOLVED: Two words.

"Fullscreen" is not in my dictionary, and web searches did not turn up definitive proof that it is a colloquially accepted compound word. Documentation for the corresponding Windows API mechanisms dithers. The text consistently uses a hyphen, but none-the-less, there is a SetFullscreenState method in the DXGI swapchain object. Given this inconclusive external guidance, it is best to adhere to the Vulkan style guidelines and avoid inventing new compound words.

Version History

- Revision 4, 2019-03-12 (Tobias Hector)
  - Added application-controlled mode, and related functions
  - Tidied up appendix
- Revision 3, 2019-01-03 (James Jones)
  - Renamed to VK_EXT_full_screen_exclusive
  - Made related adjustments to the tri-state enumerant names.
- Revision 2, 2018-11-27 (James Jones)
  - Renamed to VK_KHR_fullscreen_behavior
  - Switched from boolean flag to tri-state enum

- Revision 1, 2018-11-06 (James Jones)
  - Internal revision

Description

This extension allows the separate compilation of four distinct parts of graphics pipelines, with the intent of allowing faster pipeline loading for applications reusing the same shaders or state in multiple pipelines. Each part can be independently compiled into a graphics pipeline library, with a final link step required to create an executable pipeline that can be bound to a command buffer.

New Structures

- Extending VkGraphicsPipelineCreateInfo:
  - VkGraphicsPipelineLibraryCreateInfoEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceGraphicsPipelineLibraryPropertiesEXT

New Enums

- VkGraphicsPipelineLibraryFlagBitsEXT
- VkPipelineLayoutCreateFlagBits

New Bitmasks

- VkGraphicsPipelineLibraryFlagsEXT

New Enum Constants

- `VK_EXT_GRAPHICS_PIPELINE_LIBRARY_EXTENSION_NAME`
- `VK_EXT_GRAPHICS_PIPELINE_LIBRARY_SPEC_VERSION`
- Extending VkPipelineCreateFlagBits:
  - `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`
  - `VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT`
- Extending VkPipelineLayoutCreateFlagBits:
  - `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`
- Extending VkStructureType:

- VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_LIBRARY_CREATE_INFO_EXT
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GRAPHICS_PIPELINE_LIBRARY_FEATURES_EXT
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GRAPHICS_PIPELINE_LIBRARY_PROPERTIES_EXT

Version History

- Revision 1, 2021-08-17 (Tobias Hector)
  - Initial draft.

Description

This extension defines two new structures and a function to assign SMPTE (the Society of Motion Picture and Television Engineers) 2086 metadata and CTA (Consumer Technology Association) 861.3 metadata to a swapchain.

SMPTE 2086 metadata defines the color volume of the display on which the content was optimized for viewing and includes the color primaries, white point, and luminance range. When such content is reproduced on another display, this metadata can be used by the presentation engine to improve processing of images. For instance, values in the image can first be clamped to the color volume described in the metadata, and then what remains can be remapped to the color volume of the presentation engine.

CTA 861.3 metadata additionally includes the maximum intended luminance for the content and the maximum average light level across frames.

This extension does not define exactly how this metadata is used, however, it simply provides a mechanism to provide it to the presentation engine. Presentation engines may process the image based on the metadata before displaying it, resulting in the image being modified outside of Vulkan. For example, the clamping of colors in the image to the color volume may change those values in the image itself.

The metadata does not override or otherwise influence the color space and color encoding.

New Commands

- vkSetHdrMetadataEXT

New Structures

- VkHdrMetadataEXT
- VkXYColorEXT

New Enum Constants

- `VK_EXT_HDR_METADATA_EXTENSION_NAME`
- `VK_EXT_HDR_METADATA_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`

Issues

1) Do we need a query function for the currently specified metadata?

No, Vulkan does not provide queries for state that the application can track on its own.

2) Should we specify default metadata if not specified by the application?

No, the metadata is optional and the absence of the metadata is well-defined.

Description

The `VK_EXT_headless_surface` extension is an instance extension. It provides a mechanism to create VkSurfaceKHR objects independently of any window system or display device. The presentation

operation for a swapchain created from a headless surface is by default a no-op, resulting in no externally-visible result.

Because there is no real presentation target, future extensions can layer on top of the headless surface to introduce arbitrary or customizable sets of restrictions or features. These could include features like saving to a file or restrictions to emulate a particular presentation target.

This functionality is expected to be useful for application and driver development because it allows any platform to expose an arbitrary or customizable set of restrictions and features of a presentation engine. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

New Commands

- vkCreateHeadlessSurfaceEXT

New Structures

- VkHeadlessSurfaceCreateInfoEXT

New Bitmasks

- VkHeadlessSurfaceCreateFlagsEXT

New Enum Constants

Description

This extension allows applications to copy data between host memory and images on the host processor, without staging the data through a GPU-accessible buffer. This removes the need to allocate and manage the buffer and its associated memory. On some architectures it may also eliminate an extra copy operation. This extension additionally allows applications to copy data between images on the host.

To support initializing a new image in preparation for a host copy, it is now possible to transition a

new image to VK_IMAGE_LAYOUT_GENERAL or other host-copyable layouts via vkTransitionImageLayoutEXT. Additionally, it is possible to perform copies that preserve the swizzling layout of the image by using the VK_HOST_IMAGE_COPY_MEMCPY_EXT flag. In that case, the memory size needed for copies to or from a buffer can be retrieved by chaining VkSubresourceHostMemcpySizeEXT to pLayout in vkGetImageSubresourceLayout2EXT.

New Commands

- vkCopyImageToImageEXT
- vkCopyImageToMemoryEXT
- vkCopyMemoryToImageEXT
- vkGetImageSubresourceLayout2EXT
- vkTransitionImageLayoutEXT

New Structures

- VkCopyImageToImageInfoEXT
- VkCopyImageToMemoryInfoEXT
- VkCopyMemoryToImageInfoEXT
- VkHostImageLayoutTransitionInfoEXT
- VkImageSubresource2EXT
- VkImageToMemoryCopyEXT
- VkMemoryToImageCopyEXT
- VkSubresourceLayout2EXT
- Extending VkImageFormatProperties2:
  - VkHostImageCopyDevicePerformanceQueryEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceHostImageCopyFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceHostImageCopyPropertiesEXT

New Bitmasks

- VkHostImageCopyFlagsEXT

New Enum Constants

- `VK_EXT_HOST_IMAGE_COPY_EXTENSION_NAME`
- `VK_EXT_HOST_IMAGE_COPY_SPEC_VERSION`
- Extending VkFormatFeatureFlagBits2:
  - `VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT_EXT`
- Extending VkImageUsageFlagBits:
  - `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_IMAGE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_MEMORY_INFO_EXT`
  - `VK_STRUCTURE_TYPE_COPY_MEMORY_TO_IMAGE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_HOST_IMAGE_COPY_DEVICE_PERFORMANCE_QUERY_EXT`
  - `VK_STRUCTURE_TYPE_HOST_IMAGE_LAYOUT_TRANSITION_INFO_EXT`
  - `VK_STRUCTURE_TYPE_IMAGE_TO_MEMORY_COPY_EXT`
  - `VK_STRUCTURE_TYPE_MEMORY_TO_IMAGE_COPY_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_IMAGE_COPY_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_IMAGE_COPY_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_SUBRESOURCE_HOST_MEMCPY_SIZE_EXT`

Issues

1) When uploading data to an image, the data is usually loaded from disk. Why not have the application load the data directly into a `VkDeviceMemory` bound to a buffer (instead of host memory), and use vkCmdCopyBufferToImage? The same could be done when downloading data from an image.

RESOLVED: This may not always be possible. Complicated Vulkan applications such as game engines often have decoupled subsystems for streaming data and rendering. It may be unreasonable to require the streaming subsystem to coordinate with the rendering subsystem to allocate memory on its behalf, especially as Vulkan may not be the only API supported by the engine. In emulation layers, the image data is necessarily provided by the application in host memory, so an optimization as suggested is not possible. Most importantly, the device memory may not be mappable by an application, but still accessible to the driver.

2) Are `optimalBufferCopyOffsetAlignment` and `optimalBufferCopyRowPitchAlignment` applicable to host memory as well with the functions introduced by this extension? Or should there be new limits?

RESOLVED: No alignment requirements for the host memory pointer.

3) Should there be granularity requirements for image offsets and extents?

RESOLVED: No granularity requirements, i.e. a granularity of 1 pixel (for non-compressed formats)

and 1 texel block (for compressed formats) is assumed.

4) How should the application deal with layout transitions before or after copying to or from images?

RESOLVED: An existing issue with linear images is that when emulating other APIs, it is impossible to know when to transition them as they are written to by the host and then used bindlessly. The copy operations in this extension are affected by the same limitation. A new command is thus introduced by this extension to address this problem by allowing the host to perform an image layout transition between a handful of layouts.

Description

This extension allows a single slice of a 3D image to be used as a 2D view in image descriptors, matching both the functionality of glBindImageTexture in OpenGL with the `layer` parameter set to true and 2D view binding provided by the extension EGL_KHR_gl_texture_3D_image. It is primarily intended to support GL emulation.

Description

This extension enables fixed-rate image compression and adds the ability to control when this kind of compression can be applied. Many implementations support some form of framebuffer compression. This is typically transparent to applications as lossless compression schemes are used. With fixed-rate compression, the compression is done at a defined bitrate. Such compression algorithms generally produce results that are visually lossless, but the results are typically not bit-exact when compared to a non-compressed result. The implementation may not be able to use the requested compression rate in all cases. This extension adds a query that can be used to determine the compression scheme and rate that was applied to an image.

Description

This extension provides the ability to use *DRM format modifiers* with images, enabling Vulkan to better integrate with the Linux ecosystem of graphics, video, and display APIs.

Its functionality closely overlaps with `EGL_EXT_image_dma_buf_import_modifiers`[2] and `EGL_MESA_image_dma_buf_export`[3]. Unlike the EGL extensions, this extension does not require the use of a specific handle type (such as a dma_buf) for external memory and provides more explicit control of image creation.

Introduction to DRM Format Modifiers

A *DRM format modifier* is a 64-bit, vendor-prefixed, semi-opaque unsigned integer. Most *modifiers* represent a concrete, vendor-specific tiling format for images. Some exceptions are `DRM_FORMAT_MOD_LINEAR` (which is not vendor-specific); `DRM_FORMAT_MOD_NONE` (which is an alias of `DRM_FORMAT_MOD_LINEAR` due to historical accident); and `DRM_FORMAT_MOD_INVALID` (which does not represent a tiling format). The *modifier's* vendor prefix consists of the 8 most significant bits. The canonical list of *modifiers* and vendor prefixes is found in `drm_fourcc.h` in the Linux kernel source. The other dominant source of *modifiers* are vendor kernel trees.

One goal of *modifiers* in the Linux ecosystem is to enumerate for each vendor a reasonably sized set of tiling formats that are appropriate for images shared across processes, APIs, and/or devices, where each participating component may possibly be from different vendors. A non-goal is to enumerate all tiling formats supported by all vendors. Some tiling formats used internally by vendors are inappropriate for sharing; no *modifiers* should be assigned to such tiling formats.

Modifier values typically do not *describe* memory layouts. More precisely, a *modifier*'s lower 56 bits usually have no structure. Instead, modifiers *name* memory layouts; they name a small set of vendor-preferred layouts for image sharing. As a consequence, in each vendor namespace the modifier values are often sequentially allocated starting at 1.

Each *modifier* is usually supported by a single vendor and its name matches the pattern `{VENDOR}_FORMAT_MOD_*` or `DRM_FORMAT_MOD_{VENDOR}_*`. Examples are `I915_FORMAT_MOD_X_TILED` and

DRM_FORMAT_MOD_BROADCOM_VC4_T_TILED. An exception is DRM_FORMAT_MOD_LINEAR, which is supported by most vendors.

Many APIs in Linux use *modifiers* to negotiate and specify the memory layout of shared images. For example, a Wayland compositor and Wayland client may, by relaying *modifiers* over the Wayland protocol zwp_linux_dmabuf_v1, negotiate a vendor-specific tiling format for a shared wl_buffer. The client may allocate the underlying memory for the wl_buffer with GBM, providing the chosen *modifier* to gbm_bo_create_with_modifiers. The client may then import the wl_buffer into Vulkan for producing image content, providing the resource's dma_buf to VkImportMemoryFdInfoKHR and its *modifier* to VkImageDrmFormatModifierExplicitCreateInfoEXT. The compositor may then import the wl_buffer into OpenGL for sampling, providing the resource's dma_buf and *modifier* to eglCreateImage. The compositor may also bypass OpenGL and submit the wl_buffer directly to the kernel's display API, providing the dma_buf and *modifier* through drm_mode_fb_cmd2.

Format Translation

Modifier-capable APIs often pair *modifiers* with DRM formats, which are defined in drm_fourcc.h. However, VK_EXT_image_drm_format_modifier uses VkFormat instead of DRM formats. The application must convert between VkFormat and DRM format when it sends or receives a DRM format to or from an external API.

The mapping from VkFormat to DRM format is lossy. Therefore, when receiving a DRM format from an external API, often the application must use information from the external API to accurately map the DRM format to a VkFormat. For example, DRM formats do not distinguish between RGB and sRGB (as of 2018-03-28); external information is required to identify the image's color space.

The mapping between VkFormat and DRM format is also incomplete. For some DRM formats there exist no corresponding Vulkan format, and for some Vulkan formats there exist no corresponding DRM format.

Usage Patterns

Three primary usage patterns are intended for this extension:

- **Negotiation.** The application negotiates with *modifier*-aware, external components to determine sets of image creation parameters supported among all components.

  In the Linux ecosystem, the negotiation usually assumes the image is a 2D, single-sampled, non-mipmapped, non-array image; this extension permits that assumption but does not require it. The result of the negotiation usually resembles a set of tuples such as *(drmFormat, drmFormatModifier)*, where each participating component supports all tuples in the set.

  Many details of this negotiation - such as the protocol used during negotiation, the set of image creation parameters expressible in the protocol, and how the protocol chooses which process and which API will create the image - are outside the scope of this specification.

  In this extension, vkGetPhysicalDeviceFormatProperties2 with VkDrmFormatModifierPropertiesListEXT serves a primary role during the negotiation, and vkGetPhysicalDeviceImageFormatProperties2 with VkPhysicalDeviceImageDrmFormatModifierInfoEXT serves a secondary role.

- **Import.** The application imports an image with a *modifier*.

  In this pattern, the application receives from an external source the image's memory and its creation parameters, which are often the result of the negotiation described above. Some image creation parameters are implicitly defined by the external source; for example, `VK_IMAGE_TYPE_2D` is often assumed. Some image creation parameters are usually explicit, such as the image's `format`, `drmFormatModifier`, and `extent`; and each plane's `offset` and `rowPitch`.

  Before creating the image, the application first verifies that the physical device supports the received creation parameters by querying vkGetPhysicalDeviceFormatProperties2 with VkDrmFormatModifierPropertiesListEXT and vkGetPhysicalDeviceImageFormatProperties2 with VkPhysicalDeviceImageDrmFormatModifierInfoEXT. Then the application creates the image by chaining VkImageDrmFormatModifierExplicitCreateInfoEXT and VkExternalMemoryImageCreateInfo onto VkImageCreateInfo.

- **Export.** The application creates an image and allocates its memory. Then the application exports to *modifier*-aware consumers the image's memory handles; its creation parameters; its *modifier*; and the `offset`, `size`, and `rowPitch` of each *memory plane*.

  In this pattern, the Vulkan device is the authority for the image; it is the allocator of the image's memory and the decider of the image's creation parameters. When choosing the image's creation parameters, the application usually chooses a tuple *(format, drmFormatModifier)* from the result of the negotiation described above. The negotiation's result often contains multiple tuples that share the same format but differ in their *modifier*. In this case, the application should defer the choice of the image's *modifier* to the Vulkan implementation by providing all such *modifiers* to VkImageDrmFormatModifierListCreateInfoEXT::`pDrmFormatModifiers`; and the implementation should choose from `pDrmFormatModifiers` the optimal *modifier* in consideration with the other image parameters.

  The application creates the image by chaining VkImageDrmFormatModifierListCreateInfoEXT and VkExternalMemoryImageCreateInfo onto VkImageCreateInfo. The protocol and APIs by which the application will share the image with external consumers will likely determine the value of VkExternalMemoryImageCreateInfo::`handleTypes`. The implementation chooses for the image an optimal *modifier* from VkImageDrmFormatModifierListCreateInfoEXT ::`pDrmFormatModifiers`. The application then queries the implementation-chosen *modifier* with vkGetImageDrmFormatModifierPropertiesEXT, and queries the memory layout of each plane with vkGetImageSubresourceLayout.

  The application then allocates the image's memory with VkMemoryAllocateInfo, adding chained extending structures for external memory; binds it to the image; and exports the memory, for example, with vkGetMemoryFdKHR.

  Finally, the application sends the image's creation parameters, its *modifier*, its per-plane memory layout, and the exported memory handle to the external consumers. The details of how the application transmits this information to external consumers is outside the scope of this specification.

Prior Art

Extension `EGL_EXT_image_dma_buf_import`[1] introduced the ability to create an `EGLImage` by importing for each plane a dma_buf, offset, and row pitch.

Later, extension `EGL_EXT_image_dma_buf_import_modifiers`[2] introduced the ability to query which combination of formats and *modifiers* the implementation supports and to specify *modifiers* during creation of the `EGLImage`.

Extension `EGL_MESA_image_dma_buf_export`[3] is the inverse of `EGL_EXT_image_dma_buf_import_modifiers`.

The Linux kernel modesetting API (KMS), when configuring the display's framebuffer with `struct drm_mode_fb_cmd2`[4], allows one to specify the framebuffer's *modifier* as well as a per-plane memory handle, offset, and row pitch.

GBM, a graphics buffer manager for Linux, allows creation of a `gbm_bo` (that is, a graphics *buffer object*) by importing data similar to that in `EGL_EXT_image_dma_buf_import_modifiers`[1]; and symmetrically allows exporting the same data from the `gbm_bo`. See the references to *modifier* and *plane* in `gbm.h`[5].

New Commands

- vkGetImageDrmFormatModifierPropertiesEXT

New Structures

- VkDrmFormatModifierPropertiesEXT
- VkImageDrmFormatModifierPropertiesEXT
- Extending VkFormatProperties2:
  - VkDrmFormatModifierPropertiesListEXT
- Extending VkImageCreateInfo:
  - VkImageDrmFormatModifierExplicitCreateInfoEXT
  - VkImageDrmFormatModifierListCreateInfoEXT
- Extending VkPhysicalDeviceImageFormatInfo2:
  - VkPhysicalDeviceImageDrmFormatModifierInfoEXT

If VK_KHR_format_feature_flags2 or Vulkan Version 1.3 is supported:

- VkDrmFormatModifierProperties2EXT
- Extending VkFormatProperties2:
  - VkDrmFormatModifierPropertiesList2EXT

New Enum Constants

- `VK_EXT_IMAGE_DRM_FORMAT_MODIFIER_EXTENSION_NAME`
- `VK_EXT_IMAGE_DRM_FORMAT_MODIFIER_SPEC_VERSION`

- Extending VkImageAspectFlagBits:
  - VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT
  - VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT
  - VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT
  - VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT
- Extending VkImageTiling:
  - VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT
- Extending VkResult:
  - VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_EXT
  - VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_EXPLICIT_CREATE_INFO_EXT
  - VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_LIST_CREATE_INFO_EXT
  - VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_PROPERTIES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_DRM_FORMAT_MODIFIER_INFO_EXT

If VK_KHR_format_feature_flags2 or Vulkan Version 1.3 is supported:

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_2_EXT

Issues

1) Should this extension define a single DRM format modifier per VkImage? Or define one per plane?

+

RESOLVED: There exists a single DRM format modifier per VkImage.

DISCUSSION: Prior art, such as EGL_EXT_image_dma_buf_import_modifiers[2], struct drm_mode_fb_cmd2[4], and struct gbm_import_fd_modifier_data[5], allows defining one *modifier* per plane. However, developers of the GBM and kernel APIs concede it was a mistake. Beginning in Linux 4.10, the kernel requires that the application provide the same DRM format *modifier* for each plane. (See Linux commit bae781b259269590109e8a4a8227331362b88212). And GBM provides an entry point, gbm_bo_get_modifier, for querying the *modifier* of the image but does not provide one to query the modifier of individual planes.

2) When creating an image with VkImageDrmFormatModifierExplicitCreateInfoEXT, which is typically used when *importing* an image, should the application explicitly provide the size of each plane?

+

RESOLVED: No. The application **must** not provide the size. To enforce this, the API requires that

VkImageDrmFormatModifierExplicitCreateInfoEXT::pPlaneLayouts->size **must** be 0.

DISCUSSION: Prior art, such as EGL_EXT_image_dma_buf_import_modifiers[2], struct drm_mode_fb_cmd2[4], and struct gbm_import_fd_modifier_data[5], omits from the API the size of each plane. Instead, the APIs infer each plane's size from the import parameters, which include the image's pixel format and a dma_buf, offset, and row pitch for each plane.

However, Vulkan differs from EGL and GBM with regards to image creation in the following ways:

Differences in Image Creation

- **Undedicated allocation by default.** When importing or exporting a set of dma_bufs as an EGLImage or gbm_bo, common practice mandates that each dma_buf's memory be dedicated (in the sense of VK_KHR_dedicated_allocation) to the image (though not necessarily dedicated to a single plane). In particular, neither the GBM documentation nor the EGL extension specifications explicitly state this requirement, but in light of common practice this is likely due to under-specification rather than intentional omission. In contrast, VK_EXT_image_drm_format_modifier permits, but does not require, the implementation to require dedicated allocations for images created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT.
- **Separation of image creation and memory allocation.** When importing a set of dma_bufs as an EGLImage or gbm_bo, EGL and GBM create the image resource and bind it to memory (the dma_bufs) simultaneously. This allows EGL and GBM to query each dma_buf's size during image creation. In Vulkan, image creation and memory allocation are independent unless a dedicated allocation is used (as in VK_KHR_dedicated_allocation). Therefore, without requiring dedicated allocation, Vulkan cannot query the size of each dma_buf (or other external handle) when calculating the image's memory layout. Even if dedication allocation were required, Vulkan cannot calculate the image's memory layout until after the image is bound to its dma_ufs.

The above differences complicate the potential inference of plane size in Vulkan. Consider the following problematic cases:

Problematic Plane Size Calculations

- **Padding.** Some plane of the image may require implementation-dependent padding.
- **Metadata.** For some *modifiers*, the image may have a metadata plane which requires a non-trivial calculation to determine its size.
- **Mipmapped, array, and 3D images.** The implementation may support VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT for images whose mipLevels, arrayLayers, or depth is greater than 1. For such images with certain *modifiers*, the calculation of each plane's size may be non-trivial.

However, an application-provided plane size solves none of the above problems.

For simplicity, consider an external image with a single memory plane. The implementation is obviously capable calculating the image's size when its tiling is VK_IMAGE_TILING_OPTIMAL. Likewise, any reasonable implementation is capable of calculating the image's size when its tiling uses a supported *modifier*.

Suppose that the external image's size is smaller than the implementation-calculated size. If the

application provided the external image's size to vkCreateImage, the implementation would observe the mismatched size and recognize its inability to comprehend the external image's layout (unless the implementation used the application-provided size to select a refinement of the tiling layout indicated by the *modifier*, which is strongly discouraged). The implementation would observe the conflict, and reject image creation with VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT. On the other hand, if the application did not provide the external image's size to vkCreateImage, then the application would observe after calling vkGetImageMemoryRequirements that the external image's size is less than the size required by the implementation. The application would observe the conflict and refuse to bind the VkImage to the external memory. In both cases, the result is explicit failure.

Suppose that the external image's size is larger than the implementation-calculated size. If the application provided the external image's size to vkCreateImage, for reasons similar to above the implementation would observe the mismatched size and recognize its inability to comprehend the image data residing in the extra size. The implementation, however, must assume that image data resides in the entire size provided by the application. The implementation would observe the conflict and reject image creation with VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT. On the other hand, if the application did not provide the external image's size to vkCreateImage, then the application would observe after calling vkGetImageMemoryRequirements that the external image's size is larger than the implementation-usable size. The application would observe the conflict and refuse to bind the VkImage to the external memory. In both cases, the result is explicit failure.

Therefore, an application-provided size provides no benefit, and this extension should not require it. This decision renders VkSubresourceLayout::size an unused field during image creation, and thus introduces a risk that implementations may require applications to submit sideband creation parameters in the unused field. To prevent implementations from relying on sideband data, this extension *requires* the application to set size to 0.

Description

This extension adds stricter requirements for how out of bounds reads from images are handled.

Rather than returning undefined values, most out of bounds reads return R, G, and B values of zero and alpha values of either zero or one. Components not present in the image format may be set to zero or to values based on the format as described in Conversion to RGBA.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceImageRobustnessFeaturesEXT

New Enum Constants

- `VK_EXT_IMAGE_ROBUSTNESS_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ROBUSTNESS_FEATURES_EXT`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Issues

1. How does this extension differ from VK_EXT_robustness2?

The guarantees provided by this extension are a subset of those provided by the robustImageAccess2 feature of VK_EXT_robustness2. Where this extension allows return values of (0, 0, 0, 0) or (0, 0, 0, 1), robustImageAccess2 requires that a particular value dependent on the image format be returned. This extension provides no guarantees about the values returned for an access to an invalid Lod.

Description

This extension allows applications to clamp the minimum LOD value during Image Level(s) Selection, Texel Gathering and Integer Texel Coordinate Operations with a given VkImageView by VkImageViewMinLodCreateInfoEXT::`minLod`.

This extension may be useful to restrict a VkImageView to only mips which have been uploaded, and the use of fractional `minLod` can be useful for smoothly introducing new mip levels when using linear mipmap filtering.

Description

This extension introduces the ability to back uniform blocks directly with descriptor sets by storing inline uniform data within descriptor pool storage. Compared to push constants this new construct allows uniform data to be reused across multiple disjoint sets of drawing or dispatching commands and **may** enable uniform data to be accessed with fewer indirections compared to uniforms backed by buffer memory.

New Structures

- Extending VkDescriptorPoolCreateInfo:
  - VkDescriptorPoolInlineUniformBlockCreateInfoEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:

  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK_EXT`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Vulkan 1.3 adds additional functionality related to this extension in the form of the `maxInlineUniformTotalSize` limit.

Issues

1) Do we need a new storage class for inline uniform blocks vs. uniform blocks?

RESOLVED: No. The `Uniform` storage class is used to allow the same syntax used for both uniform buffers and inline uniform blocks.

2) Is the descriptor array index and array size expressed in terms of bytes or dwords for inline uniform block descriptors?

RESOLVED: In bytes, but both **must** be a multiple of 4, similar to how push constant ranges are specified. The `descriptorCount` of `VkDescriptorSetLayoutBinding` thus provides the total number of bytes a particular binding with an inline uniform block descriptor type can hold, while the `srcArrayElement`, `dstArrayElement`, and `descriptorCount` members of `VkWriteDescriptorSet`, `VkCopyDescriptorSet`, and `VkDescriptorUpdateTemplateEntry` (where applicable) specify the byte offset and number of bytes to write/copy to the binding's backing store. Additionally, the `stride` member of `VkDescriptorUpdateTemplateEntry` is ignored for inline uniform blocks and a default value of one is used, meaning that the data to update inline uniform block bindings with must be contiguous in memory.

3) What layout rules apply for uniform blocks corresponding to inline constants?

RESOLVED: They use the same layout rules as uniform buffers.

4) Do we need to add non-uniform indexing features/properties as introduced by `VK_EXT_descriptor_indexing` for inline uniform blocks?

RESOLVED: No, because inline uniform blocks are not allowed to be "arrayed". A single binding with an inline uniform block descriptor type corresponds to a single uniform block instance and the array indices inside that binding refer to individual offsets within the uniform block (see issue #2). However, this extension does introduce new features/properties about the level of support for update-after-bind inline uniform blocks.

5) Is the `descriptorBindingVariableDescriptorCount` feature introduced by `VK_EXT_descriptor_indexing` supported for inline uniform blocks?

RESOLVED: Yes, as long as other inline uniform block specific limits are respected.

6) Do the robustness guarantees of `robustBufferAccess` apply to inline uniform block accesses?

RESOLVED: No, similarly to push constants, as they are not backed by buffer memory like uniform buffers.

Description

This extension provides a mechanism for configuring programmatically through the Vulkan API the behavior of layers.

This extension provides the VkLayerSettingsCreateInfoEXT struct that can be included in the `pNext` chain of the VkInstanceCreateInfo structure passed as the `pCreateInfo` parameter of vkCreateInstance.

The structure contains an array of VkLayerSettingEXT structure values that configure specific features of layers.

NOTE	The `VK_EXT_layer_settings` extension subsumes all the functionality provided in the `VK_EXT_validation_flags` extension and the `VK_EXT_validation_features` extension.

New Structures

- VkLayerSettingEXT
- Extending VkInstanceCreateInfo:
  - VkLayerSettingsCreateInfoEXT

New Enums

- VkLayerSettingTypeEXT

New Enum Constants

- `VK_EXT_LAYER_SETTINGS_EXTENSION_NAME`
- `VK_EXT_LAYER_SETTINGS_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT`

Example

One example usage of `VK_EXT_layer_settings` is as implemented by the Vulkan Profiles layer.

It allows the profiles layer tests used by the profiles layer C.I. to programmatically configure the layer for each test without affecting the C.I. environment, allowing to run multiple tests concurrently.

```
const char* profile_file_data = JSON_TEST_FILES_PATH "VP_KHR_roadmap_2022.json";
const char* profile_name_data = "VP_KHR_roadmap_2022";
VkBool32 emulate_portability_data = VK_TRUE;
const char* simulate_capabilities[] = {
    "SIMULATE_API_VERSION_BIT",
    "SIMULATE_FEATURES_BIT",
    "SIMULATE_PROPERTIES_BIT",
    "SIMULATE_EXTENSIONS_BIT",
```

```
    "SIMULATE_FORMATS_BIT",
    "SIMULATE_QUEUE_FAMILY_PROPERTIES_BIT"
};
const char* debug_reports[] = {
    "DEBUG_REPORT_ERROR_BIT",
    "DEBUG_REPORT_WARNING_BIT",
    "DEBUG_REPORT_NOTIFICATION_BIT",
    "DEBUG_REPORT_DEBUG_BIT"
};

const VkLayerSettingEXT settings[] = {
     {kLayerName, kLayerSettingsProfileFile, VK_LAYER_SETTING_TYPE_STRING_EXT, 1,
&profile_file_data},
     {kLayerName, kLayerSettingsProfileName, VK_LAYER_SETTING_TYPE_STRING_EXT, 1,
&profile_name_data},
     {kLayerName, kLayerSettingsEmulatePortability, VK_LAYER_SETTING_TYPE_BOOL32_EXT,
1, &emulate_portability_data},
     {kLayerName, kLayerSettingsSimulateCapabilities,
VK_LAYER_SETTING_TYPE_STRING_EXT,
        static_cast<uint32_t>(std::size(simulate_capabilities)),
simulate_capabilities},
     {kLayerName, kLayerSettingsDebugReports, VK_LAYER_SETTING_TYPE_STRING_EXT,
        static_cast<uint32_t>(std::size(debug_reports)), debug_reports}
};

const VkLayerSettingsCreateInfoEXT layer_settings_create_info{
    VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT, nullptr,
    static_cast<uint32_t>(std::size(settings)), settings};

VkInstanceCreateInfo inst_create_info = {};
...
inst_create_info.pNext = &layer_settings_create_info;
vkCreateInstance(&inst_create_info, nullptr, &_instances);
```

Issues

- How should application developers figure out the list of available settings?

This extension does not provide a reflection API for layer settings. Layer settings are described in each layer JSON manifest and the documentation of each layer which implements this extension.

Version History

Description

This extension exposes a hardware feature used by some vendors to implement OpenGL's dithering. The purpose of this extension is to support layering OpenGL over Vulkan, by allowing the layer to take advantage of the same hardware feature and provide equivalent dithering to OpenGL applications.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceLegacyDitheringFeaturesEXT

New Enum Constants

- `VK_EXT_LEGACY_DITHERING_EXTENSION_NAME`
- `VK_EXT_LEGACY_DITHERING_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LEGACY_DITHERING_FEATURES_EXT`
- Extending VkSubpassDescriptionFlagBits:
  - `VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT`

If VK_KHR_dynamic_rendering or Vulkan Version 1.3 and VK_KHR_maintenance5 is supported:

- Extending VkPipelineCreateFlagBits2KHR:
  - `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT`
- Extending VkRenderingFlagBits:
  - `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT`

Version History

- Revision 1, 2022-03-31 (Shahbaz Youssefi)
  - Internal revisions
- Revision 2, 2024-02-22 (Shahbaz Youssefi)
  - Added pipeline create flag to support dynamic rendering

Issues

1) In OpenGL, the dither state can change dynamically. Should this extension add a pipeline state for dither?

RESOLVED: No. Changing dither state is rarely, if ever, done during rendering. Every surveyed Android application either entirely disables dither, explicitly enables it, or uses the default state (which is enabled). Additionally, on some hardware dither can only be specified in a render pass granularity, so a change in dither state would necessarily need to cause a render pass break. This extension considers dynamic changes in OpenGL dither state a theoretical situation, and expects the layer to break the render pass in such a situation without any practical downsides.

Last Modified Date

2024-02-23

IP Status

No known IP claims.

Contributors

- Mike Blumenkrantz, Valve
- Piers Daniell, NVIDIA
- Spencer Fricke, LunarG
- Alyssa Rosenzweig, Valve

Description

This extension adds support for legacy features of (non-64-bit) vertex attributes as found in OpenGL:

- Vertex attributes loaded from arbitrary buffer alignments
- Vertex attributes using arbitrary strides
- Vertex attributes where the component data type of the binding does not match the component numeric type of the shader input

These features are only usable with dynamic vertex input. Unaligned loads of vertex attributes may incur performance penalties, indicated with a property.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceLegacyVertexAttributesFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceLegacyVertexAttributesPropertiesEXT

New Enum Constants

- `VK_EXT_LEGACY_VERTEX_ATTRIBUTES_EXTENSION_NAME`
- `VK_EXT_LEGACY_VERTEX_ATTRIBUTES_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LEGACY_VERTEX_ATTRIBUTES_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LEGACY_VERTEX_ATTRIBUTES_PROPERTIES_EXT`

Issues

1.) Should implementations convert float/integer values?

RESOLVED: No. When fetching an integer data type from float values or float data types from integer values, the resulting shader values are implementation-dependent.

Description

While running a Vulkan application, other processes on the machine might also be attempting to use the same device memory, which can pose problems. This extension adds support for querying the amount of memory used and the total memory budget for a memory heap. The values returned by this query are implementation-dependent and can depend on a variety of factors including operating system and system load.

The VkPhysicalDeviceMemoryBudgetPropertiesEXT::`heapBudget` values can be used as a guideline for how much total memory from each heap the **current process** can use at any given time, before allocations may start failing or causing performance degradation. The values may change based on other activity in the system that is outside the scope and control of the Vulkan implementation.

The VkPhysicalDeviceMemoryBudgetPropertiesEXT::`heapUsage` will display the **current process** estimated heap usage.

With this information, the idea is for an application at some interval (once per frame, per few seconds, etc) to query `heapBudget` and `heapUsage`. From here the application can notice if it is over budget and decide how it wants to handle the memory situation (free it, move to host memory, changing mipmap levels, etc). This extension is designed to be used in concert with `VK_EXT_memory_priority` to help with this part of memory management.

New Structures

- Extending VkPhysicalDeviceMemoryProperties2:
  - VkPhysicalDeviceMemoryBudgetPropertiesEXT

New Enum Constants

- `VK_EXT_MEMORY_BUDGET_EXTENSION_NAME`
- `VK_EXT_MEMORY_BUDGET_SPEC_VERSION`

Description

This extension adds a `priority` value specified at memory allocation time. On some systems with both device-local and non-device-local memory heaps, the implementation may transparently move memory from one heap to another when a heap becomes full (for example, when the total memory used across all processes exceeds the size of the heap). In such a case, this priority value may be used to determine which allocations are more likely to remain in device-local memory.

Description

This extension provides a new mechanism allowing applications to generate collections of geometric primitives via programmable mesh shading. It is an alternative to the existing programmable primitive shading pipeline, which relied on generating input primitives by a fixed function assembler as well as fixed function vertex fetch.

This extension also adds support for the following SPIR-V extension in Vulkan:

- `SPV_EXT_mesh_shader`

New Commands

- vkCmdDrawMeshTasksEXT
- vkCmdDrawMeshTasksIndirectCountEXT
- vkCmdDrawMeshTasksIndirectEXT

New Structures

- VkDrawMeshTasksIndirectCommandEXT

Description

In a Vulkan implementation that is layered on top of Metal on Apple device platforms, this extension provides the ability to import and export the underlying Metal objects associated with specific Vulkan objects.

As detailed in the extension proposal document, this extension adds one new Vulkan command, vkExportMetalObjectsEXT, to export underlying Metal objects from Vulkan objects, and supports importing the appropriate existing Metal objects when creating Vulkan objects of types VkDeviceMemory, VkImage, VkSemaphore, and VkEvent,

The intent is that this extension will be advertised and supported only on implementations that are layered on top of Metal on Apple device platforms.

New Base Types

- IOSurfaceRef
- MTLBuffer_id
- MTLCommandQueue_id
- MTLDevice_id
- MTLSharedEvent_id
- MTLTexture_id

New Commands

- vkExportMetalObjectsEXT

New Structures

- VkExportMetalObjectsInfoEXT
- Extending VkExportMetalObjectsInfoEXT:
  - VkExportMetalBufferInfoEXT
  - VkExportMetalCommandQueueInfoEXT
  - VkExportMetalDeviceInfoEXT
  - VkExportMetalIOSurfaceInfoEXT
  - VkExportMetalSharedEventInfoEXT
  - VkExportMetalTextureInfoEXT
- Extending VkImageCreateInfo:
  - VkImportMetalIOSurfaceInfoEXT
  - VkImportMetalTextureInfoEXT
- Extending VkInstanceCreateInfo, VkMemoryAllocateInfo, VkImageCreateInfo, VkImageViewCreateInfo, VkBufferViewCreateInfo, VkSemaphoreCreateInfo, VkEventCreateInfo:

    - VkExportMetalObjectCreateInfoEXT
- Extending VkMemoryAllocateInfo:
    - VkImportMetalBufferInfoEXT
- Extending VkSemaphoreCreateInfo, VkEventCreateInfo:
    - VkImportMetalSharedEventInfoEXT

New Enums

- VkExportMetalObjectTypeFlagBitsEXT

New Bitmasks

- VkExportMetalObjectTypeFlagsEXT

New Enum Constants

- `VK_EXT_METAL_OBJECTS_EXTENSION_NAME`
- `VK_EXT_METAL_OBJECTS_SPEC_VERSION`
- Extending VkStructureType:
    - `VK_STRUCTURE_TYPE_EXPORT_METAL_BUFFER_INFO_EXT`
    - `VK_STRUCTURE_TYPE_EXPORT_METAL_COMMAND_QUEUE_INFO_EXT`
    - `VK_STRUCTURE_TYPE_EXPORT_METAL_DEVICE_INFO_EXT`
    - `VK_STRUCTURE_TYPE_EXPORT_METAL_IO_SURFACE_INFO_EXT`
    - `VK_STRUCTURE_TYPE_EXPORT_METAL_OBJECTS_INFO_EXT`
    - `VK_STRUCTURE_TYPE_EXPORT_METAL_OBJECT_CREATE_INFO_EXT`
    - `VK_STRUCTURE_TYPE_EXPORT_METAL_SHARED_EVENT_INFO_EXT`
    - `VK_STRUCTURE_TYPE_EXPORT_METAL_TEXTURE_INFO_EXT`
    - `VK_STRUCTURE_TYPE_IMPORT_METAL_BUFFER_INFO_EXT`
    - `VK_STRUCTURE_TYPE_IMPORT_METAL_IO_SURFACE_INFO_EXT`
    - `VK_STRUCTURE_TYPE_IMPORT_METAL_SHARED_EVENT_INFO_EXT`
    - `VK_STRUCTURE_TYPE_IMPORT_METAL_TEXTURE_INFO_EXT`

Issues

None.

Version History

- Revision 1, 2022-05-28 (Bill Hollings)
    - Initial draft.
    - Incorporated feedback from review by the Vulkan Working Group. Renamed many structures, moved import/export of MTLBuffer to VkDeviceMemory, added export of

MTLSharedEvent, added import of MTLSharedEvent for VkSemaphore and VkEvent, and changed used bit mask fields to individual bit fields to simplify Valid Usage rules.

- Revision 2, 2024-04-04 (Bill Hollings)
  - Add an `__unsafe_unretained` ownership qualifier to all Metal object declarations, to support Automatic Reference Counting (ARC) on Apple devices.

Description

Processing multiple draw commands in sequence incurs measurable overhead within drivers due to repeated state checks and updates during dispatch. This extension enables passing the entire sequence of draws directly to the driver in order to avoid any such overhead, using an array of VkMultiDrawInfoEXT or VkMultiDrawIndexedInfoEXT structs with `vkCmdDrawMultiEXT` or `vkCmdDrawMultiIndexedEXT`, respectively. These functions could be used any time multiple draw commands are being recorded without any state changes between them in order to maximize performance.

New Commands

- vkCmdDrawMultiEXT
- vkCmdDrawMultiIndexedEXT

New Structures

- VkMultiDrawIndexedInfoEXT
- VkMultiDrawInfoEXT

Description

With careful usage of resolve attachments, multisampled image memory allocated with `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT`, `loadOp` not equal to `VK_ATTACHMENT_LOAD_OP_LOAD` and `storeOp` not equal to `VK_ATTACHMENT_STORE_OP_STORE`, a Vulkan application is able to efficiently perform multisampled rendering without incurring any additional memory penalty on some implementations.

Under certain circumstances however, the application may not be able to complete its multisampled rendering within a single render pass; for example if it does partial rasterization from frame to frame, blending on an image from a previous frame, or in emulation of GL_EXT_multisampled_render_to_texture. In such cases, the application can use an initial subpass to effectively load single-sampled data from the next subpass's resolve attachment and fill in the multisampled attachment which otherwise uses `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_DONT_CARE`. However, this is not always possible (for example for stencil in the absence of VK_EXT_shader_stencil_export) and has multiple drawbacks.

Some implementations are able to perform said operation efficiently in hardware, effectively loading a multisampled attachment from the contents of a single sampled one. Together with the ability to perform a resolve operation at the end of a subpass, these implementations are able to perform multisampled rendering on single-sampled attachments with no extra memory or bandwidth overhead. This extension exposes this capability by allowing a framebuffer and render pass to include single-sampled attachments while rendering is done with a specified number of samples.

New Structures

- Extending VkFormatProperties2:
  - VkSubpassResolvePerformanceQueryEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT
- Extending VkSubpassDescription2, VkRenderingInfo:
  - VkMultisampledRenderToSingleSampledInfoEXT

New Enum Constants

- `VK_EXT_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_EXTENSION_NAME`
- `VK_EXT_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_SPEC_VERSION`
- Extending VkImageCreateFlagBits:
  - `VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_INFO_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_SUBPASS_RESOLVE_PERFORMANCE_QUERY_EXT`

Issues

1) Could the multisampled attachment be initialized through some form of copy?

RESOLVED: No. Some implementations do not support copying between attachments in general, and find expressing this operation through a copy unnatural.

2) Another way to achieve this is by introducing a new `loadOp` to load the contents of the multisampled image from a single-sampled one. Why is this extension preferred?

RESOLVED: Using this extension simplifies the application, as it does not need to manage a secondary lazily-allocated image. Additionally, using this extension leaves less room for error; for example a single mistake in `loadOp` or `storeOp` would result in the lazily-allocated image to actually take up memory, and remain so until destruction.

3) There is no guarantee that multisampled data between two subpasses with the same number of samples will be retained as the implementation may be forced to split the render pass implicitly for various reasons. Should this extension require that every subpass that uses multisampled-render-to-single-sampled end in an implicit render pass split (which results in a resolve operation)?

RESOLVED: No. Not requiring this allows render passes with multiple multisampled-render-to-single-sampled subpasses to potentially execute more efficiently (though there is no guarantee).

Description

This extension allows applications to reduce descriptor memory footprint by allowing a descriptor

to be able to mutate to a given list of descriptor types depending on which descriptor types are written into, or copied into a descriptor set.

The main use case this extension intends to address is descriptor indexing with VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT where the descriptor types are completely generic, as this means applications can allocate one large descriptor set, rather than having one large descriptor set per descriptor type, which significantly bloats descriptor memory usage and causes performance issues.

This extension also adds a mechanism to declare that a descriptor pool, and therefore the descriptor sets that are allocated from it, reside only in host memory; as such these descriptors can only be updated/copied, but not bound.

These features together allow much more efficient emulation of the raw D3D12 binding model. This extension is primarily intended to be useful for API layering efforts.

New Structures

- VkMutableDescriptorTypeListEXT
- Extending VkDescriptorSetLayoutCreateInfo, VkDescriptorPoolCreateInfo:
  - VkMutableDescriptorTypeCreateInfoEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT

New Enum Constants

- VK_EXT_MUTABLE_DESCRIPTOR_TYPE_EXTENSION_NAME
- VK_EXT_MUTABLE_DESCRIPTOR_TYPE_SPEC_VERSION
- Extending VkDescriptorPoolCreateFlagBits:
  - VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT
- Extending VkDescriptorSetLayoutCreateFlagBits:
  - VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT
- Extending VkDescriptorType:
  - VK_DESCRIPTOR_TYPE_MUTABLE_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_MUTABLE_DESCRIPTOR_TYPE_CREATE_INFO_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MUTABLE_DESCRIPTOR_TYPE_FEATURES_EXT

Version History

- Revision 1, 2022-08-22 (Jon Leech)
  - Initial version, promoted from VK_VALVE_mutable_descriptor_type.

Description

With core Vulkan it is not legal to call vkCmdExecuteCommands when recording a secondary command buffer. This extension relaxes that restriction, allowing secondary command buffers to execute other secondary command buffers.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceNestedCommandBufferFeaturesEXT

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceNestedCommandBufferPropertiesEXT

New Enum Constants

- VK_EXT_NESTED_COMMAND_BUFFER_EXTENSION_NAME
- VK_EXT_NESTED_COMMAND_BUFFER_SPEC_VERSION
- Extending VkRenderingFlagBits:
  - VK_RENDERING_CONTENTS_INLINE_BIT_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_NESTED_COMMAND_BUFFER_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_NESTED_COMMAND_BUFFER_PROPERTIES_EXT
- Extending VkSubpassContents:
  - VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT

Issues

1) The Command Buffer Levels property for the Vulkan commands comes from the `cmdbufferlevel` attribute in `vk.xml` for the command, and it is currently not possible to modify this attribute based on whether an extension is enabled. For this extension we want the `cmdbufferlevel` attribute for vkCmdExecuteCommands to be `primary,secondary` when this extension is enabled and `primary` otherwise.

RESOLVED: The `cmdbufferlevel` attribute for vkCmdExecuteCommands has been changed to `primary,secondary` and a new VUID added to prohibit recording this command in a secondary command buffer unless this extension is enabled.

Interactions and External Dependencies

- This extension provides API support for `GLSL_EXT_opacity_micromap`

Contributors

- Christoph Kubisch, NVIDIA
- Eric Werness, NVIDIA
- Josh Barczak, Intel
- Stu Smith, AMD

Description

When adding transparency to a ray traced scene, an application can choose between further tessellating the geometry or using an any-hit shader to allow the ray through specific parts of the geometry. These options have the downside of either significantly increasing memory consumption or adding runtime overhead to run shader code in the middle of traversal, respectively.

This extension adds the ability to add an *opacity micromap* to geometry when building an acceleration structure. The opacity micromap compactly encodes opacity information which can be read by the implementation to mark parts of triangles as opaque or transparent. The format is externally visible to allow the application to compress its internal geometry and surface representations into the compressed format ahead of time. The compressed format subdivides each triangle into a set of subtriangles, each of which can be assigned either two or four opacity values. These opacity values can control if a ray hitting that subtriangle is treated as an opaque hit, complete miss, or possible hit, depending on the controls described in Ray Opacity Micromap.

This extension provides:

- a VkMicromapEXT structure to store the micromap,
- functions similar to acceleration structure build functions to build the opacity micromap array, and
- a structure to extend VkAccelerationStructureGeometryTrianglesDataKHR to attach a micromap to the geometry of the acceleration structure.

New Object Types

- VkMicromapEXT

New Commands

Reference Code

```
uint32_t BarycentricsToSpaceFillingCurveIndex(float u, float v, uint32_t level)
{
    u = clamp(u, 0.0f, 1.0f);
    v = clamp(v, 0.0f, 1.0f);

    uint32_t iu, iv, iw;

    // Quantize barycentric coordinates
    float fu = u * (1u << level);
    float fv = v * (1u << level);

    iu = (uint32_t)fu;
    iv = (uint32_t)fv;

    float uf = fu - float(iu);
    float vf = fv - float(iv);

    if (iu >= (1u << level)) iu = (1u << level) - 1u;
    if (iv >= (1u << level)) iv = (1u << level) - 1u;

    uint32_t iuv = iu + iv;

    if (iuv >= (1u << level))
        iu -= iuv - (1u << level) + 1u;

    iw = ~(iu + iv);

    if (uf + vf >= 1.0f && iuv < (1u << level) - 1u) --iw;

    uint32_t b0 = ~(iu ^ iw);
    b0 &= ((1u << level) - 1u);
    uint32_t t = (iu ^ iv) & b0;

    uint32_t f = t;
    f ^= f >> 1u;
    f ^= f >> 2u;
    f ^= f >> 4u;
    f ^= f >> 8u;
    uint32_t b1 = ((f ^ iu) & ~b0) | t;
```

```
    // Interleave bits
    b0 = (b0 | (b0 << 8u)) & 0x00ff00ffu;
    b0 = (b0 | (b0 << 4u)) & 0x0f0f0f0fu;
    b0 = (b0 | (b0 << 2u)) & 0x33333333u;
    b0 = (b0 | (b0 << 1u)) & 0x55555555u;
    b1 = (b1 | (b1 << 8u)) & 0x00ff00ffu;
    b1 = (b1 | (b1 << 4u)) & 0x0f0f0f0fu;
    b1 = (b1 | (b1 << 2u)) & 0x33333333u;
    b1 = (b1 | (b1 << 1u)) & 0x55555555u;

    return b0 | (b1 << 1u);
}
```

Issues

(1) Is the build actually similar to an acceleration structure build?

- Resolved: The build should be much lighter-weight than an acceleration structure build, but the infrastructure is similar enough that it makes sense to keep the concepts compatible.

(2) Why does VkMicromapUsageEXT not have type/pNext?

- Resolved: There can be a very large number of these structures, so doubling the size of these can be significant memory consumption. Also, an application may be loading these directly from a file which is more compatible with it being a flat structure. The including structures are extensible and are probably a more suitable place to add extensibility.

(3) Why is there a SPIR-V extension?

- Resolved: There is a ray flag. To be consistent with how the existing ray tracing extensions work that ray flag needs its own extension.

(4) Should there be indirect micromap build?

- Resolved: Not for now. There is more in-depth usage metadata required and it seems less likely that something like a GPU culling system would need to change the counts for a micromap.

(5) Should micromaps have a micromap device address?

- Resolved: There is no need right now (can just use the handle) but that is a bit different from acceleration structures, though the two are not completely parallel in their usage.

(6) Why are the alignment requirements defined as a mix of hardcoded values and caps?

- Resolved: This is most parallel with the definition of `VK_KHR_acceleration_structure` and maintaining commonality makes it easier for applications to share memory.

Description

Vulkan is frequently implemented on multi-user and multi-process operating systems where the device-local memory can be shared by more than one process. On such systems the size of the device-local memory available to the application may not be the full size of the memory heap at all times. In order for these operating systems to support multiple applications the device-local

memory is virtualized and paging is used to move memory between device-local and host-local memory heaps, transparent to the application.

The current Vulkan specification does not expose this behavior well and may cause applications to make suboptimal memory choices when allocating memory. For example, in a system with multiple applications running, the application may think that device-local memory is full and revert to making performance-sensitive allocations from host-local memory. In reality the memory heap might not have been full, it just appeared to be at the time memory consumption was queried, and a device-local allocation would have succeeded. A well designed operating system that implements pageable device-local memory will try to have all memory allocations for the foreground application paged into device-local memory, and paged out for other applications as needed when not in use.

When this extension is exposed by the Vulkan implementation it indicates to the application that the operating system implements pageable device-local memory and the application should adjust its memory allocation strategy accordingly. The extension also exposes a new vkSetDeviceMemoryPriorityEXT function to allow the application to dynamically adjust the priority of existing memory allocations based on its current needs. This will help the operating system page out lower priority memory allocations before higher priority allocations when needed. It will also help the operating system decide which memory allocations to page back into device-local memory first.

To take best advantage of pageable device-local memory the application must create the Vulkan device with the VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT ::`pageableDeviceLocalMemory` feature enabled. When enabled the Vulkan implementation will allow device-local memory allocations to be paged in and out by the operating system, and **may** not return VK_ERROR_OUT_OF_DEVICE_MEMORY even if device-local memory appears to be full, but will instead page this, or other allocations, out to make room. The Vulkan implementation will also ensure that host-local memory allocations will never be promoted to device-local memory by the operating system, or consume device-local memory.

New Commands

Description

This extension adds a new query to obtain PCI bus information about a physical device.

Not all physical devices have PCI bus information, either due to the device not being connected to the system through a PCI interface or due to platform specific restrictions and policies. Thus this

extension is only expected to be supported by physical devices which can provide the information.

As a consequence, applications should always check for the presence of the extension string for each individual physical device for which they intend to issue the new query for and should not have any assumptions about the availability of the extension on any given platform.

New Structures

Description

This extension provides new facilities to query DRM properties for physical devices, enabling users to match Vulkan physical devices with DRM nodes on Linux.

Its functionality closely overlaps with `EGL_EXT_device_drm`[1]. Unlike the EGL extension, this extension does not expose a string containing the name of the device file and instead exposes device minor numbers.

DRM defines multiple device node types. Each physical device may have one primary node and one render node associated. Physical devices may have no primary node (e.g. if the device does not have a display subsystem), may have no render node (e.g. if it is a software rendering engine), or may have neither (e.g. if it is a software rendering engine without a display subsystem).

To query DRM properties for a physical device, chain VkPhysicalDeviceDrmPropertiesEXT to VkPhysicalDeviceProperties2.

New Structures

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceDrmPropertiesEXT

New Enum Constants

- `VK_EXT_PHYSICAL_DEVICE_DRM_EXTENSION_NAME`
- `VK_EXT_PHYSICAL_DEVICE_DRM_SPEC_VERSION`

Description

This extension adds flags to `Vk*PipelineCreateInfo` and VkPipelineCacheCreateInfo structures with the aim of improving the predictability of pipeline creation cost. The goal is to provide information about potentially expensive hazards within the client driver during pipeline creation to the application before carrying them out rather than after.

Background

Pipeline creation is a costly operation, and the explicit nature of the Vulkan design means that cost is not hidden from the developer. Applications are also expected to schedule, prioritize, and load balance all calls for pipeline creation. It is strongly advised that applications create pipelines sufficiently ahead of their usage. Failure to do so will result in an unresponsive application, intermittent stuttering, or other poor user experiences. Proper usage of pipeline caches and/or derivative pipelines help mitigate this but is not assured to eliminate disruption in all cases. In the event that an ahead-of-time creation is not possible, considerations should be taken to ensure that the current execution context is suitable for the workload of pipeline creation including possible shader compilation.

Applications making API calls to create a pipeline must be prepared for any of the following to occur:

- OS/kernel calls to be made by the ICD
- Internal memory allocation not tracked by the `pAllocator` passed to `vkCreate*Pipelines`
- Internal thread synchronization or yielding of the current thread's core
- Extremely long (multi-millisecond+), blocking, compilation times
- Arbitrary call stacks depths and stack memory usage

The job or task based game engines that are being developed to take advantage of explicit graphics APIs like Vulkan may behave exceptionally poorly if any of the above scenarios occur. However, most game engines are already built to "stream" in assets dynamically as the user plays the game. By adding control by way of VkPipelineCreateFlags, we can require an ICD to report back a failure in critical execution paths rather than forcing an unexpected wait.

Applications can prevent unexpected compilation by setting `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT` on `Vk*PipelineCreateInfo`::`flags`. When set, an ICD must not attempt pipeline or shader compilation to create the pipeline object. In

such a case, if the implementation fails to create a pipeline without compilation, the implementation **must** return the result VK_PIPELINE_COMPILE_REQUIRED_EXT and return VK_NULL_HANDLE for the pipeline.

By default vkCreate*Pipelines calls must attempt to create all pipelines before returning. Setting VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT on Vk*PipelineCreateInfo::flags can be used as an escape hatch for batched pipeline creates.

Hidden locks also add to the unpredictability of the cost of pipeline creation. The most common case of locks inside the vkCreate*Pipelines is internal synchronization of the VkPipelineCache object. VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT can be set when calling vkCreatePipelineCache to state the cache is externally synchronized.

The hope is that armed with this information application and engine developers can leverage existing asset streaming systems to recover from "just-in-time" pipeline creation stalls.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePipelineCreationCacheControlFeaturesEXT

New Enums

- VkPipelineCacheCreateFlagBits

New Enum Constants

- VK_EXT_PIPELINE_CREATION_CACHE_CONTROL_EXTENSION_NAME

Description

When using pipeline libraries in ray tracing pipelines, a library might get linked into different pipelines in an incremental way. An application can have a strategy where a ray tracing pipeline is comprised of N pipeline libraries and is later augmented by creating a new pipeline with N + 1 libraries. Without this extension, all group handles must be re-queried as the group handle is tied to the pipeline, not the library. This is problematic for applications which aim to decouple construction of record buffers and the linkage of ray tracing pipelines.

To aid in this, this extension enables support for querying group handles directly from pipeline libraries. Group handles obtained from a library **must** remain bitwise identical in any `VkPipeline` that links to the library.

With this feature, the extension also improves compatibility with DXR 1.1 AddToStateObject(), which guarantees that group handles returned remain bitwise identical between parent and child pipelines. In addition, querying group handles from COLLECTION objects is also supported with that API.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT

New Enum Constants

- `VK_EXT_PIPELINE_LIBRARY_GROUP_HANDLES_EXTENSION_NAME`
- `VK_EXT_PIPELINE_LIBRARY_GROUP_HANDLES_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_LIBRARY_GROUP_HANDLES_FEATURES_EXT`

Description

Vulkan SC requires offline compilation of pipelines. In order to support this, the pipeline state is represented in a JSON schema that is read by an offline tool for compilation.

One method of developing a Vulkan SC application is to author a Vulkan application and use a layer to record and serialize the pipeline state and shaders for offline compilation. Each pipeline is represented by a separate JSON file, and can be identified with a `pipelineIdentifier`.

Once the pipelines have been compiled by the offline pipeline cache compiler, the Vulkan SC application can then use this `pipelineIdentifier` for identifying the pipeline via Vulkan SC's `VkPipelineIdentifierInfo` structure.

This extension allows the Vulkan application to query the `pipelineIdentifier` associated with each pipeline so that the application can store this with its pipeline metadata and the Vulkan SC application will then use to map the same state to an entry in the Vulkan SC pipeline cache.

It is expected that this extension will initially be implemented in the json generation layer, although

we can envision that there might be future uses for it in native Vulkan drivers as well.

New Commands

- vkGetPipelinePropertiesEXT

New Structures

- VkPipelineInfoEXT
- VkPipelinePropertiesIdentifierEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePipelinePropertiesFeaturesEXT

New Enum Constants

- `VK_EXT_PIPELINE_PROPERTIES_EXTENSION_NAME`
- `VK_EXT_PIPELINE_PROPERTIES_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_PROPERTIES_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_PROPERTIES_IDENTIFIER_EXT`

Issues

(1) This extension does not make sense on a strict Vulkan SC implementation. It may however be of potential use in a non-strict Vulkan SC implementation. Should this extension be enabled as part of Vulkan SC as well?

RESOLVED: No. This extension will not be enabled for Vulkan SC.

(2) This is intended to be a general pipeline properties query, but is currently only retrieving the pipeline identifier. Should the pipeline identifier query be mandatory for this extension and for all queries using this command?

RESOLVED: Use VkBaseOutStructure for the return parameter. Currently this is required to actually be a VkPipelinePropertiesIdentifierEXT structure, but that could be relaxed in the future to allow other structure types or to allow other structures to be chained in along with this one.

(3) Should there be a feature structure? Should it be required?

RESOLVED: Add a feature structure, and a feature for querying pipeline identifier, but allow it to be optional so that this extension can be used as the basis for other pipeline property queries without requiring the pipeline identifier to be supported.

Interactions and External Dependencies

- This extension provides API support for `GL_ARB_post_depth_coverage` and

GL_EXT_post_depth_coverage

Contributors

- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- SPV_KHR_post_depth_coverage

which allows the fragment shader to control whether values in the SampleMask built-in input variable reflect the coverage after early depth and stencil tests are applied.

This extension adds a new PostDepthCoverage execution mode under the SampleMaskPostDepthCoverage capability. When this mode is specified along with EarlyFragmentTests, the value of an input variable decorated with the SampleMask built-in reflects the coverage after the early fragment tests are applied. Otherwise, it reflects the coverage before the depth and stencil tests.

When using GLSL source-based shading languages, the post_depth_coverage layout qualifier from GL_ARB_post_depth_coverage or GL_EXT_post_depth_coverage maps to the PostDepthCoverage execution mode.

New Enum Constants

- VK_EXT_POST_DEPTH_COVERAGE_EXTENSION_NAME
- VK_EXT_POST_DEPTH_COVERAGE_SPEC_VERSION

New SPIR-V Capabilities

- SampleMaskPostDepthCoverage

Description

This device extension adds a new present mode, `VK_PRESENT_MODE_FIFO_LATEST_READY_EXT`.

This tear-free present mode behaves much like `VK_PRESENT_MODE_FIFO_KHR`, except that each vertical blanking period dequeues consecutive present requests until the latest ready is found to update the current image.

While this seems similar in concept to `VK_PRESENT_MODE_MAILBOX_KHR`, the fundamental difference is that the processing of the present requests is done during vblank. From the application perspective, this means for example, that in a flip-based model, a single vblank **may** cause multiple swapchain images to be released at once, while `VK_PRESENT_MODE_MAILBOX_KHR` **may** continuously be releasing images as new requests become ready.

This additional present mode is useful when using a time-based present API.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePresentModeFifoLatestReadyFeaturesEXT

New Enum Constants

- `VK_EXT_PRESENT_MODE_FIFO_LATEST_READY_EXTENSION_NAME`

Description

This extension adds support for a new query type to match OpenGL's `GL_PRIMITIVES_GENERATED` to support layering.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT

New Enum Constants

- `VK_EXT_PRIMITIVES_GENERATED_QUERY_EXTENSION_NAME`
- `VK_EXT_PRIMITIVES_GENERATED_QUERY_SPEC_VERSION`
- Extending VkQueryType:
  - `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT`
- Extending VkStructureType:

    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIMITIVES_GENERATED_QUERY_FEATURES_EXT

Issues

1) Can the query from VK_EXT_transform_feedback be used instead?

RESOLVED: No. While the query from VK_EXT_transform_feedback can produce the same results as in this extension, it is only available while transform feedback is active. The OpenGL GL_PRIMITIVES_GENERATED query is independent from transform feedback. Emulation through artificial transform feedback is unnecessarily inefficient.

2) Can VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT be used instead?

RESOLVED: It could, but we prefer the extension for simplicity. Vulkan requires that only one query be active at a time. If both the GL_PRIMITIVES_GENERATED and the GL_CLIPPING_INPUT_PRIMITIVES_ARB queries need to be simultaneously enabled, emulation of both through VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT is inconvenient.

3) On some hardware, this query cannot be implemented if VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable is enabled. How will this be handled?

RESOLVED: A feature flag is exposed by this extension for this. On said hardware, the GL implementation disables rasterizer-discard and achieves the same effect through other means. It will not be able to do the same in Vulkan due to lack of state information. A feature flag is exposed by this extension so the OpenGL implementation on top of Vulkan would be able to implement a similar workaround.

4) On some hardware, this query cannot be implemented for non-zero query indices. How will this be handled?

RESOLVED: A feature flag is exposed by this extension for this. If this feature is not present, the query from VK_EXT_transform_feedback can be used to the same effect.

5) How is the interaction of this extension with transformFeedbackRasterizationStreamSelect handled?

RESOLVED: Disallowed for non-zero streams. In OpenGL, the rasterization stream is always stream zero.

Description

This extension is a device extension which enables attaching arbitrary payloads to Vulkan objects. It introduces the idea of private data slots as a means of storing a 64-bit unsigned integer of application-defined data. Private data slots can be created or destroyed any time an associated device is available. Private data slots can be reserved at device creation time, and limiting use to the amount reserved will allow the extension to exhibit better performance characteristics.

New Object Types

- VkPrivateDataSlotEXT

New Commands

- vkCreatePrivateDataSlotEXT
- vkDestroyPrivateDataSlotEXT
- vkGetPrivateDataEXT
- vkSetPrivateDataEXT

New Structures

- VkPrivateDataSlotCreateInfoEXT
- Extending VkDeviceCreateInfo:
  - VkDevicePrivateDataCreateInfoEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePrivateDataFeaturesEXT

New Bitmasks

- VkPrivateDataSlotCreateFlagsEXT

New Enum Constants

- `VK_EXT_PRIVATE_DATA_EXTENSION_NAME`
- `VK_EXT_PRIVATE_DATA_SPEC_VERSION`
- Extending VkObjectType:
  - `VK_OBJECT_TYPE_PRIVATE_DATA_SLOT_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DEVICE_PRIVATE_DATA_CREATE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIVATE_DATA_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO_EXT`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Examples

- In progress

Issues

(1) If I have to create a VkPrivateDataSlot to store and retrieve data on an object, how does this extension help me? Will I not need to store the VkPrivateDataSlot mapping with each object, and if I am doing that, I might as well just store the original data!

RESOLVED: The VkPrivateDataSlot can be thought of as an opaque index into storage that is reserved in each object. That is, you can use the same VkPrivateDataSlot with each object for a specific piece of information. For example, if a layer wishes to track per-object information, the layer only needs to allocate one VkPrivateDataSlot per device and it can use that private data slot for all of the device's child objects. This allows multiple layers to store private data without conflicting with each other's and/or the application's private data.

(2) What if I need to store more than 64-bits of information per object?

RESOLVED: The data that you store per object could be a pointer to another object or structure of your own allocation.

Description

This extension allows changing the provoking vertex convention between Vulkan's default convention (first vertex) and OpenGL's convention (last vertex).

This extension is intended for use by API-translation layers that implement APIs like OpenGL on top of Vulkan, and need to match the source API's provoking vertex convention. Applications using Vulkan directly should use Vulkan's default convention.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceProvokingVertexFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceProvokingVertexPropertiesEXT
- Extending VkPipelineRasterizationStateCreateInfo:
  - VkPipelineRasterizationProvokingVertexStateCreateInfoEXT

New Enums

- VkProvokingVertexModeEXT

New Enum Constants

- `VK_EXT_PROVOKING_VERTEX_EXTENSION_NAME`
- `VK_EXT_PROVOKING_VERTEX_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROVOKING_VERTEX_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROVOKING_VERTEX_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT`

Issues

1) At what granularity should this state be set?

RESOLVED: At pipeline bind, with an optional per-render pass restriction.

The most natural place to put this state is in the graphics pipeline object. Some implementations require it to be known when creating the pipeline, and pipeline state is convenient for implementing OpenGL 3.2's glProvokingVertex, which can change the state between draw calls. However, some implementations can only change it approximately render pass granularity. To accommodate both, provoking vertex will be pipeline state, but implementations can require that only one mode is used within a render pass instance; the render pass's mode is chosen implicitly when the first pipeline is bound.

2) Does the provoking vertex mode affect the order that vertices are written to transform feedback buffers?

RESOLVED: Yes, to enable layered implementations of OpenGL and D3D.

All of OpenGL, OpenGL ES, and Direct3D 11 require that vertices are written to transform feedback buffers such that flat-shaded attributes have the same value when drawing the contents of the transform feedback buffer as they did in the original drawing when the transform feedback buffer was written (assuming the provoking vertex mode has not changed, in APIs that support more than one mode).

Version History

- Revision 1, (1c) 2021-02-22 (Jesse Hall)
  - Added VkPhysicalDeviceProvokingVertexPropertiesEXT::transformFeedbackPreservesTriangleFanProvokingVertex to accommodate implementations that cannot change the transform feedback vertex order for triangle fans.
- Revision 1, (1b) 2020-06-14 (Jesse Hall)
  - Added VkPhysicalDeviceProvokingVertexFeaturesEXT::transformFeedbackPreservesProvokingVertex and required that transform feedback write vertices so as to preserve the provoking vertex of each primitive.

- Revision 1, (1a) 2019-10-23 (Jesse Hall)
    - Initial draft, based on a proposal by Alexis Hétu

Description

This extension defines a special queue family, VK_QUEUE_FAMILY_FOREIGN_EXT, which can be used to transfer ownership of resources backed by external memory to foreign, external queues. This is similar to VK_QUEUE_FAMILY_EXTERNAL_KHR, defined in VK_KHR_external_memory. The key differences between the two are:

- The queues represented by VK_QUEUE_FAMILY_EXTERNAL_KHR must share the same physical device and the same driver version as the current VkInstance. VK_QUEUE_FAMILY_FOREIGN_EXT has no such restrictions. It can represent devices and drivers from other vendors, and can even represent non-Vulkan-capable devices.
- All resources backed by external memory support VK_QUEUE_FAMILY_EXTERNAL_KHR. Support for VK_QUEUE_FAMILY_FOREIGN_EXT is more restrictive.
- Applications should expect transitions to/from VK_QUEUE_FAMILY_FOREIGN_EXT to be more expensive than transitions to/from VK_QUEUE_FAMILY_EXTERNAL_KHR.

Description

This extension enables the `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16` format to be used without a sampler $Y'C_BC_R$ conversion enabled.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT

New Enum Constants

- `VK_EXT_RGBA10X6_FORMATS_EXTENSION_NAME`
- `VK_EXT_RGBA10X6_FORMATS_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RGBA10X6_FORMATS_FEATURES_EXT`

Issues

1) Should we reuse the existing format enumeration or introduce a new one?

RESOLVED: We reuse an existing format enumeration, `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16`, that was previously exclusively used for YCbCr and therefore had a set of limitations related to that usage. The alternative was to introduce a new format token with exactly the same bit representation as the existing token, but without the limitations.

2) Should we only introduce `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16` or also 1-3 component variations?

RESOLVED: Only the 4-component format is introduced because the 1- and 2- component variations are already not exclusive to YCbCr, and the 3-component variation is not a good match for hardware capabilities.

Description

This extension adds stricter requirements for how out of bounds reads and writes are handled. Most accesses **must** be tightly bounds-checked, out of bounds writes **must** be discarded, out of bound reads **must** return zero. Rather than allowing multiple possible (0,0,0,x) vectors, the out of bounds values are treated as zero, and then missing components are inserted based on the format as described in Conversion to RGBA and vertex input attribute extraction.

These additional requirements **may** be expensive on some implementations, and should only be enabled when truly necessary.

This extension also adds support for “null descriptors”, where VK_NULL_HANDLE **can** be used

instead of a valid handle. Accesses to null descriptors have well-defined behavior, and do not rely on robustness.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRobustness2FeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceRobustness2PropertiesEXT

New Enum Constants

- VK_EXT_ROBUSTNESS_2_EXTENSION_NAME
- VK_EXT_ROBUSTNESS_2_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_PROPERTIES_EXT

Issues

1. Why do VkPhysicalDeviceRobustness2PropertiesEXT::robustUniformBufferAccessSizeAlignment and VkPhysicalDeviceRobustness2PropertiesEXT::robustStorageBufferAccessSizeAlignment exist?

RESOLVED: Some implementations cannot efficiently tightly bounds-check all buffer accesses. Rather, the size of the bound range is padded to some power of two multiple, up to 256 bytes for uniform buffers and up to 4 bytes for storage buffers, and that padded size is bounds-checked. This is sufficient to implement D3D-like behavior, because D3D only allows binding whole uniform buffers or ranges that are a multiple of 256 bytes, and D3D raw and structured buffers only support 32-bit accesses.

Examples

None.

Description

This extension allows an application to modify the locations of samples within a pixel used in rasterization. Additionally, it allows applications to specify different sample locations for each pixel in a group of adjacent pixels, which **can** increase antialiasing quality (particularly if a custom resolve shader is used that takes advantage of these different locations).

It is common for implementations to optimize the storage of depth values by storing values that **can** be used to reconstruct depth at each sample location, rather than storing separate depth values for each sample. For example, the depth values from a single triangle **may** be represented using plane equations. When the depth value for a sample is needed, it is automatically evaluated at the sample location. Modifying the sample locations causes the reconstruction to no longer evaluate the same depth values as when the samples were originally generated, thus the depth aspect of a depth/stencil attachment **must** be cleared before rendering to it using different sample locations.

Some implementations **may** need to evaluate depth image values while performing image layout transitions. To accommodate this, instances of the VkSampleLocationsInfoEXT structure **can** be specified for each situation where an explicit or automatic layout transition has to take place. VkSampleLocationsInfoEXT **can** be chained from VkImageMemoryBarrier structures to provide sample locations for layout transitions performed by vkCmdWaitEvents and vkCmdPipelineBarrier calls, and VkRenderPassSampleLocationsBeginInfoEXT **can** be chained from VkRenderPassBeginInfo to provide sample locations for layout transitions performed implicitly by a render pass instance.

Description

In unextended Vulkan, minification and magnification filters such as LINEAR allow sampled image lookups to return a filtered texel value produced by computing a weighted average of a collection of texels in the neighborhood of the texture coordinate provided.

This extension provides a new sampler parameter which allows applications to produce a filtered texel value by computing a component-wise minimum (MIN) or maximum (MAX) of the texels that would normally be averaged. The reduction mode is orthogonal to the minification and magnification filter parameters. The filter parameters are used to identify the set of texels used to produce a final filtered value; the reduction mode identifies how these texels are combined.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2, with the EXT suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

Description

This extension enables C-like structure layout for SPIR-V blocks. It modifies the alignment rules for uniform buffers, storage buffers and push constants, allowing non-scalar types to be aligned solely based on the size of their components, without additional requirements.

Promotion to Vulkan 1.2

Vulkan APIs in this extension are included in core Vulkan 1.2, with the EXT suffix omitted. However, if Vulkan 1.2 is supported and this extension is not, the `scalarBlockLayout` capability is optional. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

No known IP claims.

Interactions and External Dependencies

- This extension provides API support for `GLSL_EXT_shader_atomic_float2`

Contributors

- Faith Ekstrand, Intel

Description

This extension allows a shader to perform 16-bit floating-point atomic operations on buffer and workgroup memory as well as floating-point atomic minimum and maximum operations on buffer, workgroup, and image memory. It advertises the SPIR-V `AtomicFloat16AddEXT` capability which allows atomic add operations on 16-bit floating-point numbers and the SPIR-V `AtomicFloat16MinMaxEXT`, `AtomicFloat32MinMaxEXT` and `AtomicFloat64MinMaxEXT` capabilities which allow atomic minimum and maximum operations on floating-point numbers. The supported operations include `OpAtomicFAddEXT`, `OpAtomicFMinEXT` and `OpAtomicFMaxEXT`.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT

New Enum Constants

- `VK_EXT_SHADER_ATOMIC_FLOAT_2_EXTENSION_NAME`
- `VK_EXT_SHADER_ATOMIC_FLOAT_2_SPEC_VERSION`
- Extending VkStructureType:

    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_2_FEATURES_EXT

Issues

1) Should this extension add support for 16-bit image atomics?

RESOLVED: No. While Vulkan supports creating storage images with VK_FORMAT_R16_SFLOAT and doing load and store on them, the data in the shader has a 32-bit representation. Vulkan currently has no facility for even basic reading or writing such images using 16-bit float values in the shader. Adding such functionality would be required before 16-bit image atomics would make sense and is outside the scope of this extension.

New SPIR-V Capabilities

- AtomicFloat32MinMaxEXT
- AtomicFloat32MinMaxEXT
- AtomicFloat32MinMaxEXT
- AtomicFloat64MinMaxEXT

Interactions and External Dependencies

- This extension provides API support for `GL_EXT_demote_to_helper_invocation`

Contributors

- Jeff Bolz, NVIDIA

Description

This extension adds Vulkan support for the `SPV_EXT_demote_to_helper_invocation` SPIR-V extension. That SPIR-V extension provides a new instruction `OpDemoteToHelperInvocationEXT` allowing shaders to “demote” a fragment shader invocation to behave like a helper invocation for its duration. The demoted invocation will have no further side effects and will not output to the framebuffer, but remains active and can participate in computing derivatives and in group operations. This is a better match for the “discard” instruction in HLSL.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderDemoteToHelperInvocationFeaturesEXT

New Enum Constants

- `VK_EXT_SHADER_DEMOTE_TO_HELPER_INVOCATION_EXTENSION_NAME`
- `VK_EXT_SHADER_DEMOTE_TO_HELPER_INVOCATION_SPEC_VERSION`

- Jeff Bolz, Nvidia
- Faith Ekstrand, Intel

Description

This extension extends existing 64-bit integer atomic support to enable these operations on images as well.

When working with large 2- or 3-dimensional data sets (e.g. rasterization or screen-space effects), image accesses are generally more efficient than equivalent buffer accesses. This extension allows applications relying on 64-bit integer atomics in this manner to quickly improve performance with only relatively minor code changes.

64-bit integer atomic support is guaranteed for optimally tiled images with the `VK_FORMAT_R64_UINT` and `VK_FORMAT_R64_SINT` formats.

Description

Some applications generate SPIR-V code at runtime. When pipeline caches are primed, either explicitly through e.g. VkPipelineCache mechanisms, or implicitly through driver managed caches, having to re-generate SPIR-V modules is redundant. SPIR-V modules could be cached on disk by an application, but the extra disk size requirement might be prohibitive in some use cases.

This extension adds the ability for an application to query a small identifier associated with a VkShaderModule. On subsequent runs of the application, the same identifier **can** be provided in lieu of a VkShaderModule object. A pipeline creation call with such a module **may** succeed if a

pipeline could be created without invoking compilation, and information inside the SPIR-V module is not required by the implementation.

VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT **must** be used if only the identifier is provided, and this use case is intended to work like a non-blocking, speculative compile. Applications **can** fallback as necessary.

The main motivation for identifying the module itself and not the entire pipeline is that pipeline identifiers change when a driver is updated, but module identifiers are expected to be stable for any particular driver implementation. This approach is helpful for shader pre-compilation systems which can prime pipeline caches ahead of time. When on-disk pipeline caches are updated, the same shader identifiers could lead to a pipeline cache hit.

If VK_EXT_fragment_density_map is supported:

- Extending VkShaderCreateFlagBitsEXT:
  - VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

If VK_EXT_mesh_shader or VK_NV_mesh_shader is supported:

- Extending VkShaderCreateFlagBitsEXT:
  - VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT

If VK_EXT_subgroup_size_control or Vulkan Version 1.3 is supported:

- Extending VkShaderCreateFlagBitsEXT:
  - VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT
  - VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT

If VK_KHR_device_group or Vulkan Version 1.1 is supported:

- Extending VkShaderCreateFlagBitsEXT:
  - VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT

If VK_KHR_fragment_shading_rate is supported:

- Extending VkShaderCreateFlagBitsEXT:
  - VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT

Examples

Example 1

Create linked pair of vertex and fragment shaders.

```
// Logical device created with the shaderObject feature enabled
VkDevice device;

// SPIR-V shader code for a vertex shader, along with its size in bytes
void* pVertexSpirv;
size_t vertexSpirvSize;

// SPIR-V shader code for a fragment shader, along with its size in bytes
void* pFragmentSpirv;
size_t fragmentSpirvSize;

// Descriptor set layout compatible with the shaders
VkDescriptorSetLayout descriptorSetLayout;

VkShaderCreateInfoEXT shaderCreateInfos[2] =
{
    {
```

```
        .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = VK_SHADER_CREATE_LINK_STAGE_BIT_EXT,
        .stage = VK_SHADER_STAGE_VERTEX_BIT,
        .nextStage = VK_SHADER_STAGE_FRAGMENT_BIT,
        .codeType = VK_SHADER_CODE_TYPE_SPIRV_EXT,
        .codeSize = vertexSpirvSize,
        .pCode = pVertexSpirv,
        .pName = "main",
        .setLayoutCount = 1,
        .pSetLayouts = &descriptorSetLayout;
        .pushConstantRangeCount = 0,
        .pPushConstantRanges = NULL,
        .pSpecializationInfo = NULL
    },
    {
        .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = VK_SHADER_CREATE_LINK_STAGE_BIT_EXT,
        .stage = VK_SHADER_STAGE_FRAGMENT_BIT,
        .nextStage = 0,
        .codeType = VK_SHADER_CODE_TYPE_SPIRV_EXT,
        .codeSize = fragmentSpirvSize,
        .pCode = pFragmentSpirv,
        .pName = "main",
        .setLayoutCount = 1,
        .pSetLayouts = &descriptorSetLayout;
        .pushConstantRangeCount = 0,
        .pPushConstantRanges = NULL,
        .pSpecializationInfo = NULL
    }
};

VkResult result;
VkShaderEXT shaders[2];

result = vkCreateShadersEXT(device, 2, &shaderCreateInfos, NULL, shaders);
if (result != VK_SUCCESS)
{
    // Handle error
}
```

Later, during command buffer recording, bind the linked shaders and draw.

```
// Command buffer in the recording state
VkCommandBuffer commandBuffer;

// Vertex and fragment shader objects created above
VkShaderEXT shaders[2];
```

```
// Assume vertex buffers, descriptor sets, etc. have been bound, and existing
// state setting commands have been called to set all required state

const VkShaderStageFlagBits stages[2] =
{
    VK_SHADER_STAGE_VERTEX_BIT,
    VK_SHADER_STAGE_FRAGMENT_BIT
};

// Bind linked shaders
vkCmdBindShadersEXT(commandBuffer, 2, stages, shaders);

// Equivalent to the previous line. Linked shaders can be bound one at a time,
// in any order:
// vkCmdBindShadersEXT(commandBuffer, 1, &stages[1], &shaders[1]);
// vkCmdBindShadersEXT(commandBuffer, 1, &stages[0], &shaders[0]);

// The above is sufficient to draw if the device was created with the
// tessellationShader and geometryShader features disabled. Otherwise, since
// those stages should not execute, vkCmdBindShadersEXT() must be called at
// least once with each of their stages in pStages before drawing:

const VkShaderStageFlagBits unusedStages[3] =
{
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT,
    VK_SHADER_STAGE_GEOMETRY_BIT
};

// NULL pShaders is equivalent to an array of stageCount VK_NULL_HANDLE values,
// meaning no shaders are bound to those stages, and that any previously bound
// shaders are unbound
vkCmdBindShadersEXT(commandBuffer, 3, unusedStages, NULL);

// Graphics shader objects may only be used to draw inside dynamic render pass
// instances begun with vkCmdBeginRendering(), assume one has already been begun

// Draw a triangle
vkCmdDraw(commandBuffer, 3, 1, 0, 0);
```

Example 2

Create unlinked vertex, geometry, and fragment shaders.

```
// Logical device created with the shaderObject feature enabled
VkDevice device;

// SPIR-V shader code for vertex shaders, along with their sizes in bytes
void* pVertexSpirv[2];
size_t vertexSpirvSize[2];
```

```
// SPIR-V shader code for a geometry shader, along with its size in bytes
void pGeometrySpirv;
size_t geometrySpirvSize;

// SPIR-V shader code for fragment shaders, along with their sizes in bytes
void* pFragmentSpirv[2];
size_t fragmentSpirvSize[2];

// Descriptor set layout compatible with the shaders
VkDescriptorSetLayout descriptorSetLayout;

VkShaderCreateInfoEXT shaderCreateInfos[5] =
{
    // Stage order does not matter
    {
        .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = 0,
        .stage = VK_SHADER_STAGE_GEOMETRY_BIT,
        .nextStage = VK_SHADER_STAGE_FRAGMENT_BIT,
        .codeType = VK_SHADER_CODE_TYPE_SPIRV_EXT,
        .codeSize = pGeometrySpirv,
        .pCode = geometrySpirvSize,
        .pName = "main",
        .setLayoutCount = 1,
        .pSetLayouts = &descriptorSetLayout;
        .pushConstantRangeCount = 0,
        .pPushConstantRanges = NULL,
        .pSpecializationInfo = NULL
    },
    {
        .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = 0,
        .stage = VK_SHADER_STAGE_VERTEX_BIT,
        .nextStage = VK_SHADER_STAGE_GEOMETRY_BIT,
        .codeType = VK_SHADER_CODE_TYPE_SPIRV_EXT,
        .codeSize = vertexSpirvSize[0],
        .pCode = pVertexSpirv[0],
        .pName = "main",
        .setLayoutCount = 1,
        .pSetLayouts = &descriptorSetLayout;
        .pushConstantRangeCount = 0,
        .pPushConstantRanges = NULL,
        .pSpecializationInfo = NULL
    },
    {
        .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = 0,
```

```
        .stage = VK_SHADER_STAGE_FRAGMENT_BIT,
        .nextStage = 0,
        .codeType = VK_SHADER_CODE_TYPE_SPIRV_EXT,
        .codeSize = fragmentSpirvSize[0],
        .pCode = pFragmentSpirv[0],
        .pName = "main",
        .setLayoutCount = 1,
        .pSetLayouts = &descriptorSetLayout;
        .pushConstantRangeCount = 0,
        .pPushConstantRanges = NULL,
        .pSpecializationInfo = NULL
    },
    {
        .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = 0,
        .stage = VK_SHADER_STAGE_FRAGMENT_BIT,
        .nextStage = 0,
        .codeType = VK_SHADER_CODE_TYPE_SPIRV_EXT,
        .codeSize = fragmentSpirvSize[1],
        .pCode = pFragmentSpirv[1],
        .pName = "main",
        .setLayoutCount = 1,
        .pSetLayouts = &descriptorSetLayout;
        .pushConstantRangeCount = 0,
        .pPushConstantRanges = NULL,
        .pSpecializationInfo = NULL
    },
    {
        .sType = VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = 0,
        .stage = VK_SHADER_STAGE_VERTEX_BIT,
        // Suppose we want this vertex shader to be able to be followed by
        // either a geometry shader or fragment shader:
        .nextStage = VK_SHADER_STAGE_GEOMETRY_BIT | VK_SHADER_STAGE_FRAGMENT_BIT,
        .codeType = VK_SHADER_CODE_TYPE_SPIRV_EXT,
        .codeSize = vertexSpirvSize[1],
        .pCode = pVertexSpirv[1],
        .pName = "main",
        .setLayoutCount = 1,
        .pSetLayouts = &descriptorSetLayout;
        .pushConstantRangeCount = 0,
        .pPushConstantRanges = NULL,
        .pSpecializationInfo = NULL
    }
};

VkResult result;
VkShaderEXT shaders[5];
```

```
result = vkCreateShadersEXT(device, 5, &shaderCreateInfos, NULL, shaders);
if (result != VK_SUCCESS)
{
    // Handle error
}
```

Later, during command buffer recording, bind the linked shaders in different combinations and draw.

```
// Command buffer in the recording state
VkCommandBuffer commandBuffer;

// Vertex, geometry, and fragment shader objects created above
VkShaderEXT shaders[5];

// Assume vertex buffers, descriptor sets, etc. have been bound, and existing
// state setting commands have been called to set all required state

const VkShaderStageFlagBits stages[3] =
{
    // Any order is allowed
    VK_SHADER_STAGE_FRAGMENT_BIT,
    VK_SHADER_STAGE_VERTEX_BIT,
    VK_SHADER_STAGE_GEOMETRY_BIT,
};

VkShaderEXT bindShaders[3] =
{
    shaders[2], // FS
    shaders[1], // VS
    shaders[0]  // GS
};

// Bind unlinked shaders
vkCmdBindShadersEXT(commandBuffer, 3, stages, bindShaders);

// Assume the tessellationShader feature is disabled, so vkCmdBindShadersEXT()
// need not have been called with either tessellation stage

// Graphics shader objects may only be used to draw inside dynamic render pass
// instances begun with vkCmdBeginRendering(), assume one has already been begun

// Draw a triangle
vkCmdDraw(commandBuffer, 3, 1, 0, 0);

// Bind a different unlinked fragment shader
const VkShaderStageFlagBits fragmentStage = VK_SHADER_STAGE_FRAGMENT_BIT;
vkCmdBindShadersEXT(commandBuffer, 1, &fragmentStage, &shaders[3]);

// Draw another triangle
```

```
vkCmdDraw(commandBuffer, 3, 1, 0, 0);

// Bind a different unlinked vertex shader
const VkShaderStageFlagBits vertexStage = VK_SHADER_STAGE_VERTEX_BIT;
vkCmdBindShadersEXT(commandBuffer, 1, &vertexStage, &shaders[4]);

// Draw another triangle
vkCmdDraw(commandBuffer, 3, 1, 0, 0);
```

Description

This extension adds support for the SPIR-V extension `SPV_EXT_shader_stencil_export`, providing a mechanism whereby a shader may generate the stencil reference value per invocation. When stencil testing is enabled, this allows the test to be performed against the value generated in the shader.

New Enum Constants

Interactions and External Dependencies

- This extension provides API support for `GL_ARB_shader_ballot`

Contributors

- Jeff Bolz, NVIDIA
- Neil Henning, Codeplay
- Daniel Koch, NVIDIA Corporation

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_shader_ballot`

This extension provides the ability for a group of invocations, which execute in parallel, to do limited forms of cross-invocation communication via a group broadcast of an invocation value, or broadcast of a bit array representing a predicate value from each invocation in the group.

This extension provides access to a number of additional built-in shader variables in Vulkan:

- `SubgroupEqMaskKHR`, containing the subgroup mask of the current subgroup invocation,
- `SubgroupGeMaskKHR`, containing the subgroup mask of the invocations greater than or equal to the current invocation,
- `SubgroupGtMaskKHR`, containing the subgroup mask of the invocations greater than the current invocation,
- `SubgroupLeMaskKHR`, containing the subgroup mask of the invocations less than or equal to the current invocation,
- `SubgroupLtMaskKHR`, containing the subgroup mask of the invocations less than the current invocation,
- `SubgroupLocalInvocationId`, containing the index of an invocation within a subgroup, and
- `SubgroupSize`, containing the maximum number of invocations in a subgroup.

Additionally, this extension provides access to the new SPIR-V instructions:

- `OpSubgroupBallotKHR`,
- `OpSubgroupFirstInvocationKHR`, and
- `OpSubgroupReadInvocationKHR`,

When using GLSL source-based shader languages, the following variables and shader functions from GL_ARB_shader_ballot can map to these SPIR-V built-in decorations and instructions:

- `in uint64_t gl_SubGroupEqMaskARB;` → `SubgroupEqMaskKHR`,
- `in uint64_t gl_SubGroupGeMaskARB;` → `SubgroupGeMaskKHR`,
- `in uint64_t gl_SubGroupGtMaskARB;` → `SubgroupGtMaskKHR`,
- `in uint64_t gl_SubGroupLeMaskARB;` → `SubgroupLeMaskKHR`,
- `in uint64_t gl_SubGroupLtMaskARB;` → `SubgroupLtMaskKHR`,
- `in uint gl_SubGroupInvocationARB;` → `SubgroupLocalInvocationId`,
- `uniform uint gl_SubGroupSizeARB;` → `SubgroupSize`,
- `ballotARB`() → `OpSubgroupBallotKHR`,
- `readFirstInvocationARB`() → `OpSubgroupFirstInvocationKHR`, and
- `readInvocationARB`() → `OpSubgroupReadInvocationKHR`.

Deprecated by Vulkan 1.2

Most of the functionality in this extension is superseded by the core Vulkan 1.1 subgroup operations. However, Vulkan 1.1 required the `OpGroupNonUniformBroadcast` “Id” to be constant. This restriction was removed in Vulkan 1.2 with the addition of the `subgroupBroadcastDynamicId` feature.

New Enum Constants

- `VK_EXT_SHADER_SUBGROUP_BALLOT_EXTENSION_NAME`

- `VK_EXT_SHADER_SUBGROUP_BALLOT_SPEC_VERSION`

New Built-In Variables

- `SubgroupEqMaskKHR`
- `SubgroupGeMaskKHR`
- `SubgroupGtMaskKHR`
- `SubgroupLeMaskKHR`
- `SubgroupLtMaskKHR`
- `SubgroupLocalInvocationId`
- `SubgroupSize`

New SPIR-V Capabilities

- `SubgroupBallotKHR`

- Tobias Hector, AMD
- Jeff Bolz, NVIDIA
- Shahbaz Youssefi, Google

Description

This extension allows fragment shader invocations to read color, depth and stencil values at their pixel location in rasterization order. The functionality is only available when using dynamic render passes introduced by VK_KHR_dynamic_rendering. Example use cases are programmable blending and deferred shading.

See fragment shader tile image reads for more information.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderTileImageFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceShaderTileImagePropertiesEXT

New Enum Constants

- VK_EXT_SHADER_TILE_IMAGE_EXTENSION_NAME
- VK_EXT_SHADER_TILE_IMAGE_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_PROPERTIES_EXT

Issues

None.

Examples

Color read example.

```
layout( location = 0 /* aliased to color attachment 0 */ ) tileImageEXT highp
attachmentEXT color0;
layout( location = 1 /* aliased to color attachment 1 */ ) tileImageEXT highp
attachmentEXT color1;

layout( location = 0 ) out vec4 fragColor;

void main()
{
    vec4 value = colorAttachmentReadEXT(color0) + colorAttachmentReadEXT(color1);
    fragColor = value;
}
```

Depth & Stencil read example.

```
void main()
{
    // read sample 0: works for non-MSAA or MSAA targets
    highp float last_depth = depthAttachmentReadEXT();
    lowp uint last_stencil = stencilAttachmentReadEXT();

    //..
}
```

Description

This extension adds support for the ShaderViewportIndexLayerEXT capability from the SPV_EXT_shader_viewport_index_layer extension in Vulkan.

This extension allows variables decorated with the Layer and ViewportIndex built-ins to be exported from vertex or tessellation shaders, using the ShaderViewportIndexLayerEXT capability.

When using GLSL source-based shading languages, the gl_ViewportIndex and gl_Layer built-in variables map to the SPIR-V ViewportIndex and Layer built-in decorations, respectively. Behavior of these variables is extended as described in the GL_ARB_shader_viewport_layer_array (or the precursor GL_AMD_vertex_shader_layer, GL_AMD_vertex_shader_viewport_index, and GL_NV_viewport_array2 extensions).

NOTE	The ShaderViewportIndexLayerEXT capability is equivalent to the ShaderViewportIndexLayerNV capability added by VK_NV_viewport_array2.

Promotion to Vulkan 1.2

All functionality in this extension is included in core Vulkan 1.2.

The single ShaderViewportIndexLayerEXT capability from the SPV_EXT_shader_viewport_index_layer extension is replaced by the ShaderViewportIndex and ShaderLayer capabilities from SPIR-V 1.5 which are enabled by the shaderOutputViewportIndex and shaderOutputLayer features, respectively. Additionally, if Vulkan 1.2 is supported but this extension is not, these capabilities are optional.

Enabling both features is equivalent to enabling the VK_EXT_shader_viewport_index_layer extension.

Description

This extension enables an implementation to control the subgroup size by allowing a varying subgroup size and also specifying a required subgroup size.

It extends the subgroup support in Vulkan 1.1 to allow an implementation to expose a varying subgroup size. Previously Vulkan exposed a single subgroup size per physical device, with the expectation that implementations will behave as if all subgroups have the same size. Some implementations **may** dispatch shaders with a varying subgroup size for different subgroups. As a result they could implicitly split a large subgroup into smaller subgroups or represent a small subgroup as a larger subgroup, some of whose invocations were inactive on launch.

To aid developers in understanding the performance characteristics of their programs, this extension exposes a minimum and maximum subgroup size that a physical device supports and a pipeline create flag to enable that pipeline to vary its subgroup size. If enabled, any `SubgroupSize` decorated variables in the SPIR-V shader modules provided to pipeline creation **may** vary between the minimum and maximum subgroup sizes.

An implementation is also optionally allowed to support specifying a required subgroup size for a given pipeline stage. Implementations advertise which stages support a required subgroup size, and any pipeline of a supported stage can be passed a VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT structure to set the subgroup size for that shader stage of the pipeline. For compute shaders, this requires the developer to query the `maxComputeWorkgroupSubgroups` and ensure that:

$$s = WorkGroupSize.x \times WorkGroupSize.y \times WorkgroupSize.z \leq SubgroupSize \times maxComputeWorkgroupSubgroups$$

Developers can also specify a new pipeline shader stage create flag that requires the implementation to have fully populated subgroups within local workgroups. This requires the workgroup size in the X dimension to be a multiple of the subgroup size.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceSubgroupSizeControlFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceSubgroupSizeControlPropertiesEXT
- Extending VkPipelineShaderStageCreateInfo, VkShaderCreateInfoEXT:
  - VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT

New Enum Constants

- `VK_EXT_SUBGROUP_SIZE_CONTROL_EXTENSION_NAME`
- `VK_EXT_SUBGROUP_SIZE_CONTROL_SPEC_VERSION`
- Extending VkPipelineShaderStageCreateFlagBits:
  - `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT`
  - `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_PROPERTIES_EXT
  - VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO_EXT

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Description

`VK_EXT_surface_maintenance1` adds a collection of window system integration features that were intentionally left out or overlooked in the original `VK_KHR_surface` extension.

The new features are as follows:

- Allow querying number of min/max images from a surface for a particular presentation mode.
- Allow querying a surface's scaled presentation capabilities.
- Allow querying a surface for the set of presentation modes which can be easily switched between without requiring swapchain recreation.

New Structures

- Extending VkPhysicalDeviceSurfaceInfo2KHR:
  - VkSurfacePresentModeEXT
- Extending VkSurfaceCapabilities2KHR:
  - VkSurfacePresentModeCompatibilityEXT
  - VkSurfacePresentScalingCapabilitiesEXT

New Enums

- VkPresentGravityFlagBitsEXT
- VkPresentScalingFlagBitsEXT

New Bitmasks

- VkPresentGravityFlagsEXT
- VkPresentScalingFlagsEXT

New Enum Constants

- `VK_EXT_SURFACE_MAINTENANCE_1_EXTENSION_NAME`
- `VK_EXT_SURFACE_MAINTENANCE_1_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_COMPATIBILITY_EXT`
  - `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_EXT`

- `VK_STRUCTURE_TYPE_SURFACE_PRESENT_SCALING_CAPABILITIES_EXT`

Last Modified Date

2019-04-26

IP Status

No known IP claims.

Contributors

- Courtney Goeltzenleuchter, Google

Description

This extension expands VkColorSpaceKHR to add support for most standard color spaces beyond `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR`. This extension also adds support for `VK_COLOR_SPACE_PASS_THROUGH_EXT` which allows applications to use color spaces not explicitly

enumerated in VkColorSpaceKHR.

New Enum Constants

- VK_EXT_SWAPCHAIN_COLOR_SPACE_EXTENSION_NAME
- VK_EXT_SWAPCHAIN_COLOR_SPACE_SPEC_VERSION
- Extending VkColorSpaceKHR:
  - VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT
  - VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT
  - VK_COLOR_SPACE_BT2020_LINEAR_EXT
  - VK_COLOR_SPACE_BT709_LINEAR_EXT
  - VK_COLOR_SPACE_BT709_NONLINEAR_EXT
  - VK_COLOR_SPACE_DCI_P3_LINEAR_EXT
  - VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT
  - VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT
  - VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT
  - VK_COLOR_SPACE_DOLBYVISION_EXT
  - VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT
  - VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT
  - VK_COLOR_SPACE_HDR10_HLG_EXT
  - VK_COLOR_SPACE_HDR10_ST2084_EXT
  - VK_COLOR_SPACE_PASS_THROUGH_EXT

Issues

1) Does the spec need to specify which kinds of image formats support the color spaces?

RESOLVED: Pixel format is independent of color space (though some color spaces really want / need floating-point color components to be useful). Therefore, do not plan on documenting what formats support which color spaces. An application **can** call vkGetPhysicalDeviceSurfaceFormatsKHR to query what a particular implementation supports.

2) How does application determine if HW supports appropriate transfer function for a color space?

RESOLVED: Extension indicates that implementation **must** not do the OETF encoding if it is not sRGB. That responsibility falls to the application shaders. Any other native OETF / EOTF functions supported by an implementation can be described by separate extension.

Version History

- Revision 1, 2016-12-27 (Courtney Goeltzenleuchter)
  - Initial version

- Revision 2, 2017-01-19 (Courtney Goeltzenleuchter)
  - Add pass through and multiple options for BT2020.
  - Clean up some issues with equations not displaying properly.
- Revision 3, 2017-06-23 (Courtney Goeltzenleuchter)
  - Add extended sRGB non-linear enum.
- Revision 4, 2019-04-26 (Graeme Leese)
  - Clarify color space transfer function usage.
  - Refer to normative definitions in the Data Format Specification.
  - Clarify DCI-P3 and Display P3 usage.
- Revision 5, 2024-03-16 (Zehui Lin)
  - Fix interchanged concepts of EOTF and OETF.
  - Clarify that the presentation engine can accept the color spaces.

Description

`VK_EXT_swapchain_maintenance1` adds a collection of window system integration features that were intentionally left out or overlooked in the original `VK_KHR_swapchain` extension.

The new features are as follows:

- Specify a fence that will be signaled when the resources associated with a present operation **can** be safely destroyed.
- Allow changing the present mode a swapchain is using at per-present granularity.
- Allow applications to define the behavior when presenting a swapchain image to a surface with different dimensions than the image. Using this feature **may** allow implementations to avoid returning `VK_ERROR_OUT_OF_DATE_KHR` in this situation.
- Allow applications to defer swapchain memory allocation for improved startup time and memory footprint.
- Allow applications to release previously acquired images without presenting them.

New Commands

- vkReleaseSwapchainImagesEXT

New Structures

- VkReleaseSwapchainImagesInfoEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT
- Extending VkPresentInfoKHR:

Description

This extension adds more expressive alignment requirements for uniform and storage texel buffers. Some implementations have single texel alignment requirements that cannot be expressed via VkPhysicalDeviceLimits::`minTexelBufferOffsetAlignment`.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT

New Enum Constants

- `VK_EXT_TEXEL_BUFFER_ALIGNMENT_EXTENSION_NAME`
- `VK_EXT_TEXEL_BUFFER_ALIGNMENT_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_PROPERTIES_EXT`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, only the properties structure is promoted. The feature structure is not promoted and `texelBufferAlignment` is enabled if using a Vulkan 1.3 instance. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API name is still available as an alias of the core functionality.

Description

This extension adds support for textures compressed using the Adaptive Scalable Texture Compression (ASTC) High Dynamic Range (HDR) profile.

When this extension is enabled, the HDR profile is supported for all ASTC formats listed in ASTC Compressed Image Formats.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceTextureCompressionASTCHDRFeaturesEXT

New Enum Constants

- `VK_EXT_TEXTURE_COMPRESSION_ASTC_HDR_EXTENSION_NAME`
- `VK_EXT_TEXTURE_COMPRESSION_ASTC_HDR_SPEC_VERSION`
- Extending VkFormat:
  - `VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK_EXT`
  - `VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK_EXT`

    - VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK_EXT
    - VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK_EXT
    - VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK_EXT
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXTURE_COMPRESSION_ASTC_HDR_FEATURES_EXT

Promotion to Vulkan 1.3

This extension has been partially promoted. Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, the feature is made optional in Vulkan 1.3. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Issues

1) Should we add a feature or limit for this functionality?

Yes. It is consistent with the ASTC LDR support to add a feature like textureCompressionASTC_HDR.

The feature is strictly speaking redundant as long as this is just an extension; it would be sufficient to just enable the extension. But adding the feature is more forward-looking if wanted to make this an optional core feature in the future.

2) Should we introduce new format enums for HDR?

Yes. Vulkan 1.0 describes the ASTC format enums as UNORM, e.g. VK_FORMAT_ASTC_4x4_UNORM_BLOCK, so it is confusing to make these contain HDR data. Note that the OpenGL (ES) extensions did not make this distinction because a single ASTC HDR texture may contain both unorm and float blocks. Implementations **may** not be able to distinguish between LDR and HDR ASTC textures internally and just treat them as the same format, i.e. if this extension is supported then sampling from a VK_FORMAT_ASTC_4x4_UNORM_BLOCK image format **may** return HDR results. Applications **can** get predictable results by using the appropriate image format.

Description

When an error occurs during application development, a common question is "What tools are actually running right now?" This extension adds the ability to query that information directly from the Vulkan implementation.

Outdated versions of one tool might not play nicely with another, or perhaps a tool is not actually running when it should have been. Trying to figure that out can cause headaches as it is necessary to consult each known tool to figure out what is going on — in some cases the tool might not even be known.

Typically, the expectation is that developers will simply print out this information for visual inspection when an issue occurs, however a small amount of semantic information about what the tool is doing is provided to help identify it programmatically. For example, if the advertised limits or features of an implementation are unexpected, is there a tool active which modifies these limits? Or if an application is providing debug markers, but the implementation is not actually doing anything with that information, this can quickly point that out.

New Commands

- vkGetPhysicalDeviceToolPropertiesEXT

New Structures

- VkPhysicalDeviceToolPropertiesEXT

New Enums

- VkToolPurposeFlagBitsEXT

New Bitmasks

- VkToolPurposeFlagsEXT

New Enum Constants

- `VK_EXT_TOOLING_INFO_EXTENSION_NAME`
- `VK_EXT_TOOLING_INFO_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TOOL_PROPERTIES_EXT`

If VK_EXT_debug_marker is supported:

- Extending VkToolPurposeFlagBits:
  - `VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT`

If VK_EXT_debug_report is supported:

- Extending VkToolPurposeFlagBits:
  - `VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT`

If VK_EXT_debug_utils is supported:

- Extending VkToolPurposeFlagBits:
  - `VK_TOOL_PURPOSE_DEBUG_MARKERS_BIT_EXT`
  - `VK_TOOL_PURPOSE_DEBUG_REPORTING_BIT_EXT`

Promotion to Vulkan 1.3

Vulkan APIs in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. External interactions defined by this extension, such as SPIR-V token names, retain their original names. The original Vulkan API names are still available as aliases of the core functionality.

Examples

Printing Tool Information

```
uint32_t num_tools;
VkPhysicalDeviceToolPropertiesEXT *pToolProperties;
vkGetPhysicalDeviceToolPropertiesEXT(physicalDevice, &num_tools, NULL);

pToolProperties =
(VkPhysicalDeviceToolPropertiesEXT*)malloc(sizeof(VkPhysicalDeviceToolPropertiesEXT) *
num_tools);

vkGetPhysicalDeviceToolPropertiesEXT(physicalDevice, &num_tools, pToolProperties);

for (int i = 0; i < num_tools; ++i) {
    printf("%s:\n", pToolProperties[i].name);
    printf("Version:\n");
    printf("%s:\n", pToolProperties[i].version);
    printf("Description:\n");
    printf("\t%s\n", pToolProperties[i].description);
    printf("Purposes:\n");
    printf("\t%s\n", VkToolPurposeFlagBitsEXT_to_string(pToolProperties[i].purposes));
    if (strnlen_s(pToolProperties[i].layer,VK_MAX_EXTENSION_NAME_SIZE) > 0) {
        printf("Corresponding Layer:\n");
        printf("\t%s\n", pToolProperties[i].layer);
    }
}
```

Issues

1) Why is this information separate from the layer mechanism?

Some tooling may be built into a driver, or be part of the Vulkan loader etc. Tying this information directly to layers would have been awkward at best.

Description

This extension adds transform feedback to the Vulkan API by exposing the SPIR-V `TransformFeedback` and `GeometryStreams` capabilities to capture vertex, tessellation or geometry shader outputs to one or more buffers. It adds API functionality to bind transform feedback buffers to capture the primitives emitted by the graphics pipeline from SPIR-V outputs decorated for transform feedback. The transform feedback capture can be paused and resumed by way of storing and retrieving a byte counter. The captured data can be drawn again where the vertex count is derived from the byte counter without CPU intervention. If the implementation is capable, a vertex stream other than zero can be rasterized.

All these features are designed to match the full capabilities of OpenGL core transform feedback functionality and beyond. Many of the features are optional to allow base OpenGL ES GPUs to also implement this extension.

The primary purpose of the functionality exposed by this extension is to support translation layers from other 3D APIs. This functionality is not considered forward looking, and is not expected to be promoted to a KHR extension or to core Vulkan. Unless this is needed for translation, it is recommended that developers use alternative techniques of using the GPU to process and capture vertex data.

New Commands

- vkCmdBeginQueryIndexedEXT
- vkCmdBeginTransformFeedbackEXT
- vkCmdBindTransformFeedbackBuffersEXT
- vkCmdDrawIndirectByteCountEXT
- vkCmdEndQueryIndexedEXT
- vkCmdEndTransformFeedbackEXT

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceTransformFeedbackFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceTransformFeedbackPropertiesEXT
- Extending VkPipelineRasterizationStateCreateInfo:
  - VkPipelineRasterizationStateStreamCreateInfoEXT

New Bitmasks

- VkPipelineRasterizationStateStreamCreateFlagsEXT

New Enum Constants

- `VK_EXT_TRANSFORM_FEEDBACK_EXTENSION_NAME`

- VK_EXT_TRANSFORM_FEEDBACK_SPEC_VERSION
- Extending VkAccessFlagBits:
  - VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT
  - VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT
  - VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT
- Extending VkBufferUsageFlagBits:
  - VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT
  - VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT
- Extending VkPipelineStageFlagBits:
  - VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT
- Extending VkQueryType:
  - VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_PROPERTIES_EXT
  - VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT

Issues

1) Should we include pause/resume functionality?

RESOLVED: Yes, this is needed to ease layering other APIs which have this functionality. To pause use vkCmdEndTransformFeedbackEXT and provide valid buffer handles in the pCounterBuffers array and offsets in the pCounterBufferOffsets array for the implementation to save the resume points. Then to resume use vkCmdBeginTransformFeedbackEXT with the previous pCounterBuffers and pCounterBufferOffsets values. Between the pause and resume there needs to be a memory barrier for the counter buffers with a source access of VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT at pipeline stage VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT to a destination access of VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT at pipeline stage VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT.

2) How does this interact with multiview?

RESOLVED: Transform feedback cannot be made active in a render pass with multiview enabled.

3) How should queries be done?

RESOLVED: There is a new query type VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT. A query pool created with this type will capture 2 integers - numPrimitivesWritten and numPrimitivesNeeded - for the specified vertex stream output from the last pre-rasterization shader stage. The vertex stream output queried is zero by default, but can be specified with the new vkCmdBeginQueryIndexedEXT and vkCmdEndQueryIndexedEXT commands.

Description

This extension provides a mechanism for caching the results of potentially expensive internal validation operations across multiple runs of a Vulkan application. At the core is the VkValidationCacheEXT object type, which is managed similarly to the existing VkPipelineCache.

The new struct VkShaderModuleValidationCacheCreateInfoEXT can be included in the `pNext` chain at vkCreateShaderModule time. It contains a VkValidationCacheEXT to use when validating the

VkShaderModule.

New Object Types

- VkValidationCacheEXT

New Commands

- vkCreateValidationCacheEXT
- vkDestroyValidationCacheEXT
- vkGetValidationCacheDataEXT
- vkMergeValidationCachesEXT

New Structures

- VkValidationCacheCreateInfoEXT
- Extending VkShaderModuleCreateInfo, VkPipelineShaderStageCreateInfo:
  - VkShaderModuleValidationCacheCreateInfoEXT

New Enums

- VkValidationCacheHeaderVersionEXT

New Bitmasks

- VkValidationCacheCreateFlagsEXT

New Enum Constants

- `VK_EXT_VALIDATION_CACHE_EXTENSION_NAME`
- `VK_EXT_VALIDATION_CACHE_SPEC_VERSION`
- Extending VkObjectType:

Description

It can be detrimental to performance for applications to have to define fake vertex attribute locations and buffer bindings for vertex shaders that may reference attribute locations for which there is no vertex data.

This extension allows applications to not have to specify fake vertex attribute locations, and if the vertex shader reads those attributes it will read (0,0,0,0) or (0,0,0,1).

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVertexAttributeRobustnessFeaturesEXT

New Enum Constants

- `VK_EXT_VERTEX_ATTRIBUTE_ROBUSTNESS_EXTENSION_NAME`

- VK_EXT_VERTEX_ATTRIBUTE_ROBUSTNESS_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_ROBUSTNESS_FEATURES_EXT

Description

One of the states that contributes to the combinatorial explosion of pipeline state objects that need to be created, is the vertex input binding and attribute descriptions. By allowing them to be dynamic applications may reduce the number of pipeline objects they need to create.

This extension adds dynamic state support for what is normally static state in VkPipelineVertexInputStateCreateInfo.

New Commands

- vkCmdSetVertexInputEXT

New Structures

- VkVertexInputAttributeDescription2EXT
- VkVertexInputBindingDescription2EXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT

New Enum Constants

- `VK_EXT_VERTEX_INPUT_DYNAMIC_STATE_EXTENSION_NAME`
- `VK_EXT_VERTEX_INPUT_DYNAMIC_STATE_SPEC_VERSION`
- Extending VkDynamicState:

- Ping Liu, Intel

Description

This extension adds some Y'C_BC_R formats that are in common use for video encode and decode, but were not part of the `VK_KHR_sampler_ycbcr_conversion` extension.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:

- VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT

New Enum Constants

- VK_EXT_YCBCR_2PLANE_444_FORMATS_EXTENSION_NAME
- VK_EXT_YCBCR_2PLANE_444_FORMATS_SPEC_VERSION
- Extending VkFormat:
  - VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16_EXT
  - VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16_EXT
  - VK_FORMAT_G16_B16R16_2PLANE_444_UNORM_EXT
  - VK_FORMAT_G8_B8R8_2PLANE_444_UNORM_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_2_PLANE_444_FORMATS_FEATURES_EXT

Promotion to Vulkan 1.3

This extension has been partially promoted. The format enumerants introduced by the extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, runtime support for these formats is optional in core Vulkan 1.3, while if this extension is supported, runtime support is mandatory. The feature structure is not promoted. The original enum names are still available as aliases of the core functionality.

Contributors

- Ping Fu, AMD
- Timothy Lottes, AMD
- Tobias Hector, AMD

Description

This extension adds the device coherent and device uncached memory types. Any device accesses to device coherent memory are automatically made visible to any other device access. Device uncached memory indicates to applications that caches are disabled for a particular memory type, which guarantees device coherence.

Device coherent and uncached memory are expected to have lower performance for general access than non-device coherent memory, but can be useful in certain scenarios; particularly so for debugging.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceCoherentMemoryFeaturesAMD

New Enum Constants

- VK_AMD_DEVICE_COHERENT_MEMORY_EXTENSION_NAME
- VK_AMD_DEVICE_COHERENT_MEMORY_SPEC_VERSION

- Matthaeus G. Chajdas, AMD
- Maciej Jesionowski, AMD
- Daniel Rakos, AMD

Description

This extension enables applications to use multisampled rendering with a depth/stencil sample count that is larger than the color sample count. Having a depth/stencil sample count larger than the color sample count allows maintaining geometry and coverage information at a higher sample rate than color information. All samples are depth/stencil tested, but only the first color sample count number of samples get a corresponding color output.

New Structures

If Vulkan Version 1.3 or VK_KHR_dynamic_rendering is supported:

- Extending VkCommandBufferInheritanceInfo, VkGraphicsPipelineCreateInfo:
  - VkAttachmentSampleCountInfoAMD

New Enum Constants

- `VK_AMD_MIXED_ATTACHMENT_SAMPLES_EXTENSION_NAME`
- `VK_AMD_MIXED_ATTACHMENT_SAMPLES_SPEC_VERSION`

If Vulkan Version 1.3 or VK_KHR_dynamic_rendering is supported:

- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_ATTACHMENT_SAMPLE_COUNT_INFO_AMD`

Issues

None.

Last Modified Date

2016-04-25

IP Status

No known IP claims.

Contributors

- Matthaeus G. Chajdas, AMD
- Jaakko Konttinen, AMD
- Daniel Rakos, AMD
- Graham Sellers, AMD
- Dominik Witczak, AMD

Description

This extension introduces the possibility for the application to control the order of primitive rasterization. In unextended Vulkan, the following stages are guaranteed to execute in *API order*:

- depth bounds test
- stencil test, stencil op, and stencil write
- depth test and depth write
- occlusion queries
- blending, logic op, and color write

This extension enables applications to opt into a relaxed, implementation defined primitive rasterization order that may allow better parallel processing of primitives and thus enabling higher primitive throughput. It is applicable in cases where the primitive rasterization order is known to not affect the output of the rendering or any differences caused by a different rasterization order are not a concern from the point of view of the application's purpose.

A few examples of cases when using the relaxed primitive rasterization order would not have an effect on the final rendering:

- If the primitives rendered are known to not overlap in framebuffer space.
- If depth testing is used with a comparison operator of `VK_COMPARE_OP_LESS`, `VK_COMPARE_OP_LESS_OR_EQUAL`, `VK_COMPARE_OP_GREATER`, or `VK_COMPARE_OP_GREATER_OR_EQUAL`, and the primitives rendered are known to not overlap in clip space.
- If depth testing is not used and blending is enabled for all attachments with a commutative blend operator.

New Structures

- Extending VkPipelineRasterizationStateCreateInfo:
  - VkPipelineRasterizationStateRasterizationOrderAMD

New Enums

- VkRasterizationOrderAMD

New Enum Constants

- `VK_AMD_RASTERIZATION_ORDER_EXTENSION_NAME`
- `VK_AMD_RASTERIZATION_ORDER_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_RASTERIZATION_ORDER_AMD`

Issues

1) How is this extension useful to application developers?

RESOLVED: Allows them to increase primitive throughput for cases when strict API order rasterization is not important due to the nature of the content, the configuration used, or the requirements towards the output of the rendering.

2) How does this extension interact with content optimizations aiming to reduce overdraw by appropriately ordering the input primitives?

RESOLVED: While the relaxed rasterization order might somewhat limit the effectiveness of such content optimizations, most of the benefits of it are expected to be retained even when the relaxed rasterization order is used, so applications **should** still apply these optimizations even if they intend to use the extension.

3) Are there any guarantees about the primitive rasterization order when using the new relaxed mode?

RESOLVED: No. In this case the rasterization order is completely implementation-dependent, but in practice it is expected to partially still follow the order of incoming primitives.

4) Does the new relaxed rasterization order have any adverse effect on repeatability and other invariance rules of the API?

RESOLVED: Yes, in the sense that it extends the list of exceptions when the repeatability requirement does not apply.

Description

This extension exposes shader core properties for a target physical device through the `VK_KHR_get_physical_device_properties2` extension. Please refer to the example below for proper usage.

New Structures

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceShaderCorePropertiesAMD

New Enum Constants

- VK_AMD_SHADER_CORE_PROPERTIES_EXTENSION_NAME
- VK_AMD_SHADER_CORE_PROPERTIES_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_AMD

Examples

This example retrieves the shader core properties for a physical device.

```
extern VkInstance       instance;

PFN_vkGetPhysicalDeviceProperties2 pfnVkGetPhysicalDeviceProperties2 =
    reinterpret_cast<PFN_vkGetPhysicalDeviceProperties2>
    (vkGetInstanceProcAddr(instance, "vkGetPhysicalDeviceProperties2") );

VkPhysicalDeviceProperties2             general_props;
VkPhysicalDeviceShaderCorePropertiesAMD shader_core_properties;

shader_core_properties.pNext = nullptr;
shader_core_properties.sType =
VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_AMD;

general_props.pNext = &shader_core_properties;
general_props.sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2;

// After this call, shader_core_properties has been populated
pfnVkGetPhysicalDeviceProperties2(device, &general_props);

printf("Number of shader engines: %d\n",
    m_shader_core_properties.shader_engine_count =
    shader_core_properties.shaderEngineCount;
printf("Number of shader arrays: %d\n",
    m_shader_core_properties.shader_arrays_per_engine_count =
    shader_core_properties.shaderArraysPerEngineCount;
printf("Number of CUs per shader array: %d\n",
    m_shader_core_properties.compute_units_per_shader_array =
    shader_core_properties.computeUnitsPerShaderArray;
printf("Number of SIMDs per compute unit: %d\n",
    m_shader_core_properties.simd_per_compute_unit =
    shader_core_properties.simdPerComputeUnit;
printf("Number of wavefront slots in each SIMD: %d\n",
    m_shader_core_properties.wavefronts_per_simd =
    shader_core_properties.wavefrontsPerSimd;
printf("Number of threads per wavefront: %d\n",
    m_shader_core_properties.wavefront_size =
    shader_core_properties.wavefrontSize;
printf("Number of physical SGPRs per SIMD: %d\n",
```

```
    m_shader_core_properties.sgprs_per_simd =
    shader_core_properties.sgprsPerSimd;
printf("Minimum number of SGPRs that can be allocated by a wave: %d\n",
    m_shader_core_properties.min_sgpr_allocation =
    shader_core_properties.minSgprAllocation;
printf("Number of available SGPRs: %d\n",
    m_shader_core_properties.max_sgpr_allocation =

Interactions and External Dependencies

- This extension interacts with `VK_EXT_shader_stencil_export`

Contributors

- Tobias Hector, AMD

Description

This extension adds support for the SPV_AMD_shader_early_and_late_fragment_tests extension, allowing shaders to explicitly opt in to allowing both early *and* late fragment tests with the EarlyAndLateFragmentTestsAMD execution mode.

If the VK_EXT_shader_stencil_export extension is supported, additional execution modes allowing early depth tests similar to DepthUnchanged, DepthLess, and DepthGreater are provided.

IP Status

No known IP claims.

Interactions and External Dependencies

- This extension provides API support for `GL_AMD_shader_fragment_mask`

Contributors

- Aaron Hagan, AMD
- Daniel Rakos, AMD
- Timothy Lottes, AMD

Description

This extension provides efficient read access to the fragment mask in compressed multisampled color surfaces. The fragment mask is a lookup table that associates color samples with color fragment values.

From a shader, the fragment mask can be fetched with a call to `fragmentMaskFetchAMD`, which returns a single `uint` where each subsequent four bits specify the color fragment index corresponding to the color sample, starting from the least significant bit. For example, when eight color samples are used, the color fragment index for color sample 0 will be in bits 0-3 of the fragment mask, for color sample 7 the index will be in bits 28-31.

The color fragment for a particular color sample may then be fetched with the corresponding fragment mask value using the `fragmentFetchAMD` shader function.

New Enum Constants

- `VK_AMD_SHADER_FRAGMENT_MASK_EXTENSION_NAME`

- VK_AMD_SHADER_FRAGMENT_MASK_SPEC_VERSION

New SPIR-V Capabilities

- FragmentMaskAMD

Examples

This example shows a shader that queries the fragment mask from a multisampled compressed surface and uses it to query fragment values.

```
#version 450 core

#extension GL_AMD_shader_fragment_mask: enable

layout(binding = 0) uniform sampler2DMS       s2DMS;
layout(binding = 1) uniform isampler2DMSArray is2DMSArray;

layout(binding = 2, input_attachment_index = 0) uniform usubpassInputMS usubpassMS;

layout(location = 0) out vec4 fragColor;

void main()
{
    vec4 fragOne = vec4(0.0);

    uint fragMask = fragmentMaskFetchAMD(s2DMS, ivec2(2, 3));
    uint fragIndex = (fragMask & 0xF0) >> 4;
    fragOne += fragmentFetchAMD(s2DMS, ivec2(2, 3), 1);

    fragMask = fragmentMaskFetchAMD(is2DMSArray, ivec3(2, 3, 1));
    fragIndex = (fragMask & 0xF0) >> 4;
    fragOne += fragmentFetchAMD(is2DMSArray, ivec3(2, 3, 1), fragIndex);

    fragMask = fragmentMaskFetchAMD(usubpassMS);
    fragIndex = (fragMask & 0xF0) >> 4;
    fragOne += fragmentFetchAMD(usubpassMS, fragIndex);

    fragColor = fragOne;
}
```

Last Modified Date

2017-10-09

IP Status

No known IP claims.

Contributors

- Jaakko Konttinen, AMD

Description

This extension adds a way to query certain information about a compiled shader which is part of a pipeline. This information may include shader disassembly, shader binary and various statistics about a shader's resource usage.

While this extension provides a mechanism for extracting this information, the details regarding the contents or format of this information are not specified by this extension and may be provided by the vendor externally.

Furthermore, all information types are optionally supported, and users should not assume every implementation supports querying every type of information.

New Commands

- vkGetShaderInfoAMD

New Structures

- VkShaderResourceUsageAMD
- VkShaderStatisticsInfoAMD

New Enums

- VkShaderInfoTypeAMD

New Enum Constants

- VK_AMD_SHADER_INFO_EXTENSION_NAME
- VK_AMD_SHADER_INFO_SPEC_VERSION

Examples

This example extracts the register usage of a fragment shader within a particular graphics pipeline:

```
extern VkDevice device;
extern VkPipeline gfxPipeline;

PFN_vkGetShaderInfoAMD pfnGetShaderInfoAMD = (PFN_vkGetShaderInfoAMD
)vkGetDeviceProcAddr(
    device, "vkGetShaderInfoAMD");

VkShaderStatisticsInfoAMD statistics = {};

size_t dataSize = sizeof(statistics);

if (pfnGetShaderInfoAMD(device,
    gfxPipeline,
    VK_SHADER_STAGE_FRAGMENT_BIT,
    VK_SHADER_INFO_TYPE_STATISTICS_AMD,
    &dataSize,
    &statistics) == VK_SUCCESS)
{
    printf("VGPR usage: %d\n", statistics.resourceUsage.numUsedVgprs);
    printf("SGPR usage: %d\n", statistics.resourceUsage.numUsedSgprs);
```

```
}
```

The following example continues the previous example by subsequently attempting to query and print shader disassembly about the fragment shader:

```
// Query disassembly size (if available)
if (pfnGetShaderInfoAMD(device,
    gfxPipeline,
    VK_SHADER_STAGE_FRAGMENT_BIT,
    VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD,
    &dataSize,
    nullptr) == VK_SUCCESS)
{
    printf("Fragment shader disassembly:\n");

    void* disassembly = malloc(dataSize);

    // Query disassembly and print
    if (pfnGetShaderInfoAMD(device,
        gfxPipeline,
        VK_SHADER_STAGE_FRAGMENT_BIT,
        VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD,
        &dataSize,
        disassembly) == VK_SUCCESS)
    {
        printf((char*)disassembly);
    }

    free(disassembly);
}
```

- Matthaeus G. Chajdas, AMD
- Qun Lin, AMD
- Rex Xu, AMD
- Timothy Lottes, AMD

Description

This extension adds two related features.

Firstly, support for the following SPIR-V extension in Vulkan is added:

- SPV_AMD_texture_gather_bias_lod

Secondly, the extension allows the application to query which formats can be used together with the new function prototypes introduced by the SPIR-V extension.

New Structures

- Extending VkImageFormatProperties2:
  - VkTextureLODGatherFormatPropertiesAMD

New Enum Constants

- VK_AMD_TEXTURE_GATHER_BIAS_LOD_EXTENSION_NAME
- VK_AMD_TEXTURE_GATHER_BIAS_LOD_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_TEXTURE_LOD_GATHER_FORMAT_PROPERTIES_AMD

New SPIR-V Capabilities

- ImageGatherBiasLodAMD

Examples

```
struct VkTextureLODGatherFormatPropertiesAMD
{
    VkStructureType sType;
    const void*     pNext;
    VkBool32        supportsTextureGatherLODBiasAMD;
};

//
// How to detect if an image format can be used with the new function prototypes.
VkPhysicalDeviceImageFormatInfo2   formatInfo;
VkImageFormatProperties2           formatProps;
VkTextureLODGatherFormatPropertiesAMD textureLODGatherSupport;

textureLODGatherSupport.sType =
VK_STRUCTURE_TYPE_TEXTURE_LOD_GATHER_FORMAT_PROPERTIES_AMD;
textureLODGatherSupport.pNext = nullptr;

formatInfo.sType  = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_FORMAT_INFO_2;
```

```
formatInfo.pNext  = nullptr;
formatInfo.format = ...;
formatInfo.type   = ...;
formatInfo.tiling = ...;
formatInfo.usage  = ...;
formatInfo.flags  = ...;

formatProps.sType = VK_STRUCTURE_TYPE_IMAGE_FORMAT_PROPERTIES_2;
formatProps.pNext = &textureLODGatherSupport;

vkGetPhysicalDeviceImageFormatProperties2(physical_device, &formatInfo, &formatProps);

if (textureLODGatherSupport.supportsTextureGatherLODBiasAMD == VK_TRUE)
{
    // physical device supports SPV_AMD_texture_gather_bias_lod for the specified
    // format configuration.
}
else
{
    // physical device does not support SPV_AMD_texture_gather_bias_lod for the
    // specified format configuration.
}
```

Description

This extension enables an application to import Android AHardwareBuffer objects created outside of the Vulkan device into Vulkan memory objects, where they **can** be bound to images and buffers. It also allows exporting an AHardwareBuffer from a Vulkan memory object for symmetry with other operating systems. But since not all AHardwareBuffer usages and formats have Vulkan equivalents, exporting from Vulkan provides strictly less functionality than creating the AHardwareBuffer externally and importing it.

Some AHardwareBuffer images have implementation-defined *external formats* that **may** not correspond to Vulkan formats. Sampler $Y'C_BC_R$ conversion **can** be used to sample from these images and convert them to a known color space.

New Base Types

- AHardwareBuffer

New Commands

- vkGetAndroidHardwareBufferPropertiesANDROID
- vkGetMemoryAndroidHardwareBufferANDROID

New Structures

- VkAndroidHardwareBufferPropertiesANDROID
- VkMemoryGetAndroidHardwareBufferInfoANDROID
- Extending VkAndroidHardwareBufferPropertiesANDROID:
  - VkAndroidHardwareBufferFormatPropertiesANDROID
- Extending VkImageCreateInfo, VkSamplerYcbcrConversionCreateInfo, VkAttachmentDescription2, VkGraphicsPipelineCreateInfo, VkCommandBufferInheritanceInfo:
  - VkExternalFormatANDROID
- Extending VkImageFormatProperties2:
  - VkAndroidHardwareBufferUsageANDROID
- Extending VkMemoryAllocateInfo:
  - VkImportAndroidHardwareBufferInfoANDROID

If VK_KHR_format_feature_flags2 or Vulkan Version 1.3 is supported:

- Extending VkAndroidHardwareBufferPropertiesANDROID:
  - VkAndroidHardwareBufferFormatProperties2ANDROID

New Enum Constants

- `VK_ANDROID_EXTERNAL_MEMORY_ANDROID_HARDWARE_BUFFER_EXTENSION_NAME`
- `VK_ANDROID_EXTERNAL_MEMORY_ANDROID_HARDWARE_BUFFER_SPEC_VERSION`
- Extending VkExternalMemoryHandleTypeFlagBits:
  - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_ANDROID`
  - `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_PROPERTIES_ANDROID`
  - `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_USAGE_ANDROID`
  - `VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_ANDROID`
  - `VK_STRUCTURE_TYPE_IMPORT_ANDROID_HARDWARE_BUFFER_INFO_ANDROID`
  - `VK_STRUCTURE_TYPE_MEMORY_GET_ANDROID_HARDWARE_BUFFER_INFO_ANDROID`

If VK_KHR_format_feature_flags2 or Vulkan Version 1.3 is supported:

- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_2_ANDROID`

Issues

1) Other external memory objects are represented as weakly-typed handles (e.g. Win32 `HANDLE` or POSIX file descriptor), and require a handle type parameter along with handles. AHardwareBuffer is strongly typed, so naming the handle type is redundant. Does symmetry justify adding handle type parameters/fields anyway?

RESOLVED: No. The handle type is already provided in places that treat external memory objects generically. In the places we would add it, the application code that would have to provide the handle type value is already dealing with AHardwareBuffer-specific commands/structures; the extra symmetry would not be enough to make that code generic.

2) The internal layout and therefore size of a AHardwareBuffer image may depend on native usage flags that do not have corresponding Vulkan counterparts. Do we provide this information to vkCreateImage somehow, or allow the allocation size reported by vkGetImageMemoryRequirements to be approximate?

RESOLVED: Allow the allocation size to be unspecified when allocating the memory. It has to work this way for exported image memory anyway, since AHardwareBuffer allocation happens in vkAllocateMemory, and internally is performed by a separate HAL, not the Vulkan implementation itself. There is a similar issue with vkGetImageSubresourceLayout: the layout is determined by the allocator HAL, so it is not known until the image is bound to memory.

3) Should the result of sampling an external-format image with the suggested $Y'C_BC_R$ conversion parameters yield the same results as using a `samplerExternalOES` in OpenGL ES?

RESOLVED: This would be desirable, so that apps converting from OpenGL ES to Vulkan could get the same output given the same input. But since sampling and conversion from $Y'C_BC_R$ images is so loosely defined in OpenGL ES, multiple implementations do it in a way that does not conform to Vulkan's requirements. Modifying the OpenGL ES implementation would be difficult, and would change the output of existing unmodified applications. Changing the output only for applications that are being modified gives developers the chance to notice and mitigate any problems. Implementations are encouraged to minimize differences as much as possible without causing compatibility problems for existing OpenGL ES applications or violating Vulkan requirements.

4) Should an AHardwareBuffer with `AHARDWAREBUFFER_USAGE_CPU_*` usage be mappable in Vulkan? Should it be possible to export an `AHardwareBuffers` with such usage?

RESOLVED: Optional, and mapping in Vulkan is not the same as `AHardwareBuffer_lock`. The semantics of these are different: mapping in memory is persistent, just gives a raw view of the memory contents, and does not involve ownership. `AHardwareBuffer_lock` gives the host exclusive access to the buffer, is temporary, and allows for reformatting copy-in/copy-out. Implementations are not required to support host-visible memory types for imported Android hardware buffers or resources backed by them. If a host-visible memory type is supported and used, the memory can be

mapped in Vulkan, but doing so follows Vulkan semantics: it is just a raw view of the data and does not imply ownership (this means implementations must not internally call `AHardwareBuffer_lock` to implement vkMapMemory, or assume the application has done so). Implementations are not required to support linear-tiled images backed by Android hardware buffers, even if the AHardwareBuffer has CPU usage. There is no reliable way to allocate memory in Vulkan that can be exported to a AHardwareBuffer with CPU usage.

5) Android may add new AHardwareBuffer formats and usage flags over time. Can reference to them be added to this extension, or do they need a new extension?

RESOLVED: This extension can document the interaction between the new AHB formats/usages and existing Vulkan features. No new Vulkan features or implementation requirements can be added. The extension version number will be incremented when this additional documentation is added, but the version number does not indicate that an implementation supports Vulkan memory or resources that map to the new AHardwareBuffer features: support for that must be queried with vkGetPhysicalDeviceImageFormatProperties2 or is implied by successfully allocating a AHardwareBuffer outside of Vulkan that uses the new feature and has a GPU usage flag.

In essence, these are new features added to a new Android API level, rather than new Vulkan features. The extension will only document how existing Vulkan features map to that new Android feature.

- Jan-Harald Fredriksen, Arm Ltd.

Description

This extension provides the ability to determine device-specific properties on Arm GPUs. It exposes properties for the number of shader cores, the maximum number of warps that can run on a shader core, and shader builtins to enable invocations to identify which core and warp a shader invocation is executing on.

This extension enables support for the SPIR-V `CoreBuiltinsARM` capability.

These properties and built-ins can be used for debugging or performance optimization purposes. A typical optimization example would be to use `CoreIDARM` to select a per-shader-core instance of a data structure in algorithms that use atomics so as to reduce contention.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM

New Enum Constants

- `VK_ARM_SHADER_CORE_BUILTINS_EXTENSION_NAME`
- `VK_ARM_SHADER_CORE_BUILTINS_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_BUILTINS_FEATURES_ARM`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_BUILTINS_PROPERTIES_ARM`

New or Modified Built-In Variables

- `CoreCountARM`
- `CoreMaxIDARM`
- `CoreIDARM`
- `WarpsMaxIDARM`

- `WarpIDARM`

New SPIR-V Capabilities

- `CoreBuiltinsARM`

Issues

None.

Description

This extension provides the ability to determine device-specific performance properties of Arm GPUs.

It exposes properties for the number of texel, pixel, and fused multiply-add operations per clock per shader core. This can be used in combination with the `VK_ARM_shader_core_builtins` extension that provides the ability to query the number of shader cores on the physical device.

New Structures

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceShaderCorePropertiesARM

New Enum Constants

- `VK_ARM_SHADER_CORE_PROPERTIES_EXTENSION_NAME`
- `VK_ARM_SHADER_CORE_PROPERTIES_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_ARM`

Version History

Description

A buffer collection is a collection of one or more buffers which were allocated together as a group and which all have the same properties. These properties describe the buffers' internal representation such as its dimensions and memory layout. This ensures that all of the buffers can be used interchangeably by tasks that require swapping among multiple buffers, such as double-buffered graphics rendering.

By sharing such a collection of buffers between components, communication about buffer lifecycle can be made much simpler and more efficient. For example, when a content producer finishes writing to a buffer, it can message the consumer of the buffer with the buffer index, rather than passing a handle to the shared memory.

On Fuchsia, the Sysmem service uses buffer collections as a core construct in its design. VK_FUCHSIA_buffer_collection is the Vulkan extension that allows Vulkan applications to interoperate with the Sysmem service on Fuchsia.

New Object Types

- VkBufferCollectionFUCHSIA

New Commands

- vkCreateBufferCollectionFUCHSIA
- vkDestroyBufferCollectionFUCHSIA
- vkGetBufferCollectionPropertiesFUCHSIA
- vkSetBufferCollectionBufferConstraintsFUCHSIA
- vkSetBufferCollectionImageConstraintsFUCHSIA

New Structures

- VkBufferCollectionConstraintsInfoFUCHSIA
- VkBufferCollectionCreateInfoFUCHSIA
- VkBufferCollectionPropertiesFUCHSIA
- VkBufferConstraintsInfoFUCHSIA
- VkImageConstraintsInfoFUCHSIA
- VkImageFormatConstraintsInfoFUCHSIA
- VkSysmemColorSpaceFUCHSIA
- Extending VkBufferCreateInfo:
  - VkBufferCollectionBufferCreateInfoFUCHSIA
- Extending VkImageCreateInfo:
  - VkBufferCollectionImageCreateInfoFUCHSIA
- Extending VkMemoryAllocateInfo:
  - VkImportMemoryBufferCollectionFUCHSIA

New Enums

- VkImageConstraintsInfoFlagBitsFUCHSIA

New Bitmasks

- VkImageConstraintsInfoFlagsFUCHSIA
- VkImageFormatConstraintsFlagsFUCHSIA

New Enum Constants

- `VK_FUCHSIA_BUFFER_COLLECTION_EXTENSION_NAME`
- `VK_FUCHSIA_BUFFER_COLLECTION_SPEC_VERSION`
- Extending VkObjectType:
  - `VK_OBJECT_TYPE_BUFFER_COLLECTION_FUCHSIA`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_BUFFER_CREATE_INFO_FUCHSIA`

    - VK_STRUCTURE_TYPE_BUFFER_COLLECTION_CONSTRAINTS_INFO_FUCHSIA
    - VK_STRUCTURE_TYPE_BUFFER_COLLECTION_CREATE_INFO_FUCHSIA
    - VK_STRUCTURE_TYPE_BUFFER_COLLECTION_IMAGE_CREATE_INFO_FUCHSIA
    - VK_STRUCTURE_TYPE_BUFFER_COLLECTION_PROPERTIES_FUCHSIA
    - VK_STRUCTURE_TYPE_BUFFER_CONSTRAINTS_INFO_FUCHSIA
    - VK_STRUCTURE_TYPE_IMAGE_CONSTRAINTS_INFO_FUCHSIA
    - VK_STRUCTURE_TYPE_IMAGE_FORMAT_CONSTRAINTS_INFO_FUCHSIA
    - VK_STRUCTURE_TYPE_IMPORT_MEMORY_BUFFER_COLLECTION_FUCHSIA
    - VK_STRUCTURE_TYPE_SYSMEM_COLOR_SPACE_FUCHSIA

If VK_EXT_debug_report is supported:

- Extending VkDebugReportObjectTypeEXT:
    - VK_DEBUG_REPORT_OBJECT_TYPE_BUFFER_COLLECTION_FUCHSIA_EXT

Issues

1) When configuring a VkImageConstraintsInfoFUCHSIA structure for constraint setting, should a NULL pFormatConstraints parameter be allowed ?

RESOLVED: No. Specifying a NULL pFormatConstraints results in logical complexity of interpreting the relationship between the VkImageCreateInfo::usage settings of the elements of the pImageCreateInfos array and the implied or desired VkFormatFeatureFlags.

The explicit requirement for pFormatConstraints to be non-NULL simplifies the implied logic of the implementation and expectations for the Vulkan application.

Description

Vulkan apps may wish to export or import device memory handles to or from other logical devices, instances or APIs.

This memory sharing can eliminate copies of memory buffers when different subsystems need to interoperate on them. Sharing memory buffers may also facilitate a better distribution of processing workload for more complex memory manipulation pipelines.

New Commands

- vkGetMemoryZirconHandleFUCHSIA
- vkGetMemoryZirconHandlePropertiesFUCHSIA

New Structures

- VkMemoryGetZirconHandleInfoFUCHSIA
- VkMemoryZirconHandlePropertiesFUCHSIA

- Extending VkMemoryAllocateInfo:
  - VkImportMemoryZirconHandleInfoFUCHSIA

New Enum Constants

- VK_FUCHSIA_EXTERNAL_MEMORY_EXTENSION_NAME
- VK_FUCHSIA_EXTERNAL_MEMORY_SPEC_VERSION
- Extending VkExternalMemoryHandleTypeFlagBits:
  - VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_IMPORT_MEMORY_ZIRCON_HANDLE_INFO_FUCHSIA
  - VK_STRUCTURE_TYPE_MEMORY_GET_ZIRCON_HANDLE_INFO_FUCHSIA

Description

An application using external memory may wish to synchronize access to that memory using semaphores. This extension enables an application to export semaphore payload to and import semaphore payload from Zircon event handles.

New Commands

- vkGetSemaphoreZirconHandleFUCHSIA
- vkImportSemaphoreZirconHandleFUCHSIA

New Structures

- VkImportSemaphoreZirconHandleInfoFUCHSIA
- VkSemaphoreGetZirconHandleInfoFUCHSIA

New Enum Constants

- `VK_FUCHSIA_EXTERNAL_SEMAPHORE_EXTENSION_NAME`
- `VK_FUCHSIA_EXTERNAL_SEMAPHORE_SPEC_VERSION`
- Extending VkExternalSemaphoreHandleTypeFlagBits:
  - `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_ZIRCON_HANDLE_INFO_FUCHSIA`
  - `VK_STRUCTURE_TYPE_SEMAPHORE_GET_ZIRCON_HANDLE_INFO_FUCHSIA`

Issues

1) Does the application need to close the Zircon event handle returned by vkGetSemaphoreZirconHandleFUCHSIA?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the semaphore. A successful get call transfers ownership of the Zircon event handle to the application, and a successful import transfers it back to the driver. Destroying the original semaphore object will not close the Zircon event handle nor remove its reference to the underlying semaphore resource associated with it.

Description

This device extension allows an application that uses the `VK_KHR_swapchain` extension to obtain information about the presentation engine's display, to obtain timing information about each present, and to schedule a present to happen no earlier than a desired time. An application can use this to minimize various visual anomalies (e.g. stuttering).

Traditional game and real-time animation applications need to correctly position their geometry for when the presentable image will be presented to the user. To accomplish this, applications need various timing information about the presentation engine's display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This allows the application to avoid stuttering, so the animation looks smooth to the user.

This extension treats variable-refresh-rate (VRR) displays as if they are fixed-refresh-rate (FRR) displays.

New Commands

- vkGetPastPresentationTimingGOOGLE
- vkGetRefreshCycleDurationGOOGLE

New Structures

Description

This extension allows the vkGetPhysicalDeviceSurfaceFormatsKHR and vkGetPhysicalDeviceSurfacePresentModesKHR functions to accept VK_NULL_HANDLE as their `surface` parameter, allowing potential surface formats, color spaces and present modes to be queried without providing a surface. Identically, vkGetPhysicalDeviceSurfaceFormats2KHR, vkGetPhysicalDeviceSurfacePresentModes2EXT, and vkGetPhysicalDeviceSurfaceCapabilities2KHR would accept VK_NULL_HANDLE in VkPhysicalDeviceSurfaceInfo2KHR::`surface`. **This can only be supported on platforms where the results of these queries are surface-agnostic and a single presentation engine is the implicit target of all present operations**.

Description

Cluster Culling Shaders (CCS) are similar to the existing compute shaders. Their main purpose is to provide an execution environment in order to perform coarse-level geometry culling and LOD selection more efficiently on the GPU.

The traditional 2-pass GPU culling solution using a compute shader sometimes needs a pipeline barrier between compute and graphics pipeline to optimize performance. An additional compaction process may also be required. This extension addresses these shortcomings, allowing compute shaders to directly emit visible clusters to the following graphics pipeline.

A set of new built-in output variables are used to express a visible cluster, including per-cluster shading rate. In addition, a new built-in function is used to emit these variables from CCS to the IA stage. The IA stage can use these variables to fetches vertices of a visible cluster and drive vertex shaders to shading these vertices.

Note that CCS do not work with geometry or tessellation shaders, but both IA and vertex shaders are preserved. Vertex shaders are still used for vertex position shading, instead of directly outputting transformed vertices from the compute shader. This makes CCS more suitable for mobile GPUs.

New Commands

- vkCmdDrawClusterHUAWEI
- vkCmdDrawClusterIndirectHUAWEI

```
    bool render = !isSphereOutsideFrustum(inst_desc.sphere.center, inst_desc.sphere
.radius);

    if (render)
    {
        // calculate distance
        float distance = Distance(instance_id);

        // update shading rate built-in variable
        if(distance > 0.7)
            gl_ClusterShadingRateHUAWEI =
                gl_ShadingRateFlag4VerticalPixelsEXT |
gl_ShadingRateFlag4HorizontalPixelsEXT;
        else if(distance > 0.3)
            gl_ClusterShadingRateHUAWEI =
                gl_ShadingRateFlag2VerticalPixelsEXT |
gl_ShadingRateFlag2HorizontalPixelsEXT;
        else
            gl_ClusterShadingRateHUAWEI = 0;

        // this is a visible cluster, update built-in output variable.
        // in case of indexed mode:
        gl_IndexCountHUAWEI     = draw_commands[cluster_id].indexcount;
        gl_InstanceCountHUAWEI  = draw_commands[cluster_id].instanceCount;
        gl_FirstIndexHUAWEI     = draw_commands[cluster_id].firstIndex;
        gl_VertexOffsetHUAWEI   = draw_commands[cluster_id].vertexoffset;
        gl_FirstInstanceHUAWEI  = draw_commands[cluster_id].firstInstance;
        gl_ClusterIDHUAWEI      = draw_commands[cluster_id].cluster_id;

        // emit built-in output variables as a drawing command to subsequent
        // rendering pipeline.
        dispatchClusterHUAWEI();
    }
}
```

Example of graphics pipeline creation with cluster culling shader

```
// create a cluster culling shader stage info structure.
VkPipelineShaderStageCreateInfo ccsStageInfo{};
ccsStageInfo.sType = VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO;
ccsStageInfo.stage = VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI;
ccsStageInfo.module = clustercullingshaderModule;
ccsStageInfo.pName =  "main";

// pipeline shader stage creation
VkPipelineShaderStageCreateInfo shaderStages[] = { ccsStageInfo,
vertexShaderStageInfo, fragmentShaderStageInfo };

// create graphics pipeline
VkGraphicsPipelineCreateInfo pipelineInfo{};
```

```
pipelineInfo.sType = VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO;
pipelineInfo.stageCount = 3;
pipelineInfo.pStage = shaderStages;
pipelineInfo.pVertexInputState = &vertexInputInfo;
// ...
VkPipeline graphicsPipeline;
VkCreateGraphicsPipelines(device, VK_NULL_HANDLE, 1, &pipelineInfo, nullptr,
&graphicsPipeline);
```

Example of launching the execution of cluster culling shader

```
vkCmdBindPipeline(commandBuffer, VK_PIPELINE_BIND_POINT_GRAPHICS, graphicsPipeline);
vkCmdDrawClusterHUAWEI(commandBuffer, groupCountX, 1, 1);
vkCmdEndRenderPass(commandBuffer);
```

Description

This extension allows applications to assign HDR Vivid (T/UWA 005.1-2022) metadata to swapchains.

HDR Vivid is an HDR standard released by UWA (UHD World Association). It defines tone mapping from the metadata to better preserve the creator's intentions and achieve better consistency across devices with different display capabilities.

Extension Proposal

VK_HUAWEI_invocation_mask

Other Extension Metadata

Last Modified Date

2021-05-27

Interactions and External Dependencies

- This extension requires `VK_KHR_ray_tracing_pipeline`, which allow to bind an invocation mask image before the ray tracing command
- This extension requires `VK_KHR_synchronization2`, which allows new pipeline stage for the invocation mask image

Contributors

- Yunpeng Zhu

- Juntao Li, Huawei
- Liang Chen, Huawei
- Shaozhuang Shi, Huawei
- Hailong Chu, Huawei

Description

The rays to trace may be sparse in some use cases. For example, the scene only have a few regions to reflect. Providing an invocation mask image to the ray tracing commands could potentially give the hardware the hint to do certain optimization without invoking an additional pass to compact the ray buffer.

New Commands

- vkCmdBindInvocationMaskHUAWEI

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceInvocationMaskFeaturesHUAWEI

New Enum Constants

- VK_HUAWEI_INVOCATION_MASK_EXTENSION_NAME
- VK_HUAWEI_INVOCATION_MASK_SPEC_VERSION
- Extending VkAccessFlagBits2:
  - VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI
- Extending VkImageUsageFlagBits:
  - VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI
- Extending VkPipelineStageFlagBits2:
  - VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INVOCATION_MASK_FEATURES_HUAWEI

Examples

RT mask is updated before each traceRay.

Step 1. Generate InvocationMask.

```
//the rt mask image bind as color attachment in the fragment shader
Layout(location = 2) out vec4 outRTmask
vec4 mask = vec4(x,x,x,x);
outRTmask = mask;
```

Step 2. traceRay with InvocationMask

```
vkCmdBindPipeline(
    commandBuffers[imageIndex],
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR, m_rtPipeline);
    vkCmdBindDescriptorSets(commandBuffers[imageIndex],
    VK_PIPELINE_BIND_POINT_RAY_TRACING_NV,
    m_rtPipelineLayout, 0, 1, &m_rtDescriptorSet,
    0, nullptr);

vkCmdBindInvocationMaskHUAWEI(
    commandBuffers[imageIndex],
    InvocationMaskimageView,
    InvocationMaskimageLayout);
    vkCmdTraceRaysKHR(commandBuffers[imageIndex],
    pRaygenShaderBindingTable,
    pMissShaderBindingTable,
    swapChainExtent.width,
    swapChainExtent.height, 1);
```

Interactions and External Dependencies

- This extension provides API support for `GL_HUAWEI_subpass_shading`.

Contributors

- Hueilong Wang
- Juntao Li, Huawei
- Renmiao Lu, Huawei
- Pan Gao, Huawei

Description

This extension allows applications to execute a subpass shading pipeline in a subpass of a render pass in order to save memory bandwidth for algorithms like tile-based deferred rendering and forward plus. A subpass shading pipeline is a pipeline with the compute pipeline ability, allowed to read values from input attachments, and only allowed to be dispatched inside a stand-alone subpass. Its work dimension is defined by the render pass's render area size. Its workgroup size (width, height) shall be a power-of-two number in width or height, with minimum value from 8, and maximum value shall be decided from the render pass attachments and sample counts but depends on implementation.

The `GlobalInvocationId.xy` of a subpass shading pipeline is equal to the `FragCoord.xy` of a graphic pipeline in the same render pass subtracted the `offset` of the VkRenderPassBeginInfo::`renderArea`. `GlobalInvocationId.z` is mapped to the Layer if `VK_EXT_shader_viewport_index_layer` is supported. The `GlobalInvocationId.xy` is equal to the index of the local workgroup multiplied by the size of the local workgroup plus the `LocalInvocationId` and the `offset` of the VkRenderPassBeginInfo ::`renderArea`.

This extension allows a subpass's pipeline bind point to be `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`.

New Commands

- vkCmdSubpassShadingHUAWEI

  - VK_STRUCTURE_TYPE_SUBPASS_SHADING_PIPELINE_CREATE_INFO_HUAWEI

Sample Code

Example of subpass shading in a GLSL shader

```
#extension GL_HUAWEI_subpass_shading: enable
#extension GL_KHR_shader_subgroup_arithmetic: enable

layout(constant_id = 0) const uint tileWidth = 8;
layout(constant_id = 1) const uint tileHeight = 8;
layout(local_size_x_id = 0, local_size_y_id = 1, local_size_z = 1) in;
layout(set=0, binding=0, input_attachment_index=0) uniform subpassInput depth;

void main()
{
  float d = subpassLoad(depth).x;
  float minD = subgroupMin(d);
  float maxD = subgroupMax(d);
```

```
}
```

Example of subpass shading dispatching in a subpass

```
vkCmdNextSubpass(commandBuffer, VK_SUBPASS_CONTENTS_INLINE);
vkCmdBindPipeline(commandBuffer, VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI,
subpassShadingPipeline);
vkCmdBindDescriptorSets(commandBuffer, VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI,
subpassShadingPipelineLayout,
  firstSet, descriptorSetCount, pDescriptorSets, dynamicOffsetCount, pDynamicOffsets);
vkCmdSubpassShadingHUAWEI(commandBuffer)
vkCmdEndRenderPass(commandBuffer);
```

Example of subpass shading render pass creation

```

Description

`VK_IMG_filter_cubic` adds an additional, high quality cubic filtering mode to Vulkan, using a Catmull-Rom bicubic filter. Performing this kind of filtering can be done in a shader by using 16

samples and a number of instructions, but this can be inefficient. The cubic filter mode exposes an optimized high quality texture sampling using fixed texture sampling functionality.

New Enum Constants

- `VK_IMG_FILTER_CUBIC_EXTENSION_NAME`
- `VK_IMG_FILTER_CUBIC_SPEC_VERSION`
- Extending VkFilter:
  - `VK_FILTER_CUBIC_IMG`
- Extending VkFormatFeatureFlagBits:
  - `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_IMG`

Example

Creating a sampler with the new filter for both magnification and minification

```
    VkSamplerCreateInfo createInfo =
    {
        .sType = VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO,
        // Other members set to application-desired values
    };

    createInfo.magFilter = VK_FILTER_CUBIC_IMG;
    createInfo.minFilter = VK_FILTER_CUBIC_IMG;

    VkSampler sampler;
    VkResult result = vkCreateSampler(
        device,
        &createInfo,
        &sampler);
```

Description

OpenGL specifies that implementations should rasterize lines using the diamond exit rule (a slightly modified version of Bresenham's algorithm). To implement OpenGL some implementations have a device-level compatibility mode to rasterize lines according to the OpenGL specification.

This extension allows OpenGL emulation layers to enable the OpenGL compatible line rasterization mode of such implementations.

Interactions and External Dependencies

- This extension provides API support for `GL_INTEL_shader_integer_functions2`.

Contributors

- Ian Romanick, Intel
- Ben Ashbaugh, Intel

Description

This extension adds support for several new integer instructions in SPIR-V for use in graphics shaders. Many of these instructions have pre-existing counterparts in the Kernel environment.

The added integer functions are defined by the `SPV_INTEL_shader_integer_functions2` SPIR-V extension and can be used with the `GL_INTEL_shader_integer_functions2` GLSL extension.

Description

This extension allows applications to request a narrower alignment for images than an implementation would otherwise require. Some implementations internally support multiple image layouts in `VK_IMAGE_TILING_OPTIMAL`, each with different alignment requirements and performance trade-offs. In some API layering use cases such as D3D12, it is beneficial to be able to control the alignment, since certain alignments for placed resources are guaranteed to be supported, and emulating that expectation requires unnecessary padding of allocations.

VkImageAlignmentControlCreateInfoMESA **can** be chained to VkImageCreateInfo, requesting that the alignment is no more than the provided alignment. If the requested alignment is not supported for a given VkImageCreateInfo, a larger alignment **may** be returned.

While something similar could be achieved with `VK_EXT_image_drm_format_modifier` in theory, this is not the intended way to use that extension. Format modifiers are generally used for externally shareable images, and would not be platform portable. It is also a cumbersome API to use just to lower the alignment.

New Structures

- Yasuhiro Yoshioka, Nintendo
- Daniel Koch, NVIDIA

Description

The `VK_NN_vi_surface` extension is an instance extension. It provides a mechanism to create a VkSurfaceKHR object (defined by the `VK_KHR_surface` extension) associated with an `nn::vi::Layer`.

New Commands

- vkCreateViSurfaceNN

New Structures

- VkViSurfaceCreateInfoNN

New Bitmasks

- VkViSurfaceCreateFlagsNN

New Enum Constants

- `VK_NN_VI_SURFACE_EXTENSION_NAME`
- `VK_NN_VI_SURFACE_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN`

Issues

1) Does VI need a way to query for compatibility between a particular physical device (and queue family?) and a specific VI display?

RESOLVED: No. It is currently always assumed that the device and display will always be compatible.

2) VkViSurfaceCreateInfoNN::`pWindow` is intended to store an `nn::vi::NativeWindowHandle`, but its declared type is a bare `void*` to store the window handle. Why the discrepancy?

RESOLVED: It is for C compatibility. The definition for the VI native window handle type is defined inside the `nn::vi` C++ namespace. This prevents its use in C source files. `nn::vi::NativeWindowHandle` is always defined to be `void*`, so this extension uses `void*` to match.

Version History

Description

This extension allows an application to take exclusive control of a display on Windows 10 provided that the display is not already controlled by a compositor. Examples of compositors include the Windows desktop compositor, other applications using this Vulkan extension, and applications that

"Acquire" a "DisplayTarget" using a "WinRT" command such as "winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()".

When control is acquired the application has exclusive access to the display until control is released or the application terminates. An application's attempt to acquire is denied if a different application has already acquired the display.

New Commands

- vkAcquireWinrtDisplayNV
- vkGetWinrtDisplayNV

New Enum Constants

- `VK_NV_ACQUIRE_WINRT_DISPLAY_EXTENSION_NAME`
- `VK_NV_ACQUIRE_WINRT_DISPLAY_SPEC_VERSION`

Issues

1) What should the platform substring be for this extension:

RESOLVED: The platform substring is "Winrt".

The substring "Winrt" matches the fact that the OS API exposing the acquire and release functionality is called "WinRT".

The substring "Win32" is wrong because the related "WinRT" API is explicitly **not** a "Win32" API. "WinRT" is a competing API family to the "Win32" API family.

The substring "Windows" is suboptimal because there could be more than one relevant API on the Windows platform. There is preference to use the more-specific substring "Winrt".

2) Should vkAcquireWinrtDisplayNV take a winRT DisplayTarget, or a Vulkan display handle as input?

RESOLVED: A Vulkan display handle. This matches the design of vkAcquireXlibDisplayEXT.

3) Should the acquire command be platform-independent named "vkAcquireDisplayNV", or platform-specific named "vkAcquireWinrtDisplayNV"?

RESOLVED: Add a platform-specific command.

The inputs to the Acquire command are all Vulkan types. None are WinRT types. This opens the possibility of the winrt extension defining a platform-independent acquire command.

The X11 acquire command does need to accept a platform-specific parameter. This could be handled by adding to a platform-independent acquire command a params struct to which platform-dependent types can be chained by `pNext` pointer.

The prevailing opinion is that it would be odd to create a second platform-independent function that is used on the Windows 10 platform, but that is not used for the X11 platform. Since a Windows

10 platform-specific command is needed anyway for converting between vkDisplayKHR and platform-native handles, opinion was to create a platform-specific acquire function.

4) Should the vkGetWinrtDisplayNV parameter identifying a display be named “deviceRelativeId” or “adapterRelativeId”?

RESOLVED: The WinRT name is “AdapterRelativeId”. The name “adapter” is the Windows analog to a Vulkan “physical device”. Vulkan already has precedent to use the name `deviceLUID` for the concept that Windows APIs call “AdapterLuid”. Keeping form with this precedent, the name “deviceRelativeId” is chosen.

5) Does vkAcquireWinrtDisplayNV cause the Windows desktop compositor to release a display?

RESOLVED: No. vkAcquireWinrtDisplayNV does not itself cause the Windows desktop compositor to release a display. This action must be performed outside of Vulkan.

Beginning with Windows 10 version 2004 it is possible to cause the Windows desktop compositor to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. See https://docs.microsoft.com/en-us/windows-hardware/drivers/display/specialized-monitors

6) Where can one find additional information about custom compositors for Windows 10?

RESOLVED: Relevant references are as follows.

According to Microsoft’s documentation on "building a custom compositor", the ability to write a custom compositor is not a replacement for a fullscreen desktop window. The feature is for writing compositor apps that drive specialized hardware.

Only certain editions of Windows 10 support custom compositors, "documented here". The product type can be queried from Windows 10. See https://docs.microsoft.com/en-us/windows/win32/api/sysinfoapi/nf-sysinfoapi-getproductinfo

Description

Virtual Reality (VR) applications often involve a post-processing step to apply a “barrel” distortion to the rendered image to correct the “pincushion” distortion introduced by the optics in a VR device. The barrel distorted image has lower resolution along the edges compared to the center. Since the original image is rendered at high resolution, which is uniform across the complete image, a lot of pixels towards the edges do not make it to the final post-processed image.

This extension provides a mechanism to render VR scenes at a non-uniform resolution, in particular a resolution that falls linearly from the center towards the edges. This is achieved by scaling the w coordinate of the vertices in the clip space before perspective divide. The clip space w coordinate of the vertices **can** be offset as of a function of x and y coordinates as follows:

w' = w + Ax + By

In the intended use case for viewport position scaling, an application should use a set of four viewports, one for each of the four quadrants of a Cartesian coordinate system. Each viewport is set to the dimension of the image, but is scissored to the quadrant it represents. The application should specify A and B coefficients of the w-scaling equation above, that have the same value, but different signs, for each of the viewports. The signs of A and B should match the signs of x and y for the quadrant that they represent such that the value of w' will always be greater than or equal to the original w value for the entire image. Since the offset to w, (Ax + By), is always positive, and increases with the absolute values of x and y, the effective resolution will fall off linearly from the center of the image to its edges.

New Commands

- vkCmdSetViewportWScalingNV

New Structures

- VkViewportWScalingNV
- Extending VkPipelineViewportStateCreateInfo:
  - VkPipelineViewportWScalingStateCreateInfoNV

New Enum Constants

- VK_NV_CLIP_SPACE_W_SCALING_EXTENSION_NAME
- VK_NV_CLIP_SPACE_W_SCALING_SPEC_VERSION
- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV

Issues

1) Is the pipeline struct name too long?

RESOLVED: It fits with the naming convention.

2) Separate W scaling section or fold into coordinate transformations?

RESOLVED: Leaving it as its own section for now.

Examples

```
VkViewport viewports[4];
VkRect2D scissors[4];
VkViewportWScalingNV scalings[4];

for (int i = 0; i < 4; i++) {
    int x = (i & 2) ? 0 : currentWindowWidth / 2;
    int y = (i & 1) ? 0 : currentWindowHeight / 2;

    viewports[i].x = 0;
    viewports[i].y = 0;
    viewports[i].width = currentWindowWidth;
    viewports[i].height = currentWindowHeight;
    viewports[i].minDepth = 0.0f;
    viewports[i].maxDepth = 1.0f;

    scissors[i].offset.x = x;
    scissors[i].offset.y = y;
    scissors[i].extent.width = currentWindowWidth/2;
    scissors[i].extent.height = currentWindowHeight/2;

    const float factor = 0.15;
```

```
    scalings[i].xcoeff = ((i & 2) ? -1.0 : 1.0) * factor;
    scalings[i].ycoeff = ((i & 1) ? -1.0 : 1.0) * factor;
}

VkPipelineViewportWScalingStateCreateInfoNV vpWScalingStateInfo = {
VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV };

vpWScalingStateInfo.viewportWScalingEnable = VK_TRUE;
vpWScalingStateInfo.viewportCount = 4;
vpWScalingStateInfo.pViewportWScalings = &scalings[0];

VkPipelineViewportStateCreateInfo vpStateInfo = {
VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO };
vpStateInfo.viewportCount = 4;
vpStateInfo.pViewports = &viewports[0];
vpStateInfo.scissorCount = 4;
vpStateInfo.pScissors = &scissors[0];
vpStateInfo.pNext = &vpWScalingStateInfo;
```

Example shader to read from a w-scaled texture:

```
// Vertex Shader
// Draw a triangle that covers the whole screen
const vec4 positions[3] = vec4[3](vec4(-1, -1, 0, 1),
                                  vec4( 3, -1, 0, 1),
                                  vec4(-1,  3, 0, 1));
out vec2 uv;
void main()
{
    vec4 pos = positions[ gl_VertexID ];
    gl_Position = pos;
    uv = pos.xy;
}

// Fragment Shader
uniform sampler2D tex;
uniform float xcoeff;
uniform float ycoeff;
out vec4 Color;
in vec2 uv;

void main()
{
    // Handle uv as if upper right quadrant
    vec2 uvabs = abs(uv);

    // unscale: transform w-scaled image into an unscaled image
    //   scale: transform unscaled image int a w-scaled image
    float unscale = 1.0 / (1 + xcoeff * uvabs.x + xcoeff * uvabs.y);
    //float scale = 1.0 / (1 - xcoeff * uvabs.x - xcoeff * uvabs.y);
```

```
    vec2 P = vec2(unscale * uvabs.x, unscale * uvabs.y);

    // Go back to the right quadrant
    P *= sign(uv);

    Color = texture(tex, P * 0.5 + 0.5);
}
```

Description

This extension allows applications to take advantage of the graphics and compute state that remains valid in the queue between executions of submitted command buffers. This works across both primary and secondary command buffers.

The state inherited includes the previously bound pipeline state, previously bound shader objects, previously bound vertex and index buffers, previously bound descriptor sets and push constants, and all previously set dynamic state.

This extension relaxes the requirement that all that state needs to be bound and set after begin command buffer and before the next draw or dispatch.

By not having to set state that has been inherited applications can save both CPU and GPU cycles by not having to set state redundantly, and also have improved flexibility when reusing secondary command buffers.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceCommandBufferInheritanceFeaturesNV

New Enum Constants

- `VK_NV_COMMAND_BUFFER_INHERITANCE_EXTENSION_NAME`
- `VK_NV_COMMAND_BUFFER_INHERITANCE_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMMAND_BUFFER_INHERITANCE_FEATURES_NV`

Issues

1) How can the validation layer know when state is valid at draw or dispatch time if it is inherited at execution time?

RESOLVED: Validation of invalid state at draw and dispatch time cannot be done while recording those commands. Instead the validation layer will need to keep track of any unset state when draw and dispatch commands are recorded, but not report an error at that time. It should also keep track of what state is valid at the end of each recorded command buffer. When secondary command buffer execution is recorded the validation layer can update its unset state tracking for that command buffer, and also for draw and dispatch commands recorded after execution of the secondary as they will inherit state from the executed secondary. This can be done recursively so every recorded primary command buffer has a final tally of any unset state used at draw and dispatch time. Finally when the primary is submitted to the queue the validation layer will know the previous primaries submitted to the queue and will know if there is any unset state used and can report the error then.

Interactions and External Dependencies

- This extension provides API support for `GL_NV_cooperative_matrix`

Contributors

- Jeff Bolz, NVIDIA
- Markus Tavenrath, NVIDIA
- Daniel Koch, NVIDIA

Description

This extension adds support for using cooperative matrix types in SPIR-V. Cooperative matrix types are medium-sized matrices that are primarily supported in compute shaders, where the storage for the matrix is spread across all invocations in some scope (usually a subgroup) and those invocations cooperate to efficiently perform matrix multiplies.

Cooperative matrix types are defined by the `SPV_NV_cooperative_matrix` SPIR-V extension and can be used with the `GL_NV_cooperative_matrix` GLSL extension.

This extension includes support for enumerating the matrix types and dimensions that are supported by the implementation.

New Commands

- vkGetPhysicalDeviceCooperativeMatrixPropertiesNV

New Structures

- VkCooperativeMatrixPropertiesNV
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceCooperativeMatrixFeaturesNV
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceCooperativeMatrixPropertiesNV

New Enums

- VkComponentTypeNV
- VkScopeNV

New Enum Constants

- `VK_NV_COOPERATIVE_MATRIX_EXTENSION_NAME`
- `VK_NV_COOPERATIVE_MATRIX_SPEC_VERSION`
- Extending VkComponentTypeKHR:
  - `VK_COMPONENT_TYPE_FLOAT16_NV`

Interactions and External Dependencies

- This extension provides API support for `GLSL_NV_cooperative_matrix2`

Contributors

- Jeff Bolz, NVIDIA
- Karthik Vaidyanathan, NVIDIA

Description

This extension adds several new features building on the cooperative matrix types added in VK_KHR_cooperative_matrix. The goal is to add and accelerate features beyond just simple GEMM kernels, including adding support for type/use conversions, reductions, per-element operations, and tensor addressing, and also to improve usability and out-of-the-box performance by adding support for more flexible matrix sizes, and workgroup scope matrices with compiler-managed staging through shared memory.

The new functionality is defined by the `SPV_NV_tensor_addressing` and `SPV_NV_cooperative_matrix2` SPIR-V extensions and can be used with the `GLSL_NV_cooperative_matrix2` GLSL extension.

This extension includes support for enumerating the matrix types and dimensions that are supported by the implementation, and which specific features are supported.

New Commands

- vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV

New Structures

- VkCooperativeMatrixFlexibleDimensionsPropertiesNV
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceCooperativeMatrix2FeaturesNV
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceCooperativeMatrix2PropertiesNV

New Enum Constants

- VK_NV_COOPERATIVE_MATRIX_2_EXTENSION_NAME
- VK_NV_COOPERATIVE_MATRIX_2_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_FLEXIBLE_DIMENSIONS_PROPERTIES_NV
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_2_FEATURES_NV
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_2_PROPERTIES_NV

New SPIR-V Capabilities

- TensorAddressingNV
- CooperativeMatrixReductionsNV
- CooperativeMatrixConversionsNV
- CooperativeMatrixPerElementOperationsNV
- CooperativeMatrixTensorAddressingNV
- CooperativeMatrixBlockLoadsNV

Description

This extension adds support for performing copies between memory and image regions using indirect parameters that are read by the device from a buffer during execution. This functionality **may** be useful for performing copies where the copy parameters are not known during the command buffer creation time.

New Commands

- vkCmdCopyMemoryIndirectNV
- vkCmdCopyMemoryToImageIndirectNV

New Structures

- VkCopyMemoryIndirectCommandNV
- VkCopyMemoryToImageIndirectCommandNV
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:

    - VkPhysicalDeviceCopyMemoryIndirectFeaturesNV
- Extending VkPhysicalDeviceProperties2:
    - VkPhysicalDeviceCopyMemoryIndirectPropertiesNV

New Enum Constants

- VK_NV_COPY_MEMORY_INDIRECT_EXTENSION_NAME
- VK_NV_COPY_MEMORY_INDIRECT_SPEC_VERSION
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COPY_MEMORY_INDIRECT_FEATURES_NV
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COPY_MEMORY_INDIRECT_PROPERTIES_NV

Description

This extension adds support for a new image organization, which this extension refers to as “corner-sampled” images. A corner-sampled image differs from a conventional image in the following ways:

- Texels are centered on integer coordinates. See Unnormalized Texel Coordinate Operations
- Normalized coordinates are scaled using coord × (dim - 1) rather than coord × dim, where dim is the size of one dimension of the image. See normalized texel coordinate transform.
- Partial derivatives are scaled using coord × (dim - 1) rather than coord × dim. See Scale Factor Operation.
- Calculation of the next higher LOD size goes according to ⌈dim / 2⌉ rather than ⌊dim / 2⌋. See Image Mip Level Sizing.
- The minimum level size is 2x2 for 2D images and 2x2x2 for 3D images. See Image Mip Level Sizing.

This image organization is designed to facilitate a system like Ptex with separate textures for each face of a subdivision or polygon mesh. Placing sample locations at pixel corners allows applications to maintain continuity between adjacent patches by duplicating values along shared edges. Additionally, using the modified mipmapping logic along with texture dimensions of the form 2^n+1 allows continuity across shared edges even if the adjacent patches use different LOD values.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceCornerSampledImageFeaturesNV

New Enum Constants

- `VK_NV_CORNER_SAMPLED_IMAGE_EXTENSION_NAME`
- `VK_NV_CORNER_SAMPLED_IMAGE_SPEC_VERSION`
- Extending VkImageCreateFlagBits:
  - `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CORNER_SAMPLED_IMAGE_FEATURES_NV`

Issues

1. What should this extension be named?

DISCUSSION: While naming this extension, we chose the most distinctive aspect of the image organization and referred to such images as “corner-sampled images”. As a result, we decided to name the extension NV_corner_sampled_image.

2. Do we need a format feature flag so formats can advertise if they support corner-sampling?

   DISCUSSION: Currently NVIDIA supports this for all 2D and 3D formats, but not for cube maps or depth-stencil formats. A format feature might be useful if other vendors would only support this on some formats.

3. Do integer texel coordinates have a different range for corner-sampled images?

   RESOLVED: No, these are unchanged.

4. Do unnormalized sampler coordinates work with corner-sampled images? Are there any functional differences?

   RESOLVED: Yes. Unnormalized coordinates are treated as already scaled for corner-sample usage.

5. Should we have a diagram in the “Image Operations” chapter demonstrating different texel sampling locations?

   UNRESOLVED: Probably, but later.

Description

When using a framebuffer with mixed samples, a per-fragment coverage reduction operation is performed which generates color sample coverage from the pixel coverage. This extension defines the following modes to control how this reduction is performed.

- Merge: When there are more samples in the pixel coverage than color samples, there is an implementation-dependent association of each pixel coverage sample to a color sample. In the merge mode, the color sample coverage is computed such that only if any associated sample in the pixel coverage is covered, the color sample is covered. This is the default mode.
- Truncate: When there are more raster samples (N) than color samples(M), there is one to one association of the first M raster samples to the M color samples; other raster samples are ignored.

When the number of raster samples is equal to the color samples, there is a one to one mapping between them in either of the above modes.

The new command vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV can be used to query the various raster, color, depth/stencil sample count and reduction mode combinations that are supported by the implementation. This extension would allow an implementation to support the behavior of both `VK_NV_framebuffer_mixed_samples` and `VK_AMD_mixed_attachment_samples` extensions simultaneously.

Description

There are scenarios where the application does not know ahead of time how many descriptor sets it may need to allocate from a descriptor pool, or how many descriptors of any of the descriptor types it may need to allocate from the descriptor pool.

This extension gives applications the ability to request the implementation allow more sets or descriptors to be allocated than initially specified at descriptor pool creation time, subject to available resources.

The `VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV` flag lets the application allocate more than VkDescriptorPoolCreateInfo::`maxSets` descriptor sets, and the `VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_POOLS_BIT_NV` lets the application allocate more descriptors than initially specified by VkDescriptorPoolSize::`descriptorCount` for any descriptor types.

New Structures

Description

This extension allows applications to insert markers in the command stream and associate them with custom data.

If a device lost error occurs, the application **may** then query the implementation for the last markers to cross specific implementation-defined pipeline stages, in order to narrow down which commands were executing at the time and might have caused the failure.

Interactions and External Dependencies

- This extension requires Vulkan 1.1
- This extension requires VK_EXT_buffer_device_address or VK_KHR_buffer_device_address or Vulkan 1.2 for the ability to bind vertex and index buffers on the device.
- This extension interacts with VK_NV_mesh_shader. If the latter extension is not supported, remove the command token to initiate mesh tasks drawing in this extension.

Description

This extension allows the device to generate a number of critical graphics commands for command buffers.

When rendering a large number of objects, the device can be leveraged to implement a number of critical functions, like updating matrices, or implementing occlusion culling, frustum culling, front to back sorting, etc. Implementing those on the device does not require any special extension, since an application is free to define its own data structures, and just process them using shaders.

However, if the application desires to quickly kick off the rendering of the final stream of objects, then unextended Vulkan forces the application to read back the processed stream and issue graphics command from the host. For very large scenes, the synchronization overhead and cost to generate the command buffer can become the bottleneck. This extension allows an application to generate a device side stream of state changes and commands, and convert it efficiently into a command buffer without having to read it back to the host.

Furthermore, it allows incremental changes to such command buffers by manipulating only partial sections of a command stream — for example pipeline bindings. Unextended Vulkan requires re-creation of entire command buffers in such a scenario, or updates synchronized on the host.

The intended usage for this extension is for the application to:

- create `VkBuffer` objects and retrieve physical addresses from them via vkGetBufferDeviceAddressEXT
- create a graphics pipeline using `VkGraphicsPipelineShaderGroupsCreateInfoNV` for the ability to change shaders on the device.
- create a VkIndirectCommandsLayoutNV, which lists the VkIndirectCommandsTokenTypeNV it wants to dynamically execute as an atomic command sequence. This step likely involves some internal device code compilation, since the intent is for the GPU to generate the command buffer in the pipeline.
- fill the input stream buffers with the data for each of the inputs it needs. Each input is an array that will be filled with token-dependent data.
- set up a preprocess `VkBuffer` that uses memory according to the information retrieved via vkGetGeneratedCommandsMemoryRequirementsNV.
- optionally preprocess the generated content using vkCmdPreprocessGeneratedCommandsNV, for example on an asynchronous compute queue, or for the purpose of re-using the data in multiple executions.

- call vkCmdExecuteGeneratedCommandsNV to create and execute the actual device commands for all sequences based on the inputs provided.

For each draw in a sequence, the following can be specified:

- a different shader group
- a number of vertex buffer bindings
- a different index buffer, with an optional dynamic offset and index type
- a number of different push constants
- a flag that encodes the primitive winding

While the GPU can be faster than a CPU to generate the commands, it will not happen asynchronously to the device, therefore the primary use case is generating “less” total work (occlusion culling, classification to use specialized shaders, etc.).

New Object Types

- VkIndirectCommandsLayoutNV

New Commands

- vkCmdBindPipelineShaderGroupNV
- vkCmdExecuteGeneratedCommandsNV
- vkCmdPreprocessGeneratedCommandsNV
- vkCreateIndirectCommandsLayoutNV

  - `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_NV`
  - `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_NV`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_GENERATED_COMMANDS_FEATURES_NV`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_GENERATED_COMMANDS_PROPERTIES_NV`

Issues

1) How to name this extension ?

`VK_NV_device_generated_commands`

As usual, one of the hardest issues ;)

Alternatives: `VK_gpu_commands`, `VK_execute_commands`, `VK_device_commands`, `VK_device_execute_commands`, `VK_device_execute`, `VK_device_created_commands`, `VK_device_recorded_commands`, `VK_device_generated_commands` `VK_indirect_generated_commands`

2) Should we use a serial stateful token stream or stateless sequence descriptions?

Similarly to VkPipeline, fixed layouts have the most likelihood to be cross-vendor adoptable. They also benefit from being processable in parallel. This is a different design choice compared to the serial command stream generated through `GL_NV_command_list`.

3) How to name a sequence description?

`VkIndirectCommandsLayout` as in the NVX extension predecessor.

Alternative: `VkGeneratedCommandsLayout`

4) Do we want to provide `indirectCommands` inputs with layout or at `indirectCommands` time?

Separate layout from data as Vulkan does. Provide full flexibility for `indirectCommands`.

5) Should the input be provided as SoA or AoS?

Both ways are desirable. AoS can provide portability to other APIs and easier to setup, while SoA allows to update individual inputs in a cache-efficient manner, when others remain static.

6) How do we make developers aware of the memory requirements of implementation-dependent data used for the generated commands?

Make the API explicit and introduce a `preprocess` VkBuffer. Developers have to allocate it using vkGetGeneratedCommandsMemoryRequirementsNV.

In the NVX version the requirements were hidden implicitly as part of the command buffer reservation process, however as the memory requirements can be substantial, we want to give developers the ability to budget the memory themselves. By lowering the `maxSequencesCount` the memory consumption can be reduced. Furthermore reuse of the memory is possible, for example for doing explicit preprocessing and execution in a ping-pong fashion.

The actual buffer size is implementation-dependent and may be zero, i.e. not always required.

When making use of Graphics Shader Groups, the programs should behave similar with regards to vertex inputs, clipping and culling outputs of the geometry stage, as well as sample shading behavior in fragment shaders, to reduce the amount of the worst-case memory approximation.

7) Should we allow additional per-sequence dynamic state changes?

Yes

Introduced a lightweight indirect state flag VkIndirectStateFlagBitsNV. So far only switching front face winding state is exposed. Especially in CAD/DCC mirrored transforms that require such changes are common, and similar flexibility is given in the ray tracing instance description.

The flag could be extended further, for example to switch between primitive-lists or -strips, or make other state modifications.

Furthermore, as new tokens can be added easily, future extension could add the ability to change any VkDynamicState.

8) How do we allow re-using already "generated" `indirectCommands`?

Expose a `preprocessBuffer` to reuse implementation-dependencyFlags data. Set `isPreprocessed` to `VK_TRUE` in vkCmdExecuteGeneratedCommandsNV.

9) Under which conditions is vkCmdExecuteGeneratedCommandsNV legal?

It behaves like a regular draw call command.

10) Is vkCmdPreprocessGeneratedCommandsNV copying the input data or referencing it?

There are multiple implementations possible:

- one could have some emulation code that parses the inputs, and generates an output command buffer, therefore copying the inputs.
- one could just reference the inputs, and have the processing done in pipe at execution time.

If the data is mandated to be copied, then it puts a penalty on implementation that could process the inputs directly in pipe. If the data is "referenced", then it allows both types of implementation.

The inputs are "referenced", and **must** not be modified after the call to vkCmdExecuteGeneratedCommandsNV has completed.

11) Which buffer usage flags are required for the buffers referenced by `VkGeneratedCommandsInfoNV` ?

Reuse existing `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT`

- VkGeneratedCommandsInfoNV::`preprocessBuffer`
- VkGeneratedCommandsInfoNV::`sequencesCountBuffer`
- VkGeneratedCommandsInfoNV::`sequencesIndexBuffer`
- VkIndirectCommandsStreamNV::`buffer`

12) In which pipeline stage does the device generated command expansion happen?

vkCmdPreprocessGeneratedCommandsNV is treated as if it occurs in a separate logical pipeline from either graphics or compute, and that pipeline only includes `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT`, a new stage `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV`, and `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`. This new stage has two corresponding new access types,

VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV and VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV, used to synchronize reading the buffer inputs and writing the preprocess memory output.

The generated output written in the preprocess buffer memory by vkCmdExecuteGeneratedCommandsNV is considered to be consumed by the VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT pipeline stage.

Thus, to synchronize from writing the input buffers to preprocessing via vkCmdPreprocessGeneratedCommandsNV, use:

- dstStageMask = VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV
- dstAccessMask = VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV

To synchronize from vkCmdPreprocessGeneratedCommandsNV to executing the generated commands by vkCmdExecuteGeneratedCommandsNV, use:

- srcStageMask = VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV
- srcAccessMask = VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV
- dstStageMask = VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT
- dstAccessMask = VK_ACCESS_INDIRECT_COMMAND_READ_BIT

When vkCmdExecuteGeneratedCommandsNV is used with a isPreprocessed of VK_FALSE, the generated commands are implicitly preprocessed, therefore one only needs to synchronize the inputs via:

- dstStageMask = VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT
- dstAccessMask = VK_ACCESS_INDIRECT_COMMAND_READ_BIT

13) What if most token data is “static”, but we frequently want to render a subsection?

Added “sequencesIndexBuffer”. This allows to easier sort and filter what should actually be executed.

14) What are the changes compared to the previous NVX extension?

- Compute dispatch support was removed (was never implemented in drivers). There are different approaches how dispatching from the device should work, hence we defer this to a future extension.
- The ObjectTableNVX was replaced by using physical buffer addresses and introducing Shader Groups for the graphics pipeline.
- Less state changes are possible overall, but the important operations are still there (reduces complexity of implementation).
- The API was redesigned so all inputs must be passed at both preprocessing and execution time (this was implicit in NVX, now it is explicit)
- The reservation of intermediate command space is now mandatory and explicit through a preprocess buffer.

- The VkIndirectStateFlagBitsNV were introduced

15) When porting from other APIs, their indirect buffers may use different enums, for example for index buffer types. How to solve this?

Added “pIndexTypeValues” to map custom `uint32_t` values to corresponding `VkIndexType`.

16) Do we need more shader group state overrides?

The NVX version allowed all PSO states to be different, however as the goal is not to replace all state setup, but focus on highly-frequent state changes for drawing lots of objects, we reduced the amount of state overrides. Especially VkPipelineLayout as well as VkRenderPass configuration should be left static, the rest is still open for discussion.

The current focus is just to allow VertexInput changes as well as shaders, while all shader groups use the same shader stages.

Too much flexibility will increase the test coverage requirement as well. However, further extensions could allow more dynamic state as well.

17) Do we need more detailed physical device feature queries/enables?

An EXT version would need detailed implementor feedback to come up with a good set of features. Please contact us if you are interested, we are happy to make more features optional, or add further restrictions to reduce the minimum feature set of an EXT.

18) Is there an interaction with VK_KHR_pipeline_library planned?

Yes, a future version of this extension will detail the interaction, once VK_KHR_pipeline_library is no longer provisional.

Example Code

Open-Source samples illustrating the usage of the extension can be found at the following location (may not yet exist at time of writing):

https://github.com/nvpro-samples/vk_device_generated_cmds

Description

This extension allows the application to choose which type of 3D stereo hardware it wants to use so the driver can configure it properly. This configuration is useful for swapchains created from display surfaces because some environments do not have an intermediate windowing system available for easy configuration. This extension will override any stereo type configuration in the windowing system.

For HDMI 3D, only some display modes support stereo rendering, and a new structure is needed to expose that information to the application.

New Structures

- Extending VkDisplayModeProperties2KHR:
  - VkDisplayModeStereoPropertiesNV
- Extending VkDisplaySurfaceCreateInfoKHR:
  - VkDisplaySurfaceStereoCreateInfoNV

Description

Implementations may be able to support an extended address space for sparse memory resources, but only for a certain set of usages.

This extension adds a query for the extended limit, and the supported usages that are allowed for that limit. This limit is an increase to VkPhysicalDeviceLimits::`sparseAddressSpaceSize` when the VkImage or VkBuffer uses only usages that are supported.

Description

This extension adds a new VkPolygonMode `enum` where a triangle is rasterized by computing and filling its axis-aligned screen-space bounding box, disregarding the actual triangle edges. This can be useful for drawing a rectangle without being split into two triangles with an internal edge. It is also useful to minimize the number of primitives that need to be drawn, particularly for a user interface.

Description

This extension allows the fragment coverage value, represented as an integer bitmask, to be substituted for a color output being written to a single-component color attachment with integer components (e.g. `VK_FORMAT_R8_UINT`). The functionality provided by this extension is different from simply writing the `SampleMask` fragment shader output, in that the coverage value written to the framebuffer is taken after stencil test and depth test, as well as after fragment operations such as alpha-to-coverage.

This functionality may be useful for deferred rendering algorithms, where the second pass needs to know which samples belong to which original fragments.

- Jeff Bolz, NVIDIA

Description

This extension builds on the fragment shading rate functionality provided by the VK_KHR_fragment_shading_rate extension, adding support for “supersample” fragment shading rates that trigger multiple fragment shader invocations per pixel as well as a “no invocations” shading rate that discards any portions of a primitive that would use that shading rate.

New Commands

- vkCmdSetFragmentShadingRateEnumNV

New Structures

- Extending VkGraphicsPipelineCreateInfo:
  - VkPipelineFragmentShadingRateEnumStateCreateInfoNV
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV

New Enums

- VkFragmentShadingRateTypeNV

New Enum Constants

- VK_NV_FRAGMENT_SHADING_RATE_ENUMS_EXTENSION_NAME
- VK_NV_FRAGMENT_SHADING_RATE_ENUMS_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_ENUMS_FEATURES_NV
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_ENUMS_PROPERTIES_NV
  - VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_ENUM_STATE_CREATE_INFO_NV

Issues

1. Why was this extension created? How should it be named?

   RESOLVED: The primary goal of this extension was to expose support for supersample and “no invocations” shading rates, which are supported by the VK_NV_shading_rate_image extension but not by VK_KHR_fragment_shading_rate. Because VK_KHR_fragment_shading_rate specifies the primitive shading rate using a fragment size in pixels, it lacks a good way to specify supersample rates. To deal with this, we defined enums covering shading rates supported by the KHR extension as well as the new shading rates and added structures and APIs accepting shading rate enums instead of fragment sizes.

   Since this extension adds two different types of shading rates, both expressed using enums, we chose the extension name VK_NV_fragment_shading_rate_enums.

2. Is this a standalone extension?

   RESOLVED: No, this extension requires VK_KHR_fragment_shading_rate. In order to use the features of this extension, applications must enable the relevant features of KHR extension.

3. How are the shading rate enums used, and how were the enum values assigned?

   RESOLVED: The shading rates supported by the enums in this extension are accepted as pipeline, primitive, and attachment shading rates and behave identically. For the shading rates also supported by the KHR extension, the values assigned to the corresponding enums are identical to the values already used for the primitive and attachment shading rates in the KHR extension. For those enums, bits 0 and 1 specify the base two logarithm of the fragment height and bits 2 and 3 specify the base two logarithm of the fragment width. For the new shading rates added by this extension, we chose to use 11 through 14 (10 plus the base two logarithm of the invocation count) for the supersample rates and 15 for the “no invocations” rate. None of those values are supported as primitive or attachment shading rates by the KHR extension.

4. Between this extension, VK_KHR_fragment_shading_rate, and VK_NV_shading_rate_image, there are three different ways to specify shading rate state in a pipeline. How should we handle this?

   RESOLVED: We do not allow the concurrent use of VK_NV_shading_rate_image and VK_KHR_fragment_shading_rate; it is an error to enable shading rate features from both extensions. But we do allow applications to enable this extension together with VK_KHR_fragment_shading_rate together. While we expect that applications will never attach pipeline CreateInfo structures for both this extension and the KHR extension concurrently, Vulkan does not have any precedent forbidding such behavior and instead typically treats a pipeline created without an extension-specific CreateInfo structure as equivalent to one containing default values specified by the extension. Rather than adding such a rule considering the presence or absence of our new CreateInfo structure, we instead included a `shadingRateType` member to VkPipelineFragmentShadingRateEnumStateCreateInfoNV that selects between using state specified by that structure and state specified by VkPipelineFragmentShadingRateStateCreateInfoKHR.

Description

This extension allows multisample rendering with a raster and depth/stencil sample count that is larger than the color sample count. Rasterization and the results of the depth and stencil tests together determine the portion of a pixel that is “covered”. It can be useful to evaluate coverage at a higher frequency than color samples are stored. This coverage is then “reduced” to a collection of covered color samples, each having an opacity value corresponding to the fraction of the color sample covered. The opacity can optionally be blended into individual color samples.

Rendering with fewer color samples than depth/stencil samples greatly reduces the amount of memory and bandwidth consumed by the color buffer. However, converting the coverage values into opacity introduces artifacts where triangles share edges and **may** not be suitable for normal triangle mesh rendering.

One expected use case for this functionality is Stencil-then-Cover path rendering (similar to the OpenGL GL_NV_path_rendering extension). The stencil step determines the coverage (in the stencil buffer) for an entire path at the higher sample frequency, and then the cover step draws the path into the lower frequency color buffer using the coverage information to antialias path edges. With this two-step process, internal edges are fully covered when antialiasing is applied and there is no corruption on these edges.

The key features of this extension are:

- It allows render pass and framebuffer objects to be created where the number of samples in the depth/stencil attachment in a subpass is a multiple of the number of samples in the color attachments in the subpass.
- A coverage reduction step is added to Fragment Operations which converts a set of covered raster/depth/stencil samples to a set of color samples that perform blending and color writes. The coverage reduction step also includes an optional coverage modulation step, multiplying color values by a fractional opacity corresponding to the number of associated raster/depth/stencil samples covered.

Interactions and External Dependencies

- This extension provides API support for `GL_NV_geometry_shader_passthrough`
- This extension requires the `geometryShader` feature.

Contributors

- Piers Daniell, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_NV_geometry_shader_passthrough`

Geometry shaders provide the ability for applications to process each primitive sent through the graphics pipeline using a programmable shader. However, one common use case treats them largely as a "passthrough". In this use case, the bulk of the geometry shader code simply copies inputs from each vertex of the input primitive to corresponding outputs in the vertices of the output primitive. Such shaders might also compute values for additional built-in or user-defined per-primitive attributes (e.g., `Layer`) to be assigned to all the vertices of the output primitive.

This extension provides access to the `PassthroughNV` decoration under the `GeometryShaderPassthroughNV` capability. Adding this to a geometry shader input variable specifies that the values of this input are copied to the corresponding vertex of the output primitive.

When using GLSL source-based shading languages, the `passthrough` layout qualifier from `GL_NV_geometry_shader_passthrough` maps to the `PassthroughNV` decoration. To use the `passthrough` layout, in GLSL the `GL_NV_geometry_shader_passthrough` extension must be enabled. Behavior is described in the `GL_NV_geometry_shader_passthrough` extension specification.

New Enum Constants

- `VK_NV_GEOMETRY_SHADER_PASSTHROUGH_EXTENSION_NAME`
- `VK_NV_GEOMETRY_SHADER_PASSTHROUGH_SPEC_VERSION`

New Variable Decoration

- `PassthroughNV` in Geometry Shader Passthrough

New SPIR-V Capabilities

- `GeometryShaderPassthroughNV`

Issues

1) Should we require or allow a passthrough geometry shader to specify the output layout qualifiers for the output primitive type and maximum vertex count in the SPIR-V?

RESOLVED: Yes they should be required in the SPIR-V. Per GL_NV_geometry_shader_passthrough they are not permitted in the GLSL source shader, but SPIR-V is lower-level. It is straightforward for the GLSL compiler to infer them from the input primitive type and to explicitly emit them in the SPIR-V according to the following table.

Input Layout	Implied Output Layout
points	`layout(points, max_vertices=1)`
lines	`layout(line_strip, max_vertices=2)`
triangles	`layout(triangle_strip, max_vertices=3)`

2) How does interface matching work with passthrough geometry shaders?

RESOLVED: This is described in Passthrough Interface Matching. In GL when using passthrough geometry shaders in separable mode, all inputs must also be explicitly assigned location layout qualifiers. In Vulkan all SPIR-V shader inputs (except built-ins) must also have location decorations specified. Redeclarations of built-in variables that add the passthrough layout qualifier are exempted from the rule requiring location assignment because built-in variables do not have locations and are matched by `BuiltIn` decoration.

Sample Code

Consider the following simple geometry shader in unextended GLSL:

```
layout(triangles) in;
layout(triangle_strip) out;
layout(max_vertices=3) out;

in Inputs {
    vec2 texcoord;
    vec4 baseColor;
} v_in[];
out Outputs {
    vec2 texcoord;
    vec4 baseColor;
};

void main()
{
    int layer = compute_layer();
    for (int i = 0; i < 3; i++) {
        gl_Position = gl_in[i].gl_Position;
        texcoord = v_in[i].texcoord;
        baseColor = v_in[i].baseColor;
        gl_Layer = layer;
        EmitVertex();
    }
}
```

In this shader, the inputs `gl_Position`, `Inputs.texcoord`, and `Inputs.baseColor` are simply copied from the input vertex to the corresponding output vertex. The only “interesting” work done by the geometry shader is computing and emitting a `gl_Layer` value for the primitive.

The following geometry shader, using this extension, is equivalent:

```
#extension GL_NV_geometry_shader_passthrough : require

layout(triangles) in;
// No output primitive layout qualifiers required.
```

```
// Redeclare gl_PerVertex to pass through "gl_Position".
layout(passthrough) in gl_PerVertex {
    vec4 gl_Position;
} gl_in[];

// Declare "Inputs" with "passthrough" to automatically copy members.
layout(passthrough) in Inputs {
    vec2 texcoord;
    vec4 baseColor;
} v_in[];

// No output block declaration required.

void main()
{
    // The shader simply computes and writes gl_Layer.  We do not
    // loop over three vertices or call EmitVertex().
    gl_Layer = compute_layer();
}
```

Description

This extension adds the ability for a secondary command buffer to inherit the dynamic viewport and scissor state from a primary command buffer, or a previous secondary command buffer executed within the same vkCmdExecuteCommands call. It addresses a frequent scenario in applications that deal with window resizing and want to improve utilization of reusable secondary command buffers. The functionality is provided through VkCommandBufferInheritanceViewportScissorInfoNV. Viewport inheritance is effectively limited to the 2D rectangle; secondary command buffers must re-specify the inherited depth range values.

New Structures

- Extending VkCommandBufferInheritanceInfo:
  - VkCommandBufferInheritanceViewportScissorInfoNV
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceInheritedViewportScissorFeaturesNV

New Enum Constants

- `VK_NV_INHERITED_VIEWPORT_SCISSOR_EXTENSION_NAME`
- `VK_NV_INHERITED_VIEWPORT_SCISSOR_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_VIEWPORT_SCISSOR_INFO_NV`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INHERITED_VIEWPORT_SCISSOR_FEATURES_NV`

Issues

(1) Why are viewport depth values configured in the VkCommandBufferInheritanceViewportScissorInfoNV struct, rather than by a `vkCmd···` function?

DISCUSSION:

We considered both adding a new vkCmdSetViewportDepthNV function, and modifying vkCmdSetViewport to ignore the x, y, width, and height values when called with a secondary command buffer that activates this extension.

The primary design considerations for this extension are debuggability and easy integration into existing applications. The main issue with adding a new vkCmdSetViewportDepthNV function is reducing ease-of-integration. A new function pointer will have to be loaded, but more importantly, a new function would require changes to be supported in graphics debuggers; this would delay widespread adoption of the extension.

The proposal to modify vkCmdSetViewport would avoid these issues. However, we expect that the intent of applications using this extension is to have the viewport values used for drawing exactly match the inherited values; thus, it would be better for debuggability if no function for modifying the viewport depth alone is provided. By specifying viewport depth values when starting secondary command buffer recording, and requiring the specified depth values to match the inherited depth values, we allow for validation layers that flag depth changes as errors.

This design also better matches the hardware model. In fact, there is no need to re-execute a depth-setting command. The graphics device retains the viewport depth state; it is the CPU-side state of VkCommandBuffer that must be re-initialized.

(2) Why are viewport depth values specified as a partial VkViewport struct, rather than a leaner depth-only struct?

DISCUSSION:

We considered adding a new VkViewportDepthNV struct containing only minDepth and maxDepth. However, as application developers would need to maintain both a VK_NV_inherited_viewport_scissor code path and a fallback code path (at least in the short term), we ultimately chose to continue using the existing VkViewport structure. Doing so would allow application developers to reuse the same VkViewport array for both code paths, rather than constructing separate VkViewportDepthNV and VkViewport arrays for each code path.

- Piers Daniell, NVIDIA
- Sourav Parmar, NVIDIA

Description

This extension expands support for using `VK_IMAGE_TILING_LINEAR` images as color attachments when all the color attachments in the render pass instance have `VK_IMAGE_TILING_LINEAR` tiling. This extension adds a new flag bit `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` that extends the existing VkFormatFeatureFlagBits2KHR bits. This flag **can** be set for renderable color formats in the VkFormatProperties3KHR::`linearTilingFeatures` format properties structure member. Formats with the `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` flag **may** be used as color attachments as long as all the color attachments in the render pass instance have `VK_IMAGE_TILING_LINEAR` tiling, and the formats their images views are created with have VkFormatProperties3KHR ::`linearTilingFeatures` which include `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`. This extension supports both dynamic rendering and traditional render passes.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceLinearColorAttachmentFeaturesNV

New Enum Constants

  - VK_STRUCTURE_TYPE_OUT_OF_BAND_QUEUE_TYPE_INFO_NV
  - VK_STRUCTURE_TYPE_SET_LATENCY_MARKER_INFO_NV
  - VK_STRUCTURE_TYPE_SWAPCHAIN_LATENCY_CREATE_INFO_NV

Description

This extension gives applications timing suggestions on when to start the recording of new frames to reduce the latency between input sampling and frame presentation. Applications can accomplish this through the extension by calling vkSetLatencySleepModeNV to allow the driver to pace a given swapchain, then calling vkLatencySleepNV before input sampling to delay the start of the CPU side work. Additional methods and structures are provided to give insight into the latency pipeline of an application through the latency markers. VK_NV_low_latency provides legacy support for applications that make use of the NVIDIA Reflex SDK whereas new implementations should use the VK_NV_low_latency2 extension.

Issues

1) How does Low Latency 2 work with applications that utilize device groups?

Low Latency 2 does not support device groups.

Interactions and External Dependencies

- This extension provides API support for `GLSL_NV_mesh_shader`

Contributors

- Pat Brown, NVIDIA
- Jeff Bolz, NVIDIA
- Daniel Koch, NVIDIA
- Piers Daniell, NVIDIA
- Pierre Boudier, NVIDIA

Description

This extension provides a new mechanism allowing applications to generate collections of geometric primitives via programmable mesh shading. It is an alternative to the existing programmable primitive shading pipeline, which relied on generating input primitives by a fixed function assembler as well as fixed function vertex fetch.

There are new programmable shader types — the task and mesh shader — to generate these collections to be processed by fixed-function primitive assembly and rasterization logic. When task and mesh shaders are dispatched, they replace the core pre-rasterization stages, including vertex array attribute fetching, vertex shader processing, tessellation, and geometry shader processing.

This extension also adds support for the following SPIR-V extension in Vulkan:

- SPV_NV_mesh_shader

New Commands

- vkCmdDrawMeshTasksIndirectCountNV
- vkCmdDrawMeshTasksIndirectNV
- vkCmdDrawMeshTasksNV

New Structures

- VkDrawMeshTasksIndirectCommandNV
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMeshShaderFeaturesNV
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceMeshShaderPropertiesNV

New Enum Constants

- VK_NV_MESH_SHADER_EXTENSION_NAME
- VK_NV_MESH_SHADER_SPEC_VERSION
- Extending VkPipelineStageFlagBits:
  - VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV
  - VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV
- Extending VkShaderStageFlagBits:
  - VK_SHADER_STAGE_MESH_BIT_NV
  - VK_SHADER_STAGE_TASK_BIT_NV
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_FEATURES_NV
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_PROPERTIES_NV

If VK_EXT_device_generated_commands is supported:

- Extending VkIndirectCommandsTokenTypeEXT:
  - VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_COUNT_NV_EXT
  - VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV_EXT

New or Modified Built-In Variables

- (modified)`ViewportMaskPerViewNV`

New SPIR-V Capability

- `MeshShadingNV`

Issues

1. How to name this extension?

   RESOLVED: VK_NV_mesh_shader

   Other options considered:

   - VK_NV_mesh_shading
   - VK_NV_programmable_mesh_shading
   - VK_NV_primitive_group_shading
   - VK_NV_grouped_drawing

2. Do we need a new VkPrimitiveTopology?

RESOLVED: No. We skip the InputAssembler stage.

3. Should we allow Instancing?

   RESOLVED: No. There is no fixed function input, other than the IDs. However, allow offsetting with a “first” value.

4. Should we use existing vkCmdDraw or introduce new functions?

   RESOLVED: Introduce new functions.

   New functions make it easier to separate from “programmable primitive shading” chapter, less “dual use” language about existing functions having alternative behavior. The text around the existing “draws” is heavily based around emitting vertices.

5. If new functions, how to name?

   RESOLVED: CmdDrawMeshTasks*

   Other options considered:

   - CmdDrawMeshed
   - CmdDrawTasked
   - CmdDrawGrouped

6. Should VK_SHADER_STAGE_ALL_GRAPHICS be updated to include the new stages?

   RESOLVED: No. If an application were to be recompiled with headers that include additional shader stage bits in VK_SHADER_STAGE_ALL_GRAPHICS, then the previously valid application would no longer be valid on implementations that do not support mesh or task shaders. This means the change would not be backwards compatible. It is too bad VkShaderStageFlagBits does not have a dedicated “all supported graphics stages” bit like VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT, which would have avoided this problem.

Description

This extension introduces a new descriptor set layout creation flag that allows bindings in a descriptor set to be scoped to each shader stage. This means that shaders bound at the same time **may** use completely different descriptor set layouts without any restrictions on compatibility, and that the descriptor limits that would otherwise apply to the union of all stages together instead apply to each stage individually. It also means that descriptors shared by multiple stages **must** be bound to each stage or set of stages that use a unique descriptor set layout using their specific per stage descriptor set layout(s).

This extension also allows each of the new descriptor binding functions from VK_KHR_maintenance6 to have their VkPipelineLayout member be optionally set to VK_NULL_HANDLE, in which case the pipeline layout information is taken from a VkPipelineLayoutCreateInfo structure in the `pNext` chain. This enables descriptors to be directly bound using descriptor set layouts without applications needing to create and manage VkPipelineLayout objects at command recording time.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePerStageDescriptorSetFeaturesNV

New Enum Constants

- `VK_NV_PER_STAGE_DESCRIPTOR_SET_EXTENSION_NAME`
- `VK_NV_PER_STAGE_DESCRIPTOR_SET_SPEC_VERSION`

Description

This extension adds support for synchronizing corresponding presentation requests across multiple swapchains using the *present barrier*.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePresentBarrierFeaturesNV
- Extending VkSurfaceCapabilities2KHR:
  - VkSurfaceCapabilitiesPresentBarrierNV
- Extending VkSwapchainCreateInfoKHR:
  - VkSwapchainPresentBarrierCreateInfoNV

New Enum Constants

- `VK_NV_PRESENT_BARRIER_EXTENSION_NAME`
- `VK_NV_PRESENT_BARRIER_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_BARRIER_FEATURES_NV`
  - `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_PRESENT_BARRIER_NV`
  - `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_BARRIER_CREATE_INFO_NV`

Issues

1) Is there a query interface to check if a swapchain is using the present barrier?

RESOLVED. There is no such query interface. When creating a swapchain, an application can specify to use the *present barrier*, and if the swapchain is created successfully, this swapchain will be using the present barrier.

2) Do we need an extra interface to set up the present barrier across distributed systems?

RESOLVED. If the required hardware is presented in the system, and all settings for the physical synchronization with other systems are set up, an implementation manages the configuration automatically when creating a swapchain, without any extra calls from the application.

Description

This extension allows the use of the `SPV_NV_raw_access_chains` extension in SPIR-V shader modules. This enables SPIR-V producers to efficiently implement interfaces similar to Direct3D structured buffers and byte address buffers, allowing shaders compiled from an HLSL source to generate more efficient code.

Description

The ray tracing pipeline API provides some ability to reorder for locality, but it is useful to have more control over how the reordering happens and what information is included in the reordering. The shader API provides a hit object to contain result information from the hit which can be used as part of the explicit sorting plus options that contain an integer for hint bits to use to add more locality.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceRayTracingInvocationReorderPropertiesNV

New Enums

- VkRayTracingInvocationReorderModeNV

New Enum Constants

- VK_NV_RAY_TRACING_INVOCATION_REORDER_EXTENSION_NAME
- VK_NV_RAY_TRACING_INVOCATION_REORDER_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_INVOCATION_REORDER_FEATURES_NV
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_INVOCATION_REORDER_PROPERTIES_NV

HLSL Mapping

HLSL does not provide this functionality natively yet.

However, it is possible to use this functionality via SPIR-V Intrinsics.

The codes for shader invocation reorder are obtained from this page:

```
#define ShaderInvocationReorderNV 5383
#define HitObjectAttributeNV 5385

#define OpHitObjectRecordHitMotionNV 5249
#define OpHitObjectRecordHitWithIndexMotionNV 5250
#define OpHitObjectRecordMissMotionNV 5251
#define OpHitObjectGetWorldToObjectNV 5252
#define OpHitObjectGetObjectToWorldNV 5253
#define OpHitObjectGetObjectRayDirectionNV 5254
#define OpHitObjectGetObjectRayOriginNV 5255
#define OpHitObjectTraceRayMotionNV 5256
#define OpHitObjectGetShaderRecordBufferHandleNV 5257
#define OpHitObjectGetShaderBindingTableRecordIndexNV 5258
```

```
#define OpHitObjectRecordEmptyNV 5259
#define OpHitObjectTraceRayNV 5260
#define OpHitObjectRecordHitNV 5261
#define OpHitObjectRecordHitWithIndexNV 5262
#define OpHitObjectRecordMissNV 5263
#define OpHitObjectExecuteShaderNV 5264
#define OpHitObjectGetCurrentTimeNV 5265
#define OpHitObjectGetAttributesNV 5266
#define OpHitObjectGetHitKindNV 5267
#define OpHitObjectGetPrimitiveIndexNV 5268
#define OpHitObjectGetGeometryIndexNV 5269
#define OpHitObjectGetInstanceIdNV 5270
#define OpHitObjectGetInstanceCustomIndexNV 5271
#define OpHitObjectGetWorldRayDirectionNV 5272
#define OpHitObjectGetWorldRayOriginNV 5273
#define OpHitObjectGetRayTMaxNV 5274
#define OpHitObjectGetRayTMinNV 5275
#define OpHitObjectIsEmptyNV 5276
#define OpHitObjectIsHitNV 5277
#define OpHitObjectIsMissNV 5278
#define OpReorderThreadWithHitObjectNV 5279
#define OpReorderThreadWithHintNV 5280
#define OpTypeHitObjectNV 5281
```

The capability and extension need to be added:

```
[[vk::ext_capability(ShaderInvocationReorderNV)]]
[[vk::ext_extension("SPV_NV_shader_invocation_reorder")]]
```

The creation of the `HitObject` type can be done like this:

```
[[vk::ext_type_def(HitObjectAttributeNV, OpTypeHitObjectNV)]]
void createHitObjectNV();
#define HitObjectNV vk::ext_type<HitObjectAttributeNV>
```

The payload:

- must be global
- needs the `RayPayloadKHR` attribute as an extra storage class

```
struct [raypayload] HitPayload
{
  float hitT : write(closesthit, miss) : read(caller);
  int instanceIndex : write(closesthit) : read(caller);
  float3 pos : write(closesthit) : read(caller);
  float3 nrm : write(closesthit) : read(caller);
};
```

```
#define RayPayloadKHR 5338
[[vk::ext_storage_class(RayPayloadKHR)]] static HitPayload payload;
```

Here is the declaration of a few invocation reordering functions:

```
[[vk::ext_instruction(OpHitObjectRecordEmptyNV)]]
void hitObjectRecordEmptyNV([[vk::ext_reference]] HitObjectNV hitObject);

[[vk::ext_instruction(OpHitObjectTraceRayNV)]]
void hitObjectTraceRayNV(
    [[vk::ext_reference]] HitObjectNV hitObject,
    RaytracingAccelerationStructure as,
    uint RayFlags,
    uint CullMask,
    uint SBTOffset,
    uint SBTStride,
    uint MissIndex,
    float3 RayOrigin,
    float RayTmin,
    float3 RayDirection,
    float RayTMax,
    [[vk::ext_reference]] [[vk::ext_storage_class(RayPayloadKHR)]] HitPayload payload
  );

[[vk::ext_instruction(OpReorderThreadWithHintNV)]]
void reorderThreadWithHintNV(int Hint, int Bits);

[[vk::ext_instruction(OpReorderThreadWithHitObjectNV)]]
void reorderThreadWithHitObjectNV([[vk::ext_reference]] HitObjectNV hitObject);

[[vk::ext_instruction(OpHitObjectExecuteShaderNV)]]
void hitObjectExecuteShaderNV([[vk::ext_reference]] HitObjectNV hitObject, [[vk
::ext_reference]] [[vk::ext_storage_class(RayPayloadKHR)]] HitPayload payload);

[[vk::ext_instruction(OpHitObjectIsHitNV)]]
bool hitObjectIsHitNV([[vk::ext_reference]] HitObjectNV hitObject);
```

Using the function in the code, can be done like this

```
  if (USE_SER == 1)
  {
    createHitObjectNV();
    HitObjectNV hObj; //  hitObjectNV hObj;
    hitObjectRecordEmptyNV(hObj); //Initialize to an empty hit object
    hitObjectTraceRayNV(hObj, topLevelAS, rayFlags, 0xFF, 0, 0, 0, r.Origin, 0.0, r
.Direction, INFINITE, payload);
    reorderThreadWithHitObjectNV(hObj);
    hitObjectExecuteShaderNV(hObj, payload);
```

```
}
```

Note:

- createHitObjectNV() needs to be call at least once. This can be also done in the main entry of the shader.
- Function with a payload parameter, needs to have the payload struct defined before. There are no templated declaration of the function.

Interactions and External Dependencies

- This extension provides API support for `GL_NV_ray_tracing_motion_blur`

Contributors

- Eric Werness, NVIDIA
- Ashwin Lele, NVIDIA

Description

Ray tracing support in the API provides an efficient mechanism to intersect rays against static geometry, but rendering algorithms often want to support motion, which is more efficiently supported with motion-specific algorithms. This extension adds a set of mechanisms to support fast tracing of moving geometry:

- A ray pipeline trace call which takes a time parameter
- Flags to enable motion support in an acceleration structure
- Support for time-varying vertex positions in a geometry
- Motion instances to move existing instances over time

The motion represented here is parameterized across a normalized timestep between 0.0 and 1.0. A motion trace using `OpTraceRayMotionNV` provides a time within that normalized range to be used when intersecting that ray with geometry. The geometry can be provided with motion by a combination of adding a second vertex position for time of 1.0 using `VkAccelerationStructureGeometryMotionTrianglesDataNV` and providing multiple transforms in the instance using `VkAccelerationStructureMotionInstanceNV`.

New Structures

Description

This extension provides a new representative fragment test that allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all other early fragment tests, the implementation is permitted to choose one or more “representative” fragments for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives.

This extension is useful for applications that use an early render pass to determine the full set of primitives that would be visible in the final scene. In this render pass, such applications would set up a fragment shader that enables early fragment tests and writes to an image or shader storage buffer to record the ID of the primitive that generated the fragment. Without this extension, the shader would record the ID separately for each visible fragment of each primitive. With this extension, fewer stores will be performed, particularly for large primitives.

The representative fragment test has no effect if early fragment tests are not enabled via the fragment shader. The set of fragments discarded by the representative fragment test is implementation-dependent and may vary from frame to frame. In some cases, the representative fragment test may not discard any fragments for a given primitive.

New Structures

- Extending VkGraphicsPipelineCreateInfo:
  - VkPipelineRepresentativeFragmentTestStateCreateInfoNV
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV

New Enum Constants

- `VK_NV_REPRESENTATIVE_FRAGMENT_TEST_EXTENSION_NAME`
- `VK_NV_REPRESENTATIVE_FRAGMENT_TEST_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_REPRESENTATIVE_FRAGMENT_TEST_FEATURES_NV`
  - `VK_STRUCTURE_TYPE_PIPELINE_REPRESENTATIVE_FRAGMENT_TEST_STATE_CREATE_INFO_NV`

Issues

(1) Is the representative fragment test guaranteed to have any effect?

RESOLVED: No. As specified, we only guarantee that each primitive with at least one fragment that passes prior tests will have one fragment passing the representative fragment tests. We do not guarantee that any particular fragment will fail the test.

In the initial implementation of this extension, the representative fragment test is treated as an optimization that may be completely disabled for some pipeline states. This feature was designed for a use case where the fragment shader records information on individual primitives using shader storage buffers or storage images, with no writes to color or depth buffers.

(2) Will the set of fragments that pass the representative fragment test be repeatable if you draw the same scene over and over again?

RESOLVED: No. The set of fragments that pass the representative fragment test is implementation-dependent and may vary due to the timing of operations performed by the GPU.

(3) What happens if you enable the representative fragment test with writes to color and/or depth

render targets enabled?

RESOLVED: If writes to the color or depth buffer are enabled, they will be performed for any fragments that survive the relevant tests. Any fragments that fail the representative fragment test will not update color buffers. For the use cases intended for this feature, we do not expect color or depth writes to be enabled.

(4) How do derivatives and automatic texture LOD computations work with the representative fragment test enabled?

RESOLVED: If a fragment shader uses derivative functions or texture lookups using automatic LOD computation, derivatives will be computed identically whether or not the representative fragment test is enabled. For the use cases intended for this feature, we do not expect the use of derivatives in the fragment shader.

Interactions and External Dependencies

- This extension provides API support for `GL_NV_sample_mask_override_coverage`

Contributors

- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_NV_sample_mask_override_coverage`

The extension provides access to the `OverrideCoverageNV` decoration under the `SampleMaskOverrideCoverageNV` capability. Adding this decoration to a variable with the `SampleMask` builtin decoration allows the shader to modify the coverage mask and affect which samples are used to process the fragment.

When using GLSL source-based shader languages, the `override_coverage` layout qualifier from `GL_NV_sample_mask_override_coverage` maps to the `OverrideCoverageNV` decoration. To use the `override_coverage` layout qualifier in GLSL the `GL_NV_sample_mask_override_coverage` extension must be enabled. Behavior is described in the `GL_NV_sample_mask_override_coverage` extension spec.

Description

This extension adds support for an exclusive scissor test to Vulkan. The exclusive scissor test behaves like the scissor test, except that the exclusive scissor test fails for pixels inside the corresponding rectangle and passes for pixels outside the rectangle. If the same rectangle is used

for both the scissor and exclusive scissor tests, the exclusive scissor test will pass if and only if the scissor test fails.

Version 2 of this extension introduces `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` and vkCmdSetExclusiveScissorEnableNV. Applications that use this dynamic state must ensure the implementation advertises at least `specVersion` `2` of this extension.

New Commands

- vkCmdSetExclusiveScissorEnableNV
- vkCmdSetExclusiveScissorNV

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceExclusiveScissorFeaturesNV
- Extending VkPipelineViewportStateCreateInfo:
  - VkPipelineViewportExclusiveScissorStateCreateInfoNV

New Enum Constants

- `VK_NV_SCISSOR_EXCLUSIVE_EXTENSION_NAME`
- `VK_NV_SCISSOR_EXCLUSIVE_SPEC_VERSION`

  - `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV`
  - `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXCLUSIVE_SCISSOR_FEATURES_NV`
  - `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_EXCLUSIVE_SCISSOR_STATE_CREATE_INFO_NV`

Issues

1) For the scissor test, the viewport state must be created with a matching number of scissor and viewport rectangles. Should we have the same requirement for exclusive scissors?

RESOLVED: For exclusive scissors, we relax this requirement and allow an exclusive scissor rectangle count that is either zero or equal to the number of viewport rectangles. If you pass in an exclusive scissor count of zero, the exclusive scissor test is treated as disabled.

Interactions and External Dependencies

- This extension provides API support for `GL_NV_shader_texture_footprint`

Contributors

- Pat Brown, NVIDIA
- Chris Lentini, NVIDIA
- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension adds Vulkan support for the `SPV_NV_shader_image_footprint` SPIR-V extension. That SPIR-V extension provides a new instruction `OpImageSampleFootprintNV` allowing shaders to determine the set of texels that would be accessed by an equivalent filtered texture lookup.

Instead of returning a filtered texture value, the instruction returns a structure that can be interpreted by shader code to determine the footprint of a filtered texture lookup. This structure includes integer values that identify a small neighborhood of texels in the image being accessed and a bitfield that indicates which texels in that neighborhood would be used. The structure also includes a bitfield where each bit identifies whether any texel in a small aligned block of texels would be fetched by the texture lookup. The size of each block is specified by an access *granularity* provided by the shader. The minimum granularity supported by this extension is 2x2 (for 2D textures) and 2x2x2 (for 3D textures); the maximum granularity is 256x256 (for 2D textures) or 64x32x32 (for 3D textures). Each footprint query returns the footprint from a single texture level. When using minification filters that combine accesses from multiple mipmap levels, shaders must perform separate queries for the two levels accessed (“fine” and “coarse”). The footprint query also returns a flag indicating if the texture lookup would access texels from only one mipmap level or from two neighboring levels.

This extension should be useful for multi-pass rendering operations that do an initial expensive rendering pass to produce a first image that is then used as a texture for a second pass. If the second pass ends up accessing only portions of the first image (e.g., due to visibility), the work spent rendering the non-accessed portion of the first image was wasted. With this feature, an application can limit this waste using an initial pass over the geometry in the second image that performs a

footprint query for each visible pixel to determine the set of pixels that it needs from the first image. This pass would accumulate an aggregate footprint of all visible pixels into a separate "footprint image" using shader atomics. Then, when rendering the first image, the application can kill all shading work for pixels not in this aggregate footprint.

This extension has a number of limitations. The `OpImageSampleFootprintNV` instruction only supports for two- and three-dimensional textures. Footprint evaluation only supports the CLAMP_TO_EDGE wrap mode; results are undefined for all other wrap modes. Only a limited set of granularity values and that set does not support separate coverage information for each texel in the original image.

When using SPIR-V generated from the OpenGL Shading Language, the new instruction will be generated from code using the new `textureFootprint*NV` built-in functions from the `GL_NV_shader_texture_footprint` shading language extension.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderImageFootprintFeaturesNV

New Enum Constants

- `VK_NV_SHADER_IMAGE_FOOTPRINT_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_FOOTPRINT_FEATURES_NV`

New SPIR-V Capability

- `ImageFootprintNV`

Issues

(1) The footprint returned by the SPIR-V instruction is a structure that includes an anchor, an offset, and a mask that represents a 8x8 or 4x4x4 neighborhood of texel groups. But the bits of the mask are not stored in simple pitch order. Why is the footprint built this way?

RESOLVED: We expect that applications using this feature will want to use a fixed granularity and accumulate coverage information from the returned footprints into an aggregate "footprint image" that tracks the portions of an image that would be needed by regular texture filtering. If an application is using a two-dimensional image with 4x4 pixel granularity, we expect that the footprint image will use 64-bit texels where each bit in an 8x8 array of bits corresponds to coverage for a 4x4 block in the original image. Texel (0,0) in the footprint image would correspond to texels (0,0) through (31,31) in the original image.

In the usual case, the footprint for a single access will fully contained in a 32x32 aligned region of the original texture, which corresponds to a single 64-bit texel in the footprint image. In that case, the implementation will return an anchor coordinate pointing at the single footprint image texel, an offset vector of (0,0), and a mask whose bits are aligned with the bits in the footprint texel. For

this case, the shader can simply atomically OR the mask bits into the contents of the footprint texel to accumulate footprint coverage.

In the worst case, the footprint for a single access spans multiple 32x32 aligned regions and may require updates to four separate footprint image texels. In this case, the implementation will return an anchor coordinate pointing at the lower right footprint image texel and an offset will identify how many “columns” and “rows” of the returned 8x8 mask correspond to footprint texels to the left and above the anchor texel. If the anchor is (2,3), the 64 bits of the returned mask are arranged spatially as follows, where each 4x4 block is assigned a bit number that matches its bit number in the footprint image texels:

```
    +-------------------------+-------------------------+
    | -- -- -- -- -- -- -- -- | -- -- -- -- -- -- -- -- |
    | -- -- -- -- -- -- -- -- | -- -- -- -- -- -- -- -- |
    | -- -- -- -- -- -- -- -- | -- -- -- -- -- -- -- -- |
    | -- -- -- -- -- -- -- -- | -- -- -- -- -- -- -- -- |
    | -- -- -- -- -- -- -- -- | -- -- -- -- -- -- -- -- |
    | -- -- -- -- -- -- 46 47 | 40 41 42 43 44 45 -- -- |
    | -- -- -- -- -- -- 54 55 | 48 49 50 51 52 53 -- -- |
    | -- -- -- -- -- -- 62 63 | 56 57 58 59 60 61 -- -- |
    +-------------------------+-------------------------+
    | -- -- -- -- -- -- 06 07 | 00 01 02 03 04 05 -- -- |
    | -- -- -- -- -- -- 14 15 | 08 09 10 11 12 13 -- -- |
    | -- -- -- -- -- -- 22 23 | 16 17 18 19 20 21 -- -- |
    | -- -- -- -- -- -- 30 31 | 24 25 26 27 28 29 -- -- |
    | -- -- -- -- -- -- 38 39 | 32 33 34 35 36 37 -- -- |
    | -- -- -- -- -- -- -- -- | -- -- -- -- -- -- -- -- |
    | -- -- -- -- -- -- -- -- | -- -- -- -- -- -- -- -- |
    | -- -- -- -- -- -- -- -- | -- -- -- -- -- -- -- -- |
    +-------------------------+-------------------------+
```

To accumulate coverage for each of the four footprint image texels, a shader can AND the returned mask with simple masks derived from the x and y offset values and then atomically OR the updated mask bits into the contents of the corresponding footprint texel.

```
    uint64_t returnedMask = (uint64_t(footprint.mask.x) | (uint64_t(footprint.mask.y)
<< 32));
    uint64_t rightMask    = ((0xFF >> footprint.offset.x) * 0x0101010101010101UL);
    uint64_t bottomMask   = 0xFFFFFFFFFFFFFFFFUL >> (8 * footprint.offset.y);
    uint64_t bottomRight  = returnedMask & bottomMask & rightMask;
    uint64_t bottomLeft   = returnedMask & bottomMask & (~rightMask);
    uint64_t topRight     = returnedMask & (~bottomMask) & rightMask;
    uint64_t topLeft      = returnedMask & (~bottomMask) & (~rightMask);
```

(2) What should an application do to ensure maximum performance when accumulating footprints into an aggregate footprint image?

RESOLVED: We expect that the most common usage of this feature will be to accumulate aggregate

footprint coverage, as described in the previous issue. Even if you ignore the anisotropic filtering case where the implementation may return a granularity larger than that requested by the caller, each shader invocation will need to use atomic functions to update up to four footprint image texels for each LOD accessed. Having each active shader invocation perform multiple atomic operations can be expensive, particularly when neighboring invocations will want to update the same footprint image texels.

Techniques can be used to reduce the number of atomic operations performed when accumulating coverage include:

- Have logic that detects returned footprints where all components of the returned offset vector are zero. In that case, the mask returned by the footprint function is guaranteed to be aligned with the footprint image texels and affects only a single footprint image texel.
- Have fragment shaders communicate using built-in functions from the `VK_NV_shader_subgroup_partitioned` extension or other shader subgroup extensions. If you have multiple invocations in a subgroup that need to update the same texel (x,y) in the footprint image, compute an aggregate footprint mask across all invocations in the subgroup updating that texel and have a single invocation perform an atomic operation using that aggregate mask.
- When the returned footprint spans multiple texels in the footprint image, each invocation need to perform four atomic operations. In the previous issue, we had an example that computed separate masks for “topLeft”, “topRight”, “bottomLeft”, and “bottomRight”. When the invocations in a subgroup have good locality, it might be the case the “top left” for some invocations might refer to footprint image texel (10,10), while neighbors might have their “top left” texels at (11,10), (10,11), and (11,11). If you compute separate masks for even/odd x and y values instead of left/right or top/bottom, the “odd/odd” mask for all invocations in the subgroup hold coverage for footprint image texel (11,11), which can be updated by a single atomic operation for the entire subgroup.

Examples

Interactions and External Dependencies

- This extension provides API support for `GL_NV_shader_sm_builtins`

Contributors

- Jeff Bolz, NVIDIA
- Eric Werness, NVIDIA

Description

This extension provides the ability to determine device-specific properties on NVIDIA GPUs. It provides the number of streaming multiprocessors (SMs), the maximum number of warps (subgroups) that can run on an SM, and shader builtins to enable invocations to identify which SM and warp a shader invocation is executing on.

This extension enables support for the SPIR-V `ShaderSMBuiltinsNV` capability.

These properties and built-ins **should** typically only be used for debugging purposes.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderSMBuiltinsFeaturesNV
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceShaderSMBuiltinsPropertiesNV

New Enum Constants

- VK_NV_SHADER_SM_BUILTINS_EXTENSION_NAME
- VK_NV_SHADER_SM_BUILTINS_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SM_BUILTINS_FEATURES_NV
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SM_BUILTINS_PROPERTIES_NV

New or Modified Built-In Variables

- WarpsPerSMNV
- SMCountNV
- WarpIDNV
- SMIDNV

New SPIR-V Capabilities

- ShaderSMBuiltinsNV

Issues

1. What should we call this extension?

   RESOLVED: NV_shader_sm_builtins. Other options considered included:

   - NV_shader_smid - but SMID is really easy to typo/confuse as SIMD.
   - NV_shader_sm_info - but **Info** is typically reserved for input structures

Description

This extension enables support for a new class of group operations on subgroups via the `GL_NV_shader_subgroup_partitioned` GLSL extension and `SPV_NV_shader_subgroup_partitioned` SPIR-V extension. Support for these new operations is advertised via the `VK_SUBGROUP_FEATURE_PARTITIONED_BIT_NV` bit.

This extension requires Vulkan 1.1, for general subgroup support.

Description

This extension allows applications to use a variable shading rate when processing fragments of rasterized primitives. By default, Vulkan will spawn one fragment shader for each pixel covered by a primitive. In this extension, applications can bind a *shading rate image* that can be used to vary the number of fragment shader invocations across the framebuffer. Some portions of the screen may be configured to spawn up to 16 fragment shaders for each pixel, while other portions may use a single fragment shader invocation for a 4x4 block of pixels. This can be useful for use cases like

eye tracking, where the portion of the framebuffer that the user is looking at directly can be processed at high frequency, while distant corners of the image can be processed at lower frequency. Each texel in the shading rate image represents a fixed-size rectangle in the framebuffer, covering 16x16 pixels in the initial implementation of this extension. When rasterizing a primitive covering one of these rectangles, the Vulkan implementation reads a texel in the bound shading rate image and looks up the fetched value in a palette to determine a base shading rate.

In addition to the API support controlling rasterization, this extension also adds Vulkan support for the `SPV_NV_shading_rate` extension to SPIR-V. That extension provides two fragment shader variable decorations that allow fragment shaders to determine the shading rate used for processing the fragment:

- `FragmentSizeNV`, which indicates the width and height of the set of pixels processed by the fragment shader.
- `InvocationsPerPixel`, which indicates the maximum number of fragment shader invocations that could be spawned for the pixel(s) covered by the fragment.

When using SPIR-V in conjunction with the OpenGL Shading Language (GLSL), the fragment shader capabilities are provided by the `GL_NV_shading_rate_image` language extension and correspond to the built-in variables `gl_FragmentSizeNV` and `gl_InvocationsPerPixelNV`, respectively.

Issues

(1) When using shading rates specifying "coarse" fragments covering multiple pixels, we will generate a combined coverage mask that combines the coverage masks of all pixels covered by the fragment. By default, these masks are combined in an implementation-dependent order. Should we provide a mechanism allowing applications to query or specify an exact order?

RESOLVED: Yes, this feature is useful for cases where most of the fragment shader can be evaluated once for an entire coarse fragment, but where some per-pixel computations are also required. For example, a per-pixel alpha test may want to kill all the samples for some pixels in a coarse fragment. This sort of test can be implemented using an output sample mask, but such a shader would need to know which bit in the mask corresponds to each sample in the coarse fragment. We are including a mechanism to allow applications to specify the orders of coverage samples for each shading rate and sample count, either as static pipeline state or dynamically via a command buffer. This portion of the extension has its own feature bit.

We will not be providing a query to determine the implementation-dependent default ordering. The thinking here is that if an application cares enough about the coarse fragment sample ordering to perform such a query, it could instead just set its own order, also using custom per-pixel sample locations if required.

(2) For the pipeline stage VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV, should we specify a precise

location in the pipeline the shading rate image is accessed (after geometry shading, but before the early fragment tests) or leave it under-specified in case there are other implementations that access the image in a different pipeline location?

RESOLVED We are specifying the pipeline stage to be between the final pre-rasterization shader stage (`VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`) and before the first stage used for fragment processing (`VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`), which seems to be the natural place to access the shading rate image.

(3) How do centroid-sampled variables work with fragments larger than one pixel?

RESOLVED For single-pixel fragments, fragment shader inputs decorated with `Centroid` are sampled at an implementation-dependent location in the intersection of the area of the primitive being rasterized and the area of the pixel that corresponds to the fragment. With multi-pixel fragments, we follow a similar pattern, using the intersection of the primitive and the **set** of pixels corresponding to the fragment.

One important thing to keep in mind when using such “coarse” shading rates is that fragment attributes are sampled at the center of the fragment by default, regardless of the set of pixels/samples covered by the fragment. For fragments with a size of 4x4 pixels, this center location will be more than two pixels (1.5 * sqrt(2)) away from the center of the pixels at the corners of the fragment. When rendering a primitive that covers only a small part of a coarse fragment, sampling a color outside the primitive can produce overly bright or dark color values if the color values have a large gradient. To deal with this, an application can use centroid sampling on attributes where “extrapolation” artifacts can lead to overly bright or dark pixels. Note that this same problem also exists for multisampling with single-pixel fragments, but is less severe because it only affects certain samples of a pixel and such bright/dark samples may be averaged with other samples that do not have a similar problem.

Interactions and External Dependencies

- This extension provides API support for `GL_NV_viewport_array2`
- This extension requires the `geometryShader` and `multiViewport` features.
- This extension interacts with the `tessellationShader` feature.

Contributors

- Piers Daniell, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_NV_viewport_array2`

which allows a single primitive to be broadcast to multiple viewports and/or multiple layers. A new shader built-in output `ViewportMaskNV` is provided, which allows a single primitive to be output to multiple viewports simultaneously. Also, a new SPIR-V decoration is added to control whether the effective viewport index is added into the variable decorated with the `Layer` built-in decoration. These capabilities allow a single primitive to be output to multiple layers simultaneously.

This extension allows variables decorated with the `Layer` and `ViewportIndex` built-ins to be exported from vertex or tessellation shaders, using the `ShaderViewportIndexLayerNV` capability.

This extension adds a new `ViewportMaskNV` built-in decoration that is available for output variables in vertex, tessellation evaluation, and geometry shaders, and a new `ViewportRelativeNV` decoration

that can be added on variables decorated with Layer when using the ShaderViewportMaskNV capability.

When using GLSL source-based shading languages, the gl_ViewportMask[] built-in output variable and viewport_relative layout qualifier from GL_NV_viewport_array2 map to the ViewportMaskNV and ViewportRelativeNV decorations, respectively. Behavior is described in the GL_NV_viewport_array2 extension specification.

NOTE	The ShaderViewportIndexLayerNV capability is equivalent to the ShaderViewportIndexLayerEXT capability added by VK_EXT_shader_viewport_index_layer.

Interactions and External Dependencies

- This extension requires `multiViewport` and `geometryShader` features to be useful.

Contributors

- Daniel Koch, NVIDIA
- Jeff Bolz, NVIDIA

Description

This extension provides a new per-viewport swizzle that can modify the position of primitives sent to each viewport. New viewport swizzle state is added for each viewport, and a new position vector is computed for each vertex by selecting from and optionally negating any of the four components of the original position vector.

This new viewport swizzle is useful for a number of algorithms, including single-pass cube map rendering (broadcasting a primitive to multiple faces and reorienting the vertex position for each face) and voxel rasterization. The per-viewport component remapping and negation provided by the swizzle allows application code to re-orient three-dimensional geometry with a view along any of the **X**, **Y**, or **Z** axes. If a perspective projection and depth buffering is required, 1/W buffering should be used, as described in the single-pass cube map rendering example in the “Issues” section below.

New Structures

- VkViewportSwizzleNV
- Extending VkPipelineViewportStateCreateInfo:
  - VkPipelineViewportSwizzleStateCreateInfoNV

New Enums

- VK_NV_VIEWPORT_SWIZZLE_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SWIZZLE_STATE_CREATE_INFO_NV

Issues

1) Where does viewport swizzling occur in the pipeline?

RESOLVED: Despite being associated with the viewport, viewport swizzling must happen prior to the viewport transform. In particular, it needs to be performed before clipping and perspective division.

The viewport mask expansion (VK_NV_viewport_array2) and the viewport swizzle could potentially be performed before or after transform feedback, but feeding back several viewports worth of primitives with different swizzles does not seem particularly useful. This specification applies the viewport mask and swizzle after transform feedback, and makes primitive queries only count each primitive once.

2) Any interesting examples of how this extension, VK_NV_viewport_array2, and VK_NV_geometry_shader_passthrough can be used together in practice?

RESOLVED: One interesting use case for this extension is for single-pass rendering to a cube map. In this example, the application would attach a cube map texture to a layered FBO where the six cube faces are treated as layers. Vertices are sent through the vertex shader without applying a projection matrix, where the gl_Position output is (x,y,z,1) and the center of the cube map is at (0,0,0). With unextended Vulkan, one could have a conventional instanced geometry shader that looks something like the following:

```
layout(invocations = 6) in;     // separate invocation per face
layout(triangles) in;
layout(triangle_strip) out;
layout(max_vertices = 3) out;

in Inputs {
vec2 texcoord;
vec3 normal;
vec4 baseColor;
} v[];
```

```
    out Outputs {
    vec2 texcoord;
    vec3 normal;
    vec4 baseColor;
    };

    void main()
    {
    int face = gl_InvocationID;  // which face am I?

    // Project gl_Position for each vertex onto the cube map face.
    vec4 positions[3];
    for (int i = 0; i < 3; i++) {
        positions[i] = rotate(gl_in[i].gl_Position, face);
    }

    // If the primitive does not project onto this face, we are done.
    if (shouldCull(positions)) {
        return;
    }

    // Otherwise, emit a copy of the input primitive to the
    // appropriate face (using gl_Layer).
    for (int i = 0; i < 3; i++) {
        gl_Layer = face;
        gl_Position = positions[i];
        texcoord = v[i].texcoord;
        normal = v[i].normal;
        baseColor = v[i].baseColor;
        EmitVertex();
    }
}
```

With passthrough geometry shaders, this can be done using a much simpler shader:

```
layout(triangles) in;
layout(passthrough) in Inputs {
    vec2 texcoord;
    vec3 normal;
    vec4 baseColor;
}
layout(passthrough) in gl_PerVertex {
    vec4 gl_Position;
} gl_in[];
layout(viewport_relative) out int gl_Layer;

void main()
{
    // Figure out which faces the primitive projects onto and
```

```
    // generate a corresponding viewport mask.
    uint mask = 0;
    for (int i = 0; i < 6; i++) {
        if (!shouldCull(face)) {
        mask |= 1U << i;
        }
    }
    gl_ViewportMask = mask;
    gl_Layer = 0;
}
```

The application code is set up so that each of the six cube faces has a separate viewport (numbered 0 to 5). Each face also has a separate swizzle, programmed via the VkPipelineViewportSwizzleStateCreateInfoNV pipeline state. The viewport swizzle feature performs the coordinate transformation handled by the `rotate`() function in the original shader. The `viewport_relative` layout qualifier says that the viewport number (0 to 5) is added to the base `gl_Layer` value of 0 to determine which layer (cube face) the primitive should be sent to.

Note that the use of the passed through input `normal` in this example suggests that the fragment shader in this example would perform an operation like per-fragment lighting. The viewport swizzle would transform the position to be face-relative, but `normal` would remain in the original coordinate system. It seems likely that the fragment shader in either version of the example would want to perform lighting in the original coordinate system. It would likely do this by reconstructing the position of the fragment in the original coordinate system using `gl_FragCoord`, a constant or uniform holding the size of the cube face, and the input `gl_ViewportIndex` (or `gl_Layer`), which identifies the cube face. Since the value of `normal` is in the original coordinate system, it would not need to be modified as part of this coordinate transformation.

Note that while the `rotate`() operation in the regular geometry shader above could include an arbitrary post-rotation projection matrix, the viewport swizzle does not support arbitrary math. To get proper projection, 1/W buffering should be used. To do this:

1. Program the viewport swizzles to move the pre-projection W eye coordinate (typically 1.0) into the Z coordinate of the swizzle output and the eye coordinate component used for depth into the W coordinate. For example, the viewport corresponding to the +Z face might use a swizzle of (+X, -Y, +W, +Z). The Z normalized device coordinate computed after swizzling would then be $z'/w' = 1/Z_{eye}$.
2. On NVIDIA implementations supporting floating-point depth buffers with values outside [0,1], prevent unwanted near plane clipping by enabling `depthClampEnable`. Ensure that the depth clamp does not mess up depth testing by programming the depth range to very large values, such as `minDepthBounds`=-z, `maxDepthBounds`=+z, where $z = 2^{127}$. It should be possible to use IEEE infinity encodings also (`0xFF800000` for `-INF`, `0x7F800000` for `+INF`). Even when near/far clipping is disabled, primitives extending behind the eye will still be clipped because one or more vertices will have a negative W coordinate and fail X/Y clipping tests.

   On other implementations, scale X, Y, and Z eye coordinates so that vertices on the near plane have a post-swizzle W coordinate of 1.0. For example, if the near plane is at $Z_{eye} = 1/256$, scale X, Y, and Z by 256.

3. Adjust depth testing to reflect the fact that 1/W values are large near the eye and small away from the eye. Clear the depth buffer to zero (infinitely far away) and use a depth test of `VK_COMPARE_OP_GREATER` instead of `VK_COMPARE_OP_LESS`.

void vkDestroyCuFunctionNVX(
    VkDevice                                    device,
    VkCuFunctionNVX                             function,
    const VkAllocationCallbacks*                pAllocator);
```

Valid Usage (Implicit)

- VUID-vkDestroyCuFunctionNVX-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyCuFunctionNVX-function-parameter
  `function` **must** be a valid VkCuFunctionNVX handle
- VUID-vkDestroyCuFunctionNVX-pAllocator-parameter

If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyCuFunctionNVX-function-parent
  `function` **must** have been created, allocated, or retrieved from `device`

There is currently no specification language written for this command. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_NVX_binary_import
VkResult vkCreateCuModuleNVX(
    VkDevice                                    device,
    const VkCuModuleCreateInfoNVX*              pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkCuModuleNVX*                              pModule);
```

Valid Usage (Implicit)

- VUID-vkCreateCuModuleNVX-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateCuModuleNVX-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkCuModuleCreateInfoNVX structure
- VUID-vkCreateCuModuleNVX-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateCuModuleNVX-pModule-parameter
  `pModule` **must** be a valid pointer to a VkCuModuleNVX handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_NVX_binary_import
typedef struct VkCuModuleCreateInfoNVX {
    VkStructureType    sType;
    const void*        pNext;
    size_t             dataSize;
    const void*        pData;
} VkCuModuleCreateInfoNVX;
```

Valid Usage (Implicit)

- VUID-VkCuModuleCreateInfoNVX-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_CU_MODULE_CREATE_INFO_NVX`
- VUID-VkCuModuleCreateInfoNVX-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkCuModuleTexturingModeCreateInfoNVX
- VUID-VkCuModuleCreateInfoNVX-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkCuModuleCreateInfoNVX-pData-parameter
  If `dataSize` is not `0`, `pData` **must** be a valid pointer to an array of `dataSize` bytes

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_NVX_binary_import
typedef struct VkCuModuleTexturingModeCreateInfoNVX {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           use64bitTexturing;
} VkCuModuleTexturingModeCreateInfoNVX;
```

Valid Usage (Implicit)

- VUID-VkCuModuleTexturingModeCreateInfoNVX-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_CU_MODULE_TEXTURING_MODE_CREATE_INFO_NVX`

There is currently no specification language written for this command. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_NVX_binary_import
void vkDestroyCuModuleNVX(
    VkDevice                                    device,
    VkCuModuleNVX                               module,
    const VkAllocationCallbacks*                pAllocator);
```

Valid Usage (Implicit)

- VUID-vkDestroyCuModuleNVX-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyCuModuleNVX-module-parameter
  `module` **must** be a valid VkCuModuleNVX handle
- VUID-vkDestroyCuModuleNVX-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyCuModuleNVX-module-parent
  `module` **must** have been created, allocated, or retrieved from `device`

There is currently no specification language written for this command. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_NVX_binary_import
void vkCmdCuLaunchKernelNVX(
    VkCommandBuffer                             commandBuffer,
    const VkCuLaunchInfoNVX*                    pLaunchInfo);
```

Valid Usage (Implicit)

- VUID-vkCmdCuLaunchKernelNVX-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdCuLaunchKernelNVX-pLaunchInfo-parameter
  `pLaunchInfo` **must** be a valid pointer to a valid VkCuLaunchInfoNVX structure
- VUID-vkCmdCuLaunchKernelNVX-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdCuLaunchKernelNVX-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- VUID-vkCmdCuLaunchKernelNVX-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics Compute	Action

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_NVX_binary_import
typedef struct VkCuLaunchInfoNVX {
    VkStructureType        sType;
    const void*            pNext;
    VkCuFunctionNVX        function;
    uint32_t               gridDimX;
    uint32_t               gridDimY;
    uint32_t               gridDimZ;
    uint32_t               blockDimX;
    uint32_t               blockDimY;
    uint32_t               blockDimZ;
    uint32_t               sharedMemBytes;

Interactions and External Dependencies

- This extension provides API support for `GL_NVX_multiview_per_view_attributes`
- This extension interacts with `VK_NV_viewport_array2`.

Contributors

- Jeff Bolz, NVIDIA
- Daniel Koch, NVIDIA

Description

This extension adds a new way to write shaders to be used with multiview subpasses, where the attributes for all views are written out by a single invocation of the pre-rasterization shader stages. Related SPIR-V and GLSL extensions `SPV_NVX_multiview_per_view_attributes` and `GL_NVX_multiview_per_view_attributes` introduce per-view position and viewport mask attributes arrays, and this extension defines how those per-view attribute arrays are interpreted by Vulkan. Pipelines using per-view attributes **may** only execute the pre-rasterization shader stages once for all views rather than once per-view, which reduces redundant shading work.

A subpass creation flag controls whether the subpass uses this extension. A subpass **must** either exclusively use this extension or not use it at all.

Some Vulkan implementations only support the position attribute varying between views in the X component. A subpass can declare via a second creation flag whether all pipelines compiled for this subpass will obey this restriction.

Shaders that use the new per-view outputs (e.g. `gl_PositionPerViewNV`) **must** also write the non-per-view output (`gl_Position`), and the values written **must** be such that `gl_Position = gl_PositionPerViewNV[gl_ViewIndex]` for all views in the subpass. Implementations are free to either use the per-view outputs or the non-per-view outputs, whichever would be more efficient.

If the `VK_NV_viewport_array2` extension is not also supported and enabled, the per-view viewport mask **must** not be used.

New Structures

- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX

If Vulkan Version 1.3 or VK_KHR_dynamic_rendering is supported:

- Extending VkCommandBufferInheritanceInfo, VkGraphicsPipelineCreateInfo, VkRenderingInfo:
  - VkMultiviewPerViewAttributesInfoNVX

New Enum Constants

- `VK_NVX_MULTIVIEW_PER_VIEW_ATTRIBUTES_EXTENSION_NAME`
- `VK_NVX_MULTIVIEW_PER_VIEW_ATTRIBUTES_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER_VIEW_ATTRIBUTES_PROPERTIES_NVX`
- Extending VkSubpassDescriptionFlagBits:
  - `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX`
  - `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX`

If Vulkan Version 1.3 or VK_KHR_dynamic_rendering is supported:

- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_ATTRIBUTES_INFO_NVX`

New Built-In Variables

- `PositionPerViewNV`
- `ViewportMaskPerViewNV`

New SPIR-V Capabilities

- `PerViewAttributesNV`

Examples

```
#version 450 core

#extension GL_KHX_multiview : enable
#extension GL_NVX_multiview_per_view_attributes : enable

layout(location = 0) in vec4 position;
layout(set = 0, binding = 0) uniform Block { mat4 mvpPerView[2]; } buf;

void main()
{
    // Output both per-view positions and gl_Position as a function
    // of gl_ViewIndex
    gl_PositionPerViewNV[0] = buf.mvpPerView[0] * position;
    gl_PositionPerViewNV[1] = buf.mvpPerView[1] * position;
    gl_Position = buf.mvpPerView[gl_ViewIndex] * position;
}
```

Description

This extension extends cubic filtering by adding the ability to enable an anti-ringing clamp. Cubic filtering samples from a 4x4 region of texels and computes a cubic weighted average of the region. In some cases, the resulting value is outside the range of any of the texels in the 4x4 region. This is sometimes referred to as “filter overshoot” or “filter ringing” and can occur when there is a sharp discontinuity in the 4x4 region being filtered. For some use cases this “ringing” can produces unacceptable artifacts.

The solution to the ringing problem is to clamp the post-cubic-filtered value to be within the max and min of texel values in the 4x4 region. While such “range clamping” can be performed in shader code, the additional texture fetches and clamping ALU operations can be costly.

Certain Adreno GPUs are able to perform the range clamp in the texture unit during cubic filtering at significant performance/power savings versus a shader-based clamping approach. This extension exposes such hardware functionality.

This extension extends VkSamplerReductionMode, adding `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` which enables the range clamp operation.

Description

This extension extends cubic filtering by adding the ability to select a set of weights. Without this extension, the weights used in cubic filtering are limited to those corresponding to a Catmull-Rom spline. This extension adds support for 3 additional spline weights.

This extension adds a new structure that **can** be added to the `pNext` chain of VkSamplerCreateInfo that **can** be used to specify which set of cubic weights are used in cubic filtering. A similar structure can be added to the `pNext` chain of VkBlitImageInfo2 to specify cubic weights used in a blit operation.

With this extension weights corresponding to the following additional splines can be selected for cubic filtered sampling and blits:

- Zero Tangent Cardinal
- B-Spline
- Mitchell-Netravali

New Structures

Interactions and External Dependencies

- This extension provides API support for `GL_QCOM_image_processing`

Contributors

- Jeff Leger, Qualcomm Technologies, Inc.
- Ruihao Zhang, Qualcomm Technologies, Inc.

Description

GPUs are commonly used to process images for various applications from 3D graphics to UI and from composition to compute applications. Simple scaling and filtering can be done with bilinear filtering, which comes for free during texture sampling. However, as screen sizes get larger and more use cases rely on GPU such as camera and video post-processing needs, there is increasing demand for GPU to support higher order filtering and other advanced image processing.

This extension introduces a new set of SPIR-V built-in functions for image processing. It exposes the following new imaging operations

- The `OpImageSampleWeightedQCOM` instruction takes 3 operands: *sampled image*, *weight image*, and texture coordinates. The instruction computes a weighted average of an MxN region of texels in the *sampled image*, using a set of MxN weights in the *weight image*.
- The `OpImageBoxFilterQCOM` instruction takes 3 operands: *sampled image*, *box size*, and texture coordinates. Note that *box size* specifies a floating-point width and height in texels. The instruction computes a weighted average of all texels in the *sampled image* that are covered (either partially or fully) by a box with the specified size and centered at the specified texture coordinates.
- The `OpImageBlockMatchSADQCOM` and `OpImageBlockMatchSSDQCOM` instructions each takes 5 operands: *target image*, *target coordinates*, *reference image*, *reference coordinates*, and *block size*. Each instruction computes an error metric, that describes whether a block of texels in the *target image* matches a corresponding block of texels in the *reference image*. The error metric is computed per-component. `OpImageBlockMatchSADQCOM` computes "Sum Of Absolute Difference" and `OpImageBlockMatchSSDQCOM` computes "Sum of Squared Difference".

Each of the image processing instructions operate only on 2D images. The instructions do not-support sampling of mipmap, multi-plane, multi-layer, multi-sampled, or depth/stencil images. The

instructions can be used in any shader stage.

Implementations of this extension should support these operations natively at the HW instruction level, offering potential performance gains as well as ease of development.

New Structures

- Extending VkImageViewCreateInfo:
  - VkImageViewSampleWeightCreateInfoQCOM
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceImageProcessingFeaturesQCOM
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceImageProcessingPropertiesQCOM

New Enum Constants

- `VK_QCOM_IMAGE_PROCESSING_EXTENSION_NAME`
- `VK_QCOM_IMAGE_PROCESSING_SPEC_VERSION`
- Extending VkDescriptorType:
  - `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`
  - `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`
- Extending VkImageUsageFlagBits:
  - `VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM`
  - `VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM`
- Extending VkSamplerCreateFlagBits:
  - `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

Interactions and External Dependencies

- This extension provides API support for `GL_QCOM_image_processing2`

Contributors

- Jeff Leger, Qualcomm Technologies, Inc.

Description

This extension enables support for the SPIR-V `TextureBlockMatch2QCOM` capability. It builds on the functionality of QCOM_image_processing with the addition of 4 new image processing operations.

- The `opImageBlockMatchWindowSADQCOM` SPIR-V instruction builds upon the functionality of `opImageBlockMatchSADQCOM` by repeatedly performing block match operations across a 2D window. The “2D windowExtent” and “compareMode” are specified by VkSamplerBlockMatchWindowCreateInfoQCOM in the sampler used to create the *target image*.

Like `OpImageBlockMatchSADQCOM`, `opImageBlockMatchWindowSADQCOM` computes an error metric, that describes whether a block of texels in the *target image* matches a corresponding block of texels in the *reference image*. Unlike `OpImageBlockMatchSADQCOM`, this instruction computes an error metric at each (X,Y) location within the 2D window and returns either the minimum or maximum error. The instruction only supports single-component formats. Refer to the pseudocode below for details.

- The `opImageBlockMatchWindowSSDQCOM` follows the same pattern, computing the SSD error metric at each location within the 2D window.
- The `opImageBlockMatchGatherSADQCOM` builds upon `OpImageBlockMatchSADQCOM`. This instruction computes an error metric, that describes whether a block of texels in the *target image* matches a corresponding block of texels in the *reference image*. The instruction computes the SAD error metric at 4 texel offsets and returns the error metric for each offset in the X,Y,Z,and W components. The instruction only supports single-component texture formats. Refer to the pseudocode below for details.
- The `opImageBlockMatchGatherSSDQCOM` follows the same pattern, computing the SSD error metric for 4 offsets.

Each of the above 4 image processing instructions are limited to single-component formats.

Below is the pseudocode for GLSL built-in function `textureWindowBlockMatchSADQCOM`. The pseudocode for `textureWindowBlockMatchSSD` is identical other than replacing all instances of `"SAD"` with `"SSD"`.

```
vec4 textureBlockMatchWindowSAD( sampler2D target,
                                 uvec2 targetCoord,
                                 samler2D reference,
                                 uvec2 refCoord,
                                 uvec2 blocksize) {
    // compareMode (MIN or MAX) comes from the vkSampler associated with `target`
    // uvec2 window  comes from the vkSampler associated with `target`
    minSAD = INF;
    maxSAD = -INF;
    uvec2 minCoord;
    uvec2 maxCoord;

    for (uint x=0, x < window.width; x++) {
        for (uint y=0; y < window.height; y++) {
            float SAD = textureBlockMatchSAD(target,
                                             targetCoord + uvec2(x, y),
                                             reference,
                                             refCoord,
                                             blocksize).x;
            // Note: the below comparison operator will produce undefined results
            // if SAD is a denorm value.
            if (SAD < minSAD) {
                minSAD = SAD;
                minCoord = uvec2(x,y);
            }
```

```
            if (SAD > maxSAD) {
                maxSAD = SAD;
                maxCoord = uvec2(x,y);
            }
        }
    }
    if (compareMode=MIN) {
        return vec4(minSAD, minCoord.x, minCoord.y, 0.0);
    } else {
        return vec4(maxSAD, maxCoord.x, maxCoord.y, 0.0);
    }
}
```

Below is the pseudocode for `textureBlockMatchGatherSADQCOM`. The pseudocode for `textureBlockMatchGatherSSD` follows an identical pattern.

```
vec4 textureBlockMatchGatherSAD( sampler2D target,
                                 uvec2 targetCoord,
                                 samler2D reference,
                                 uvec2 refCoord,
                                 uvec2 blocksize) {
    vec4 out;
    for (uint x=0, x<4; x++) {
            float SAD = textureBlockMatchSAD(target,
                                             targetCoord + uvec2(x, 0),
                                             reference,
                                             refCoord,
                                             blocksize).x;
            out[x] = SAD;
    }
    return out;
}
```

New Structures

- Jonathan Wicks, Qualcomm

Description

Certain use cases (e.g., side-by-side VR rendering) use multiview and render to distinct regions of the framebuffer for each view. On some implementations, there may be a performance benefit for providing per-view render areas to the implementation. Such per-view render areas can be used by the implementation to reduce the pixels that are affected by attachment load, store, and multisample resolve operations.

The extension enables a multiview render pass instance to define per-view render areas. For each view of a multiview render pass instance, only those pixels in the per-view render area are affected by load, store and resolve operations.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM
- Extending VkRenderPassBeginInfo, VkRenderingInfo:
  - VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM

New Enum Constants

- `VK_QCOM_MULTIVIEW_PER_VIEW_RENDER_AREAS_EXTENSION_NAME`
- `VK_QCOM_MULTIVIEW_PER_VIEW_RENDER_AREAS_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_RENDER_AREAS_RENDER_PASS_BEGIN_INFO_QCOM`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER_VIEW_RENDER_AREAS_FEATURES_QCOM`

Issues

1) Do the per-view `renderAreas` interact with vkGetRenderAreaGranularity ?

RESOLVED: There is no change. The granularity returned by vkGetRenderAreaGranularity also applies to the per-view renderAreas.

2) How does this extension interact with VK_QCOM_render_pass_transform?

RESOLVED: When VK_QCOM_render_pass_transform is enabled, the application provides render area in non-rotated coordinates which is rotated by the implementation to the rotated coordinate system. When this extension is used in combination with VK_QCOM_render_pass_transform, then the renderArea provided in VkRenderingInfo::renderArea, VkRenderPassBeginInfo::renderArea, or VkCommandBufferInheritanceRenderPassTransformInfoQCOM::renderArea is rotated by the implementation. The per-view render areas are not rotated.

3) How does this extension interact with VK_QCOM_multiview_per_view_viewports

RESOLVED: There is no direct interaction. The per-view viewports and the per-view renderAreas are orthogonal features.

4) When a per-view renderArea is specified, must multiview rendering for each view of a multiview render pass be contained within the per-view renderArea?

RESOLVED: Yes, and the VK_QCOM_multiview_per_view_viewports may help here since it provides per-view scissors.

5) When per-view render areas are specified, what purpose if any do VkRenderPassBeginInfo::renderArea and VkRenderingInfo::renderArea serve?

RESOLVED: The per-view renderArea effectively overrides the per-renderpass renderArea. The per-view renderArea defines the regions of the attachments that are effected by load, store, and multisample resolve operations. A valid implementation could ignore the per-renderpass renderArea. However, as an aid to the implementation, the application must set the per-renderpass renderArea to an area that is at least as large as the union of all the per-view render areas. Pixels that are within the per-renderpass renderArea but not within any per-view render area must not be affected by load, store, or multisample resolve operations.

Description

Certain use cases for multiview have a need for specifying a separate viewport and scissor for each view, without using shader-based viewport indexing as introduced with `VK_EXT_shader_viewport_index_layer`.

This extension adds a new way to control ViewportIndex with multiview. When the `multiviewPerViewViewports` feature is enabled and if the last pre-rasterization shader entry point's interface does not use the `ViewportIndex` built-in decoration, then each view of a multiview render pass instance will use a viewport and scissor index equal to the `ViewIndex`.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM

New Enum Constants

- VK_QCOM_MULTIVIEW_PER_VIEW_VIEWPORTS_EXTENSION_NAME
- VK_QCOM_MULTIVIEW_PER_VIEW_VIEWPORTS_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER_VIEW_VIEWPORTS_FEATURES_QCOM

Issues

1) Is it possible to enable/disable the multiviewPerViewViewports feature for individual render pass instances?

RESOLVED: No, when the multiviewPerViewViewports feature is enabled during vkCreateDevice, then all created render pass instances (including dynamic render passes from VK_KHR_dynamic_rendering) and all created VkPipelines will have the feature enabled. This approach was chosen because it simplifies application code and there is no known use case to enable/disable the feature for individual render passes or pipelines.

2) When this extension is used, is the value of ViewportIndex implicitly written by the last pre-rasterization shader stage and can the value of ViewportIndex be read in the fragment shader?

RESOLVED: No, use of the extension does not add an implicit write to ViewportIndex in any shader stage, and additionally, the value of ViewportIndex in the fragment shader is undefined.

Description

This extension allows a shader resolve to replace fixed-function resolve.

Fixed-function resolve is limited in function to simple filters of multisample buffers to a single sample buffer.

Fixed-function resolve is more performance efficient and/or power efficient than shader resolve for such simple filters.

Shader resolve allows a shader writer to create complex, non-linear filtering of a multisample buffer in the last subpass of a subpass dependency chain.

This extension also provides a bit which **can** be used to enlarge a sample region dependency to a fragment region dependency, so that a framebuffer-region dependency **can** replace a framebuffer-global dependency in some cases.

New Enum Constants

- `VK_QCOM_RENDER_PASS_SHADER_RESOLVE_EXTENSION_NAME`
- `VK_QCOM_RENDER_PASS_SHADER_RESOLVE_SPEC_VERSION`
- Extending VkSubpassDescriptionFlagBits:
  - `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`
  - `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`

Issues

1) Should this extension be named render_pass_shader_resolve?

RESOLVED Yes.

This is part of suite of small extensions to render pass.

Following the style guide, instead of following VK_KHR_create_renderpass2.

2) Should the VK_SAMPLE_COUNT_1_BIT be required for each pColorAttachment and the DepthStencilAttachent?

RESOLVED No.

While this may not be a common use case, and while most fixed-function resolve hardware has this limitation, there is little reason to require a shader resolve to resolve to a single sample buffer.

3) Should a shader resolve subpass be the last subpass in a render pass?

RESOLVED Yes.

To be more specific, it should be the last subpass in a subpass dependency chain.

4) Do we need the `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM` bit?

RESOLVED Yes.

This applies when an input attachment's sample count is equal to `rasterizationSamples`. Further, if `sampleShading` is enabled (explicitly or implicitly) then `minSampleShading` **must** equal 0.0.

However, this bit may be set on any subpass, it is not restricted to a shader resolve subpass.

Description

Render pass attachments **can** be read-only for the duration of a render pass.

Examples include input attachments and depth attachments where depth tests are enabled but depth writes are not enabled.

In such cases, there **can** be no contents generated for an attachment within the render area.

This extension adds a new VkAttachmentStoreOp `VK_ATTACHMENT_STORE_OP_NONE_QCOM` specifying that the contents within the render area **may** not be written to memory, but that the prior contents of the attachment in memory are preserved. However, if any contents were generated within the render area during rendering, the contents of the attachment will be undefined inside the render area.

NOTE

The VkAttachmentStoreOp `VK_ATTACHMENT_STORE_OP_STORE` **may** force an implementation to assume that the attachment was written and force an implementation to flush data to memory or to a higher level cache. The VkAttachmentStoreOp `VK_ATTACHMENT_STORE_OP_NONE_QCOM` **may** allow an implementation to assume that the attachment was not written and allow an implementation to avoid such a flush.

Description

This extension provides a mechanism for applications to enable driver support for render pass transform.

Mobile devices can be rotated and mobile applications need to render properly when a device is held in a landscape or portrait orientation. When the current orientation differs from the device's native orientation, a rotation is required so that the "up" direction of the rendered scene matches the current orientation.

If the Display Processing Unit (DPU) does not natively support rotation, the Vulkan presentation engine can handle this rotation in a separate composition pass. Alternatively, the application can render frames "pre-rotated" to avoid this extra pass. The latter is preferred to reduce power consumption and achieve the best performance because it avoids tasking the GPU with extra work to perform the copy/rotate operation.

Unlike OpenGL ES, the burden of pre-rotation in Vulkan falls on the application. To implement pre-rotation, applications render into swapchain images matching the device native aspect ratio of the display and "pre-rotate" the rendering content to match the device's current orientation. The burden is more than adjusting the Model View Projection (MVP) matrix in the vertex shader to account for rotation and aspect ratio. The coordinate systems of scissors, viewports, derivatives and several shader built-ins may need to be adapted to produce the correct result.

It is difficult for some game engines to manage this burden; many chose to simply accept the performance/power overhead of performing rotation in the presentation engine.

This extension allows applications to achieve the performance benefits of pre-rotated rendering by moving much of the above-mentioned burden to the graphics driver. The following is unchanged with this extension:

- Applications create a swapchain matching the native orientation of the display. Applications must also set the VkSwapchainCreateInfoKHR::`preTransform` equal to the `currentTransform` as returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR.

The following is changed with this extension:

- At vkCmdBeginRenderPass, the application provides extension struct VkRenderPassTransformBeginInfoQCOM specifying the render pass transform parameters.
- At vkBeginCommandBuffer for secondary command buffers, the application provides extension

struct VkCommandBufferInheritanceRenderPassTransformInfoQCOM specifying the render pass transform parameters.

- The renderArea, viewports, scissors, and fragmentSize are all provided in the current (non-rotated) coordinate system. The implementation will transform those into the native (rotated) coordinate system.
- The implementation is responsible for transforming shader built-ins (FragCoord, PointCoord, SamplePosition, PrimitiveShadingRateKHR, interpolateAt(), dFdx, dFdy, fWidth) into the rotated coordinate system.
- The implementation is responsible for transforming position to the rotated coordinate system.
- If this extension is used with VK_QCOM_tile_properties, then vkGetFramebufferTilePropertiesQCOM and vkGetDynamicRenderingTilePropertiesQCOM return tile properties in the rotated coordinate space.

New Structures

- Extending VkCommandBufferInheritanceInfo:
  - VkCommandBufferInheritanceRenderPassTransformInfoQCOM
- Extending VkRenderPassBeginInfo:
  - VkRenderPassTransformBeginInfoQCOM

New Enum Constants

- VK_QCOM_RENDER_PASS_TRANSFORM_EXTENSION_NAME
- VK_QCOM_RENDER_PASS_TRANSFORM_SPEC_VERSION
- Extending VkRenderPassCreateFlagBits:
  - VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM
  - VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM

Issues

1) Some early Adreno drivers (October 2019 through March 2020) advertised support for this extension but expected VK_STRUCTURE_TYPE values different from those in the vukan headers. To cover all Adreno devices on the market, applications need to detect the driver version and use the appropriate VK_STRUCTURE_TYPE values from the table below.

The driver version reported in VkPhysicalDeviceProperties.driverVersion is a uint32_t type. You can decode the uint32_t value into a major.minor.patch version as shown below:

```
uint32_t  major = ((driverVersion) >> 22);
uint32_t  minor = ((driverVersion) >> 12) & 0x3ff);
uint32_t  patch = ((driverVersion) & 0xfff);
```

If the Adreno major.minor.patch version is greater than or equal to 512.469.0, then simply use the VK_STRUCTURE_TYPE values as defined in vulkan_core.h. If the version is less than or equal to 512.468.0, then use the alternate values for the two VK_STRUCTURE_TYPEs in the table below.

Table 111. Adreno Driver Requirements

	Adreno Driver Version	
	512.468.0 and earlier	512.469.0 and later
VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM	1000282000	1000282001
VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM	1000282001	1000282000

2) Should the extension support only rotations (e.g. 90, 180, 270-degrees), or also mirror transforms (e.g. vertical flips)? Mobile use cases only require rotation. Other display systems such as projectors might require a flipped transform.

RESOLVED: In this version of the extension, the functionality is restricted to 90, 180, and 270-degree rotations to address mobile use cases.

3) How does this extension interact with VK_EXT_fragment_density_map?

RESOLVED Some implementations may not be able to support a render pass that enables both render pass transform and fragment density maps. For simplicity, this extension disallows enabling both features within a single render pass.

4) What should this extension be named?

We considered names such as “rotated_rendering”, “pre_rotation” and others. Since the functionality is limited to a render pass, it seemed the name should include “render_pass”. While the current extension is limited to rotations, it could be extended to other transforms (like mirror) in the future.

RESOLVED The name “render_pass_transform” seems like the most accurate description of the introduced functionality.

5) How does this extension interact with VK_KHR_fragment_shading_rate?

RESOLVED: For the same reasons as issue 3, this extension disallows enabling both `pFragmentShadingRateAttachment` and render pass transform within a single render pass.

However, pipeline shading rate and primitive shading rate are supported, and their respective `fragmentSize` and `PrimitiveShadingRateKHR` are provided in the current (non-rotated) coordinate system. The implementation is responsible for transforming them to the rotated coordinate system.

The set of supported shading rates **may** be different per transform. Supported rates queried from

vkGetPhysicalDeviceFragmentShadingRatesKHR are in the native (rotated) coordinate system. This means that the application **must** swap the x/y of the reported rates to get the set of rates supported for 90 and 270 degree rotation.

- Matthew Netsch, Qualcomm Technologies, Inc.

Description

This extension extends adds an optional rotation transform to copy commands vkCmdBlitImage2KHR, vkCmdCopyImageToBuffer2KHR and vkCmdCopyBufferToImage2KHR. When copying between two resources, where one resource contains rotated content and the other does not, a rotated copy may be desired. This extension may be used in combination with VK_QCOM_render_pass_transform which adds rotated render passes.

This extension adds an extension structure to the following commands: vkCmdBlitImage2KHR, vkCmdCopyImageToBuffer2KHR and vkCmdCopyBufferToImage2KHR

Issues

1) What is an appropriate name for the added extension structure? The style guide says “Structures which extend other structures through the pNext chain should reflect the name of the base structure they extend.”, but in this case a single extension structure is used to extend three base structures (vkCmdBlitImage2KHR, vkCmdCopyImageToBuffer2KHR and vkCmdCopyBufferToImage2KHR). Creating three identical structures with unique names seemed undesirable.

RESOLVED: Deviate from the style guide for extension structure naming.

2) Should this extension add a rotation capability to vkCmdCopyImage2KHR?

RESOLVED: No. Use of rotated vkCmdBlitImage2KHR can fully address this use case.

3) Should this extension add a rotation capability to vkCmdResolveImage2KHR?

RESOLVED No. Use of vkCmdResolveImage2KHR is very slow and extremely bandwidth intensive on Qualcomm’s GPU architecture and use of pResolveAttachments in vkRenderPass is the strongly preferred approach. Therefore, we choose not to introduce a rotation capability to vkCmdResolveImage2KHR.

Description

This extension allows implementations to expose support for “sRGB EOTF” also known as “sRGB degamma”, used in combination with images using 8-bit $Y'C_BC_R$ formats. In addition, the degamma can be selectively applied to the Y (luma) or CrCb (chroma).

`VK_KHR_sampler_ycbcr_conversion` adds support for $Y'C_BC_R$ conversion, but allows texture sampling in a non-linear space which can cause artifacts. This extension allows implementations to expose sRGB degamma for $Y'C_BC_R$ formats, which is performed during texture filtering, allowing texture filtering to operate in a linear space.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceYcbcrDegammaFeaturesQCOM

- Extending VkSamplerYcbcrConversionCreateInfo:
  - VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM

New Enum Constants

- VK_QCOM_YCBCR_DEGAMMA_EXTENSION_NAME
- VK_QCOM_YCBCR_DEGAMMA_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_DEGAMMA_FEATURES_QCOM
  - VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_YCBCR_DEGAMMA_CREATE_INFO_QCOM

Issues

1) Which Y'C_BC_R formats support the degamma feature?

RESOLVED: For implementations that support the extension, each format that contains 8-bit R, G, and B components and supports either VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT or VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT must support degamma.

Since non-compressed Vulkan sRGB formats are already limited to 8-bit components, and since Adreno supports degamma for all 8bit Y'C_BC_R formats, this extension does not introduce a new VK_FORMAT_FEATURE* bit for the degamma feature.

2) On which Y'C_BC_R components is the degamma applied?

RESOLVED: While degamma is expected to be applied to only the Y (luma) component, the extension provides the ability to selectively enable degamma for both the Y (luma) and/or CbCr (chroma) components.

3) Should degamma be enabled for the sampler object or for the image view object?

RESOLVED: Both. This extension extends VkSamplerYcbcrConversionCreateInfo and the specification already requires that both sampler and view objects must be created with an *identical* VkSamplerYcbcrConversionCreateInfo in their pNext chains.

4) Why apply the “sRGB” transfer function directly to Y'C_BC_R data when it would be more correct to use the “ITU transfer function”, and do so only after the values have been converted into non-linear R’G’B'?

RESOLVED: Y'C_BC_R is frequently stored according to standards (e.g. BT.601 and BT.709) that specify that the conversion between linear and non-linear should use the ITU Transfer function. The ITU transfer function is mathematically different from the sRGB transfer function and while sRGB and ITU define similar curves, the difference is significant. Performing the “sRGB degamma” prior to range expansion can introduce artifacts if the content uses VK_SAMPLER_YCBCR_RANGE_ITU_NARROW encoding. Nevertheless, using sRGB can make sense for certain use cases where camera YCbCr images are known to be encoded with sRGB (or a pure gamma 2.2) transfer function and are known to use full-range encoding.

For those use cases, this extension leverages the GPU ability to enable sRGB degamma at little cost,

and can improve quality because texture filtering is able to occur in linear space.

Description

This extension enables an application to import QNX Screen `_screen_buffer` objects created outside of the Vulkan device into Vulkan memory objects, where they can be bound to images and buffers.

Some `_screen_buffer` images have implementation-defined *external formats* that **may** not correspond to Vulkan formats. Sampler $Y'C_BC_R$ conversion **can** be used to sample from these images and convert them to a known color space.

`_screen_buffer` is strongly typed, so naming the handle type is redundant. The internal layout and therefore size of a `_screen_buffer` image may depend on native usage flags that do not have corresponding Vulkan counterparts.

New Commands

- vkGetScreenBufferPropertiesQNX

New Structures

- VkScreenBufferPropertiesQNX

Description

The `VK_QNX_screen_surface` extension is an instance extension. It provides a mechanism to create a VkSurfaceKHR object (defined by the `VK_KHR_surface` extension) that refers to a QNX Screen `window`, as well as a query to determine support for rendering to a QNX Screen compositor.

New Commands

- vkCreateScreenSurfaceQNX

Description

This extension is intended to communicate information from layered API implementations such as ANGLE to internal proprietary system schedulers. It has no behavioral implications beyond enabling more intelligent behavior from the system scheduler.

Application developers should avoid using this extension. It is documented solely for the benefit of tools and layer developers, who may need to manipulate `pNext` chains that include these structures.

NOTE	There is currently no specification language written for this extension. The links to APIs defined by the extension are to stubs that only include generated content such as API declarations and implicit valid usage statements.

NOTE	This extension is only intended for use in specific embedded environments with known implementation details, and is therefore undocumented.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceAmigoProfilingFeaturesSEC
- Extending VkSubmitInfo:
  - VkAmigoProfilingSubmitInfoSEC

New Enum Constants

- `VK_SEC_AMIGO_PROFILING_EXTENSION_NAME`
- `VK_SEC_AMIGO_PROFILING_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_AMIGO_PROFILING_SUBMIT_INFO_SEC`

- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_AMIGO_PROFILING_FEATURES_SEC

Stub API References

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_SEC_amigo_profiling
typedef struct VkPhysicalDeviceAmigoProfilingFeaturesSEC {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           amigoProfiling;
} VkPhysicalDeviceAmigoProfilingFeaturesSEC;
```

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceAmigoProfilingFeaturesSEC-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_AMIGO_PROFILING_FEATURES_SEC

There is currently no specification language written for this type. This section acts only as placeholder and to avoid dead links in the specification and reference pages.

```
// Provided by VK_SEC_amigo_profiling
typedef struct VkAmigoProfilingSubmitInfoSEC {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           firstDrawTimestamp;
    uint64_t           swapBufferTimestamp;
} VkAmigoProfilingSubmitInfoSEC;
```

Valid Usage (Implicit)

Description

The VK_KHR_portability_subset extension allows a non-conformant Vulkan implementation to be built on top of another non-Vulkan graphics API, and identifies differences between that implementation and a fully-conformant native Vulkan implementation.

This extension provides Vulkan implementations with the ability to mark otherwise-required capabilities as unsupported, or to establish additional properties and limits that the application should adhere to in order to guarantee portable behavior and operation across platforms, including platforms where Vulkan is not natively supported.

The goal of this specification is to document, and make queryable, capabilities which are required to be supported by a fully-conformant Vulkan 1.0 implementation, but may be optional for an implementation of the Vulkan 1.0 Portability Subset.

The intent is that this extension will be advertised only on implementations of the Vulkan 1.0 Portability Subset, and not on conformant implementations of Vulkan 1.0. Fully-conformant Vulkan implementations provide all the required capabilities, and so will not provide this extension. Therefore, the existence of this extension can be used to determine that an implementation is likely not fully conformant with the Vulkan spec.

If this extension is supported by the Vulkan implementation, the application must enable this extension.

This extension defines several new structures that can be chained to the existing structures used by certain standard Vulkan calls, in order to query for non-conformant portable behavior.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePortabilitySubsetFeaturesKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDevicePortabilitySubsetPropertiesKHR

New Enum Constants

- VK_KHR_PORTABILITY_SUBSET_EXTENSION_NAME

Description

Interoperability between APIs can sometimes create additional overhead depending on the platform used. This extension targets deployment of existing CUDA kernels via Vulkan, with a way to directly upload PTX kernels and dispatch the kernels from Vulkan's command buffer without the need to use interoperability between the Vulkan and CUDA contexts. However, we do encourage actual development using the native CUDA runtime for the purpose of debugging and profiling.

The application will first have to create a CUDA module using vkCreateCudaModuleNV then create the CUDA function entry point with vkCreateCudaFunctionNV.

Then in order to dispatch this function, the application will create a command buffer where it will launch the kernel with vkCmdCudaLaunchKernelNV.

When done, the application will then destroy the function handle, as well as the CUDA module handle with vkDestroyCudaFunctionNV and vkDestroyCudaModuleNV.

To reduce the impact of compilation time, this extension offers the capability to return a binary cache from the PTX that was provided. For this, a first query for the required cache size is made with vkGetCudaModuleCacheNV with a `NULL` pointer to a buffer and with a valid pointer receiving the size; then another call of the same function with a valid pointer to a buffer to retrieve the data. The resulting cache could then be used later for further runs of this application by sending this cache instead of the PTX code (using the same vkCreateCudaModuleNV), thus significantly speeding up the initialization of the CUDA module.

As with VkPipelineCache, the binary cache depends on the hardware architecture. The application must assume the cache might fail, and need to handle falling back to the original PTX code as necessary. Most often, the cache will succeed if the same GPU driver and architecture is used between the cache generation from PTX and the use of this cache. In the event of a new driver version, or if using a different GPU architecture, the cache is likely to become invalid.

New Object Types

- VkCudaFunctionNV
- VkCudaModuleNV

New Commands

- vkCmdCudaLaunchKernelNV
- vkCreateCudaFunctionNV
- vkCreateCudaModuleNV
- vkDestroyCudaFunctionNV
- vkDestroyCudaModuleNV
- vkGetCudaModuleCacheNV

New Structures

- VkCudaFunctionCreateInfoNV
- VkCudaLaunchInfoNV
- VkCudaModuleCreateInfoNV
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceCudaKernelLaunchFeaturesNV
- Extending VkPhysicalDeviceProperties2:

    - VkPhysicalDeviceCudaKernelLaunchPropertiesNV

New Enum Constants

- VK_NV_CUDA_KERNEL_LAUNCH_EXTENSION_NAME
- VK_NV_CUDA_KERNEL_LAUNCH_SPEC_VERSION
- Extending VkObjectType:
    - VK_OBJECT_TYPE_CUDA_FUNCTION_NV
    - VK_OBJECT_TYPE_CUDA_MODULE_NV
- Extending VkStructureType:
    - VK_STRUCTURE_TYPE_CUDA_FUNCTION_CREATE_INFO_NV
    - VK_STRUCTURE_TYPE_CUDA_LAUNCH_INFO_NV
    - VK_STRUCTURE_TYPE_CUDA_MODULE_CREATE_INFO_NV
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUDA_KERNEL_LAUNCH_FEATURES_NV
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUDA_KERNEL_LAUNCH_PROPERTIES_NV

If VK_EXT_debug_report is supported:

- Extending VkDebugReportObjectTypeEXT:
    - VK_DEBUG_REPORT_OBJECT_TYPE_CUDA_FUNCTION_NV_EXT
    - VK_DEBUG_REPORT_OBJECT_TYPE_CUDA_MODULE_NV_EXT

Issues

None.

Description

Ray tracing can very efficiently render from geometry which has very fine detail, but when using only a basic triangle representation, memory consumption can be an issue. This extension adds the ability to add a *displacement map* to add more detail to triangles in an acceleration structure with an efficient in-memory format. The format is externally visible to allow the application to compress its internal geometry representations into the compressed format ahead of time. This format adds displacements along a defined vector to subtriangle vertices which are subdivided from the main triangles.

This extension provides:

- a new VkMicromapTypeEXT format for the displacement micromap,
- a structure to extend VkAccelerationStructureGeometryTrianglesDataKHR to attach a displacement micromap to the geometry of the acceleration structure,
- enums extending VkBuildAccelerationStructureFlagBitsKHR to allow for updates.

New Structures

- Extending VkAccelerationStructureGeometryTrianglesDataKHR:
  - VkAccelerationStructureTrianglesDisplacementMicromapNV
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:

    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DISPLACEMENT_MICROMAP_PROPERTIES_NV

Issues

(1) What is the status of this extension?

- Provisional and expected to change. The broad structure and encoding format are stable, but there will likely be changes to the structures, enumerant values, and shader interface.

Description

The `VK_KHR_16bit_storage` extension allows use of 16-bit types in shader input and output interfaces, and push constant blocks. This extension introduces several new optional features which map to SPIR-V capabilities and allow access to 16-bit data in `Block`-decorated objects in the `Uniform` and the `StorageBuffer` storage classes, and objects in the `PushConstant` storage class. This extension allows 16-bit variables to be declared and used as user-defined shader inputs and outputs but does not change location assignment and component assignment rules.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. However, if Vulkan 1.1 is supported and this extension is not, the `storageBuffer16BitAccess` capability is optional. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevice16BitStorageFeaturesKHR

New Enum Constants

- `VK_KHR_16BIT_STORAGE_EXTENSION_NAME`
- `VK_KHR_16BIT_STORAGE_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES_KHR`

New SPIR-V Capabilities

- `StorageBuffer16BitAccess`
- `UniformAndStorageBuffer16BitAccess`
- `StoragePushConstant16`
- `StorageInputOutput16`

Version History

Description

This extension provides versions of vkBindBufferMemory and vkBindImageMemory that allow multiple bindings to be performed at once, and are extensible.

This extension also introduces `VK_IMAGE_CREATE_ALIAS_BIT_KHR`, which allows “identical” images that alias the same memory to interpret the contents consistently, even across image layout changes.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The

original type, enum, and command names are still available as aliases of the core functionality.

New Commands

- vkBindBufferMemory2KHR
- vkBindImageMemory2KHR

New Structures

- VkBindBufferMemoryInfoKHR
- VkBindImageMemoryInfoKHR

New Enum Constants

- `VK_KHR_BIND_MEMORY_2_EXTENSION_NAME`
- `VK_KHR_BIND_MEMORY_2_SPEC_VERSION`
- Extending VkImageCreateFlagBits:
  - `VK_IMAGE_CREATE_ALIAS_BIT_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO_KHR`
  - `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO_KHR`

Version History

- Revision 1, 2017-05-19 (Tobias Hector)
  - Pulled bind memory functions into their own extension

Description

This extension enables resources to be bound to a dedicated allocation, rather than suballocated. For any particular resource, applications **can** query whether a dedicated allocation is recommended, in which case using a dedicated allocation **may** improve the performance of access to that resource. Normal device memory allocations must support multiple resources per allocation, memory aliasing and sparse binding, which could interfere with some optimizations. Applications should query the implementation for when a dedicated allocation **may** be beneficial by adding a `VkMemoryDedicatedRequirementsKHR` structure to the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of a call to `vkGetBufferMemoryRequirements2` or `vkGetImageMemoryRequirements2`. Certain external handle types and external images or buffers **may** also depend on dedicated allocations on implementations that associate image or buffer metadata with OS-level memory objects.

This extension adds a two small structures to memory requirements querying and memory allocation: a new structure that flags whether an image/buffer should have a dedicated allocation, and a structure indicating the image or buffer that an allocation will be bound to.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- Extending VkMemoryAllocateInfo:
  - VkMemoryDedicatedAllocateInfoKHR

- Extending VkMemoryRequirements2:
  - VkMemoryDedicatedRequirementsKHR

New Enum Constants

- VK_KHR_DEDICATED_ALLOCATION_EXTENSION_NAME
- VK_KHR_DEDICATED_ALLOCATION_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO_KHR
  - VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS_KHR

Examples

```
    // Create an image with a dedicated allocation based on the
    // implementation's preference

    VkImageCreateInfo imageCreateInfo =
    {
        // Image creation parameters
    };

    VkImage image;
    VkResult result = vkCreateImage(
        device,
        &imageCreateInfo,
        NULL,               // pAllocator
        &image);

    VkMemoryDedicatedRequirementsKHR dedicatedRequirements =
    {
        .sType = VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS_KHR,
        .pNext = NULL,
    };

    VkMemoryRequirements2 memoryRequirements =
    {
        .sType = VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2,
        .pNext = &dedicatedRequirements,
    };

    const VkImageMemoryRequirementsInfo2 imageRequirementsInfo =
    {
        .sType = VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2,
        .pNext = NULL,
        .image = image
    };

    vkGetImageMemoryRequirements2(
```

```
        device,
        &imageRequirementsInfo,
        &memoryRequirements);

    if (dedicatedRequirements.prefersDedicatedAllocation) {
        // Allocate memory with VkMemoryDedicatedAllocateInfoKHR::image
        // pointing to the image we are allocating the memory for

        VkMemoryDedicatedAllocateInfoKHR dedicatedInfo =
        {
            .sType = VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO_KHR,
            .pNext = NULL,
            .image = image,
            .buffer = VK_NULL_HANDLE,
        };

        VkMemoryAllocateInfo memoryAllocateInfo =
        {
            .sType = VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO,
            .pNext = &dedicatedInfo,
            .allocationSize = memoryRequirements.size,
            .memoryTypeIndex = FindMemoryTypeIndex(memoryRequirements.memoryTypeBits),
        };

        VkDeviceMemory memory;
        vkAllocateMemory(
            device,
            &memoryAllocateInfo,
            NULL,               // pAllocator
            &memory);

        // Bind the image to the memory

        vkBindImageMemory(
            device,
            image,
            memory,
            0);
    } else {
        // Take the normal memory sub-allocation path
    }
```

Version History

- Revision 1, 2017-02-27 (James Jones)
  - Copy content from VK_NV_dedicated_allocation
  - Add some references to external object interactions to the overview.
- Revision 2, 2017-03-27 (Faith Ekstrand)

    - Rework the extension to be query-based
- Revision 3, 2017-07-31 (Faith Ekstrand)
    - Clarify that memory objects allocated with VkMemoryDedicatedAllocateInfoKHR can only have the specified resource bound and no others.

Interactions and External Dependencies

- Interacts with `VK_KHR_push_descriptor`

Contributors

- Jeff Bolz, NVIDIA

- Michael Worcester, Imagination Technologies

Description

Applications may wish to update a fixed set of descriptors in a large number of descriptor sets very frequently, i.e. during initialization phase or if it is required to rebuild descriptor sets for each frame. For those cases it is also not unlikely that all information required to update a single descriptor set is stored in a single struct. This extension provides a way to update a fixed set of descriptors in a single VkDescriptorSet with a pointer to an application-defined data structure describing the new descriptors.

Promotion to Vulkan 1.1

vkCmdPushDescriptorSetWithTemplateKHR is included as an interaction with `VK_KHR_push_descriptor`. If Vulkan 1.1 and `VK_KHR_push_descriptor` are supported, this is included by `VK_KHR_push_descriptor`.

The base functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Object Types

Description

This extension provides functionality to use a logical device that consists of multiple physical devices, as created with the `VK_KHR_device_group_creation` extension. A device group can allocate memory across the subdevices, bind memory from one subdevice to a resource on another subdevice, record command buffers where some work executes on an arbitrary subset of the subdevices, and potentially present a swapchain image from one or more subdevices.

Promotion to Vulkan 1.1

The following enums, types and commands are included as interactions with `VK_KHR_swapchain`:

- `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`
- `VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR`
- `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR`
- `VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR`
- `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`
- `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
- `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`
- VkDeviceGroupPresentModeFlagBitsKHR
- VkDeviceGroupPresentCapabilitiesKHR
- VkImageSwapchainCreateInfoKHR

- VkBindImageMemorySwapchainInfoKHR
- VkAcquireNextImageInfoKHR
- VkDeviceGroupPresentInfoKHR
- VkDeviceGroupSwapchainCreateInfoKHR
- vkGetDeviceGroupPresentCapabilitiesKHR
- vkGetDeviceGroupSurfacePresentModesKHR
- vkGetPhysicalDevicePresentRectanglesKHR
- vkAcquireNextImage2KHR

If Vulkan 1.1 and `VK_KHR_swapchain` are supported, these are included by `VK_KHR_swapchain`.

The base functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Commands

- vkCmdDispatchBaseKHR
- vkCmdSetDeviceMaskKHR
- vkGetDeviceGroupPeerMemoryFeaturesKHR

If VK_KHR_surface is supported:

- vkGetDeviceGroupPresentCapabilitiesKHR
- vkGetDeviceGroupSurfacePresentModesKHR
- vkGetPhysicalDevicePresentRectanglesKHR

If VK_KHR_swapchain is supported:

- vkAcquireNextImage2KHR

New Structures

- Extending VkBindSparseInfo:
  - VkDeviceGroupBindSparseInfoKHR
- Extending VkCommandBufferBeginInfo:
  - VkDeviceGroupCommandBufferBeginInfoKHR
- Extending VkMemoryAllocateInfo:
  - VkMemoryAllocateFlagsInfoKHR
- Extending VkRenderPassBeginInfo, VkRenderingInfo:
  - VkDeviceGroupRenderPassBeginInfoKHR
- Extending VkSubmitInfo:
  - VkDeviceGroupSubmitInfoKHR

If VK_KHR_bind_memory2 is supported:

- Extending VkBindBufferMemoryInfo:
  - VkBindBufferMemoryDeviceGroupInfoKHR
- Extending VkBindImageMemoryInfo:
  - VkBindImageMemoryDeviceGroupInfoKHR

If VK_KHR_surface is supported:

- VkDeviceGroupPresentCapabilitiesKHR

If VK_KHR_swapchain is supported:

- VkAcquireNextImageInfoKHR
- Extending VkBindImageMemoryInfo:
  - VkBindImageMemorySwapchainInfoKHR
- Extending VkImageCreateInfo:
  - VkImageSwapchainCreateInfoKHR
- Extending VkPresentInfoKHR:
  - VkDeviceGroupPresentInfoKHR
- Extending VkSwapchainCreateInfoKHR:
  - VkDeviceGroupSwapchainCreateInfoKHR

New Enums

- VkMemoryAllocateFlagBitsKHR
- VkPeerMemoryFeatureFlagBitsKHR

If VK_KHR_surface is supported:

- VkDeviceGroupPresentModeFlagBitsKHR

New Bitmasks

- VkMemoryAllocateFlagsKHR
- VkPeerMemoryFeatureFlagsKHR

If VK_KHR_surface is supported:

- VkDeviceGroupPresentModeFlagsKHR

New Enum Constants

- `VK_KHR_DEVICE_GROUP_EXTENSION_NAME`
- `VK_KHR_DEVICE_GROUP_SPEC_VERSION`

- Extending VkDependencyFlagBits:
  - VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR
- Extending VkMemoryAllocateFlagBits:
  - VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR
- Extending VkPeerMemoryFeatureFlagBits:
  - VK_PEER_MEMORY_FEATURE_COPY_DST_BIT_KHR
  - VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT_KHR
  - VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT_KHR
  - VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT_KHR
- Extending VkPipelineCreateFlagBits:
  - VK_PIPELINE_CREATE_DISPATCH_BASE_KHR
  - VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO_KHR
  - VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO_KHR
  - VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO_KHR
  - VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO_KHR
  - VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO_KHR

If VK_KHR_bind_memory2 is supported:

- Extending VkImageCreateFlagBits:
  - VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO_KHR
  - VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO_KHR

If VK_KHR_surface is supported:

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR

If VK_KHR_swapchain is supported:

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR
  - VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR
  - VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR
  - VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR

    - VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR
- Extending VkSwapchainCreateFlagBitsKHR:
    - VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR

New Built-in Variables

Description

This extension provides instance-level commands to enumerate groups of physical devices, and to create a logical device from a subset of one of those groups. Such a logical device can then be used with new features in the `VK_KHR_device_group` extension.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Commands

- vkEnumeratePhysicalDeviceGroupsKHR

New Structures

- VkPhysicalDeviceGroupPropertiesKHR
- Extending VkDeviceCreateInfo:
  - VkDeviceGroupDeviceCreateInfoKHR

New Enum Constants

- `VK_KHR_DEVICE_GROUP_CREATION_EXTENSION_NAME`
- `VK_KHR_DEVICE_GROUP_CREATION_SPEC_VERSION`
- `VK_MAX_DEVICE_GROUP_SIZE_KHR`
- Extending VkMemoryHeapFlagBits:
  - `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO_KHR`

- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES_KHR

Examples

```
    VkDeviceCreateInfo devCreateInfo = { VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO };
    // (not shown) fill out devCreateInfo as usual.
    uint32_t deviceGroupCount = 0;
    VkPhysicalDeviceGroupPropertiesKHR *props = NULL;

    // Query the number of device groups
    vkEnumeratePhysicalDeviceGroupsKHR(g_vkInstance, &deviceGroupCount, NULL);

    // Allocate and initialize structures to query the device groups
    props = (VkPhysicalDeviceGroupPropertiesKHR *)malloc(deviceGroupCount*sizeof
(VkPhysicalDeviceGroupPropertiesKHR));
    for (i = 0; i < deviceGroupCount; ++i) {
        props[i].sType = VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES_KHR;
        props[i].pNext = NULL;
    }
    vkEnumeratePhysicalDeviceGroupsKHR(g_vkInstance, &deviceGroupCount, props);

    // If the first device group has more than one physical device. create
    // a logical device using all of the physical devices.
    VkDeviceGroupDeviceCreateInfoKHR deviceGroupInfo = {
VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO_KHR };
    if (props[0].physicalDeviceCount > 1) {
        deviceGroupInfo.physicalDeviceCount = props[0].physicalDeviceCount;
        deviceGroupInfo.pPhysicalDevices = props[0].physicalDevices;
        devCreateInfo.pNext = &deviceGroupInfo;
    }

    vkCreateDevice(props[0].physicalDevices[0], &devCreateInfo, NULL, &g_vkDevice);
    free(props);
```

Description

An application may wish to reference device memory in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension enables an application to export non-Vulkan handles from Vulkan memory objects such that the underlying resources can be referenced outside the scope of the Vulkan logical device that created them.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- Extending VkBufferCreateInfo:
  - VkExternalMemoryBufferCreateInfoKHR
- Extending VkImageCreateInfo:
  - VkExternalMemoryImageCreateInfoKHR
- Extending VkMemoryAllocateInfo:
  - VkExportMemoryAllocateInfoKHR

New Enum Constants

- `VK_KHR_EXTERNAL_MEMORY_EXTENSION_NAME`
- `VK_KHR_EXTERNAL_MEMORY_SPEC_VERSION`
- `VK_QUEUE_FAMILY_EXTERNAL_KHR`
- Extending VkResult:
  - `VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO_KHR`
  - `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO_KHR`

Issues

1) How do applications correlate two physical devices across process or Vulkan instance boundaries?

RESOLVED: New device ID fields have been introduced by `VK_KHR_external_memory_capabilities`. These fields, combined with the existing VkPhysicalDeviceProperties::`driverVersion` field can be used to identify compatible devices across processes, drivers, and APIs. VkPhysicalDeviceProperties::`pipelineCacheUUID` is not sufficient for this purpose because despite its description in the specification, it need only identify a unique pipeline cache format in practice. Multiple devices may be able to use the same pipeline cache data, and hence it would be desirable for all of them to have the same pipeline cache UUID. However, only the same concrete physical

device can be used when sharing memory, so an actual unique device ID was introduced. Further, the pipeline cache UUID was specific to Vulkan, but correlation with other, non-extensible APIs is required to enable interoperation with those APIs.

2) If memory objects are shared between processes and APIs, is this considered aliasing according to the rules outlined in the Memory Aliasing section?

RESOLVED: Yes. Applications must take care to obey all restrictions imposed on aliased resources when using memory across multiple Vulkan instances or other APIs.

3) Are new image layouts or metadata required to specify image layouts and layout transitions compatible with non-Vulkan APIs, or with other instances of the same Vulkan driver?

RESOLVED: Separate instances of the same Vulkan driver running on the same GPU should have identical internal layout semantics, so applications have the tools they need to ensure views of images are consistent between the two instances. Other APIs will fall into two categories: Those that are Vulkan- compatible, and those that are Vulkan-incompatible. Vulkan-incompatible APIs will require the image to be in the GENERAL layout whenever they are accessing them.

Note this does not attempt to address cross-device transitions, nor transitions to engines on the same device which are not visible within the Vulkan API. Both of these are beyond the scope of this extension.

4) Is a new barrier flag or operation of some type needed to prepare external memory for handoff to another Vulkan instance or API and/or receive it from another instance or API?

RESOLVED: Yes. Some implementations need to perform additional cache management when transitioning memory between address spaces and other APIs, instances, or processes which may operate in a separate address space. Options for defining this transition include:

- A new structure that can be added to the `pNext` list in VkMemoryBarrier, VkBufferMemoryBarrier, and VkImageMemoryBarrier.
- A new bit in VkAccessFlags that can be set to indicate an “external” access.
- A new bit in VkDependencyFlags
- A new special queue family that represents an “external” queue.

A new structure has the advantage that the type of external transition can be described in as much detail as necessary. However, there is not currently a known need for anything beyond differentiating between external and internal accesses, so this is likely an over-engineered solution. The access flag bit has the advantage that it can be applied at buffer, image, or global granularity, and semantically it maps pretty well to the operation being described. Additionally, the API already includes `VK_ACCESS_MEMORY_READ_BIT` and `VK_ACCESS_MEMORY_WRITE_BIT` which appear to be intended for this purpose. However, there is no obvious pipeline stage that would correspond to an external access, and therefore no clear way to use `VK_ACCESS_MEMORY_READ_BIT` or `VK_ACCESS_MEMORY_WRITE_BIT`. VkDependencyFlags and VkPipelineStageFlags operate at command granularity rather than image or buffer granularity, which would make an entire pipeline barrier an internal→external or external→internal barrier. This may not be a problem in practice, but seems like the wrong scope. Another downside of VkDependencyFlags is that it lacks inherent directionality: there are no `src` and `dst` variants of it in the barrier or dependency description semantics, so two bits might need to

be added to describe both internal→external and external→internal transitions. Transitioning a resource to a special queue family corresponds well with the operation of transitioning to a separate Vulkan instance, in that both operations ideally include scheduling a barrier on both sides of the transition: Both the releasing and the acquiring queue or process. Using a special queue family requires adding an additional reserved queue family index. Re-using `VK_QUEUE_FAMILY_IGNORED` would have left it unclear how to transition a concurrent usage resource from one process to another, since the semantics would have likely been equivalent to the currently-ignored transition of `VK_QUEUE_FAMILY_IGNORED` → `VK_QUEUE_FAMILY_IGNORED`. Fortunately, creating a new reserved queue family index is not invasive.

Based on the above analysis, the approach of transitioning to a special "external" queue family was chosen.

5) Do internal driver memory arrangements and/or other internal driver image properties need to be exported and imported when sharing images across processes or APIs.

RESOLVED: Some vendors claim this is necessary on their implementations, but it was determined that the security risks of allowing opaque metadata to be passed from applications to the driver were too high. Therefore, implementations which require metadata will need to associate it with the objects represented by the external handles, and rely on the dedicated allocation mechanism to associate the exported and imported memory objects with a single image or buffer.

6) Most prior interoperation and cross-process sharing APIs have been based on image-level sharing. Should Vulkan sharing be based on memory-object sharing or image sharing?

RESOLVED: These extensions have assumed memory-level sharing is the correct granularity. Vulkan is a lower-level API than most prior APIs, and as such attempts to closely align with to the underlying primitives of the hardware and system-level drivers it abstracts. In general, the resource that holds the backing store for both images and buffers of various types is memory. Images and buffers are merely metadata containing brief descriptions of the layout of bits within that memory.

Because memory object-based sharing is aligned with the overall Vulkan API design, it enables the full range of Vulkan capabilities with external objects. External memory can be used as backing for sparse images, for example, whereas such usage would be awkward at best with a sharing mechanism based on higher-level primitives such as images. Further, aligning the mechanism with the API in this way provides some hope of trivial compatibility with future API enhancements. If new objects backed by memory objects are added to the API, they too can be used across processes with minimal additions to the base external memory APIs.

Earlier APIs implemented interop at a higher level, and this necessitated entirely separate sharing APIs for images and buffers. To co-exist and interoperate with those APIs, the Vulkan external sharing mechanism must accommodate their model. However, if it can be agreed that memory-based sharing is the more desirable and forward-looking design, legacy interoperation constraints can be considered another reason to favor memory-based sharing: while native and legacy driver primitives that may be used to implement sharing may not be as low-level as the API here suggests, raw memory is still the least common denominator among the types. Image-based sharing can be cleanly derived from a set of base memory- object sharing APIs with minimal effort, whereas image-based sharing does not generalize well to buffer or raw-memory sharing. Therefore,

following the general Vulkan design principle of minimalism, it is better to expose interopability with image-based native and external primitives via the memory sharing API, and place sufficient limits on their usage to ensure they can be used only as backing for equivalent Vulkan images. This provides a consistent API for applications regardless of which platform or external API they are targeting, which makes development of multi-API and multi-platform applications simpler.

7) Should Vulkan define a common external handle type and provide Vulkan functions to facilitate cross-process sharing of such handles rather than relying on native handles to define the external objects?

RESOLVED: No. Cross-process sharing of resources is best left to native platforms. There are myriad security and extensibility issues with such a mechanism, and attempting to re-solve all those issues within Vulkan does not align with Vulkan's purpose as a graphics API. If desired, such a mechanism could be built as a layer or helper library on top of the opaque native handle defined in this family of extensions.

8) Must implementations provide additional guarantees about state implicitly included in memory objects for those memory objects that may be exported?

RESOLVED: Implementations must ensure that sharing memory objects does not transfer any information between the exporting and importing instances and APIs other than that required to share the data contained in the memory objects explicitly shared. As specific examples, data from previously freed memory objects that used the same underlying physical memory, and data from memory objects using adjacent physical memory must not be visible to applications importing an exported memory object.

9) Must implementations validate external handles the application provides as inputs to memory import operations?

RESOLVED: Implementations must return an error to the application if the provided memory handle cannot be used to complete the requested import operation. However, implementations need not validate handles are of the exact type specified by the application.

    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_IMAGE_FORMAT_INFO_KHR
    - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES_KHR

Issues

1) Why do so many external memory capabilities need to be queried on a per-memory-handle-type basis?

PROPOSED RESOLUTION: This is because some handle types are based on OS-native objects that have far more limited capabilities than the very generic Vulkan memory objects. Not all memory handle types can name memory objects that support 3D images, for example. Some handle types cannot even support the deferred image and memory binding behavior of Vulkan and require specifying the image when allocating or importing the memory object.

2) Do the VkExternalImageFormatPropertiesKHR and VkExternalBufferPropertiesKHR structs need to include a list of memory type bits that support the given handle type?

PROPOSED RESOLUTION: No. The memory types that do not support the handle types will simply be filtered out of the results returned by vkGetImageMemoryRequirements and vkGetBufferMemoryRequirements when a set of handle types was specified at image or buffer creation time.

3) Should the non-opaque handle types be moved to their own extension?

PROPOSED RESOLUTION: Perhaps. However, defining the handle type bits does very little and does not require any platform-specific types on its own, and it is easier to maintain the bitfield values in a single extension for now. Presumably more handle types could be added by separate extensions though, and it would be midly weird to have some platform-specific ones defined in the core spec and some in extensions

4) Do we need a D3D11_TILEPOOL type?

PROPOSED RESOLUTION: No. This is technically possible, but the synchronization is awkward. D3D11 surfaces must be synchronized using shared mutexes, and these synchronization primitives are shared by the entire memory object, so D3D11 shared allocations divided among multiple buffer and image bindings may be difficult to synchronize.

5) Should the Windows 7-compatible handle types be named “KMT” handles or “GLOBAL_SHARE” handles?

PROPOSED RESOLUTION: KMT, simply because it is more concise.

6) How do applications identify compatible devices and drivers across instance, process, and API boundaries when sharing memory?

PROPOSED RESOLUTION: New device properties are exposed that allow applications to correctly correlate devices and drivers. A device and driver UUID that must both match to ensure sharing compatibility between two Vulkan instances, or a Vulkan instance and an extensible external API are added. To allow correlating with Direct3D devices, a device LUID is added that corresponds to a DXGI adapter LUID. A driver ID is not needed for Direct3D because mismatched driver component versions are not currently supported on the Windows OS. Should support for such configurations be introduced at the OS level, further Vulkan extensions would be needed to correlate userspace component builds.

- Extending VkSemaphoreImportFlagBits:
  - `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT_KHR`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO_KHR`

Issues

1) Should there be restrictions on what side effects can occur when waiting on imported semaphores that are in an invalid state?

RESOLVED: Yes. Normally, validating such state would be the responsibility of the application, and the implementation would be free to enter an undefined state if valid usage rules were violated. However, this could cause security concerns when using imported semaphores, as it would require the importing application to trust the exporting application to ensure the state is valid. Requiring this level of trust is undesirable for many potential use cases.

2) Must implementations validate external handles the application provides as input to semaphore state import operations?

RESOLVED: Implementations must return an error to the application if the provided semaphore state handle cannot be used to complete the requested import operation. However, implementations need not validate handles are of the exact type specified by the application.

Description

This extension provides new queries for device features, device properties, and format properties that can be easily extended by other extensions, without introducing any further queries. The Vulkan 1.0 feature/limit/formatproperty structures do not include `sType`/`pNext` members. This extension wraps them in new structures with `sType`/`pNext` members, so an application can query a chain of feature/limit/formatproperty structures by constructing the chain and letting the implementation fill them in. A new command is added for each `vkGetPhysicalDevice*` command in core Vulkan 1.0. The new feature structure (and a `pNext` chain of extending structures) can also be passed in to device creation to enable features.

This extension also allows applications to use the physical-device components of device extensions before vkCreateDevice is called.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Commands

- vkGetPhysicalDeviceFeatures2KHR
- vkGetPhysicalDeviceFormatProperties2KHR
- vkGetPhysicalDeviceImageFormatProperties2KHR
- vkGetPhysicalDeviceMemoryProperties2KHR
- vkGetPhysicalDeviceProperties2KHR
- vkGetPhysicalDeviceQueueFamilyProperties2KHR
- vkGetPhysicalDeviceSparseImageFormatProperties2KHR

New Structures

Description

`VK_KHR_maintenance1` adds a collection of minor features that were intentionally left out or overlooked from the original Vulkan 1.0 release.

The new features are as follows:

- Allow 2D and 2D array image views to be created from 3D images, which can then be used as

color framebuffer attachments. This allows applications to render to slices of a 3D image.

- Support vkCmdCopyImage between 2D array layers and 3D slices. This extension allows copying from layers of a 2D array image to slices of a 3D image and vice versa.
- Allow negative height to be specified in the VkViewport::`height` field to perform y-inversion of the clip-space to framebuffer-space transform. This allows apps to avoid having to use `gl_Position.y = -gl_Position.y` in shaders also targeting other APIs.
- Allow implementations to express support for doing just transfers and clears of image formats that they otherwise support no other format features for. This is done by adding new format feature flags `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT_KHR` and `VK_FORMAT_FEATURE_TRANSFER_DST_BIT_KHR`.
- Support vkCmdFillBuffer on transfer-only queues. Previously vkCmdFillBuffer was defined to only work on command buffers allocated from command pools which support graphics or compute queues. It is now allowed on queues that just support transfer operations.
- Fix the inconsistency of how error conditions are returned between the vkCreateGraphicsPipelines and vkCreateComputePipelines functions and the vkAllocateDescriptorSets and vkAllocateCommandBuffers functions.
- Add new `VK_ERROR_OUT_OF_POOL_MEMORY_KHR` error so implementations can give a more precise reason for vkAllocateDescriptorSets failures.
- Add a new command vkTrimCommandPoolKHR which gives the implementation an opportunity to release any unused command pool memory back to the system.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Commands

- vkTrimCommandPoolKHR

New Bitmasks

- VkCommandPoolTrimFlagsKHR

New Enum Constants

- Daniel Rakos, AMD
- Neil Henning, Codeplay
- Piers Daniell, NVIDIA

Description

`VK_KHR_maintenance2` adds a collection of minor features that were intentionally left out or overlooked from the original Vulkan 1.0 release.

The new features are as follows:

- Allow the application to specify which aspect of an input attachment might be read for a given subpass.
- Allow implementations to express the clipping behavior of points.
- Allow creating images with usage flags that may not be supported for the base image's format, but are supported for image views of the image that have a different but compatible format.
- Allow creating uncompressed image views of compressed images.
- Allow the application to select between an upper-left and lower-left origin for the tessellation domain space.
- Adds two new image layouts for depth stencil images to allow either the depth or stencil aspect to be read-only while the other aspect is writable.

Input Attachment Specification

Input attachment specification allows an application to specify which aspect of a multi-aspect image (e.g. a depth/stencil format) will be accessed via a `subpassLoad` operation.

On some implementations there **may** be a performance penalty if the implementation does not know (at vkCreateRenderPass time) which aspect(s) of multi-aspect images **can** be accessed as input attachments.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- VkInputAttachmentAspectReferenceKHR

- Extending VkImageViewCreateInfo:
  - VkImageViewUsageCreateInfoKHR
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDevicePointClippingPropertiesKHR
- Extending VkPipelineTessellationStateCreateInfo:
  - VkPipelineTessellationDomainOriginStateCreateInfoKHR
- Extending VkRenderPassCreateInfo:
  - VkRenderPassInputAttachmentAspectCreateInfoKHR

New Enums

- VkPointClippingBehaviorKHR
- VkTessellationDomainOriginKHR

New Enum Constants

- VK_KHR_MAINTENANCE2_EXTENSION_NAME
- VK_KHR_MAINTENANCE2_SPEC_VERSION
- VK_KHR_MAINTENANCE_2_EXTENSION_NAME
- VK_KHR_MAINTENANCE_2_SPEC_VERSION
- Extending VkImageCreateFlagBits:
  - VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR
  - VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR
- Extending VkImageLayout:
  - VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR
  - VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL_KHR
- Extending VkPointClippingBehavior:
  - VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR
  - VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_POINT_CLIPPING_PROPERTIES_KHR
  - VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO_KHR
  - VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO_KHR
- Extending VkTessellationDomainOrigin:
  - VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR
  - VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR

Input Attachment Specification Example

Consider the case where a render pass has two subpasses and two attachments.

Attachment 0 has the format `VK_FORMAT_D24_UNORM_S8_UINT`, attachment 1 has some color format.

Subpass 0 writes to attachment 0, subpass 1 reads only the depth information from attachment 0 (using inputAttachmentRead) and writes to attachment 1.

```
    VkInputAttachmentAspectReferenceKHR references[] = {
        {
            .subpass = 1,
            .inputAttachmentIndex = 0,
            .aspectMask = VK_IMAGE_ASPECT_DEPTH_BIT
        }
    };

    VkRenderPassInputAttachmentAspectCreateInfoKHR specifyAspects = {
        .sType =
VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO_KHR,
        .pNext = NULL,
        .aspectReferenceCount = 1,
        .pAspectReferences = references
    };

    VkRenderPassCreateInfo createInfo = {
        ...
        .pNext = &specifyAspects,
        ...
    };

    vkCreateRenderPass(...);
```

Issues

1) What is the default tessellation domain origin?

RESOLVED: Vulkan 1.0 originally inadvertently documented a lower-left origin, but the conformance tests and all implementations implemented an upper-left origin. This extension adds a control to select between lower-left (for compatibility with OpenGL) and upper-left, and we retroactively fix unextended Vulkan to have a default of an upper-left origin.

Description

VK_KHR_maintenance3 adds a collection of minor features that were intentionally left out or overlooked from the original Vulkan 1.0 release.

The new features are as follows:

- A limit on the maximum number of descriptors that are supported in a single descriptor set layout. Some implementations have a limit on the total size of descriptors in a set, which cannot be expressed in terms of the limits in Vulkan 1.0.
- A limit on the maximum size of a single memory allocation. Some platforms have kernel interfaces that limit the maximum size of an allocation.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

Interactions and External Dependencies

- This extension provides API support for `GL_EXT_multiview`

Contributors

- Jeff Bolz, NVIDIA

Description

This extension has the same goal as the OpenGL ES `GL_OVR_multiview` extension. Multiview is a rendering technique originally designed for VR where it is more efficient to record a single set of commands to be executed with slightly different behavior for each “view”.

It includes a concise way to declare a render pass with multiple views, and gives implementations freedom to render the views in the most efficient way possible. This is done with a multiview configuration specified during render pass creation with the VkRenderPassMultiviewCreateInfo passed into VkRenderPassCreateInfo::`pNext`.

This extension enables the use of the `SPV_KHR_multiview` shader extension, which adds a new `ViewIndex` built-in type that allows shaders to control what to do for each view. If using GLSL there is also the `GL_EXT_multiview` extension that introduces a `highp int gl_ViewIndex;` built-in variable for vertex, tessellation, geometry, and fragment shaders.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

Description

The use of $Y'C_BC_R$ sampler conversion is an area in 3D graphics not used by most Vulkan developers. It is mainly used for processing inputs from video decoders and cameras. The use of the extension assumes basic knowledge of $Y'C_BC_R$ concepts.

This extension provides the ability to perform specified color space conversions during texture sampling operations for the $Y'C_BC_R$ color space natively. It also adds a selection of multi-planar formats, image aspect plane, and the ability to bind memory to the planes of an image collectively or separately.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted. However, if Vulkan 1.1 is supported and this extension is not, the `samplerYcbcrConversion` capability is optional. The original type, enum, and command names are still available as aliases of the core functionality.

Interactions and External Dependencies

- This extension provides API support for `GL_ARB_shader_draw_parameters`

Contributors

- Daniel Koch, NVIDIA Corporation
- Jeff Bolz, NVIDIA
- Daniel Rakos, AMD
- Jan-Harald Fredriksen, ARM
- John Kessenich, Google
- Stuart Smith, IMG

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_shader_draw_parameters`

The extension provides access to three additional built-in shader variables in Vulkan:

- `BaseInstance`, containing the `firstInstance` parameter passed to drawing commands,
- `BaseVertex`, containing the `firstVertex` or `vertexOffset` parameter passed to drawing commands, and
- `DrawIndex`, containing the index of the draw call currently being processed from an indirect drawing call.

When using GLSL source-based shader languages, the following variables from `GL_ARB_shader_draw_parameters` can map to these SPIR-V built-in decorations:

- `in int gl_BaseInstanceARB;` → `BaseInstance`,
- `in int gl_BaseVertexARB;` → `BaseVertex`, and
- `in int gl_DrawIDARB;` → `DrawIndex`.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1. However, the `shaderDrawParameters` feature bit was added to distinguish whether it is actually available or not.

New Enum Constants

- `VK_KHR_SHADER_DRAW_PARAMETERS_EXTENSION_NAME`
- `VK_KHR_SHADER_DRAW_PARAMETERS_SPEC_VERSION`

New Built-In Variables

- `BaseInstance`
- `BaseVertex`
- `DrawIndex`

New SPIR-V Capabilities

- `DrawParameters`

Issues

1) Is this the same functionality as `GL_ARB_shader_draw_parameters`?

RESOLVED: It is actually a superset, as it also adds in support for arrayed drawing commands.

In GL for `GL_ARB_shader_draw_parameters`, `gl_BaseVertexARB` holds the integer value passed to the parameter to the command that resulted in the current shader invocation. In the case where the command has no `baseVertex` parameter, the value of `gl_BaseVertexARB` is zero. This means that `gl_BaseVertexARB` = `baseVertex` (for `glDrawElements` commands with `baseVertex`) or 0. In particular there are no `glDrawArrays` commands that take a `baseVertex` parameter.

Now in Vulkan, we have `BaseVertex` = `vertexOffset` (for indexed drawing commands) or `firstVertex` (for arrayed drawing commands), and so Vulkan's version is really a superset of GL functionality.

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_storage_buffer_storage_class`

This extension provides a new SPIR-V `StorageBuffer` storage class. A `Block`-decorated object in this class is equivalent to a `BufferBlock`-decorated object in the `Uniform` storage class.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1.

New Enum Constants

- `VK_KHR_STORAGE_BUFFER_STORAGE_CLASS_EXTENSION_NAME`
- `VK_KHR_STORAGE_BUFFER_STORAGE_CLASS_SPEC_VERSION`

Version History

Description

The `VK_KHR_variable_pointers` extension allows implementations to indicate their level of support for the `SPV_KHR_variable_pointers` SPIR-V extension. The SPIR-V extension allows shader modules to use invocation-private pointers into uniform and/or storage buffers, where the pointer values can be dynamic and non-uniform.

The `SPV_KHR_variable_pointers` extension introduces two capabilities. The first, `VariablePointersStorageBuffer`, **must** be supported by all implementations of this extension. The second, `VariablePointers`, is optional.

Promotion to Vulkan 1.1

All functionality in this extension is included in core Vulkan 1.1, with the KHR suffix omitted, however support for the `variablePointersStorageBuffer` feature is made optional. The original type, enum, and command names are still available as aliases of the core functionality.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVariablePointerFeaturesKHR
  - VkPhysicalDeviceVariablePointersFeaturesKHR

New Enum Constants

- `VK_KHR_VARIABLE_POINTERS_EXTENSION_NAME`
- `VK_KHR_VARIABLE_POINTERS_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES_KHR`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTER_FEATURES_KHR`

New SPIR-V Capabilities

- `VariablePointers`
- `VariablePointersStorageBuffer`

Issues

1) Do we need an optional property for the SPIR-V `VariablePointersStorageBuffer` capability or should it be mandatory when this extension is advertised?

RESOLVED: Add it as a distinct feature, but make support mandatory. Adding it as a feature makes the extension easier to include in a future core API version. In the extension, the feature is mandatory, so that presence of the extension guarantees some functionality. When included in a core API version, the feature would be optional.

2) Can support for these capabilities vary between shader stages?

RESOLVED: No, if the capability is supported in any stage it must be supported in all stages.

3) Should the capabilities be features or limits?

RESOLVED: Features, primarily for consistency with other similar extensions.

Interactions and External Dependencies

- This extension provides API support for `GLSL_EXT_buffer_reference` and `GLSL_EXT_buffer_reference_uvec2`

Contributors

- Jeff Bolz, NVIDIA
- Neil Henning, AMD
- Tobias Hector, AMD
- Faith Ekstrand, Intel
- Baldur Karlsson, Valve

Description

This extension allows the application to query a 64-bit buffer device address value for a buffer, which can be used to access the buffer memory via the `PhysicalStorageBufferEXT` storage class in the `GL_EXT_buffer_reference` GLSL extension and `SPV_EXT_physical_storage_buffer` SPIR-V extension.

It also allows buffer device addresses to be provided by a trace replay tool, so that it matches the address used when the trace was captured.

New Commands

- vkGetBufferDeviceAddressEXT

New Structures

- VkBufferDeviceAddressInfoEXT
- Extending VkBufferCreateInfo:
  - VkBufferDeviceAddressCreateInfoEXT

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceBufferAddressFeaturesEXT
  - VkPhysicalDeviceBufferDeviceAddressFeaturesEXT

New Enum Constants

- VK_EXT_BUFFER_DEVICE_ADDRESS_EXTENSION_NAME
- VK_EXT_BUFFER_DEVICE_ADDRESS_SPEC_VERSION
- Extending VkBufferCreateFlagBits:
  - VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT
- Extending VkBufferUsageFlagBits:
  - VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_EXT
- Extending VkResult:
  - VK_ERROR_INVALID_DEVICE_ADDRESS_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_CREATE_INFO_EXT
  - VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_ADDRESS_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES_EXT

New SPIR-V Capabilities

- PhysicalStorageBufferAddressesEXT

Issues

1) Where is VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_ADDRESS_FEATURES_EXT and VkPhysicalDeviceBufferAddressFeaturesEXT?

RESOLVED: They were renamed as VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES_EXT and VkPhysicalDeviceBufferDeviceAddressFeaturesEXT accordingly for consistency. Even though, the old names can still be found in the generated header files for compatibility.

Description

The `VK_EXT_debug_marker` extension is a device extension. It introduces concepts of object naming and tagging, for better tracking of Vulkan objects, as well as additional commands for recording annotations of named sections of a workload to aid organization and offline analysis in external tools.

New Commands

- vkCmdDebugMarkerBeginEXT
- vkCmdDebugMarkerEndEXT
- vkCmdDebugMarkerInsertEXT
- vkDebugMarkerSetObjectNameEXT
- vkDebugMarkerSetObjectTagEXT

New Structures

- VkDebugMarkerMarkerInfoEXT
- VkDebugMarkerObjectNameInfoEXT
- VkDebugMarkerObjectTagInfoEXT

New Enums

- VkDebugReportObjectTypeEXT

New Enum Constants

- VK_EXT_DEBUG_MARKER_EXTENSION_NAME
- VK_EXT_DEBUG_MARKER_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT
  - VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_NAME_INFO_EXT
  - VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_TAG_INFO_EXT

Examples

Example 1

Associate a name with an image, for easier debugging in external tools or with validation layers that can print a friendly name when referring to objects in error messages.

```
    extern VkDevice device;
    extern VkImage image;

    // Must call extension functions through a function pointer:
    PFN_vkDebugMarkerSetObjectNameEXT pfnDebugMarkerSetObjectNameEXT =
(PFN_vkDebugMarkerSetObjectNameEXT)vkGetDeviceProcAddr(device,
"vkDebugMarkerSetObjectNameEXT");

    // Set a name on the image
    const VkDebugMarkerObjectNameInfoEXT imageNameInfo =
    {
        .sType = VK_STRUCTURE_TYPE_DEBUG_MARKER_OBJECT_NAME_INFO_EXT,
```

```
        .pNext = NULL,
        .objectType = VK_DEBUG_REPORT_OBJECT_TYPE_IMAGE_EXT,
        .object = (uint64_t)image,
        .pObjectName = "Brick Diffuse Texture",
    };

    pfnDebugMarkerSetObjectNameEXT(device, &imageNameInfo);

    // A subsequent error might print:
    //   Image 'Brick Diffuse Texture' (0xc0dec0dedeadbeef) is used in a
    //   command buffer with no memory bound to it.
```

Example 2

Annotating regions of a workload with naming information so that offline analysis tools can display a more usable visualization of the commands submitted.

```
    extern VkDevice device;
    extern VkCommandBuffer commandBuffer;

    // Must call extension functions through a function pointer:
    PFN_vkCmdDebugMarkerBeginEXT pfnCmdDebugMarkerBeginEXT =
(PFN_vkCmdDebugMarkerBeginEXT)vkGetDeviceProcAddr(device, "vkCmdDebugMarkerBeginEXT");
    PFN_vkCmdDebugMarkerEndEXT pfnCmdDebugMarkerEndEXT = (PFN_vkCmdDebugMarkerEndEXT
)vkGetDeviceProcAddr(device, "vkCmdDebugMarkerEndEXT");
    PFN_vkCmdDebugMarkerInsertEXT pfnCmdDebugMarkerInsertEXT =
(PFN_vkCmdDebugMarkerInsertEXT)vkGetDeviceProcAddr(device,
"vkCmdDebugMarkerInsertEXT");

    // Describe the area being rendered
    const VkDebugMarkerMarkerInfoEXT houseMarker =
    {
        .sType = VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT,
        .pNext = NULL,
        .pMarkerName = "Brick House",
        .color = { 1.0f, 0.0f, 0.0f, 1.0f },
    };

    // Start an annotated group of calls under the 'Brick House' name
    pfnCmdDebugMarkerBeginEXT(commandBuffer, &houseMarker);
    {
        // A mutable structure for each part being rendered
        VkDebugMarkerMarkerInfoEXT housePartMarker =
        {
            .sType = VK_STRUCTURE_TYPE_DEBUG_MARKER_MARKER_INFO_EXT,
            .pNext = NULL,
            .pMarkerName = NULL,
            .color = { 0.0f, 0.0f, 0.0f, 0.0f },
        };
```

```
        // Set the name and insert the marker
        housePartMarker.pMarkerName = "Walls";
        pfnCmdDebugMarkerInsertEXT(commandBuffer, &housePartMarker);

        // Insert the drawcall for the walls
        vkCmdDrawIndexed(commandBuffer, 1000, 1, 0, 0, 0);

        // Insert a recursive region for two sets of windows
        housePartMarker.pMarkerName = "Windows";
        pfnCmdDebugMarkerBeginEXT(commandBuffer, &housePartMarker);
        {
            vkCmdDrawIndexed(commandBuffer, 75, 6, 1000, 0, 0);
            vkCmdDrawIndexed(commandBuffer, 100, 2, 1450, 0, 0);
        }
        pfnCmdDebugMarkerEndEXT(commandBuffer);

        housePartMarker.pMarkerName = "Front Door";
        pfnCmdDebugMarkerInsertEXT(commandBuffer, &housePartMarker);

        vkCmdDrawIndexed(commandBuffer, 350, 1, 1650, 0, 0);

        housePartMarker.pMarkerName = "Roof";
        pfnCmdDebugMarkerInsertEXT(commandBuffer, &housePartMarker);

        vkCmdDrawIndexed(commandBuffer, 500, 1, 2000, 0, 0);
    }
    // End the house annotation started above
    pfnCmdDebugMarkerEndEXT(commandBuffer);
```

Issues

1) Should the tag or name for an object be specified using the `pNext` parameter in the object's `Vk*CreateInfo` structure?

RESOLVED: No. While this fits with other Vulkan patterns and would allow more type safety and future proofing against future objects, it has notable downsides. In particular passing the name at `Vk*CreateInfo` time does not allow renaming, prevents late binding of naming information, and does not allow naming of implicitly created objects such as queues and swapchain images.

2) Should the command annotation functions vkCmdDebugMarkerBeginEXT and vkCmdDebugMarkerEndEXT support the ability to specify a color?

RESOLVED: Yes. The functions have been expanded to take an optional color which can be used at will by implementations consuming the command buffer annotations in their visualization.

3) Should the functions added in this extension accept an extensible structure as their parameter for a more flexible API, as opposed to direct function parameters? If so, which functions?

RESOLVED: Yes. All functions have been modified to take a structure type with extensible `pNext` pointer, to allow future extensions to add additional annotation information in the same

commands.

Version History

- Revision 1, 2016-02-24 (Baldur Karlsson)
  - Initial draft, based on LunarG marker spec
- Revision 2, 2016-02-26 (Baldur Karlsson)
  - Renamed Dbg to DebugMarker in function names
  - Allow markers in secondary command buffers under certain circumstances
  - Minor language tweaks and edits
- Revision 3, 2016-04-23 (Baldur Karlsson)
  - Reorganize spec layout to closer match desired organization
  - Added optional color to markers (both regions and inserted labels)
  - Changed functions to take extensible structs instead of direct function parameters
- Revision 4, 2017-01-31 (Baldur Karlsson)
  - Added explicit dependency on VK_EXT_debug_report
  - Moved definition of VkDebugReportObjectTypeEXT to debug report chapter.
  - Fixed typo in dates in revision history

- Mark Lobodzinski, LunarG

Description

Due to the nature of the Vulkan interface, there is very little error information available to the developer and application. By enabling optional validation layers and using the `VK_EXT_debug_report` extension, developers **can** obtain much more detailed feedback on the application's use of Vulkan. This extension defines a way for layers and the implementation to call back to the application for events of interest to the application.

New Object Types

- VkDebugReportCallbackEXT

New Commands

- vkCreateDebugReportCallbackEXT
- vkDebugReportMessageEXT
- vkDestroyDebugReportCallbackEXT

New Structures

- Extending VkInstanceCreateInfo:
  - VkDebugReportCallbackCreateInfoEXT

New Function Pointers

- PFN_vkDebugReportCallbackEXT

New Enums

- VkDebugReportFlagBitsEXT
- VkDebugReportObjectTypeEXT

New Bitmasks

- VkDebugReportFlagsEXT

New Enum Constants

- `VK_EXT_DEBUG_REPORT_EXTENSION_NAME`
- `VK_EXT_DEBUG_REPORT_SPEC_VERSION`
- Extending VkObjectType:
  - `VK_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT`
- Extending VkResult:
  - `VK_ERROR_VALIDATION_FAILED_EXT`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT`
  - `VK_STRUCTURE_TYPE_DEBUG_REPORT_CREATE_INFO_EXT`

If Vulkan Version 1.1 is supported:

- Extending VkDebugReportObjectTypeEXT:
  - `VK_DEBUG_REPORT_OBJECT_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_EXT`
  - `VK_DEBUG_REPORT_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION_EXT`

Examples

`VK_EXT_debug_report` allows an application to register multiple callbacks with the validation layers. Some callbacks may log the information to a file, others may cause a debug break point or other application-defined behavior. An application **can** register callbacks even when no validation layers are enabled, but they will only be called for loader and, if implemented, driver events.

To capture events that occur while creating or destroying an instance an application **can** link a VkDebugReportCallbackCreateInfoEXT structure to the `pNext` element of the VkInstanceCreateInfo structure given to vkCreateInstance.

Example uses: Create three callback objects. One will log errors and warnings to the debug console using Windows `OutputDebugString`. The second will cause the debugger to break at that callback when an error happens and the third will log warnings to stdout.

```
    VkResult res;
    VkDebugReportCallbackEXT cb1, cb2, cb3;

    VkDebugReportCallbackCreateInfoEXT callback1 = {
```

```
        .sType = VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = VK_DEBUG_REPORT_ERROR_BIT_EXT |
                 VK_DEBUG_REPORT_WARNING_BIT_EXT,
        .pfnCallback = myOutputDebugString,
        .pUserData = NULL
    };
    res = vkCreateDebugReportCallbackEXT(instance, &callback1, &cb1);
    if (res != VK_SUCCESS)
       /* Do error handling for VK_ERROR_OUT_OF_MEMORY */

    callback.flags = VK_DEBUG_REPORT_ERROR_BIT_EXT;
    callback.pfnCallback = myDebugBreak;
    callback.pUserData = NULL;
    res = vkCreateDebugReportCallbackEXT(instance, &callback, &cb2);
    if (res != VK_SUCCESS)
       /* Do error handling for VK_ERROR_OUT_OF_MEMORY */

    VkDebugReportCallbackCreateInfoEXT callback3 = {
        .sType = VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT,
        .pNext = NULL,
        .flags = VK_DEBUG_REPORT_WARNING_BIT_EXT,
        .pfnCallback = mystdOutLogger,
        .pUserData = NULL
    };
    res = vkCreateDebugReportCallbackEXT(instance, &callback3, &cb3);
    if (res != VK_SUCCESS)
       /* Do error handling for VK_ERROR_OUT_OF_MEMORY */

    ...

    /* remove callbacks when cleaning up */
    vkDestroyDebugReportCallbackEXT(instance, cb1);
    vkDestroyDebugReportCallbackEXT(instance, cb2);
    vkDestroyDebugReportCallbackEXT(instance, cb3);
```

NOTE In the initial release of the `VK_EXT_debug_report` extension, the token `VK_STRUCTURE_TYPE_DEBUG_REPORT_CREATE_INFO_EXT` was used. Starting in version 2 of the extension branch, `VK_STRUCTURE_TYPE_DEBUG_REPORT_CALLBACK_CREATE_INFO_EXT` is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

NOTE In the initial release of the `VK_EXT_debug_report` extension, the token `VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_EXT` was used. Starting in version 8 of the extension branch, `VK_DEBUG_REPORT_OBJECT_TYPE_DEBUG_REPORT_CALLBACK_EXT_EXT` is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

Issues

1) What is the hierarchy / seriousness of the message flags? E.g. `ERROR` > `WARN` > `PERF_WARN` ...

RESOLVED: There is no specific hierarchy. Each bit is independent and should be checked via bitwise AND. For example:

```
    if (localFlags & VK_DEBUG_REPORT_ERROR_BIT_EXT) {
        process error message
    }
    if (localFlags & VK_DEBUG_REPORT_DEBUG_BIT_EXT) {
        process debug message
    }
```

The validation layers do use them in a hierarchical way (`ERROR` > `WARN` > `PERF`, `WARN` > `DEBUG` > `INFO`) and they (at least at the time of this writing) only set one bit at a time. But it is not a requirement of this extension.

It is possible that a layer may intercept and change, or augment the flags with extension values the application's debug report handler may not be familiar with, so it is important to treat each flag independently.

2) Should there be a VU requiring VkDebugReportCallbackCreateInfoEXT::`flags` to be non-zero?

RESOLVED: It may not be very useful, but we do not need VU statement requiring the `VkDebugReportCallbackCreateInfoEXT`::`msgFlags` at create-time to be non-zero. One can imagine that apps may prefer it as it allows them to set the mask as desired - including nothing - at runtime without having to check.

3) What is the difference between `VK_DEBUG_REPORT_DEBUG_BIT_EXT` and `VK_DEBUG_REPORT_INFORMATION_BIT_EXT`?

RESOLVED: `VK_DEBUG_REPORT_DEBUG_BIT_EXT` specifies information that could be useful debugging the Vulkan implementation itself.

4) How do you compare handles returned by the debug_report callback to the application's handles?

RESOLVED: Due to the different nature of dispatchable and nondispatchable handles there is no generic way (that we know of) that works for common compilers with 32bit, 64bit, C and C++. We recommend applications use the same cast that the validation layers use:

+

```
reinterpret_cast<uint64_t &>(dispatchableHandle)
(uint64_t)(nondispatchableHandle)
```

+ This does require that the application treat dispatchable and nondispatchable handles differently.

Version History

- Revision 1, 2015-05-20 (Courtney Goetzenleuchter)
  - Initial draft, based on LunarG KHR spec, other KHR specs
- Revision 2, 2016-02-16 (Courtney Goetzenleuchter)
  - Update usage, documentation
- Revision 3, 2016-06-14 (Courtney Goetzenleuchter)
  - Update VK_EXT_DEBUG_REPORT_SPEC_VERSION to indicate added support for vkCreateInstance and vkDestroyInstance
- Revision 4, 2016-12-08 (Mark Lobodzinski)
  - Added Display_KHR, DisplayModeKHR extension objects
  - Added ObjectTable_NVX, IndirectCommandsLayout_NVX extension objects
  - Bumped spec revision
  - Retroactively added version history
- Revision 5, 2017-01-31 (Baldur Karlsson)
  - Moved definition of VkDebugReportObjectTypeEXT from debug marker chapter
- Revision 6, 2017-01-31 (Baldur Karlsson)

Description

In Vulkan, users can specify device-scope queue priorities. In some cases it may be useful to extend this concept to a system-wide scope. This extension provides a mechanism for callers to set their system-wide priority. The default queue priority is `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`.

The driver implementation will attempt to skew hardware resource allocation in favor of the higher-priority task. Therefore, higher-priority work may retain similar latency and throughput characteristics even if the system is congested with lower priority work.

The global priority level of a queue shall take precedence over the per-process queue priority (`VkDeviceQueueCreateInfo`::`pQueuePriorities`).

Abuse of this feature may result in starving the rest of the system from hardware resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (`VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`) if the caller does not have sufficient privileges. In this scenario `VK_ERROR_NOT_PERMITTED_EXT` is returned.

The driver implementation may fail the queue allocation request if resources required to complete

the operation have been exhausted (either by the same process or a different process). In this scenario VK_ERROR_INITIALIZATION_FAILED is returned.

New Structures

- Extending VkDeviceQueueCreateInfo:
  - VkDeviceQueueGlobalPriorityCreateInfoEXT

New Enums

- VkQueueGlobalPriorityEXT

New Enum Constants

- VK_EXT_GLOBAL_PRIORITY_EXTENSION_NAME
- VK_EXT_GLOBAL_PRIORITY_SPEC_VERSION
- Extending VkResult:
  - VK_ERROR_NOT_PERMITTED_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_EXT

Version History

- Revision 2, 2017-11-03 (Andres Rodriguez)
  - Fixed VkQueueGlobalPriorityEXT missing _EXT suffix
- Revision 1, 2017-10-06 (Andres Rodriguez)
  - First version.

Description

This device extension allows applications to query the global queue priorities supported by a queue family. It allows implementations to report which global priority levels are treated differently by the implementation, instead of silently mapping multiple requested global priority levels to the same internal priority, or using device creation failure to signal that a requested priority is not supported. It is intended primarily for use by system integration along with certain platform-specific priority enforcement rules.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceGlobalPriorityQueryFeaturesEXT
- Extending VkQueueFamilyProperties2:
  - VkQueueFamilyGlobalPriorityPropertiesEXT

New Enum Constants

- `VK_EXT_GLOBAL_PRIORITY_QUERY_EXTENSION_NAME`
- `VK_EXT_GLOBAL_PRIORITY_QUERY_SPEC_VERSION`
- `VK_MAX_GLOBAL_PRIORITY_SIZE_EXT`
- Extending VkStructureType:

- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GLOBAL_PRIORITY_QUERY_FEATURES_EXT`
- `VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_EXT`

Issues

1) Can we additionally query whether a caller is permitted to acquire a specific global queue priority in this extension?

RESOLVED: No. Whether a caller has enough privilege goes with the OS, and the Vulkan driver cannot really guarantee that the privilege will not change in between this query and the actual queue creation call.

2) If more than 1 queue using global priority is requested, is there a good way to know which queue is failing the device creation?

RESOLVED: No. There is not a good way at this moment, and it is also not quite actionable for the applications to know that because the information may not be accurate. Queue creation can fail because of runtime constraints like insufficient privilege or lack of resource, and the failure is not necessarily tied to that particular queue configuration requested.

IP Status

No known IP claims.

Contributors

- Jeff Bolz, NVIDIA
- Allen Jensen, NVIDIA
- Faith Ekstrand, Intel

Description

This extension adds some line rasterization features that are commonly used in CAD applications and supported in other APIs like OpenGL. Bresenham-style line rasterization is supported, smooth rectangular lines (coverage to alpha) are supported, and stippled lines are supported for all three line rasterization modes.

Promotion to VK_KHR_line_rasterization

All functionality in this extension is included in VK_KHR_line_rasterization, with the suffix changed to KHR. The original enum names are still available as aliases of the KHR functionality.

New Commands

- vkCmdSetLineStippleEXT

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceLineRasterizationFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceLineRasterizationPropertiesEXT
- Extending VkPipelineRasterizationStateCreateInfo:
  - VkPipelineRasterizationLineStateCreateInfoEXT

New Enums

- VkLineRasterizationModeEXT

New Enum Constants

- VK_EXT_LINE_RASTERIZATION_EXTENSION_NAME
- VK_EXT_LINE_RASTERIZATION_SPEC_VERSION
- Extending VkDynamicState:
  - VK_DYNAMIC_STATE_LINE_STIPPLE_EXT
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_EXT
  - VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT

Issues

1) Do we need to support Bresenham-style and smooth lines with more than one rasterization sample? i.e. the equivalent of glDisable(GL_MULTISAMPLE) in OpenGL when the framebuffer has more than one sample?

RESOLVED: Yes. For simplicity, Bresenham line rasterization carries forward a few restrictions from OpenGL, such as not supporting per-sample shading, alpha to coverage, or alpha to one.

- Bill Licea-Kane, Qualcomm Technologies, Inc.
- Tobias Hector, AMD

Description

This extension incorporates `VK_ATTACHMENT_STORE_OP_NONE_EXT` from `VK_QCOM_render_pass_store_ops`, enabling applications to avoid unnecessary synchronization when an attachment is not written during a render pass.

Additionally, `VK_ATTACHMENT_LOAD_OP_NONE_EXT` is introduced to avoid unnecessary synchronization when an attachment is not used during a render pass at all. In combination with `VK_ATTACHMENT_STORE_OP_NONE_EXT`, this is useful as an alternative to preserve attachments in applications that cannot decide if an attachment will be used in a render pass until after the

necessary pipelines have been created.

Promotion to VK_KHR_load_store_op_none

All functionality in this extension is included in VK_KHR_load_store_op_none, with the suffix changed to KHR. The original enum names are still available as aliases of the KHR functionality.

New Enum Constants

- VK_EXT_LOAD_STORE_OP_NONE_EXTENSION_NAME
- VK_EXT_LOAD_STORE_OP_NONE_SPEC_VERSION
- Extending VkAttachmentLoadOp:
  - VK_ATTACHMENT_LOAD_OP_NONE_EXT
- Extending VkAttachmentStoreOp:
  - VK_ATTACHMENT_STORE_OP_NONE_EXT

> **NOTE** While VK_ATTACHMENT_STORE_OP_NONE is part of Vulkan 1.3, this extension was not promoted to core either in whole or in part. This functionality was promoted from VK_KHR_dynamic_rendering.

Version History

- Revision 1, 2021-06-06 (Shahbaz Youssefi)
  - Initial revision, based on VK_QCOM_render_pass_store_ops.
  - Added VK_ATTACHMENT_LOAD_OP_NONE_EXT.

Interactions and External Dependencies

- This extension provides API support for `GL_ARB_shader_group_vote`

Contributors

- Neil Henning, Codeplay
- Daniel Koch, NVIDIA Corporation

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_KHR_subgroup_vote`

This extension provides new SPIR-V instructions:

- `OpSubgroupAllKHR`,
- `OpSubgroupAnyKHR`, and
- `OpSubgroupAllEqualKHR`.

to compute the composite of a set of boolean conditions across a group of shader invocations that are running concurrently (a *subgroup*). These composite results may be used to execute shaders more efficiently on a VkPhysicalDevice.

When using GLSL source-based shader languages, the following shader functions from GL_ARB_shader_group_vote can map to these SPIR-V instructions:

- `anyInvocationARB`() → `OpSubgroupAnyKHR`,
- `allInvocationsARB`() → `OpSubgroupAllKHR`, and
- `allInvocationsEqualARB`() → `OpSubgroupAllEqualKHR`.

The subgroup across which the boolean conditions are evaluated is implementation-dependent, and this extension provides no guarantee over how individual shader invocations are assigned to

subgroups. In particular, a subgroup has no necessary relationship with the compute shader *local workgroup* — any pair of shader invocations in a compute local workgroup may execute in different subgroups as used by these instructions.

Compute shaders operate on an explicitly specified group of threads (a local workgroup), but many implementations will also group non-compute shader invocations and execute them concurrently. When executing code like

```
if (condition) {
  result = do_fast_path();
} else {
  result = do_general_path();
}
```

where `condition` diverges between invocations, an implementation might first execute `do_fast_path()` for the invocations where `condition` is true and leave the other invocations dormant. Once `do_fast_path()` returns, it might call `do_general_path()` for invocations where `condition` is `false` and leave the other invocations dormant. In this case, the shader executes **both** the fast and the general path and might be better off just using the general path for all invocations.

This extension provides the ability to avoid divergent execution by evaluating a condition across an entire subgroup using code like:

```
if (allInvocationsARB(condition)) {
  result = do_fast_path();
} else {
  result = do_general_path();
}
```

The built-in function `allInvocationsARB()` will return the same value for all invocations in the group, so the group will either execute `do_fast_path()` or `do_general_path()`, but never both. For example, shader code might want to evaluate a complex function iteratively by starting with an approximation of the result and then refining the approximation. Some input values may require a small number of iterations to generate an accurate result (`do_fast_path`) while others require a larger number (`do_general_path`). In another example, shader code might want to evaluate a complex function (`do_general_path`) that can be greatly simplified when assuming a specific value for one of its inputs (`do_fast_path`).

Deprecated by Vulkan 1.1

All functionality in this extension is superseded by the core Vulkan 1.1 subgroup operations.

Last Modified Date

2018-08-03

IP Status

No known IP claims.

Contributors

- Vikram Kushwaha, NVIDIA
- Faith Ekstrand, Intel

Description

This extension allows instance-rate vertex attributes to be repeated for certain number of instances instead of advancing for every instance when instanced rendering is enabled.

New Structures

- VkVertexInputBindingDivisorDescriptionEXT
- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT
- Extending VkPipelineVertexInputStateCreateInfo:
  - VkPipelineVertexInputDivisorStateCreateInfoEXT

New Enum Constants

- VK_EXT_VERTEX_ATTRIBUTE_DIVISOR_EXTENSION_NAME
- VK_EXT_VERTEX_ATTRIBUTE_DIVISOR_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_PROPERTIES_EXT
  - VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT

Issues

1) What is the effect of a non-zero value for `firstInstance`?

RESOLVED: The Vulkan API should follow the OpenGL convention and offset attribute fetching by `firstInstance` while computing vertex attribute offsets.

2) Should zero be an allowed divisor?

RESOLVED: Yes. A zero divisor means the vertex attribute is repeated for all instances.

Examples

To create a vertex binding such that the first binding uses instanced rendering and the same attribute is used for every 4 draw instances, an application could use the following set of structures:

```
    const VkVertexInputBindingDivisorDescriptionEXT divisorDesc =
    {
        .binding = 0,
        .divisor = 4
    };

    const VkPipelineVertexInputDivisorStateCreateInfoEXT divisorInfo =
    {
        .sType =
VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT,
        .pNext = NULL,
        .vertexBindingDivisorCount = 1,
        .pVertexBindingDivisors = &divisorDesc
    }

    const VkVertexInputBindingDescription binding =
    {
        .binding = 0,
        .stride = sizeof(Vertex),
        .inputRate = VK_VERTEX_INPUT_RATE_INSTANCE
    };

    const VkPipelineVertexInputStateCreateInfo viInfo =
    {
```

```
        .sType = VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_CREATE_INFO,
        .pNext = &divisorInfo,
        ...
    };
    //...
```

Version History

- Revision 1, 2017-12-04 (Vikram Kushwaha)
  - First Version
- Revision 2, 2018-07-16 (Faith Ekstrand)
  - Adjust the interaction between `divisor` and `firstInstance` to match the OpenGL convention.
  - Disallow divisors of zero.
- Revision 3, 2018-08-03 (Vikram Kushwaha)
  - Allow a zero divisor.
  - Add a physical device features structure to query/enable this feature.

- Graham Sellers, AMD
- Baldur Karlsson

Description

This extension allows an application to specify a negative viewport height. The result is that the viewport transformation will flip along the y-axis.

- Allow negative height to be specified in the VkViewport::`height` field to perform y-inversion of the clip-space to framebuffer-space transform. This allows apps to avoid having to use `gl_Position.y = -gl_Position.y` in shaders also targeting other APIs.

Obsoletion by VK_KHR_maintenance1 and Vulkan 1.1

Functionality in this extension is included in the VK_KHR_maintenance1 extension and subsequently Vulkan 1.1. Due to some slight behavioral differences, this extension **must** not be enabled alongside VK_KHR_maintenance1, or in an instance created with version 1.1 or later requested in VkApplicationInfo::apiVersion.

New Enum Constants

Description

Render passes, and specifically subpass dependencies, enable much of the same functionality as the framebuffer fetch and pixel local storage extensions did for OpenGL ES. But certain techniques such as programmable blending are awkward or impractical to implement with these alone, in part because a self-dependency is required every time a fragment will read a value at a given sample coordinate.

This extension extends the mechanism of input attachments to allow access to framebuffer attachments when used as both input and color, or depth/stencil, attachments from one fragment to the next, in rasterization order, without explicit synchronization.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM

New Enum Constants

- VK_ARM_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_EXTENSION_NAME
- VK_ARM_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_SPEC_VERSION
- Extending VkPipelineColorBlendStateCreateFlagBits:
  - VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_ARM
- Extending VkPipelineDepthStencilStateCreateFlagBits:
  - VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM
  - VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_FEATURES_ARM
- Extending VkSubpassDescriptionFlagBits:
  - VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_ARM
  - VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM
  - VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM

Issues

1) Is there any interaction with the VK_KHR_dynamic_rendering extension?

No. This extension only affects reads from input attachments. Render pass instances begun with vkCmdBeginRenderingKHR do not have input attachments and a different mechanism will be needed to provide similar functionality in this case.

Examples

None.

Description

`VK_IMG_format_pvrtc` provides additional texture compression functionality specific to Imagination Technologies PowerVR Texture compression format (called PVRTC).

NOTE	As also noted in the Khronos Data Format Specification, PVRTC1 images must have dimensions that are a power of two.

Deprecation

Both PVRTC1 and PVRTC2 are slower than standard image formats on PowerVR GPUs, and support will be removed from future hardware.

New Enum Constants

- `VK_IMG_FORMAT_PVRTC_EXTENSION_NAME`
- `VK_IMG_FORMAT_PVRTC_SPEC_VERSION`

Description

The `VK_MVK_ios_surface` extension is an instance extension. It provides a mechanism to create a VkSurfaceKHR object (defined by the `VK_KHR_surface` extension) based on a `UIView`, the native surface type of iOS, which is underpinned by a CAMetalLayer, to support rendering to the surface using Apple's Metal framework.

Deprecation by `VK_EXT_metal_surface`

The `VK_MVK_ios_surface` extension is considered deprecated and has been superseded by the `VK_EXT_metal_surface` extension.

Interactions and External Dependencies

- This extension provides API support for `GL_NV_compute_shader_derivatives`

Contributors

- Pat Brown, NVIDIA

Description

This extension adds Vulkan support for the `SPV_NV_compute_shader_derivatives` SPIR-V extension.

The SPIR-V extension provides two new execution modes, both of which allow compute shaders to use built-ins that evaluate compute derivatives explicitly or implicitly. Derivatives will be computed via differencing over a 2x2 group of shader invocations. The `DerivativeGroupQuadsNV` execution mode assembles shader invocations into 2x2 groups, where each group has x and y coordinates of the local invocation ID of the form (2m+{0,1}, 2n+{0,1}). The `DerivativeGroupLinearNV` execution mode assembles shader invocations into 2x2 groups, where each group has local invocation index values of the form 4m+{0,1,2,3}.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceComputeShaderDerivativesFeaturesNV

New Enum Constants

- `VK_NV_COMPUTE_SHADER_DERIVATIVES_EXTENSION_NAME`
- `VK_NV_COMPUTE_SHADER_DERIVATIVES_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_FEATURES_NV`

New SPIR-V Capability

- `ComputeDerivativeGroupQuadsNV`
- `ComputeDerivativeGroupLinearNV`

Issues

(1) Should we specify that the groups of four shader invocations used for derivatives in a compute shader are the same groups of four invocations that form a “quad” in shader subgroups?

RESOLVED: Yes.

Examples

None.

Description

This extension allows device memory to be allocated for a particular buffer or image resource, which on some devices can significantly improve the performance of that resource. Normal device memory allocations must support memory aliasing and sparse binding, which could interfere with

optimizations like framebuffer compression or efficient page table usage. This is important for render targets and very large resources, but need not (and probably should not) be used for smaller resources that can benefit from suballocation.

This extension adds a few small structures to resource creation and memory allocation: a new structure that flags whether am image/buffer will have a dedicated allocation, and a structure indicating the image or buffer that an allocation will be bound to.

New Structures

- Extending VkBufferCreateInfo:
  - VkDedicatedAllocationBufferCreateInfoNV
- Extending VkImageCreateInfo:
  - VkDedicatedAllocationImageCreateInfoNV
- Extending VkMemoryAllocateInfo:
  - VkDedicatedAllocationMemoryAllocateInfoNV

New Enum Constants

- VK_NV_DEDICATED_ALLOCATION_EXTENSION_NAME
- VK_NV_DEDICATED_ALLOCATION_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_BUFFER_CREATE_INFO_NV
  - VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV
  - VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV

Examples

```
    // Create an image with
    // VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation
    // set to VK_TRUE

    VkDedicatedAllocationImageCreateInfoNV dedicatedImageInfo =
    {
        .sType = VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV,
        .pNext = NULL,
        .dedicatedAllocation = VK_TRUE,
    };

    VkImageCreateInfo imageCreateInfo =
    {
        .sType = VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO,
        .pNext = &dedicatedImageInfo
        // Other members set as usual
    };
```

```
VkImage image;
VkResult result = vkCreateImage(
    device,
    &imageCreateInfo,
    NULL,               // pAllocator
    &image);

VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(
    device,
    image,
    &memoryRequirements);

// Allocate memory with VkDedicatedAllocationMemoryAllocateInfoNV::image
// pointing to the image we are allocating the memory for

VkDedicatedAllocationMemoryAllocateInfoNV dedicatedInfo =
{
    .sType = VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV,
    .pNext = NULL,
    .image = image,
    .buffer = VK_NULL_HANDLE,
};

VkMemoryAllocateInfo memoryAllocateInfo =
{
    .sType = VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO,
    .pNext = &dedicatedInfo,
    .allocationSize = memoryRequirements.size,
    .memoryTypeIndex = FindMemoryTypeIndex(memoryRequirements.memoryTypeBits),
};

VkDeviceMemory memory;
vkAllocateMemory(
    device,
    &memoryAllocateInfo,
    NULL,               // pAllocator
    &memory);

// Bind the image to the memory

vkBindImageMemory(
    device,
    image,
    memory,
    0);
```

Description

Applications may wish to export memory to other Vulkan instances or other APIs, or import memory from other Vulkan instances or other APIs to enable Vulkan workloads to be split up across application module, process, or API boundaries. This extension enables applications to create exportable Vulkan memory objects such that the underlying resources can be referenced outside the Vulkan instance that created them.

New Structures

- Extending VkImageCreateInfo:
  - VkExternalMemoryImageCreateInfoNV
- Extending VkMemoryAllocateInfo:
  - VkExportMemoryAllocateInfoNV

New Enum Constants

- `VK_NV_EXTERNAL_MEMORY_EXTENSION_NAME`
- `VK_NV_EXTERNAL_MEMORY_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_NV`
  - `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO_NV`

Issues

1) If memory objects are shared between processes and APIs, is this considered aliasing according to the rules outlined in the Memory Aliasing section?

RESOLVED: Yes, but strict exceptions to the rules are added to allow some forms of aliasing in these cases. Further, other extensions may build upon these new aliasing rules to define specific support usage within Vulkan for imported native memory objects, or memory objects from other APIs.

2) Are new image layouts or metadata required to specify image layouts and layout transitions compatible with non-Vulkan APIs, or with other instances of the same Vulkan driver?

RESOLVED: No. Separate instances of the same Vulkan driver running on the same GPU should have identical internal layout semantics, so applications have the tools they need to ensure views of images are consistent between the two instances. Other APIs will fall into two categories: Those that are Vulkan compatible (a term to be defined by subsequent interopability extensions), or Vulkan incompatible. When sharing images with Vulkan incompatible APIs, the Vulkan image must be transitioned to the `VK_IMAGE_LAYOUT_GENERAL` layout before handing it off to the external API.

Note this does not attempt to address cross-device transitions, nor transitions to engines on the same device which are not visible within the Vulkan API. Both of these are beyond the scope of this extension.

Examples

```
    // TODO: Write some sample code here.
```

Description

Applications may wish to import memory from the Direct 3D API, or export memory to other Vulkan instances. This extension provides a set of capability queries that allow applications determine what types of win32 memory handles an implementation supports for a given set of use

cases.

New Commands

- vkGetPhysicalDeviceExternalImageFormatPropertiesNV

New Structures

- VkExternalImageFormatPropertiesNV

New Enums

- VkExternalMemoryFeatureFlagBitsNV
- VkExternalMemoryHandleTypeFlagBitsNV

New Bitmasks

- VkExternalMemoryFeatureFlagsNV
- VkExternalMemoryHandleTypeFlagsNV

New Enum Constants

- `VK_NV_EXTERNAL_MEMORY_CAPABILITIES_EXTENSION_NAME`
- `VK_NV_EXTERNAL_MEMORY_CAPABILITIES_SPEC_VERSION`

Issues

1) Why do so many external memory capabilities need to be queried on a per-memory-handle-type basis?

RESOLVED: This is because some handle types are based on OS-native objects that have far more limited capabilities than the very generic Vulkan memory objects. Not all memory handle types can name memory objects that support 3D images, for example. Some handle types cannot even support the deferred image and memory binding behavior of Vulkan and require specifying the image when allocating or importing the memory object.

2) Does the VkExternalImageFormatPropertiesNV struct need to include a list of memory type bits that support the given handle type?

RESOLVED: No. The memory types that do not support the handle types will simply be filtered out of the results returned by vkGetImageMemoryRequirements when a set of handle types was specified at image creation time.

3) Should the non-opaque handle types be moved to their own extension?

RESOLVED: Perhaps. However, defining the handle type bits does very little and does not require any platform-specific types on its own, and it is easier to maintain the bitmask values in a single extension for now. Presumably more handle types could be added by separate extensions though, and it would be midly weird to have some platform-specific ones defined in the core spec and some in extensions

Description

Applications may wish to export memory to other Vulkan instances or other APIs, or import memory from other Vulkan instances or other APIs to enable Vulkan workloads to be split up across application module, process, or API boundaries. This extension enables win32 applications

to export win32 handles from Vulkan memory objects such that the underlying resources can be referenced outside the Vulkan instance that created them, and import win32 handles created in the Direct3D API to Vulkan memory objects.

New Commands

- vkGetMemoryWin32HandleNV

New Structures

- Extending VkMemoryAllocateInfo:
  - VkExportMemoryWin32HandleInfoNV
  - VkImportMemoryWin32HandleInfoNV

New Enum Constants

- `VK_NV_EXTERNAL_MEMORY_WIN32_EXTENSION_NAME`
- `VK_NV_EXTERNAL_MEMORY_WIN32_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_NV`
  - `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_NV`

Issues

1) If memory objects are shared between processes and APIs, is this considered aliasing according to the rules outlined in the Memory Aliasing section?

RESOLVED: Yes, but strict exceptions to the rules are added to allow some forms of aliasing in these cases. Further, other extensions may build upon these new aliasing rules to define specific support usage within Vulkan for imported native memory objects, or memory objects from other APIs.

2) Are new image layouts or metadata required to specify image layouts and layout transitions compatible with non-Vulkan APIs, or with other instances of the same Vulkan driver?

RESOLVED: No. Separate instances of the same Vulkan driver running on the same GPU should have identical internal layout semantics, so applications have the tools they need to ensure views of images are consistent between the two instances. Other APIs will fall into two categories: Those that are Vulkan compatible (a term to be defined by subsequent interopability extensions), or Vulkan incompatible. When sharing images with Vulkan incompatible APIs, the Vulkan image must be transitioned to the `VK_IMAGE_LAYOUT_GENERAL` layout before handing it off to the external API.

Note this does not attempt to address cross-device transitions, nor transitions to engines on the same device which are not visible within the Vulkan API. Both of these are beyond the scope of this extension.

3) Do applications need to call `CloseHandle`() on the values returned from vkGetMemoryWin32HandleNV when `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV`?

RESOLVED: Yes, unless it is passed back in to another driver instance to import the object. A successful get call transfers ownership of the handle to the application, while an import transfers ownership to the associated driver. Destroying the memory object will not destroy the handle or the handle's reference to the underlying memory resource.

Examples

```
    //
    // Create an exportable memory object and export an external
    // handle from it.
    //

    // Pick an external format and handle type.
    static const VkFormat format = VK_FORMAT_R8G8B8A8_UNORM;

Interactions and External Dependencies

- This extension provides API support for `GL_NV_fragment_shader_barycentric`

Contributors

- Pat Brown, NVIDIA
- Daniel Koch, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_NV_fragment_shader_barycentric`

The extension provides access to three additional fragment shader variable decorations in SPIR-V:

- `PerVertexNV`, which indicates that a fragment shader input will not have interpolated values, but

instead must be accessed with an extra array index that identifies one of the vertices of the primitive producing the fragment

- `BaryCoordNV`, which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using perspective interpolation
- `BaryCoordNoPerspNV`, which indicates that the variable is a three-component floating-point vector holding barycentric weights for the fragment produced using linear interpolation

When using GLSL source-based shader languages, the following variables from `GL_NV_fragment_shader_barycentric` maps to these SPIR-V built-in decorations:

- `in vec3 gl_BaryCoordNV;` → `BaryCoordNV`
- `in vec3 gl_BaryCoordNoPerspNV;` → `BaryCoordNoPerspNV`

GLSL variables declared using the `__pervertexNV` GLSL qualifier are expected to be decorated with `PerVertexNV` in SPIR-V.

Promotion to `VK_KHR_fragment_shader_barycentric`

All functionality in this extension is included in `VK_KHR_fragment_shader_barycentric`, with the suffix changed to KHR.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV

New Enum Constants

- `VK_NV_FRAGMENT_SHADER_BARYCENTRIC_EXTENSION_NAME`
- `VK_NV_FRAGMENT_SHADER_BARYCENTRIC_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_FEATURES_NV`

New Built-In Variables

- `BaryCoordNV`
- `BaryCoordNoPerspNV`

New SPIR-V Decorations

- `PerVertexNV`

New SPIR-V Capabilities

- `FragmentBarycentricNV`

Issues

(1) The AMD_shader_explicit_vertex_parameter extension provides similar functionality. Why write a new extension, and how is this extension different?

RESOLVED: For the purposes of Vulkan/SPIR-V, we chose to implement a separate extension due to several functional differences.

First, the hardware supporting this extension can provide a three-component barycentric weight vector for variables decorated with `BaryCoordNV`, while variables decorated with `BaryCoordSmoothAMD` provide only two components. In some cases, it may be more efficient to explicitly interpolate an attribute via:

```
float value = (baryCoordNV.x * v[0].attrib +
               baryCoordNV.y * v[1].attrib +
               baryCoordNV.z * v[2].attrib);
```

instead of

```
float value = (baryCoordSmoothAMD.x * (v[0].attrib - v[2].attrib) +
               baryCoordSmoothAMD.y * (v[1].attrib - v[2].attrib) +
               v[2].attrib);
```

Additionally, the semantics of the decoration `BaryCoordPullModelAMD` do not appear to map to anything supported by the initial hardware implementation of this extension.

This extension provides a smaller number of decorations than the AMD extension, as we expect that shaders could derive variables decorated with things like `BaryCoordNoPerspCentroidAMD` with explicit attribute interpolation instructions. One other relevant difference is that explicit per-vertex attribute access using this extension does not require a constant vertex number.

(2) Why do the built-in SPIR-V decorations for this extension include two separate built-ins `BaryCoordNV` and `BaryCoordNoPerspNV` when a "no perspective" variable could be decorated with `BaryCoordNV` and `NoPerspective`?

RESOLVED: The SPIR-V extension for this feature chose to mirror the behavior of the GLSL extension, which provides two built-in variables. Additionally, it is not clear that its a good idea (or even legal) to have two variables using the "same attribute", but with different interpolation modifiers.

Description

This extension allows GLSL shaders written to the `GL_KHR_vulkan_glsl` extension specification to be used instead of SPIR-V. The implementation will automatically detect whether the shader is SPIR-V or GLSL, and compile it appropriately.

Deprecation

Functionality in this extension is outside of the scope of Vulkan and is better served by a compiler library such as glslang. No new implementations will support this extension, so applications **should** not use it.

New Enum Constants

- `VK_NV_GLSL_SHADER_EXTENSION_NAME`
- `VK_NV_GLSL_SHADER_SPEC_VERSION`
- Extending VkResult:
  - `VK_ERROR_INVALID_SHADER_NV`

Examples

Example 1

Passing in GLSL code

```
    char const vss[] =
        "#version 450 core\n"
        "layout(location = 0) in vec2 aVertex;\n"
        "layout(location = 1) in vec4 aColor;\n"
        "out vec4 vColor;\n"
        "void main()\n"
        "{\n"
        "    vColor = aColor;\n"
        "    gl_Position = vec4(aVertex, 0, 1);\n"
        "}\n"
    ;
    VkShaderModuleCreateInfo vertexShaderInfo = {
VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO };
    vertexShaderInfo.codeSize = sizeof vss;
    vertexShaderInfo.pCode = vss;
    VkShaderModule vertexShader;
    vkCreateShaderModule(device, &vertexShaderInfo, 0, &vertexShader);
```

Description

Rasterization has been the dominant method to produce interactive graphics, but increasing performance of graphics hardware has made ray tracing a viable option for interactive rendering. Being able to integrate ray tracing with traditional rasterization makes it easier for applications to incrementally add ray traced effects to existing applications or to do hybrid approaches with rasterization for primary visibility and ray tracing for secondary queries.

To enable ray tracing, this extension adds a few different categories of new functionality:

- Acceleration structure objects and build commands
- A new pipeline type with new shader domains
- An indirection table to link shader groups with acceleration structure items

This extension adds support for the following SPIR-V extension in Vulkan:

- `SPV_NV_ray_tracing`

New Object Types

- VkAccelerationStructureNV

New Commands

- vkBindAccelerationStructureMemoryNV
- vkCmdBuildAccelerationStructureNV
- vkCmdCopyAccelerationStructureNV
- vkCmdTraceRaysNV
- vkCmdWriteAccelerationStructuresPropertiesNV
- vkCompileDeferredNV
- vkCreateAccelerationStructureNV
- vkCreateRayTracingPipelinesNV
- vkDestroyAccelerationStructureNV
- vkGetAccelerationStructureHandleNV
- vkGetAccelerationStructureMemoryRequirementsNV
- vkGetRayTracingShaderGroupHandlesNV

New Structures

- VkAabbPositionsNV

- VkAccelerationStructureCreateInfoNV
- VkAccelerationStructureInfoNV
- VkAccelerationStructureInstanceNV
- VkAccelerationStructureMemoryRequirementsInfoNV
- VkBindAccelerationStructureMemoryInfoNV
- VkGeometryAABBNV
- VkGeometryDataNV
- VkGeometryNV
- VkGeometryTrianglesNV
- VkRayTracingPipelineCreateInfoNV
- VkRayTracingShaderGroupCreateInfoNV
- VkTransformMatrixNV
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceRayTracingPropertiesNV
- Extending VkWriteDescriptorSet:
  - VkWriteDescriptorSetAccelerationStructureNV

If VK_KHR_get_memory_requirements2 or Vulkan Version 1.1 is supported:

- VkMemoryRequirements2KHR

New Enums

- VkAccelerationStructureMemoryRequirementsTypeNV
- VkAccelerationStructureTypeNV
- VkBuildAccelerationStructureFlagBitsNV
- VkCopyAccelerationStructureModeNV
- VkGeometryFlagBitsNV
- VkGeometryInstanceFlagBitsNV
- VkGeometryTypeNV
- VkRayTracingShaderGroupTypeNV

New Bitmasks

- VkBuildAccelerationStructureFlagsNV
- VkGeometryFlagsNV
- VkGeometryInstanceFlagsNV

New Enum Constants

- VK_NV_RAY_TRACING_EXTENSION_NAME
- VK_NV_RAY_TRACING_SPEC_VERSION
- VK_SHADER_UNUSED_NV
- Extending VkAccelerationStructureTypeKHR:
  - VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV

- RayTmaxNV
- InstanceCustomIndexNV
- InstanceId
- ObjectToWorldNV
- WorldToObjectNV
- HitTNV
- HitKindNV
- IncomingRayFlagsNV
- (modified)PrimitiveId

New SPIR-V Capabilities

- RayTracingNV

Issues

1) Are there issues?

RESOLVED: Yes.

Sample Code

Example ray generation GLSL shader

```
#version 450 core
#extension GL_NV_ray_tracing : require
layout(set = 0, binding = 0, rgba8) uniform image2D image;
```

```
layout(set = 0, binding = 1) uniform accelerationStructureNV as;
layout(location = 0) rayPayloadNV float payload;

void main()
{
   vec4 col = vec4(0, 0, 0, 1);

   vec3 origin = vec3(float(gl_LaunchIDNV.x)/float(gl_LaunchSizeNV.x), float
(gl_LaunchIDNV.y)/float(gl_LaunchSizeNV.y), 1.0);
   vec3 dir = vec3(0.0, 0.0, -1.0);

   traceNV(as, 0, 0xff, 0, 1, 0, origin, 0.0, dir, 1000.0, 0);

   col.y = payload;

   imageStore(image, ivec2(gl_LaunchIDNV.xy), col);
}
```

Version History

- Revision 1, 2018-09-11 (Robert Stepinski, Nuno Subtil, Eric Werness)
  - Internal revisions
- Revision 2, 2018-10-19 (Eric Werness)
  - rename to VK_NV_ray_tracing, add support for callables.
  - too many updates to list
- Revision 3, 2018-11-20 (Daniel Koch)
  - update to use InstanceId instead of InstanceIndex as implemented.

Description

Applications that wish to import Direct3D 11 memory objects into the Vulkan API may wish to use the native keyed mutex mechanism to synchronize access to the memory between Vulkan and Direct3D. This extension provides a way for an application to access the keyed mutex associated with an imported Vulkan memory object when submitting command buffers to a queue.

New Structures

- Extending VkSubmitInfo, VkSubmitInfo2:
  - VkWin32KeyedMutexAcquireReleaseInfoNV

New Enum Constants

- `VK_NV_WIN32_KEYED_MUTEX_EXTENSION_NAME`
- `VK_NV_WIN32_KEYED_MUTEX_SPEC_VERSION`
- Extending VkStructureType:
  - `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_NV`

Examples

```
    //
    // Import a memory object from Direct3D 11, and synchronize
    // access to it in Vulkan using keyed mutex objects.
    //
```

```

Description

This extension allows applications to reduce descriptor memory footprint by allowing a descriptor to be able to mutate to a given list of descriptor types depending on which descriptor types are written into, or copied into a descriptor set.

The main use case this extension intends to address is descriptor indexing with `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT` where the descriptor types are completely generic, as this means applications can allocate one large descriptor set, rather than having one large descriptor set per descriptor type, which significantly bloats descriptor memory usage and causes performance issues.

This extension also adds a mechanism to declare that a descriptor pool, and therefore the descriptor sets that are allocated from it, reside only in host memory; as such these descriptors can only be updated/copied, but not bound.

These features together allow much more efficient emulation of the raw D3D12 binding model. This extension is primarily intended to be useful for API layering efforts.

Appendix F: API Boilerplate

This appendix defines Vulkan API features that are infrastructure required for a complete functional description of Vulkan, but do not logically belong elsewhere in the Specification.

Vulkan Header Files

Vulkan is defined as an API in the C99 language. Khronos provides a corresponding set of header files for applications using the API, which may be used in either C or C++ code. The interface descriptions in the specification are the same as the interfaces defined in these header files, and both are derived from the `vk.xml` XML API Registry, which is the canonical machine-readable description of the Vulkan API. The Registry, scripts used for processing it into various forms, and documentation of the registry schema are available as described at https://registry.khronos.org/vulkan/#apiregistry .

Language bindings for other languages can be defined using the information in the Specification and the Registry. Khronos does not provide any such bindings, but third-party developers have created some additional bindings.

Vulkan Combined API Header `vulkan.h` (Informative)

Applications normally will include the header `vulkan.h`. In turn, `vulkan.h` always includes the following headers:

- `vk_platform.h`, defining platform-specific macros and headers.
- `vulkan_core.h`, defining APIs for the Vulkan core and all registered extensions *other* than window system-specific and provisional extensions, which are included in separate header files.

In addition, specific preprocessor macros defined at the time `vulkan.h` is included cause header files for the corresponding window system-specific and provisional interfaces to be included, as described below.

Vulkan Platform-Specific Header `vk_platform.h` (Informative)

Platform-specific macros and interfaces are defined in `vk_platform.h`. These macros are used to control platform-dependent behavior, and their exact definitions are under the control of specific platforms and Vulkan implementations.

Platform-Specific Calling Conventions

On many platforms the following macros are empty strings, causing platform- and compiler-specific default calling conventions to be used.

`VKAPI_ATTR` is a macro placed before the return type in Vulkan API function declarations. This macro controls calling conventions for C++11 and GCC/Clang-style compilers.

`VKAPI_CALL` is a macro placed after the return type in Vulkan API function declarations. This macro controls calling conventions for MSVC-style compilers.

VKAPI_PTR is a macro placed between the '(' and '*' in Vulkan API function pointer declarations. This macro also controls calling conventions, and typically has the same definition as VKAPI_ATTR or VKAPI_CALL, depending on the compiler.

With these macros, a Vulkan function declaration takes the form of:

```
VKAPI_ATTR <return_type> VKAPI_CALL <command_name>(<command_parameters>);
```

Additionally, a Vulkan function pointer type declaration takes the form of:

```
typedef <return_type> (VKAPI_PTR *PFN_<command_name>)(<command_parameters>);
```

Platform-Specific Header Control

If the VK_NO_STDINT_H macro is defined by the application at compile time, extended integer types used by the Vulkan API, such as uint8_t, **must** also be defined by the application. Otherwise, the Vulkan headers will not compile. If VK_NO_STDINT_H is not defined, the system <stdint.h> is used to define these types. There is a fallback path when Microsoft Visual Studio version 2008 and earlier versions are detected at compile time.

If the VK_NO_STDDEF_H macro is defined by the application at compile time, size_t, **must** also be defined by the application. Otherwise, the Vulkan headers will not compile. If VK_NO_STDDEF_H is not defined, the system <stddef.h> is used to define this type.

Vulkan Core API Header vulkan_core.h

Applications that do not make use of window system-specific extensions may simply include vulkan_core.h instead of vulkan.h, although there is usually no reason to do so. In addition to the Vulkan API, vulkan_core.h also defines a small number of C preprocessor macros that are described below.

Vulkan Header File Version Number

VK_HEADER_VERSION is the version number of the vulkan_core.h header. This value is kept synchronized with the patch version of the released Specification.

```
// Provided by VK_VERSION_1_0
// Version of this file
#define VK_HEADER_VERSION 302
```

VK_HEADER_VERSION_COMPLETE is the complete version number of the vulkan_core.h header, comprising the major, minor, and patch versions. The major/minor values are kept synchronized with the complete version of the released Specification. This value is intended for use by automated tools to identify exactly which version of the header was used during their generation.

Applications should not use this value as their VkApplicationInfo::apiVersion. Instead applications

should explicitly select a specific fixed major/minor API version using, for example, one of the VK_API_VERSION_*_* values.

```
// Provided by VK_VERSION_1_0
// Complete version of this file
#define VK_HEADER_VERSION_COMPLETE VK_MAKE_API_VERSION(0, 1, 3, VK_HEADER_VERSION)
```

VK_API_VERSION is now commented out of vulkan_core.h and **cannot** be used.

```
// Provided by VK_VERSION_1_0
// DEPRECATED: This define has been removed. Specific version defines (e.g.
VK_API_VERSION_1_0), or the VK_MAKE_VERSION macro, should be used instead.
//#define VK_API_VERSION VK_MAKE_API_VERSION(0, 1, 0, 0) // Patch version should
always be set to 0
```

Vulkan Handle Macros

VK_DEFINE_HANDLE defines a dispatchable handle type.

```
// Provided by VK_VERSION_1_0

#define VK_DEFINE_HANDLE(object) typedef struct object##_T* object;
```

- object is the name of the resulting C type.

The only dispatchable handle types are those related to device and instance management, such as VkDevice.

VK_DEFINE_NON_DISPATCHABLE_HANDLE defines a non-dispatchable handle type.

```
// Provided by VK_VERSION_1_0

#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
    #if (VK_USE_64_BIT_PTR_DEFINES==1)
        #define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef struct object##_T
*object;
    #else
        #define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef uint64_t object;
    #endif
#endif
```

- object is the name of the resulting C type.

Most Vulkan handle types, such as VkBuffer, are non-dispatchable.

NOTE The vulkan_core.h header allows the VK_DEFINE_NON_DISPATCHABLE_HANDLE

> and VK_NULL_HANDLE definitions to be overridden by the application. If VK_DEFINE_NON_DISPATCHABLE_HANDLE is already defined when vulkan_core.h is compiled, the default definitions for VK_DEFINE_NON_DISPATCHABLE_HANDLE and VK_NULL_HANDLE are skipped. This allows the application to define a binary-compatible custom handle which **may** provide more type-safety or other features needed by the application. Applications **must** not define handles in a way that is not binary compatible - where binary compatibility is platform dependent.

VK_NULL_HANDLE is a reserved value representing a non-valid object handle. It may be passed to and returned from Vulkan commands only when specifically allowed.

```
// Provided by VK_VERSION_1_0

#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
    #if (VK_USE_64_BIT_PTR_DEFINES==1)
        #if (defined(__cplusplus) && (__cplusplus >= 201103L)) || (defined(_MSVC_LANG)
&& (_MSVC_LANG >= 201103L))
            #define VK_NULL_HANDLE nullptr
        #else
            #define VK_NULL_HANDLE ((void*)0)
        #endif
    #else
        #define VK_NULL_HANDLE 0ULL
    #endif
#endif
#ifndef VK_NULL_HANDLE
    #define VK_NULL_HANDLE 0
#endif
```

VK_USE_64_BIT_PTR_DEFINES defines whether the default non-dispatchable handles are declared using either a 64-bit pointer type or a 64-bit unsigned integer type.

VK_USE_64_BIT_PTR_DEFINES is set to '1' to use a 64-bit pointer type or any other value to use a 64-bit unsigned integer type.

```
// Provided by VK_VERSION_1_0

#ifndef VK_USE_64_BIT_PTR_DEFINES
    #if defined(__LP64__) || defined(_WIN64) || (defined(__x86_64__) &&
!defined(__ILP32__) ) || defined(_M_X64) || defined(__ia64) || defined (_M_IA64) ||
defined(__aarch64__) || defined(__powerpc64__) || (defined(__riscv) && __riscv_xlen ==
64)
        #define VK_USE_64_BIT_PTR_DEFINES 1
    #else
        #define VK_USE_64_BIT_PTR_DEFINES 0
    #endif
#endif
```

NOTE

The `vulkan_core.h` header allows the `VK_USE_64_BIT_PTR_DEFINES` definition to be overridden by the application. This allows the application to select either a 64-bit pointer type or a 64-bit unsigned integer type for non-dispatchable handles in the case where the predefined preprocessor check does not identify the desired configuration.

NOTE

This macro was introduced starting with the Vulkan 1.2.174 headers, and its availability can be checked at compile time by requiring `VK_HEADER_VERSION >= 174`.

It is not available if you are using older headers, such as may be shipped with an older Vulkan SDK. Developers requiring this functionality may wish to include a copy of the current Vulkan headers with their project in this case.

Window System-Specific Header Control (Informative)

To use a Vulkan extension supporting a platform-specific window system, header files for that window system **must** be included at compile time, or platform-specific types **must** be forward-declared. The Vulkan header files are unable to determine whether or not an external header is available at compile time, so platform-specific extensions are provided in separate headers from the core API and platform-independent extensions, allowing applications to decide which ones they need to be defined and how the external headers are included.

Extensions dependent on particular sets of platform headers, or that forward-declare platform-specific types, are declared in a header named for that platform. Before including these platform-specific Vulkan headers, applications **must** include both `vulkan_core.h` and any external native headers the platform extensions depend on.

As a convenience for applications that do not need the flexibility of separate platform-specific Vulkan headers, `vulkan.h` includes `vulkan_core.h`, and then conditionally includes platform-specific Vulkan headers and the external headers they depend on. Applications control which platform-specific headers are included by #defining macros before including `vulkan.h`.

The correspondence between platform-specific extensions, external headers they require, the platform-specific header which declares them, and the preprocessor macros which enable inclusion by `vulkan.h` are shown in the following table.

Table 112. Window System Extensions and Headers

Extension Name	Window System Name	Platform-specific Header	Required External Headers	Controlling `vulkan.h` Macro
`VK_KHR_android_surface`	Android	`vulkan_android.h`	None	`VK_USE_PLATFORM_ANDROID_KHR`
`VK_KHR_wayland_surface`	Wayland	`vulkan_wayland.h`	`<wayland-client.h>`	`VK_USE_PLATFORM_WAYLAND_KHR`

Extension Name	Window System Name	Platform-specific Header	Required External Headers	Controlling `vulkan.h` Macro
VK_KHR_win32_surface, VK_KHR_external_memory_win32, VK_KHR_win32_keyed_mutex, VK_KHR_external_semaphore_win32, VK_KHR_external_fence_win32, VK_NV_external_memory_win32, VK_NV_win32_keyed_mutex	Microsoft Windows	vulkan_win32.h	<windows.h>	VK_USE_PLATFORM_WIN32_KHR
VK_KHR_xcb_surface	X11 Xcb	vulkan_xcb.h	<xcb/xcb.h>	VK_USE_PLATFORM_XCB_KHR
VK_KHR_xlib_surface	X11 Xlib	vulkan_xlib.h	<X11/Xlib.h>	VK_USE_PLATFORM_XLIB_KHR
VK_EXT_directfb_surface	DirectFB	vulkan_directfb.h	<directfb/directfb.h>	VK_USE_PLATFORM_DIRECTFB_EXT
VK_EXT_acquire_xlib_display	X11 XRAndR	vulkan_xlib_xrandr.h	<X11/Xlib.h>, <X11/extensions/Xrandr.h>	VK_USE_PLATFORM_XLIB_XRANDR_EXT
VK_GGP_stream_descriptor_surface, VK_GGP_frame_token	Google Games Platform	vulkan_ggp.h	<ggp_c/vulkan_types.h>	VK_USE_PLATFORM_GGP
VK_MVK_ios_surface	iOS	vulkan_ios.h	None	VK_USE_PLATFORM_IOS_MVK
VK_MVK_macos_surface	macOS	vulkan_macos.h	None	VK_USE_PLATFORM_MACOS_MVK
VK_NN_vi_surface	VI	vulkan_vi.h	None	VK_USE_PLATFORM_VI_NN
VK_FUCHSIA_imagepipe_surface	Fuchsia	vulkan_fuchsia.h	<zircon/types.h>	VK_USE_PLATFORM_FUCHSIA
VK_EXT_metal_surface	Metal on CoreAnimation	vulkan_metal.h	None	VK_USE_PLATFORM_METAL_EXT
VK_QNX_screen_surface	QNX Screen	vulkan_screen.h	<screen/screen.h>	VK_USE_PLATFORM_SCREEN_QNX

NOTE This section describes the purpose of the headers independently of the specific underlying functionality of the window system extensions themselves. Each extension name will only link to a description of that extension when viewing a specification built with that extension included.

Provisional Extension Header Control (Informative)

Provisional extensions **should** not be used in production applications. The functionality defined by such extensions **may** change in ways that break backwards compatibility between revisions, and before final release of a non-provisional version of that extension.

Provisional extensions are defined in a separate *provisional header*, `vulkan_beta.h`, allowing applications to decide whether or not to include them. The mechanism is similar to window system-specific headers: before including `vulkan_beta.h`, applications **must** include `vulkan_core.h`.

NOTE Sometimes a provisional extension will include a subset of its interfaces in `vulkan_core.h`. This may occur if the provisional extension is promoted from an existing vendor or EXT extension and some of the existing interfaces are defined as aliases of the provisional extension interfaces. All other interfaces of that provisional extension which are not aliased will be included in `vulkan_beta.h`.

As a convenience for applications, `vulkan.h` conditionally includes `vulkan_beta.h`. Applications **can** control inclusion of `vulkan_beta.h` by #defining the macro `VK_ENABLE_BETA_EXTENSIONS` before including `vulkan.h`.

NOTE Starting in version 1.2.171 of the Specification, all provisional enumerants are protected by the macro `VK_ENABLE_BETA_EXTENSIONS`. Applications needing to use provisional extensions must always define this macro, even if they are explicitly including `vulkan_beta.h`. This is a minor change to behavior, affecting only provisional extensions.

NOTE This section describes the purpose of the provisional header independently of the specific provisional extensions which are contained in that header at any given time. The extension appendices for provisional extensions note their provisional status, and link back to this section for more information. Provisional extensions are intended to provide early access for bleeding-edge developers, with the understanding that extension interfaces may change in response to developer feedback. Provisional extensions are very likely to eventually be updated and released as non-provisional extensions, but there is no guarantee this will happen, or how long it will take if it does happen.

Video Std Headers

Performing video coding operations usually involves the application having to provide various parameters, data structures, or other syntax elements specific to the particular video compression standard used, and the associated semantics are covered by the specification of those.

The interface descriptions of these are available in the header files derived from the `video.xml` XML file, which is the canonical machine-readable description of data structures and enumerations that are associated with the externally-provided video compression standards.

Table 113. Video Std Headers

Video Std Header Name	Description	Header File	Related Extensions
vulkan_video_codecs_common	Codec-independent common definitions	<vk_video/vulkan_video_codecs_common.h>	-
vulkan_video_codec_h264std	ITU-T H.264 common definitions	<vk_video/vulkan_video_codec_h264std.h>	VK_KHR_video_decode_h264, VK_KHR_video_encode_h264
vulkan_video_codec_h264std_decode	ITU-T H.264 decode-specific definitions	<vk_video/vulkan_video_codec_h264std_decode.h>	VK_KHR_video_decode_h264
vulkan_video_codec_h264std_encode	ITU-T H.264 encode-specific definitions	<vk_video/vulkan_video_codec_h264std_encode.h>	VK_KHR_video_encode_h264
vulkan_video_codec_h265std	ITU-T H.265 common definitions	<vk_video/vulkan_video_codec_h265std.h>	VK_KHR_video_decode_h265, VK_KHR_video_encode_h265
vulkan_video_codec_h265std_decode	ITU-T H.265 decode-specific definitions	<vk_video/vulkan_video_codec_h265std_decode.h>	VK_KHR_video_decode_h265
vulkan_video_codec_h265std_encode	ITU-T H.265 encode-specific definitions	<vk_video/vulkan_video_codec_h265std_encode.h>	VK_KHR_video_encode_h265
vulkan_video_codec_av1std	AV1 common definitions	<vk_video/vulkan_video_codec_av1std.h>	VK_KHR_video_decode_av1
vulkan_video_codec_av1std_decode	AV1 decode-specific definitions	<vk_video/vulkan_video_codec_av1std_decode.h>	VK_KHR_video_decode_av1
vulkan_video_codec_av1std_encode	AV1 encode-specific definitions	<vk_video/vulkan_video_codec_av1std_encode.h>	VK_KHR_video_encode_av1

Appendix G: Invariance

The Vulkan specification is not pixel exact. It therefore does not guarantee an exact match between images produced by different Vulkan implementations. However, the specification does specify exact matches, in some cases, for images produced by the same implementation. The purpose of this appendix is to identify and provide justification for those cases that require exact matches.

Repeatability

The obvious and most fundamental case is repeated issuance of a series of Vulkan commands. For any given Vulkan and framebuffer state vector, and for any Vulkan command, the resulting Vulkan and framebuffer state **must** be identical whenever the command is executed on that initial Vulkan and framebuffer state. This repeatability requirement does not apply when using shaders containing side effects (image and buffer variable stores and atomic operations), because these memory operations are not guaranteed to be processed in a defined order.

The repeatability requirement does not apply for rendering done using a graphics pipeline that uses `VK_RASTERIZATION_ORDER_RELAXED_AMD`.

One purpose of repeatability is avoidance of visual artifacts when a double-buffered scene is redrawn. If rendering is not repeatable, swapping between two buffers rendered with the same command sequence **may** result in visible changes in the image. Such false motion is distracting to the viewer. Another reason for repeatability is testability.

Repeatability, while important, is a weak requirement. Given only repeatability as a requirement, two scenes rendered with one (small) polygon changed in position might differ at every pixel. Such a difference, while within the law of repeatability, is certainly not within its spirit. Additional invariance rules are desirable to ensure useful operation.

Multi-Pass Algorithms

Invariance is necessary for a whole set of useful multi-pass algorithms. Such algorithms render multiple times, each time with a different Vulkan mode vector, to eventually produce a result in the framebuffer. Examples of these algorithms include:

- “Erasing” a primitive from the framebuffer by redrawing it, either in a different color or using the XOR logical operation.
- Using stencil operations to compute capping planes.

Invariance Rules

For a given Vulkan device:

Rule 1 *For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the resulting Vulkan and framebuffer state **must** be identical each time the command is executed on that initial Vulkan and framebuffer state.*

Rule 2 *Changes to the following state values have no side effects (the use of any other state value is not affected by the change):*

Required:

- *Color and depth/stencil attachment contents*
- *Scissor parameters (other than enable)*
- *Write masks (color, depth, stencil)*
- *Clear values (color, depth, stencil)*

Strongly suggested:

- *Stencil parameters (other than enable)*
- *Depth test parameters (other than enable)*
- *Blend parameters (other than enable)*
- *Logical operation parameters (other than enable)*

Corollary 1 *Fragment generation is invariant with respect to the state values listed in Rule 2.*

Rule 3 *The arithmetic of each per-fragment operation is invariant except with respect to parameters that directly control it.*

Corollary 2 *Images rendered into different color attachments of the same framebuffer, either simultaneously or separately using the same command sequence, are pixel identical.*

Rule 4 *Identical pipelines will produce the same result when run multiple times with the same input. The wording "Identical pipelines" means VkPipeline objects that have been created with identical SPIR-V binaries and identical state, which are then used by commands executed using the same Vulkan state vector. Invariance is relaxed for shaders with side effects, such as performing stores or atomics.*

Rule 5 *All fragment shaders that either conditionally or unconditionally assign* `FragCoord.z` *to* `FragDepth` *are depth-invariant with respect to each other, for those fragments where the assignment to* `FragDepth` *actually is done.*

If a sequence of Vulkan commands specifies primitives to be rendered with shaders containing side effects (image and buffer variable stores and atomic operations), invariance rules are relaxed. In particular, rule 1, corollary 2, and rule 4 do not apply in the presence of shader side effects.

The following weaker versions of rules 1 and 4 apply to Vulkan commands involving shader side effects:

Rule 6 *For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the contents of any framebuffer state not directly or indirectly affected by results of shader image or buffer variable stores or atomic operations* ***must*** *be identical each time the command is executed on that initial Vulkan and framebuffer state.*

Rule 7 *Identical pipelines will produce the same result when run multiple times with the same input*

as long as:

- *shader invocations do not use image atomic operations;*
- *no framebuffer memory is written to more than once by image stores, unless all such stores write the same value; and*
- *no shader invocation, or other operation performed to process the sequence of commands, reads memory written to by an image store.*

NOTE

The OpenGL specification has the following invariance rule: Consider a primitive p' obtained by translating a primitive p through an offset (x, y) in window coordinates, where x and y are integers. As long as neither p' nor p is clipped, it **must** be the case that each fragment f' produced from p' is identical to a corresponding fragment f from p except that the center of f' is offset by (x, y) from the center of f.

This rule does not apply to Vulkan and is an intentional difference from OpenGL.

When any sequence of Vulkan commands triggers shader invocations that perform image stores or atomic operations, and subsequent Vulkan commands read the memory written by those shader invocations, these operations **must** be explicitly synchronized.

Tessellation Invariance

When using a pipeline containing tessellation evaluation shaders, the fixed-function tessellation primitive generator consumes the input patch specified by an application and emits a new set of primitives. The following invariance rules are intended to provide repeatability guarantees. Additionally, they are intended to allow an application with a carefully crafted tessellation evaluation shader to ensure that the sets of triangles generated for two adjacent patches have identical vertices along shared patch edges, avoiding “cracks” caused by minor differences in the positions of vertices along shared edges.

Rule 1 *When processing two patches with identical outer and inner tessellation levels, the tessellation primitive generator will emit an identical set of point, line, or triangle primitives as long as the pipeline used to process the patch primitives has tessellation evaluation shaders specifying the same tessellation mode, spacing, vertex order, and point mode decorations. Two sets of primitives are considered identical if and only if they contain the same number and type of primitives and the generated tessellation coordinates for the vertex numbered m of the primitive numbered n are identical for all values of m and n.*

Rule 2 *The set of vertices generated along the outer edge of the subdivided primitive in triangle and quad tessellation, and the tessellation coordinates of each, depend only on the corresponding outer tessellation level and the spacing decorations in the tessellation shaders of the pipeline.*

Rule 3 *The set of vertices generated when subdividing any outer primitive edge is always symmetric. For triangle tessellation, if the subdivision generates a vertex with tessellation coordinates of the form (0, x, 1-x), (x, 0, 1-x), or (x, 1-x, 0), it will also generate a vertex with coordinates of exactly (0, 1-x, x), (1-x, 0, x), or (1-x, x, 0), respectively. For quad tessellation, if the subdivision generates a vertex with coordinates of (x, 0) or (0, x), it will also generate a vertex with coordinates of exactly (1-x, 0) or (0, 1-x), respectively. For isoline tessellation, if it generates vertices at (0, x) and (1, x) where x is not zero, it*

will also generate vertices at exactly (0, 1-x) and (1, 1-x), respectively.

Rule 4 *The set of vertices generated when subdividing outer edges in triangular and quad tessellation **must** be independent of the specific edge subdivided, given identical outer tessellation levels and spacing. For example, if vertices at (x, 1 - x, 0) and (1-x, x, 0) are generated when subdividing the w = 0 edge in triangular tessellation, vertices **must** be generated at (x, 0, 1-x) and (1-x, 0, x) when subdividing an otherwise identical v = 0 edge. For quad tessellation, if vertices at (x, 0) and (1-x, 0) are generated when subdividing the v = 0 edge, vertices **must** be generated at (0, x) and (0, 1-x) when subdividing an otherwise identical u = 0 edge.*

Rule 5 *When processing two patches that are identical in all respects enumerated in rule 1 except for vertex order, the set of triangles generated for triangle and quad tessellation **must** be identical except for vertex and triangle order. For each triangle n1 produced by processing the first patch, there **must** be a triangle n2 produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in n1.*

Rule 6 *When processing two patches that are identical in all respects enumerated in rule 1 other than matching outer tessellation levels and/or vertex order, the set of interior triangles generated for triangle and quad tessellation **must** be identical in all respects except for vertex and triangle order. For each interior triangle n1 produced by processing the first patch, there **must** be a triangle n2 produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in n1. A triangle produced by the tessellator is considered an interior triangle if none of its vertices lie on an outer edge of the subdivided primitive.*

Rule 7 *For quad and triangle tessellation, the set of triangles connecting an inner and outer edge depends only on the inner and outer tessellation levels corresponding to that edge and the spacing decorations.*

Rule 8 *The value of all defined components of* `TessCoord` *will be in the range [0, 1]. Additionally, for any defined component x of* `TessCoord`*, the results of computing 1.0-x in a tessellation evaluation shader will be exact. If any floating-point values in the range [0, 1] fail to satisfy this property, such values **must** not be used as tessellation coordinate components.*

Appendix H: Lexicon

This appendix defines terms, abbreviations, and API prefixes used in the Specification.

Glossary

The terms defined in this section are used consistently throughout the Specification and may be used with or without capitalization.

Accessible (Descriptor Binding)

A descriptor binding is accessible to a shader stage if that stage is included in the `stageFlags` of the descriptor binding. Descriptors using that binding **can** only be used by stages in which they are accessible.

Acquire Operation (Resource)

An operation that acquires ownership of an image subresource or buffer range.

Active (Descriptor Type)

When a descriptor with *mutable* type is updated with vkUpdateDescriptorSets, the active descriptor type changes. When the descriptor is consumed by shaders, it is the active descriptor type which determines validity, i.e. `VkDescriptorSetLayoutBinding`::`descriptorType` is replaced with the active descriptor type. A mismatch in active descriptor type and consumption by shader is considered an undefined descriptor.

Active (Transform Feedback)

Transform feedback is made active after vkCmdBeginTransformFeedbackEXT executes and remains active until vkCmdEndTransformFeedbackEXT executes. While transform feedback is active, data written to variables in the output interface of the last pre-rasterization shader stage of the graphics pipeline are captured to the bound transform feedback buffers if those variables are decorated for transform feedback.

Adjacent Vertex

A vertex in an adjacency primitive topology that is not part of a given primitive, but is accessible in geometry shaders.

Active Object (Ray Tracing)

A primitive or instance in a ray tracing acceleration structure which has a corresponding ID, and is not *inactive* (meaning that it is visible to rays).

Advanced Blend Operation

Blending performed using one of the blend operation enums introduced by the `VK_EXT_blend_operation_advanced` extension. See Advanced Blending Operations.

Alias (API type/command)

An identical definition of another API type/command with the same behavior but a different name.

Aliased Range (Memory)

A range of a device memory allocation that is bound to multiple resources simultaneously.

Allocation Scope

An association of a host memory allocation to a parent object or command, where the allocation's lifetime ends before or at the same time as the parent object is freed or destroyed, or during the parent command.

API command

Any command defined in the Vulkan specification. These entry points all have a vk prefix.

Aspect (Image)

Some image types contain multiple kinds (called "aspects") of data for each pixel, where each aspect is used in a particular way by the pipeline and **may** be stored differently or separately from other aspects. For example, the color components of an image format make up the color aspect of the image, and **can** be used as a framebuffer color attachment. Some operations, like depth testing, operate only on specific aspects of an image.

Attachment (Render Pass)

A zero-based integer index name used in render pass creation to refer to a framebuffer attachment that is accessed by one or more subpasses. The index also refers to an attachment description which includes information about the properties of the image view that will later be attached.

Availability Operation

An operation that causes the values generated by specified memory write accesses to become available for future access.

Available

A state of values written to memory that allows them to be made visible.

Axis-aligned Bounding Box

A box bounding a region in space defined by extents along each axis and thus representing a box where each edge is aligned to one of the major axes.

Back-Facing

See Facingness.

Backward Prediction

Sample prediction performed during video decode and encode operations based on reference pictures that occur temporally (in display order) after the current picture.

Backward Reference

A reference picture that occurs temporally (in display order) after the current picture.

Batch

A single structure submitted to a queue as part of a queue submission command, describing a set of queue operations to execute.

Backwards Compatibility

A given version of the API is backwards compatible with an earlier version if an application, relying only on valid behavior and functionality defined by the earlier specification, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

Binary Semaphore

A semaphore with a boolean payload indicating whether the semaphore is signaled or unsignaled. Represented by a VkSemaphore object created with a semaphore type of `VK_SEMAPHORE_TYPE_BINARY` .

Binding (Memory)

An association established between a range of a resource object and a range of a memory object. These associations determine the memory locations affected by operations performed on elements of a resource object. Memory bindings are established using the vkBindBufferMemory command for non-sparse buffer objects, using the vkBindImageMemory command for non-sparse image objects , and using the vkQueueBindSparse command for sparse resources .

Blend Constant

Four floating-point (RGBA) values used as an input to blending.

Blending

Arithmetic operations between a fragment color value and a value in a color attachment that produce a final color value to be written to the attachment.

Buffer

A resource that represents a linear array of data in device memory. Represented by a VkBuffer object.

Buffer Device Address

A 64-bit value used in a shader to access buffer memory through the `PhysicalStorageBuffer` storage class.

Buffer View

An object that represents a range of a specific buffer, and state controlling how the contents are interpreted. Represented by a VkBufferView object.

Built-In Variable

A variable decorated in a shader, where the decoration makes the variable take values provided by the execution environment or values that are generated by fixed-function pipeline stages.

Built-In Interface Block

A block defined in a shader containing only variables decorated with built-in decorations, and is used to match against other shader stages.

Clip Coordinates

The homogeneous coordinate space in which vertex positions (`Position` decoration) are written by pre-rasterization shader stages.

Clip Distance

A built-in output from pre-rasterization shader stages defining a clip half-space against which the primitive is clipped.

Clip Volume

The intersection of the view volume with all clip half-spaces.

Coding Block (Video)

An element of a video picture, comprising a rectangular block of texel values that are coded as a single unit in video coding. Video coding blocks have a corresponding coding block size (width and height) defining the dimensions of these elements in units of texels. These dimensions are usually codec-specific and a single video compression standard **may** support more than one coding block type and size. Video compression standards **may** use multiple coding block types to organize coding blocks of different kinds and sizes into hierarchies.

Color Attachment

A subpass attachment point, or image view, that is the target of fragment color outputs and blending.

Color Fragment

A unique color value within a pixel of a multisampled color image. The *fragment mask* will contain indices to the *color fragment*.

Color Renderable Format

A VkFormat where `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` is set in one of the following, depending on the image's tiling:

- VkFormatProperties::`linearTilingFeatures`
- VkFormatProperties::`optimalTilingFeatures` or a VkFormat where `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` is set in VkFormatProperties::`linearTilingFeatures`
- VkDrmFormatModifierPropertiesEXT::`drmFormatModifierTilingFeatures`

Combined Image Sampler

A descriptor type that includes both a sampled image and a sampler.

Command Buffer

An object that records commands to be submitted to a queue. Represented by a VkCommandBuffer object.

Command Buffer Nesting Level

The Command Buffer Nesting Level of a secondary command buffer is equal to the maximum nesting level of all secondary command buffers executed by that command buffer plus one, where a secondary command buffer that executes no other secondary command buffers has a nesting level of zero.

Command Pool

An object that command buffer memory is allocated from, and that owns that memory.

Command pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a VkCommandPool object.

Compatible Allocator

When allocators are compatible, allocations from each allocator **can** be freed by the other allocator.

Compatible Image Formats

When formats are compatible, images created with one of the formats **can** have image views created from it using any of the compatible formats. Also see *Size-Compatible Image Formats*.

Compatible Queues

Queues within a queue family. Compatible queues have identical properties.

Complete Mipmap Chain

The entire set of mip levels that can be provided for an image, from the largest application-specified mip level size down to the *minimum mip level size*. See Image Mip Level Sizing.

Completed Operation

A deferred operation whose corresponding command has been executed to completion. See Deferred Host Operations

Component (Format)

A distinct part of a format. Color components are represented with `R`, `G`, `B`, and `A`. Depth and stencil components are represented with `D` and `S`. Formats **can** have multiple instances of the same component. Some formats have other notations such as `E` or `X` which are not considered a component of the format.

Compressed Texel Block

An element of an image having a block-compressed format, comprising a rectangular block of texel values that are encoded as a single value in memory. Compressed texel blocks of a particular block-compressed format have a corresponding width, height, and depth defining the dimensions of these elements in units of texels, and a size in bytes of the encoding in memory.

Constant Integral Expressions

A SPIR-V constant instruction whose type is `OpTypeInt`. See *Constant Instruction* in section 2.2.1 “Instructions” of the Khronos SPIR-V Specification.

Cooperative Matrix

A SPIR-V type where the storage for and computations performed on the matrix are spread across a set of invocations such as a subgroup.

Corner-Sampled Image

A VkImage where unnormalized texel coordinates are centered on integer values instead of half-integer values. Specified by setting the `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` bit on VkImageCreateInfo::`flags` at image creation.

Coverage Index

The index of a sample in the coverage mask.

Coverage Mask

A bitfield associated with a fragment representing the samples that were determined to be covered based on the result of rasterization, and then subsequently modified by fragment operations or the fragment shader.

Cull Distance

A built-in output from pre-rasterization shader stages defining a cull half-space where the primitive is rejected if all vertices have a negative value for the same cull distance.

Cull Volume

The intersection of the view volume with all cull half-spaces.

Decode Output Picture

A video picture resource used to store the result of a video decode operation.

Decoded Picture Buffer

An indexed set of reference pictures used by a video session. Abbreviated as DPB.

Decoded Picture Buffer Slot

An entry within a DPB that **can** be associated with a particular reference picture.

Decoded Picture Buffer Slot Index

The index of a DPB slot within its encompassing DPB.

Decoration (SPIR-V)

Auxiliary information such as built-in variables, stream numbers, invariance, interpolation type, relaxed precision, etc., added to variables or structure-type members through decorations.

Deferrable Command

A command which allows deferred execution of host-side work. See Deferred Host Operations.

Deferrable Operation

A single logical item of host-side work which can be deferred. Represented by the VkDeferredOperationKHR object. See Deferred Host Operations.

Deprecated (feature)

A feature is deprecated if it is no longer recommended as the correct or best way to achieve its intended purpose.

Depth/Stencil Attachment

A subpass attachment point, or image view, that is the target of depth and/or stencil test operations and writes.

Depth/Stencil Format

A VkFormat that includes depth and/or stencil components.

Depth/Stencil Image (or ImageView)

A VkImage (or VkImageView) with a depth/stencil format.

Depth/Stencil Resolve Attachment

A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding depth/stencil attachment at the end of the subpass.

Derivative Group

A set of compute, mesh, task, or fragment shader invocations that cooperate to compute derivatives, including implicit derivatives for sampled image operations.

Descriptor

Information about a resource or resource view written into a descriptor set that is used to access the resource or view from a shader.

Descriptor Binding

An entry in a descriptor set layout corresponding to zero or more descriptors of a single descriptor type in a set. Defined by a VkDescriptorSetLayoutBinding structure.

Descriptor Pool

An object that descriptor sets are allocated from, and that owns the storage of those descriptor sets. Descriptor pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a VkDescriptorPool object.

Descriptor Set

An object that resource descriptors are written into via the API, and that **can** be bound to a command buffer such that the descriptors contained within it **can** be accessed from shaders. Represented by a VkDescriptorSet object.

Descriptor Set Layout

An object defining the set of resources (types and counts) and their relative arrangement (in the binding namespace) within a descriptor set. Used when allocating descriptor sets and when creating pipeline layouts. Represented by a VkDescriptorSetLayout object.

Device

The processor(s) and execution environment that perform tasks requested by the application via the Vulkan API.

Device Group

A set of physical devices that support accessing each other's memory and recording a single command buffer that **can** be executed on all the physical devices.

Device Index

A zero-based integer that identifies one physical device from a logical device. A device index is valid if it is less than the number of physical devices in the logical device.

Device Mask

A bitmask where each bit represents one device index. A device mask value is valid if every bit that is set in the mask is at a bit position that is less than the number of physical devices in the logical device.

Device Memory

Memory accessible to the device. Represented by a VkDeviceMemory object.

Device-Level Command

Any command that is dispatched from a logical device, or from a child object of a logical device.

Device-Level Functionality

All device-level commands and objects, and their structures, enumerated types, and enumerants. Additionally, physical-device-level functionality defined by a device extension is also considered device-level functionality.

Device-Level Object

Logical device objects and their child objects. For example, VkDevice, VkQueue, and VkCommandBuffer objects are device-level objects.

Device-Local Memory

Memory that is connected to the device, and **may** be more performant for device access than host-local memory.

Direct Drawing Commands

Drawing commands that take all their parameters as direct arguments to the command (and not sourced via structures in buffer memory as the *indirect drawing commands*). Includes vkCmdDrawMultiIndexedEXT, vkCmdDrawMultiEXT, vkCmdDrawMeshTasksNV, vkCmdDrawMeshTasksEXT, vkCmdDraw, and vkCmdDrawIndexed.

Disjoint

Disjoint planes are *image planes* to which memory is bound independently.

A *disjoint image* consists of multiple *disjoint planes*, and is created with the `VK_IMAGE_CREATE_DISJOINT_BIT` bit set.

Dispatchable Command

A non-global command. The first argument to each dispatchable command is a dispatchable handle type.

Dispatchable Handle

A handle of a pointer handle type which **may** be used by layers as part of intercepting API commands.

Dispatching Commands

Commands that provoke work using a compute pipeline, such as vkCmdDispatch. See Dispatching Commands.

Drawing Commands

Commands that provoke work using a graphics pipeline. Includes vkCmdDraw, vkCmdDrawIndexed, vkCmdDrawIndirectCountKHR, vkCmdDrawIndexedIndirectCountKHR, vkCmdDrawIndirectCountAMD, vkCmdDrawIndexedIndirectCountAMD, vkCmdDrawMultiIndexedEXT, vkCmdDrawMultiEXT, vkCmdDrawMeshTasksNV, vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksIndirectCountNV, vkCmdDrawMeshTasksEXT, vkCmdDrawMeshTasksIndirectEXT, vkCmdDrawMeshTasksIndirectCountEXT, vkCmdDrawIndirect, and vkCmdDrawIndexedIndirect.

Duration (Command)

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

Dynamic Storage Buffer

A storage buffer whose offset is specified each time the storage buffer is bound to a command buffer via a descriptor set.

Dynamic Uniform Buffer

A uniform buffer whose offset is specified each time the uniform buffer is bound to a command buffer via a descriptor set.

Dynamically Uniform

See *Dynamically Uniform* in section 2.2 “Terms” of the Khronos SPIR-V Specification.

Encode Input Picture

A video picture resource used as the input of a video encode operation.

Element

Arrays are composed of multiple elements, where each element exists at a unique index within that array. Used primarily to describe data passed to or returned from the Vulkan API.

Explicitly-Enabled Layer

A layer enabled by the application by adding it to the enabled layer list in vkCreateInstance or vkCreateDevice.

Event

A synchronization primitive that is signaled when execution of previous commands completes through a specified set of pipeline stages. Events can be waited on by the device and polled by the host. Represented by a VkEvent object.

Executable State (Command Buffer)

A command buffer that has ended recording commands and **can** be executed. See also Initial State and Recording State.

Execution Dependency

A dependency that guarantees that certain pipeline stages’ work for a first set of commands has completed execution before certain pipeline stages’ work for a second set of commands begins

execution. This is accomplished via pipeline barriers, subpass dependencies, events, or implicit ordering operations.

Execution Dependency Chain

A sequence of execution dependencies that transitively act as a single execution dependency.

Explicit chroma reconstruction

An implementation of sampler $Y'C_BC_R$ conversion which reconstructs reduced-resolution chroma samples to luma resolution and then separately performs texture sample interpolation. This is distinct from an implicit implementation, which incorporates chroma sample reconstruction into texture sample interpolation.

Extension Scope

The set of objects and commands that **can** be affected by an extension. Extensions are either device scope or instance scope.

Extending Structure

A structure type which may appear in the `pNext` *chain* of another structure, extending the functionality of the other structure. Extending structures may be defined by either core API versions or extensions.

External Handle

A resource handle which has meaning outside of a specific Vulkan device or its parent instance. External handles **may** be used to share resources between multiple Vulkan devices in different instances, or between Vulkan and other APIs. Some external handle types correspond to platform-defined handles, in which case the resource **may** outlive any particular Vulkan device or instance and **may** be transferred between processes, or otherwise manipulated via functionality defined by the platform for that handle type.

External synchronization

A type of synchronization **required** of the application, where parameters defined to be externally synchronized **must** not be used simultaneously in multiple threads.

Facingness (Polygon)

A classification of a polygon as either front-facing or back-facing, depending on the orientation (winding order) of its vertices.

Facingness (Fragment)

A fragment is either front-facing or back-facing, depending on the primitive it was generated from. If the primitive was a polygon (regardless of polygon mode), the fragment inherits the facingness of the polygon. All other fragments are front-facing.

Fence

A synchronization primitive that is signaled when a set of batches or sparse binding operations complete execution on a queue. Fences **can** be waited on by the host. Represented by a VkFence object.

Field (Video)

Possibly discontinuous subregions of a frame. Frames **may** consist of two fields, a top field and a bottom field.

Flat Shading

A property of a vertex attribute that causes the value from a single vertex (the provoking vertex) to be used for all vertices in a primitive, and for interpolation of that attribute to return that single value unaltered.

Format Features

A set of features from VkFormatFeatureFlagBits that a VkFormat is capable of using for various commands. The list is determined by factors such as VkImageTiling.

Forward Prediction

Sample prediction performed during video decode and encode operations based on reference pictures that occur temporally (in display order) before the current picture.

Forward Reference

A reference picture that occurs temporally (in display order) before the current picture.

Fragment

A rectangular framebuffer region with associated data produced by rasterization and processed by fragment operations including the fragment shader.

Fragment Area

The width and height, in pixels, of a fragment.

Fragment Density

The ratio of fragments per framebuffer area in the x and y direction.

Fragment Density Texel Size

The (w,h) framebuffer region in pixels that each texel in a fragment density map applies to.

Fragment Input Attachment Interface

Variables with `UniformConstant` storage class and a decoration of `InputAttachmentIndex` that are statically used by a fragment shader's entry point, which receive values from input attachments.

Fragment Mask

A lookup table that associates color samples with color fragment values.

Fragment Output Interface

A fragment shader entry point's variables with `Output` storage class, which output to color and/or depth/stencil attachments.

Frame (Video)

A multi-dimensional array of luma samples and an optional multi-dimensional array of chroma samples.

Fragment Tile Image Interface

A fragment shader entry point's variables with `TileImageEXT` storage class and a decoration of `Location`, which are used to read values from color attachments.

Framebuffer

A collection of image views and a set of dimensions that, in conjunction with a render pass, define the inputs and outputs used by drawing commands. Represented by a VkFramebuffer object.

Framebuffer Attachment

One of the image views used in a framebuffer.

Framebuffer Coordinates

A coordinate system in which adjacent pixels' coordinates differ by 1 in x and/or y, with (0,0) in the upper left corner and pixel centers at half-integers.

Framebuffer-Space

Operating with respect to framebuffer coordinates.

Framebuffer-Local

A framebuffer-local dependency guarantees that only for a single framebuffer region, the first set of operations happens-before the second set of operations.

Framebuffer-Global

A framebuffer-global dependency guarantees that for all framebuffer regions, the first set of operations happens-before the second set of operations.

Framebuffer Region

A framebuffer region is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Front-Facing

See Facingness.

Full Compatibility

A given version of the API is fully compatible with another version if an application, relying only on valid behavior and functionality defined by either of those specifications, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

Global Command

A Vulkan command for which the first argument is not a dispatchable handle type.

Global Workgroup

A collection of local workgroups dispatched by a single dispatching or single mesh task drawing command.

Handle

An opaque integer or pointer value used to refer to a Vulkan object. Each object type has a unique handle type.

Happen-after, happens-after

A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of **A** and a destination of **B** enforces that **B** happens-after **A**. The inverse relation of happens-before.

Happen-before, happens-before

A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of **A** and a destination of **B** enforces that **A** happens-before **B**. The inverse relation of happens-after.

Helper Invocation

A fragment shader invocation that is created solely for the purposes of evaluating derivatives for use in non-helper fragment shader invocations, and which does not have side effects.

Host

The processor(s) and execution environment that the application runs on, and that the Vulkan API is exposed on.

Host Mapped Device Memory

Device memory that is mapped for host access using vkMapMemory.

Host Mapped Foreign Memory

Memory owned by a foreign device that is mapped for host access.

Host Memory

Memory not accessible to the device, used to store implementation data structures.

Host-Accessible Subresource

A buffer, or a linear image subresource in either the `VK_IMAGE_LAYOUT_PREINITIALIZED` or `VK_IMAGE_LAYOUT_GENERAL` layout. Host-accessible subresources have a well-defined addressing scheme which can be used by the host.

Host-Local Memory

Memory that is not local to the device, and **may** be less performant for device access than device-local memory.

Host-Visible Memory

Device memory that **can** be mapped on the host and **can** be read and written by the host.

ICD

Installable Client Driver. An ICD is represented as a VkPhysicalDevice.

Identically Defined Objects

Objects of the same type where all arguments to their creation or allocation functions, with the

exception of `pAllocator`, are

1. Vulkan handles which refer to the same object or
2. identical scalar or enumeration values or
3. Host pointers which point to an array of values or structures which also satisfy these three constraints.

Image

A resource that represents a multi-dimensional formatted interpretation of device memory. Represented by a VkImage object.

Image Subresource

A specific mipmap level, layer, and set of aspects of an image.

Image Subresource Range

A set of image subresources that are contiguous mipmap levels and layers.

Image View

An object that represents an image subresource range of a specific image, and state controlling how the contents are interpreted. Represented by a VkImageView object.

Immutable Sampler

A sampler descriptor provided at descriptor set layout creation time for a specific binding. This sampler is then used for that binding in all descriptor sets allocated with the layout, and it **cannot** be changed.

Implicit chroma reconstruction

An implementation of sampler $Y'C_BC_R$ conversion which reconstructs the reduced-resolution chroma samples directly at the sample point, as part of the normal texture sampling operation. This is distinct from an *explicit chroma reconstruction* implementation, which reconstructs the reduced-resolution chroma samples to the resolution of the luma samples, then filters the result as part of texture sample interpolation.

Implicitly-Enabled Layer

A layer enabled by a loader-defined mechanism outside the Vulkan API, rather than explicitly by the application during instance or device creation.

Inactive Object (Ray Tracing)

A primitive or instance in a ray tracing acceleration structure which has a corresponding ID, but which will never report an intersection with any ray.

Index Buffer

A buffer bound via vkCmdBindIndexBuffer which is the source of index values used to fetch vertex attributes for a vkCmdDrawIndexed or vkCmdDrawIndexedIndirect command.

Indexed Drawing Commands

Drawing commands which use an *index buffer* as the source of index values used to fetch vertex attributes for a drawing command. Includes vkCmdDrawIndexed,

vkCmdDrawIndexedIndirectCountKHR, vkCmdDrawIndexedIndirectCountAMD, vkCmdDrawMultiIndexedEXT, and vkCmdDrawIndexedIndirect.

Indirect Commands

Drawing or dispatching commands that source some of their parameters from structures in buffer memory. Includes vkCmdDrawIndirect, vkCmdDrawIndexedIndirect, vkCmdDrawIndirectCountKHR, vkCmdDrawIndexedIndirectCountKHR, vkCmdDrawIndirectCountAMD, vkCmdDrawIndexedIndirectCountAMD, vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksIndirectCountNV, vkCmdDrawMeshTasksIndirectEXT, vkCmdDrawMeshTasksIndirectCountEXT, and vkCmdDispatchIndirect.

Indirect Commands Layout

A definition of a sequence of commands, that are generated on the device via vkCmdPreprocessGeneratedCommandsNV and vkCmdExecuteGeneratedCommandsNV. Each sequence is comprised of multiple VkIndirectCommandsTokenTypeNV, which represent a subset of traditional command buffer commands. Represented as VkIndirectCommandsLayoutNV.

Indirect Drawing Commands

Drawing commands that source some of their parameters from structures in buffer memory. Includes vkCmdDrawIndirect, vkCmdDrawIndirectCountKHR, vkCmdDrawIndexedIndirectCountKHR, vkCmdDrawIndirectCountAMD, vkCmdDrawIndexedIndirectCountAMD, vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksIndirectCountNV, vkCmdDrawMeshTasksIndirectEXT, vkCmdDrawMeshTasksIndirectCountEXT, and vkCmdDrawIndexedIndirect.

Initial State (Command Buffer)

A command buffer that has not begun recording commands. See also Recording State and Executable State.

Inline Uniform Block

A descriptor type that represents uniform data stored directly in descriptor sets, and supports read-only access in a shader.

Input Attachment

A descriptor type that represents an image view, and supports unfiltered read-only access in a shader, only at the fragment's location in the view.

Instance

The top-level Vulkan object, which represents the application's connection to the implementation. Represented by a VkInstance object.

Instance-Level Command

Any command that is dispatched from an instance, or from a child object of an instance, except for physical devices and their children.

Instance-Level Functionality

All instance-level commands and objects, and their structures, enumerated types, and

enumerants.

Instance-Level Object

High-level Vulkan objects, which are not physical devices, nor children of physical devices. For example, VkInstance is an instance-level object.

Instance (Memory)

In a logical device representing more than one physical device, some device memory allocations have the requested amount of memory allocated multiple times, once for each physical device in a device mask. Each such replicated allocation is an instance of the device memory.

Instance (Resource)

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but **can** be bound to memory differently on each. Each such replicated resource is an instance of the resource.

Inter Block (Video)

A video coding block that uses inter prediction.

Inter Prediction (Video)

Sample prediction derived from reference picture samples or metadata.

Internal Synchronization

A type of synchronization **required** of the implementation, where parameters not defined to be externally synchronized **may** require internal mutexing to avoid multithreaded race conditions.

Intra Block (Video)

A video coding block that only uses intra prediction.

Intra Prediction (Video)

Sample prediction that is not derived from reference picture samples or metadata.

Invocation (Shader)

A single execution of an entry point in a SPIR-V module. For example, a single vertex's execution of a vertex shader or a single fragment's execution of a fragment shader.

Invocation Group

A set of shader invocations that are executed in parallel and that **must** execute the same control flow path in order for control flow to be considered dynamically uniform.

Invocation Repack Instruction

A ray tracing instruction where the implementation **may** change the set of invocations that are executing.

Join (Deferred Host Operations)

The act of instructing a thread to participate in the execution of a deferred operation. See Deferred Host Operations.

Linear Color Attachment

A color attachment with linear tiling

Linear Resource

A resource is *linear* if it is one of the following:

- a VkBuffer
- a VkImage created with `VK_IMAGE_TILING_LINEAR`
- a VkImage created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and whose Linux DRM format modifier is `DRM_FORMAT_MOD_LINEAR`
- a VkAccelerationStructureNV

Because a VkAccelerationStructureKHR resource does not have memory bound to it directly, it is considered neither linear nor non-linear. However, the VkBuffer on which a VkAccelerationStructureKHR resource is placed is a linear resource.

A resource is *non-linear* if it is one of the following:

- a VkImage created with `VK_IMAGE_TILING_OPTIMAL`
- a VkImage created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and whose Linux DRM format modifier is not `DRM_FORMAT_MOD_LINEAR`

Linux DRM Format Modifier

A 64-bit, vendor-prefixed, semi-opaque unsigned integer describing vendor-specific details of an image's memory layout. In Linux graphics APIs, *modifiers* are commonly used to specify the memory layout of externally shared images. An image has a *modifier* if and only if it is created with `tiling` equal to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`. For more details, refer to the appendix for extension `VK_EXT_image_drm_format_modifier`.

Local Workgroup

A collection of compute shader invocations invoked by a single dispatching command, which share data via `WorkgroupLocal` variables and can synchronize with each other.

Logical Device

An object that represents the application's interface to the physical device. The logical device is the parent of most Vulkan objects. Represented by a VkDevice object.

Logical Operation

Bitwise operations between a fragment color value and a value in a color attachment, that produce a final color value to be written to the attachment.

Lost Device

A state that a logical device **may** be in as a result of unrecoverable implementation errors, or other exceptional conditions.

Mappable

See Host-Visible Memory.

Memory Dependency

A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation
- The availability operation happens-before the visibility operation
- The visibility operation happens-before the second set of operations

Memory Domain

A memory domain is an abstract place to which memory writes are made available by availability operations and memory domain operations. The memory domains correspond to the set of agents that the write **can** then be made visible to. The memory domains are *host*, *device*, *shader*, *workgroup instance* (for workgroup instance there is a unique domain for each compute workgroup) and *subgroup instance* (for subgroup instance there is a unique domain for each subgroup).

Memory Domain Operation

An operation that makes the writes that are available to one memory domain available to another memory domain.

Memory Heap

A region of memory from which device memory allocations **can** be made.

Memory Type

An index used to select a set of memory properties (e.g. mappable, cached) for a device memory allocation.

Mesh Shading Pipeline

A graphics pipeline where the primitives are assembled explicitly in the shader stages. In contrast to the primitive shading pipeline where input primitives are assembled by fixed function processing.

Mesh Tasks Drawing Commands

Drawing commands which create shader invocations organized in workgroups for drawing mesh tasks. Includes vkCmdDrawMeshTasksNV, vkCmdDrawMeshTasksIndirectNV, and vkCmdDrawMeshTasksIndirectCountNV, vkCmdDrawMeshTasksEXT, vkCmdDrawMeshTasksIndirectEXT, and vkCmdDrawMeshTasksIndirectCountEXT .

Minimum Mip Level Size

The smallest size that is permitted for a mip level. For conventional images this is 1x1x1. For corner-sampled images, this is 2x2x2. See Image Mip Level Sizing.

Mip Tail Region

The set of mipmap levels of a sparse residency texture that are too small to fill a sparse block, and that **must** all be bound to memory collectively and opaquely.

Multi-planar

A *multi-planar format* (or “planar format”) is an image format consisting of more than one *plane*,

identifiable with a `_2PLANE` or `_3PLANE` component to the format name and listed in Formats Requiring Sampler $Y'C_BC_R$ Conversion for `VK_IMAGE_ASPECT_COLOR_BIT` Image Views. A *multi-planar image* (or "planar image") is an image of a multi-planar format.

Nested Command Buffers

A nested command buffer is a secondary command buffer that is executed by another secondary command buffer, which may itself execute other secondary command buffers.

Non-Dispatchable Handle

A handle of an integer handle type. Handle values **may** not be unique, even for two objects of the same type.

Non-Indexed Drawing Commands

Drawing commands for which the vertex attributes are sourced in linear order from the vertex input attributes for a drawing command (i.e. they do not use an *index buffer*). Includes vkCmdDraw, vkCmdDrawIndirectCountKHR, vkCmdDrawIndirectCountAMD, vkCmdDrawMultiEXT, and vkCmdDrawIndirect.

Normalized

A value that is interpreted as being in the range [0,1] as a result of being implicitly divided by some other value.

Normalized Device Coordinates

A coordinate space after perspective division is applied to clip coordinates, and before the viewport transformation converts them to framebuffer coordinates.

Obsoleted (feature)

A feature is obsolete if it can no longer be used.

Opaque Capture Address

A 64-bit value representing the device address of a buffer or memory object that is expected to be used by trace capture/replay tools in combination with the `bufferDeviceAddress` feature.

Overlapped Range (Aliased Range)

The aliased range of a device memory allocation that intersects a given image subresource of an image or range of a buffer.

Ownership (Resource)

If an entity (e.g. a queue family) has ownership of a resource, access to that resource is well-defined for access by that entity.

Packed Format

A format whose components are stored as a single texel block in memory, with their relative locations defined within that element.

Passthrough Geometry Shader

A geometry shader which uses the `PassthroughNV` decoration on a variable in its input interface. Output primitives in a passthrough geometry shader always have the same topology as the input

primitive and are not produced by emitting vertices.

Payload

Importable or exportable reference to the internal data of an object in Vulkan.

Per-View

A variable that has an array of values which are output, one for each view that is being generated. A mesh shader which uses the `PerViewNV` decoration on a variable in its output interface.

Peer Memory

An instance of memory corresponding to a different physical device than the physical device performing the memory access, in a logical device that represents multiple physical devices.

Physical Device

An object that represents a single device in the system. Represented by a VkPhysicalDevice object.

Physical-Device-Level Command

Any command that is dispatched from a physical device.

Physical-Device-Level Functionality

All physical-device-level commands and objects, and their structures, enumerated types, and enumerants.

Physical-Device-Level Object

Physical device objects. For example, VkPhysicalDevice is a physical-device-level object.

Picture Partition (Video)

Collective term that refers to a subregion of a video picture resource that **may** be decoded or encoded independently according to the partitioning scheme defined in the corresponding video compression standard. Picture partitions **may** be non-rectangular.

Pipeline

An object controlling how graphics or compute work is executed on the device. A pipeline includes one or more shaders, as well as state controlling any non-programmable stages of the pipeline. Represented by a VkPipeline object.

Pipeline Barrier

An execution and/or memory dependency recorded as an explicit command in a command buffer, that forms a dependency between the previous and subsequent commands.

Pipeline Cache

An object that **can** be used to collect and retrieve information from pipelines as they are created, and **can** be populated with previously retrieved information in order to accelerate pipeline creation. Represented by a VkPipelineCache object.

Pipeline Layout

An object defining the set of resources (via a collection of descriptor set layouts) and push constants used by pipelines that are created using the layout. Used when creating a pipeline and when binding descriptor sets and setting push constant values. Represented by a VkPipelineLayout object.

Pipeline Library

A pipeline that cannot be directly used, instead defining a set of shaders and shader groups which will be linked into other pipelines.

Pipeline Stage

A logically independent execution unit that performs some of the operations defined by an action command.

Pipeline Trace Ray Instruction

A ray tracing instruction which traces a ray into an acceleration structure when using ray tracing pipelines. One of:

- `OpTraceNV`
- `OpTraceRayKHR`
- `OpTraceRayMotionNV`
- `OpTraceMotionNV`
- `OpHitObjectTraceRayNV`
- `OpHitObjectTraceRayMotionNV`

`pNext` Chain

A set of structures chained together through their `pNext` members.

Planar

See *multi-planar*.

Plane

An *image plane* is part of the representation of an image, containing a subset of the color components necessary to represent the texels in the image and with a contiguous mapping of coordinates to bound memory. Most images consist only of a single plane, but some formats spread the components across multiple image planes. The host-accessible properties of each image plane are accessible for a linear layout using vkGetImageSubresourceLayout. If a multi-planar image is created with the `VK_IMAGE_CREATE_DISJOINT_BIT` bit set, the image is described as *disjoint*, and its planes are therefore bound to memory independently.

Point Sampling (Rasterization)

A rule that determines whether a fragment sample location is covered by a polygon primitive by testing whether the sample location is in the interior of the polygon in framebuffer-space, or on the boundary of the polygon according to the tie-breaking rules.

Potential Format Features

The union of all VkFormatFeatureFlagBits that the implementation supports for a specified VkFormat, over all supported image tilings. For Android external formats the VkFormatFeatureFlagBits is provided by the implementation. For QNX Screen external formats the VkFormatFeatureFlagBits is provided by the implementation.

Pre-rasterization

Operations that execute before rasterization, and any state associated with those operations.

Presentable image

A `VkImage` object obtained from a `VkSwapchainKHR` used to present to a `VkSurfaceKHR` object.

Preserve Attachment

One of a list of attachments in a subpass description that is not read or written by the subpass, but that is read or written on earlier and later subpasses and whose contents **must** be preserved through this subpass.

Primary Command Buffer

A command buffer that **can** execute secondary command buffers, and **can** be submitted directly to a queue.

Primitive Shading Pipeline

A graphics pipeline where input primitives are assembled by fixed function processing. It is the counterpart to mesh shading.

Primitive Topology

State controlling how vertices are assembled into primitives, e.g. as lists of triangles, strips of lines, etc.

Promoted (feature)

A feature from an older extension is considered promoted if it is made available as part of a new core version or newer extension with wider support.

Protected Buffer

A buffer to which protected device memory **can** be bound.

Protected-capable Device Queue

A device queue to which protected command buffers **can** be submitted.

Protected Command Buffer

A command buffer which **can** be submitted to a protected-capable device queue.

Protected Device Memory

Device memory which **can** be visible to the device but **must** not be visible to the host.

Protected Image

An image to which protected device memory **can** be bound.

Provisional

A feature is released provisionally in order to get wider feedback on the functionality before it is finalized. Provisional features may change in ways that break backwards compatibility, and thus are not recommended for use in production applications.

Provoking Vertex

The vertex in a primitive from which flat shaded attribute values are taken. This is generally the "first" vertex in the primitive, and depends on the primitive topology.

Push Constants

A small bank of values writable via the API and accessible in shaders. Push constants allow the application to set values used in shaders without creating buffers or modifying and binding descriptor sets for each update.

Push Constant Interface

The set of variables with `PushConstant` storage class that are statically used by a shader entry point, and which receive values from push constant commands.

Push Descriptors

Descriptors that are written directly into a command buffer rather than into a descriptor set. Push descriptors allow the application to set descriptors used in shaders without allocating or modifying descriptor sets for each update.

Descriptor Update Template

An object specifying a mapping from descriptor update information in host memory to elements in a descriptor set, which helps enable more efficient descriptor set updates.

Query Pool

An object containing a number of query entries and their associated state and results. Represented by a VkQueryPool object.

Queue

An object that executes command buffers and sparse binding operations on a device. Represented by a VkQueue object.

Queue Family

A set of queues that have common properties and support the same functionality, as advertised in VkQueueFamilyProperties.

Queue Operation

A unit of work to be executed by a specific queue on a device, submitted via a queue submission command. Each queue submission command details the specific queue operations that occur as a result of calling that command. Queue operations typically include work that is specific to each command, and synchronization tasks.

Queue Submission

Zero or more batches and an optional fence to be signaled, passed to a command for execution on a queue. See the Devices and Queues chapter for more information.

Ray Tracing Command

Commands that provoke work using a ray tracing pipeline. Includes vkCmdTraceRaysNV, vkCmdTraceRaysKHR, and vkCmdTraceRaysIndirectKHR .

Reconstructed Picture

A video picture resource reconstructed from a compressed bitstream using video decode or encode operations that **can** be used as a reference picture by future video decode or encode operations with the same video session.

Recording State (Command Buffer)

A command buffer that is ready to record commands. See also Initial State and Executable State.

Reference Picture

A video picture resource used by video decode and encode operations to provide predictions of the values of samples in the subsequently decoded or encoded pictures.

Reference Picture Metadata

Opaque state associated with a DPB slot, maintained by a video session.

Release Operation (Resource)

An operation that releases ownership of an image subresource or buffer range.

Render Pass

An object that represents a set of framebuffer attachments and phases of rendering using those attachments. Represented by a VkRenderPass object.

Render Pass Instance

A use of a render pass in a command buffer.

Required Extensions

Extensions that **must** be enabled alongside extensions dependent on them (see Extension Dependencies).

Reset (Command Buffer)

Resetting a command buffer discards any previously recorded commands and puts a command buffer in the initial state.

Residency Code

An integer value returned by sparse image instructions, indicating whether any sparse unbound texels were accessed.

Resolve Attachment

A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding color attachment at the end of the subpass.

Retired Swapchain

A swapchain that has been used as the `oldSwapchain` parameter to vkCreateSwapchainKHR. Images cannot be acquired from a retired swapchain, however images that were acquired (but

not presented) before the swapchain was retired **can** be presented.

Sample Index

The index of a sample within a single set of samples.

Sample Shading

Invoking the fragment shader multiple times per fragment, with the covered samples partitioned among the invocations.

Sampled Image

A descriptor type that represents an image view, and supports filtered (sampled) and unfiltered read-only access in a shader.

Sampler

An object containing state controlling how sampled image data is sampled (or filtered) when accessed in a shader. Also a descriptor type describing the object. Represented by a VkSampler object.

Secondary Command Buffer

A command buffer that **can** be executed by a primary command buffer, and **must** not be submitted directly to a queue.

Self-Dependency

A subpass dependency from a subpass to itself, i.e. with `srcSubpass` equal to `dstSubpass`. A self-dependency is not automatically performed during a render pass instance, rather a subset of it **can** be performed via vkCmdPipelineBarrier during the subpass.

Semaphore

A synchronization primitive that supports signal and wait operations, and **can** be used to synchronize operations within a queue or across queues. Represented by a VkSemaphore object.

Shader

Instructions selected (via an entry point) from a shader module, which are executed in a shader stage.

Shader Call

An instruction which **may** cause execution to continue in a different shader stage.

Shader Code

A stream of instructions used to describe the operation of a shader.

Shader Group

A set of Shader Stages that are part of a VkPipeline containing multiple of such sets. This allows the device to make use of all the shader groups from the bound pipeline independently.

Shader Module

A collection of shader code, potentially including several functions and entry points, that is used to create shaders in pipelines. Represented by a VkShaderModule object.

Shader Stage

A stage of the graphics or compute pipeline that executes shader code.

Shading Rate

The ratio of the number of fragment shader invocations generated in a fully covered framebuffer region to the size (in pixels) of that region.

Shading Rate Image

An image used to establish the shading rate for a framebuffer region, where each pixel controls the shading rate for a corresponding framebuffer region.

Shared presentable image

A presentable image created from a swapchain with VkPresentModeKHR set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

Side Effect

A store to memory or atomic operation on memory from a shader invocation.

Single-plane format

A format that is not *multi-planar*.

Size-Compatible Image Formats

When a compressed image format and an uncompressed image format are size-compatible, it means that the texel block size of the uncompressed format **must** equal the texel block size of the compressed format.

Sparse Block

An element of a sparse resource that can be independently bound to memory. Sparse blocks of a particular sparse resource have a corresponding size in bytes that they use in the bound memory.

Sparse Image Block

A sparse block in a sparse partially-resident image. In addition to the sparse block size in bytes, sparse image blocks have a corresponding width, height, and depth defining the dimensions of these elements in units of texels or compressed texel blocks, the latter being used in case of sparse images having a block-compressed format.

Sparse Unbound Texel

A texel read from a region of a sparse texture that does not have memory bound to it.

SRT

A decomposition of a spatial transform separating out scale, rotation, and translation which has better linear interpolation properties for representing motion.

Static Use

An object in a shader is statically used by a shader entry point if any function in the entry point's call tree contains an instruction using the object. A reference in the entry point's interface list does not constitute a static use. Static use is used to constrain the set of descriptors used by a

shader entry point.

Storage Buffer

A descriptor type that represents a buffer, and supports reads, writes, and atomics in a shader.

Storage Image

A descriptor type that represents an image view, and supports unfiltered loads, stores, and atomics in a shader.

Storage Texel Buffer

A descriptor type that represents a buffer view, and supports unfiltered, formatted reads, writes, and atomics in a shader.

Subgroup

A set of shader invocations that **can** synchronize and share data with each other efficiently. In compute shaders, the *local workgroup* is a superset of the subgroup.

Subgroup Mask

A bitmask for all invocations in the current subgroup with one bit per invocation, starting with the least significant bit in the first vector component, continuing to the last bit (less than `SubgroupSize`) in the last required vector component.

Subpass

A phase of rendering within a render pass, that reads and writes a subset of the attachments.

Subpass Dependency

An execution and/or memory dependency between two subpasses described as part of render pass creation, and automatically performed between subpasses in a render pass instance. A subpass dependency limits the overlap of execution of the pair of subpasses, and **can** provide guarantees of memory coherence between accesses in the subpasses.

Subpass Description

Lists of attachment indices for input attachments, color attachments, depth/stencil attachment, resolve attachments, depth/stencil resolve, and preserve attachments used by the subpass in a render pass.

Subset (Self-Dependency)

A subset of a self-dependency is a pipeline barrier performed during the subpass of the self-dependency, and whose stage masks and access masks each contain a subset of the bits set in the identically named mask in the self-dependency.

Texel Block

A single addressable element of an image with an uncompressed VkFormat, or a single compressed block of an image with a compressed VkFormat.

Texel Block Size

The size (in bytes) used to store a texel block of a compressed or uncompressed image.

Texel Coordinate System

One of three coordinate systems (normalized, unnormalized, integer) defining how texel coordinates are interpreted in an image or a specific mipmap level of an image.

Tile Image

A per-tile view of a framebuffer attachment. If the `VK_EXT_shader_tile_image` extension is enabled, the framebuffer is considered to be divided into tiles.

Timeline Semaphore

A semaphore with a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. Represented by a VkSemaphore object created with a semaphore type of `VK_SEMAPHORE_TYPE_TIMELINE`.

Uniform Texel Buffer

A descriptor type that represents a buffer view, and supports unfiltered, formatted, read-only access in a shader.

Uniform Buffer

A descriptor type that represents a buffer, and supports read-only access in a shader.

Units in the Last Place (ULP)

A measure of floating-point error loosely defined as the smallest representable step in a floating-point format near a given value. For the precise definition see Precision and Operation of SPIR-V instructions or Jean-Michel Muller, “On the definition of ulp(x)”, RR-5504, INRIA. Other sources may also use the term “unit of least precision”.

Unnormalized

A value that is interpreted according to its conventional interpretation, and is not normalized.

Unprotected Buffer

A buffer to which unprotected device memory **can** be bound.

Unprotected Command Buffer

A command buffer which **can** be submitted to an unprotected device queue or a protected-capable device queue.

Unprotected Device Memory

Device memory which **can** be visible to the device and **can** be visible to the host.

Unprotected Image

An image to which unprotected device memory **can** be bound.

User-Defined Variable Interface

A shader entry point’s variables with `Input` or `Output` storage class that are not built-in variables.

Vertex Input Attribute

A graphics pipeline resource that produces input values for the vertex shader by reading data from a vertex input binding and converting it to the attribute’s format.

Vertex Stream

A vertex stream is where the last pre-rasterization shader stages outputs vertex data, which then goes to the rasterizer, is captured to a transform feedback buffer, or both. Geometry shaders **can** emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams.

Validation Cache

An object that **can** be used to collect and retrieve validation results from the validation layers, and **can** be populated with previously retrieved results in order to accelerate the validation process. Represented by a VkValidationCacheEXT object.

Variable-Sized Descriptor Binding

A descriptor binding whose size will be specified when a descriptor set is allocated using this layout.

Vertex Input Binding

A graphics pipeline resource that is bound to a buffer and includes state that affects addressing calculations within that buffer.

Vertex Input Interface

A vertex shader entry point's variables with `Input` storage class, which receive values from vertex input attributes.

Video Bitstream Buffer

A resource that represents a linear array of data in device memory storing encoded video data. Represented by a VkBuffer object.

Video Coding Scope

A series of subsequent commands recorded into a command buffer starting with a vkCmdBeginVideoCodingKHR command and ending with a vkCmdEndVideoCodingKHR command that encompasses a set of video decode or encode operations.

Video Coding Operations

Any operations recorded into a command buffer within a video coding scope, including video decode and encode operations.

Video Decode Operation

An operation consuming data from a video bitstream buffer and zero or more reference pictures, and producing data to a decode output picture and an optional reconstructed picture.

Video Encode Operation

An operation consuming data from an encode input picture and zero or more reference pictures, and producing data to a video bitstream buffer and an optional reconstructed picture.

Video Picture Resource

A resource that represents a multi-dimensional formatted interpretation of device memory to be used with a video session as a decode output picture, encode input picture, reconstructed picture, and/or reference picture. It **may** contain metadata associated with a particular video

session it is used with. Represented by a VkImage object and referred to using VkImageView objects created from it.

Video Session

A resource that represents and maintains the state needed to perform video decode or encode operations. Represented by a VkVideoSessionKHR object.

Video Session Parameters

A resource that stores preprocessed codec-specific parameters used with a compatible video session in video codec operations. Represented by a VkVideoSessionParametersKHR object.

Video Transcoding

The process of using the outputs of video decoding operations as inputs in video encoding operations.

View Mask

When multiview is enabled, a view mask is a property of a subpass controlling which views the rendering commands are broadcast to.

View Volume

A subspace in homogeneous coordinates, corresponding to post-projection x and y values between -1 and +1, and z values between 0 and +1.

Viewport Transformation

A transformation from normalized device coordinates to framebuffer coordinates, based on a viewport rectangle and depth range.

Visibility Operation

An operation that causes available values to become visible to specified memory accesses.

Visible

A state of values written to memory that allows them to be accessed by a set of operations.

Common Abbreviations

The abbreviations and acronyms defined in this section are sometimes used in the Specification and the API where they are considered clear and commonplace.

VPS
: Video Parameter Set

Prefixes

Prefixes are used in the API to denote specific semantic meaning of Vulkan names, or as a label to avoid name clashes, and are explained here:

VK/Vk/vk
: Vulkan namespace
All types, commands, enumerants and defines in this specification are prefixed with these two characters.

PFN/pfn

Function Pointer
Denotes that a type is a function pointer, or that a variable is of a pointer type.

p

Pointer
Variable is a pointer.

vkCmd

Commands that record commands in command buffers
These API commands do not result in immediate processing on the device. Instead, they record the requested action in a command buffer for execution when the command buffer is submitted to a queue.

s

Structure
Used to denote the `VK_STRUCTURE_TYPE*` member of each structure in `sType`

Appendix I: Credits (Informative)

Vulkan 1.3 is the result of contributions from many people and companies participating in the Khronos Vulkan Working Group, as well as input from the Vulkan Advisory Panel.

Members of the Working Group, including the company that they represented at the time of their most recent contribution, are listed in the following section. Some specific contributions made by individuals are listed together with their name.

Working Group Contributors to Vulkan

- Aaron Greig, Codeplay Software Ltd. (version 1.1)
- Aaron Hagan, AMD (version 1.1)
- Adam Jackson, Red Hat (versions 1.0, 1.1)
- Adam Śmigielski, Mobica (version 1.0)
- Aditi Verma, Qualcomm (version 1.3)
- Ahmed Abdelkhalek, AMD (version 1.3)
- Aidan Fabius, Core Avionics & Industrial Inc. (version 1.2)
- Alan Baker, Google (versions 1.1, 1.2, 1.3)
- Alan Ward, Google (versions 1.1, 1.2)
- Alejandro Piñeiro, Igalia (version 1.1)
- Alex Bourd, Qualcomm Technologies, Inc. (versions 1.0, 1.1)
- Alex Crabb, Caster Communications (versions 1.2, 1.3)
- Alex Walters, Imagination Technologies (versions 1.2, 1.3)
- Alexander Galazin, Arm (versions 1.0, 1.1, 1.2, 1.3)
- Alexey Sachkov, Intel (version 1.3)
- Allan MacKinnon, Google (version 1.3)
- Allen Hux, Intel (version 1.0)
- Alon Or-bach, Google (versions 1.0, 1.1, 1.2, 1.3) (WSI technical sub-group chair)
- Anastasia Stulova, Arm (versions 1.2, 1.3)
- Andreas Vasilakis, Think Silicon (version 1.2)
- Andres Gomez, Igalia (version 1.1)
- Andrew Cox, Samsung Electronics (version 1.0)
- Andrew Ellem, Google (version 1.3)
- Andrew Garrard, Imagination Technologies (versions 1.0, 1.1, 1.2, 1.3) (format wrangler)
- Andrew Poole, Samsung Electronics (version 1.0)
- Andrew Rafter, Samsung Electronics (version 1.0)

- Andrew Richards, Codeplay Software Ltd. (version 1.0)
- Andrew Woloszyn, Google (versions 1.0, 1.1)
- Ann Thorsnes, Khronos (versions 1.2, 1.3)
- Antoine Labour, Google (versions 1.0, 1.1)
- Aras Pranckevičius, Unity Technologies (version 1.0)
- Arseny Kapoulkine, Roblox (version 1.3)
- Ashwin Kolhe, NVIDIA (version 1.0)
- Baldur Karlsson, Valve Software (versions 1.1, 1.2, 1.3)
- Barthold Lichtenbelt, NVIDIA (version 1.1)
- Bas Nieuwenhuizen, Google (versions 1.1, 1.2)
- Ben Bowman, Imagination Technologies (version 1.0)
- Benj Lipchak, Unknown (version 1.0)
- Bill Hollings, Brenwill (versions 1.0, 1.1, 1.2, 1.3)
- Bill Licea-Kane, Qualcomm Technologies, Inc. (versions 1.0, 1.1)
- Blaine Kohl, Khronos (versions 1.2, 1.3)
- Bob Fraser, Google (version 1.3)
- Boris Zanin, Mobica (versions 1.2, 1.3)
- Brent E. Insko, Intel (version 1.0)
- Brian Ellis, Qualcomm Technologies, Inc. (version 1.0)
- Brian Paul, VMware (versions 1.2, 1.3)
- Caio Marcelo de Oliveira Filho, Intel (versions 1.2, 1.3)
- Cass Everitt, Oculus VR (versions 1.0, 1.1)
- Cemil Azizoglu, Canonical (version 1.0)
- Lina Versace, Google (versions 1.0, 1.1, 1.2)
- Chang-Hyo Yu, Samsung Electronics (version 1.0)
- Charles Giessen, LunarG (version 1.3)
- Chia-I Wu, LunarG (version 1.0)
- Chris Frascati, Qualcomm Technologies, Inc. (version 1.0)
- Chris Glover, Google (version 1.3)
- Christian Forfang, Arm (version 1.3)
- Christoph Kubisch, NVIDIA (version 1.3)
- Christophe Riccio, Unity Technologies (versions 1.0, 1.1)
- Cody Northrop, LunarG (version 1.0)
- Colin Riley, AMD (version 1.1)
- Cort Stratton, Google (versions 1.1, 1.2)

- Courtney Goeltzenleuchter, Google (versions 1.0, 1.1, 1.3)
- Craig Davies, Huawei (version 1.2)
- Dae Kim, Imagination Technologies (version 1.1)
- Damien Leone, NVIDIA (version 1.0)
- Dan Baker, Oxide Games (versions 1.0, 1.1)
- Dan Ginsburg, Valve Software (versions 1.0, 1.1, 1.2, 1.3)
- Daniel Johnston, Intel (versions 1.0, 1.1)
- Daniel Koch, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Daniel Rakos, AMD (versions 1.0, 1.1, 1.2, 1.3)
- Daniel Stone, Collabora (versions 1.1, 1.2)
- Daniel Vetter, Intel (version 1.2)
- David Airlie, Red Hat (versions 1.0, 1.1, 1.2, 1.3)
- David Mao, AMD (versions 1.0, 1.2)
- David Miller, Miller & Mattson (versions 1.0, 1.1) (Vulkan reference card)
- David Neto, Google (versions 1.0, 1.1, 1.2, 1.3)
- David Pankratz, Huawei (version 1.3)
- David Wilkinson, AMD (version 1.2)
- David Yu, Pixar (version 1.0)
- Dejan Mircevski, Google (version 1.1)
- Diego Novillo, Google (version 1.3)
- Dimitris Georgakakis, Think Silicon (version 1.3)
- Dominik Witczak, AMD (versions 1.0, 1.1, 1.3)
- Donald Scorgie, Imagination Technologies (version 1.2)
- Dzmitry Malyshau, Mozilla (versions 1.1, 1.2, 1.3)
- Ed Hutchins, Oculus (version 1.2)
- Emily Stearns, Khronos (versions 1.2, 1.3)
- François Duranleau, Gameloft (version 1.3)
- Frank (LingJun) Chen, Qualcomm Technologies, Inc. (version 1.0)
- Fred Liao, Mediatek (version 1.0)
- Gabe Dagani, Freescale (version 1.0)
- Gabor Sines, AMD (version 1.2)
- Graeme Leese, Broadcom (versions 1.0, 1.1, 1.2, 1.3)
- Graham Connor, Imagination Technologies (version 1.0)
- Graham Sellers, AMD (versions 1.0, 1.1)
- Graham Wihlidal, Electronic Arts (version 1.3)

- Greg Fischer, LunarG (version 1.1)
- Gregory Grebe, AMD (version 1.3)
- Hai Nguyen, Google (versions 1.2, 1.3)
- Hans-Kristian Arntzen, Valve Software (versions 1.1, 1.2, 1.3)
- Henri Verbeet, Codeweavers (version 1.2)
- Wyvern Wang, Huawei (version 1.3)
- Hwanyong Lee, Kyungpook National University (version 1.0)
- Iago Toral, Igalia (versions 1.1, 1.2)
- Ian Elliott, Google (versions 1.0, 1.1, 1.2)
- Ian Romanick, Intel (versions 1.0, 1.1, 1.3)
- Ivan Briano, Intel (version 1.3)
- James Fitzpatrick, Imagination (version 1.3)
- James Hughes, Oculus VR (version 1.0)
- James Jones, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- James Riordon, Khronos (versions 1.2, 1.3)
- Jamie Madill, Google (version 1.3)
- Jan Hermes, Continental Corporation (versions 1.0, 1.1)
- Jan-Harald Fredriksen, Arm (versions 1.0, 1.1, 1.2, 1.3)
- Faith Ekstrand, Intel (versions 1.0, 1.1, 1.2, 1.3)
- Jean-François Roy, Google (versions 1.1, 1.2, 1.3)
- Jeff Bolz, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Jeff Juliano, NVIDIA (versions 1.0, 1.1, 1.2)
- Jeff Leger, Qualcomm Technologies, Inc. (versions 1.1, 1.3)
- Jeff Phillips, Khronos (version 1.3)
- Jeff Vigil, Samsung Electronics (versions 1.0, 1.1, 1.2, 1.3)
- Jens Owen, Google (versions 1.0, 1.1)
- Jeremy Hayes, LunarG (version 1.0)
- Jesse Barker, Unity Technologies (versions 1.0, 1.1, 1.2, 1.3)
- Jesse Hall, Google (versions 1.0, 1.1, 1.2, 1.3)
- Joe Davis, Samsung Electronics (version 1.1)
- Johannes van Waveren, Oculus VR (versions 1.0, 1.1)
- John Anthony, Arm (version 1.2, 1.3)
- John Kessenich, Google (versions 1.0, 1.1, 1.2, 1.3) (SPIR-V and GLSL for Vulkan spec author)
- John McDonald, Valve Software (versions 1.0, 1.1, 1.2, 1.3)
- John Zulauf, LunarG (versions 1.1, 1.2, 1.3)

- Jon Ashburn, LunarG (version 1.0)
- Jon Leech, Independent (versions 1.0, 1.1, 1.2, 1.3) (XML toolchain, normative language, release wrangler)
- Jonas Gustavsson, Samsung Electronics (versions 1.0, 1.1)
- Jonas Meyer, Epic Games (versions 1.2, 1.3)
- Jonathan Hamilton, Imagination Technologies (version 1.0)
- Jordan Justen, Intel (version 1.1)
- Joshua Ashton, Valve Software (version 1.3)
- Jungwoo Kim, Samsung Electronics (versions 1.0, 1.1)
- Jörg Wagner, Arm (version 1.1)
- Kalle Raita, Google (version 1.1)
- Karen Ghavam, LunarG (versions 1.1, 1.2, 1.3)
- Karl Schultz, LunarG (versions 1.1, 1.2)
- Kathleen Mattson, Khronos (versions 1.0, 1.1, 1.2)
- Kaye Mason, Google (version 1.2)
- Keith Packard, Valve (version 1.2)
- Kenneth Benzie, Codeplay Software Ltd. (versions 1.0, 1.1)
- Kenneth Russell, Google (version 1.1)
- Kerch Holt, NVIDIA (versions 1.0, 1.1)
- Kevin O'Neil, AMD (version 1.1)
- Kevin Petit, Arm (version 1.3)
- Kris Rose, Khronos (versions 1.2, 1.3)
- Kristian Kristensen, Intel (versions 1.0, 1.1)
- Krzysztof Iwanicki, Samsung Electronics (version 1.0)
- Larry Seiler, Intel (version 1.0)
- Laura Shubel, Caster Communications (version 1.3)
- Lauri Ilola, Nokia (version 1.1)
- Lei Zhang, Google (version 1.2)
- Lenny Komow, LunarG (versions 1.1, 1.2)
- Liam Middlebrook, NVIDIA (version 1.3)
- Lionel Landwerlin, Intel (versions 1.1, 1.2)
- Lisie Aartsen, Khronos (version 1.3)
- Liz Maitral, Khronos (version 1.2)
- Lou Kramer, AMD (version 1.3)
- Lutz Latta, Lucasfilm (version 1.0)

- Maciej Jesionowski, AMD (version 1.1)
- Mais Alnasser, AMD (version 1.1)
- Marcin Kantoch, AMD (version 1.3)
- Marcin Rogucki, Mobica (version 1.1)
- Maria Rovatsou, Codeplay Software Ltd. (version 1.0)
- Mariusz Merecki, Intel (version 1.3)
- Mark Bellamy, Arm (version 1.2, 1.3)
- Mark Callow, Independent (versions 1.0, 1.1, 1.2, 1.3)
- Mark Kilgard, NVIDIA (versions 1.1, 1.2)
- Mark Lobodzinski, LunarG (versions 1.0, 1.1, 1.2)
- Mark Young, LunarG (versions 1.1, 1.3)
- Markus Tavenrath, NVIDIA (version 1.1)
- Marty Johnson, Khronos (version 1.3)
- Mateusz Przybylski, Intel (version 1.0)
- Mathias Heyer, NVIDIA (versions 1.0, 1.1)
- Mathias Schott, NVIDIA (versions 1.0, 1.1)
- Mathieu Robart, Arm (version 1.2)
- Matt Netsch, Qualcomm Technologies, Inc. (version 1.1)
- Matthew Rusch, NVIDIA (version 1.3)
- Matthäus Chajdas, AMD (versions 1.1, 1.2, 1.3)
- Maurice Ribble, Qualcomm Technologies, Inc. (versions 1.0, 1.1)
- Maxim Lukyanov, Samsung Electronics (version 1.0)
- Michael Blumenkrantz, Self (version 1.3)
- Michael Lentine, Google (version 1.0)
- Michael O’Hara, AMD (version 1.1)
- Michael Phillip, Samsung Electronics (version 1.2)
- Michael Wong, Codeplay Software Ltd. (version 1.1)
- Michael Worcester, Imagination Technologies (versions 1.0, 1.1)
- Michal Pietrasiuk, Intel (versions 1.0, 1.3)
- Mika Isojarvi, Google (versions 1.0, 1.1)
- Mike Schuchardt, LunarG (versions 1.1, 1.2)
- Mike Stroyan, LunarG (version 1.0)
- Mike Weiblen, LunarG (versions 1.1, 1.2, 1.3)
- Minyoung Son, Samsung Electronics (version 1.0)
- Mitch Singer, AMD (versions 1.0, 1.1, 1.2, 1.3)

- Mythri Venugopal, Samsung Electronics (version 1.0)
- Naveen Leekha, Google (version 1.0)
- Neil Henning, AMD (versions 1.0, 1.1, 1.2, 1.3)
- Neil Hickey, Arm (version 1.2)
- Neil Trevett, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Nick Penwarden, Epic Games (version 1.0)
- Nicolai Hähnle, AMD (version 1.1)
- Niklas Smedberg, Unity Technologies (version 1.0)
- Norbert Nopper, Independent (versions 1.0, 1.1)
- Nuno Subtil, NVIDIA (versions 1.1, 1.2, 1.3)
- Pat Brown, NVIDIA (version 1.0)
- Patrick Cozzi, Independent (version 1.1)
- Patrick Doane, Blizzard Entertainment (version 1.0)
- Peter Lohrmann, AMD (versions 1.0, 1.2)
- Petros Bantolas, Imagination Technologies (version 1.1)
- Philip Rebohle, Valve Software (version 1.3)
- Pierre Boudier, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Pierre-Loup Griffais, Valve Software (versions 1.0, 1.1, 1.2, 1.3)
- Piers Daniell, NVIDIA (versions 1.0, 1.1, 1.2, 1.3)
- Ping Liu, Intel (version 1.3)
- Piotr Bialecki, Intel (version 1.0)
- Piotr Byszewski, Mobica (version 1.3)
- Prabindh Sundareson, Samsung Electronics (version 1.0)
- Pyry Haulos, Google (versions 1.0, 1.1) (Vulkan conformance test subcommittee chair)
- Rachel Bradshaw, Caster Communications (version 1.3)
- Rajeev Rao, Qualcomm (version 1.2)
- Ralph Potter, Samsung Electronics (versions 1.1, 1.2, 1.3)
- Raun Krisch, Samsung Electronics (version 1.3)
- Ray Smith, Arm (versions 1.0, 1.1, 1.2)
- Ricardo Garcia, Igalia (version 1.3)
- Richard Huddy, Samsung Electronics (versions 1.2, 1.3)
- Rob Barris, NVIDIA (version 1.1)
- Rob Stepinski, Transgaming (version 1.0)
- Robert Simpson, Qualcomm Technologies, Inc. (versions 1.0, 1.1, 1.3)
- Rolando Caloca Olivares, Epic Games (versions 1.0, 1.1, 1.2, 1.3)

- Ronan Keryell, Xilinx (version 1.3)
- Roy Ju, Mediatek (version 1.0)
- Rufus Hamade, Imagination Technologies (version 1.0)
- Ruihao Zhang, Qualcomm Technologies, Inc. (versions 1.1, 1.2, 1.3)
- Samuel (Sheng-Wen) Huang, Mediatek (version 1.3)
- Samuel Iglesias Gonsalvez, Igalia (version 1.3)
- Sascha Willems, Self (version 1.3)
- Sean Ellis, Arm (version 1.0)
- Sean Harmer, KDAB Group (versions 1.0, 1.1)
- Shannon Woods, Google (versions 1.0, 1.1, 1.2, 1.3)
- Slawomir Cygan, Intel (versions 1.0, 1.1, 1.3)
- Slawomir Grajewski, Intel (versions 1.0, 1.1, 1.3)
- Sorel Bosan, AMD (version 1.1)
- Spencer Fricke, Samsung Electronics (versions 1.2, 1.3)
- Stefanus Du Toit, Google (version 1.0)
- Stephen Huang, Mediatek (version 1.1)
- Steve Hill, Broadcom (versions 1.0, 1.2)
- Steve Viggers, Core Avionics & Industrial Inc. (versions 1.0, 1.2)
- Steve Winston, Holochip (version 1.3)
- Stuart Smith, AMD (versions 1.0, 1.1, 1.2, 1.3)
- Sujeevan Rajayogam, Google (version 1.3)
- Tilmann Scheller, Samsung Electronics (version 1.1)
- Theresa Foley, Intel (version 1.0)
- Tim Lewis, Khronos (version 1.3)
- Timo Suoranta, AMD (version 1.0)
- Timothy Lottes, AMD (versions 1.0, 1.1)
- Tobias Hector, AMD (versions 1.0, 1.1, 1.2, 1.3) (validity language and toolchain)
- Tobin Ehlis, LunarG (version 1.0)
- Tom Olson, Arm (versions 1.0, 1.1, 1.2, 1.3) (Working Group chair)
- Tomasz Bednarz, Independent (version 1.1)
- Tomasz Kubale, Intel (version 1.0)
- Tony Barbour, LunarG (versions 1.0, 1.1, 1.2)
- Tony Zlatinski, NVIDIA (version 1.3)
- Victor Eruhimov, Unknown (version 1.1)
- Vikram Kushwaha, NVIDIA (version 1.3)

- Vincent Hindriksen, Stream HPC (versions 1.2, 1.3)
- Wasim Abbas, Arm (version 1.3)
- Wayne Lister, Imagination Technologies (version 1.0)
- Wolfgang Engel, Unknown (version 1.1)
- Yanjun Zhang, VeriSilicon (versions 1.0, 1.1, 1.2, 1.3)
- Yunxing Zhu, Huawei (version 1.3)

Other Credits

The Vulkan Advisory Panel members provided important real-world usage information and advice that helped guide design decisions.

The wider Vulkan community have provided useful feedback, questions and specification changes that have helped improve the quality of the Specification via GitHub.

Administrative support to the Working Group for Vulkan 1.1, 1.2, and 1.3 was provided by Khronos staff including Ann Thorsnes, Blaine Kohl, Dominic Agoro-Ombaka, Emily Stearns, Jeff Phillips, Lisie Aartsen, Liz Maitral, Marty Johnson, Tim Lewis, and Xiao-Yu CHENG; and by Alex Crabb, Laura Shubel, and Rachel Bradshaw of Caster Communications.

Administrative support for Vulkan 1.0 was provided by Andrew Riegel, Elizabeth Riegel, Glenn Fredericks, Kathleen Mattson and Michelle Clark of Gold Standard Group.

Technical support was provided by James Riordon, site administration of Khronos.org and OpenGL.org.
